By default, these default CSS files are merged with any that are specified in the document. For more information, see Configuring and Managing Multiple CSS Styles for a Framework (on page 1933).

Default XML Catalogs

The default XML Catalogs (on page 2659) for the DITA map document type are as follows:

• `OXYGEN_INSTALL_DIR/frameworks/dita/catalog.xml`
• `DITA-OT-DIR/catalog-dita.xml`

Transformation Scenarios

Oxygen XML Editor Eclipse plugin includes numerous built-in transformation scenarios that allow you to transform DITA maps to a variety of outputs, such as WebHelp, PDF, ODF, XHTML, EPUB, and CHM. All of them are listed in the DITA Map section in the Configure Transformation Scenario(s) dialog box (on page 1284).

For more information, see the DITA Map Transformation Scenarios (on page 2501) section.

DITA Map Author Mode Actions

A variety of actions are available for DITA map documents that can be found in DITA menu, toolbar, contextual menu, and the Content Completion Assistant (on page 2653).

DITA Map Toolbar and Menu Actions

When a DITA map is opened in Author mode, the following default actions are available on the DITA Map toolbar (by default, they are also available in the DITA menu and in various submenus of the contextual menu):

- **Insert New DITA Resource**
  Opens a New DITA file dialog box (on page 2380) where you can choose the type of DITA document to create and inserts a reference to it at the current position within the map.

- **Insert Topic Reference**
  Opens the Insert Reference dialog box (on page 2340) where you can configure a topic reference and inserts it at the current position within the map.

- **Insert Key Definition with Keyword**
  Opens a dialog box where you can choose the name of a key and its keyword value and inserts the key definition at the current position within the map.

- **Reuse Content**
  Opens the Reuse Content dialog box (on page 2465) that allows you to insert and configure a content reference (@conref), or a content key reference (@conkeyref) at the cursor position.

- **Insert Topic Heading**
  Opens the Insert Reference dialog box (on page 2340) that allows you to insert a topic heading at the cursor position.

- **Insert Topic Group**
  Opens the Insert Reference dialog box (on page 2340) that allows you to insert a topic group at the cursor position.

- **Insert Relationship Table**
Opens a dialog box that allows you to configure the relationship table to be inserted. The dialog box allows you to configure the number of rows and columns of the relationship table, if the header will be generated and if the title will be added.

**Relationship Table Properties**

Allows you to change the properties of rows in relationship tables.

**Insert Relationship Row**

Inserts a new table row with empty cells. The action is available when the cursor position is inside a table.

**Insert Relationship Column**

Inserts a new table column with empty cells after the current column. The action is available when the cursor position is inside a table.

**Delete Relationship Column**

Deletes the table column where the cursor is located.

**Delete Relationship Row**

Deletes the table row where the cursor is located.

**Move Up**

Moves the selected node up one position on its same level.

**Move Down**

Moves the selected node down one position on its same level.

**Promote**

Moves the selected node up one level to the level of its parent node.

**Demote**

Moves the selected node down one level to the level of its child nodes.

**DITA Map Contextual Menu Actions**

The following actions are available in the contextual menu when editing in **Author** mode (most of them are also available in the **DITA** menu at the top of the interface):

**Edit Properties**

Opens the **Edit Properties** dialog box that allows you to configure the properties of a selected node. For more details about this dialog box, see **Edit Properties Dialog Box** (*on page 2351*).

**Cut (Ctrl + X (Command + X on macOS))**

Removes the currently selected content from the document and places it in the clipboard.

**Copy (Ctrl + C (Command + C on macOS))**
Places a copy of the currently selected content in the clipboard.

**Paste (Ctrl + V (Command + V on macOS))**

Inserts the current clipboard content into the document at the cursor position.

**Paste special submenu**

This submenu includes the following special paste actions that are specific to the DITA framework:

**Paste as content reference**

Inserts a content reference (a DITA element with a `@conref` attribute) to the DITA XML element from the clipboard. An entire DITA XML element with an ID attribute must be present in the clipboard when the action is invoked. The `conref` attribute will point to this ID value.

**Paste as content key reference**

Allows you to indirectly reference content using the `@conkeyref` attribute. When the DITA content is processed, the key references are resolved using key definitions from DITA maps (on page 2654). To use this action, you must first do the following:

1. Make sure the DITA element that contains the copied content has an ID attribute assigned to it.
2. In the DITA Maps Manager view, make sure that the Context combo box points to the correct map that stores the keys.
3. Make sure the topic that contains the content you want to reference has a key assigned to it. To assign a key, right-click the topic with its parent map opened in the DITA Maps Manager, select Edit Properties, and enter a value in the Keys field.

**Paste as link**

Looks for the first element with an ID value in the clipboard and inserts an `<xref>` that points to that element. If no elements with an ID value are found, a message will appear that informs you that to use this action, the clipboard contents must include at least one element with a declared ID.

**Paste as link (keyref)**

Inserts a link to the element that you want to reference. To use this action, you must first do the following:

1. Make sure the DITA element that contains the copied content has an ID attribute assigned to it.
2. In the DITA Maps Manager view, make sure that the Context combo box points to the correct map that stores the keys.
3. Make sure the topic that contains the content you want to reference has a key assigned to it. To assign a key, right-click the topic with its parent map opened in the DITA Maps Manager, select Edit Properties, and enter a value in the Keys field.

Insert submenu

This submenu includes the following insert actions that are specific to the DITA Map framework:

- **Insert New DITA Resource**
  Opens a New DITA file dialog box (on page 2380) where you can choose the type of DITA document to create and inserts a reference to it at the current position within the map.

- **Insert Topic Reference**
  Opens the Insert Reference dialog box (on page 2340) where you can configure a topic reference and inserts it at the current position within the map.

- **Insert Key Definition with Keyword**
  Opens a dialog box where you can choose the name of a key and its keyword value and inserts the key definition at the current position within the map.

- **Reuse Content**
  Opens the Reuse Content dialog box (on page 2465) that allows you to insert and configure a content reference (@conref), or a content key reference (@conkeyref) at the cursor position.

- **Insert Topic Heading**
  Opens the Insert Reference dialog box (on page 2340) that allows you to insert a topic heading at the cursor position.

- **Insert Topic Group**
  Opens the Insert Reference dialog box (on page 2340) that allows you to insert a topic group at the cursor position.

**Insert Entity**

Allows you to insert a predefined entity or character entity. Surrogate character entities (range #x10000 to #x10FFFF) are also accepted. Character entities can be entered in one of the following forms:

- `<decimal value>` - e.g. #65
- `&<decimal value>` - e.g. &#65
- `#x<hexadecimal value>` - e.g. #x41
- `&#x<hexadecimal value>` - e.g. &#x41
**Relationship Table > Insert Relationship Table**

Opens a dialog box that allows you to configure the relationship table to be inserted. The dialog box allows you to configure the number of rows and columns of the relationship table, if the header will be generated and if the title will be added.

**Generate IDs**

Oxygen XML Editor Eclipse plugin generates unique IDs for the current element (or elements), depending on how the action is invoked:

- When invoked on a single selection, an ID is generated for the selected element at the cursor position.
- When invoked on a block of selected content, IDs are generated for all top-level elements and elements listed in the ID Options dialog box that are found in the current selection.

**Note:**

The Generate IDs action does not overwrite existing ID values. It only affects elements that do not already have an `@id` attribute.

**Search References**

Finds the references to the `@href` or `@keys` attribute value of the topic/map reference element at the current cursor position, in all the topics from the current DITA map (opened in the DITA Maps Manager view (on page 2315)). The current topic/map reference element must have an `@href` or `@keys` attribute defined to complete the search.

**Show Key Definition**

Available for elements that have a `@conkeyref` or `@keyref` attribute set (or elements with an ancestor element that has a `@conkeyref` or `@keyref` attribute). It computes the key name and opens the DITA map (on page 2654) that contains the definition of the key with the element that defines that key selected.

**Select submenu**

This submenu allows you to select the following:

**Element**

Selects the entire element at the current cursor position.

**Content**

Selects the entire content of the element at the current cursor position, excluding the start and end tag. Performing this action repeatedly will result in the selection of the content of the ancestor of the currently selected element content.

**Parent**

Selects the entire parent element at the current cursor position.
Text submenu

This submenu contains the following actions:

To Lower Case
Converts the selected content to lower case characters.

To Upper Case
Converts the selected content to upper case characters.

Capitalize Sentences
Converts to upper case the first character of every selected sentence.

Capitalize Words
Converts to upper case the first character of every selected word.

Count Words
Counts the number of words and characters (no spaces) in the entire document or in the selection for regular content and read-only content.

Note:
The content marked as deleted with change tracking (on page 2659) is ignored when counting words.

Convert Hexadecimal Sequence to Character (Ctrl + Shift + H (Command + Shift + H on macOS))

Converts a sequence of hexadecimal characters to the corresponding Unicode character (on page 298). The action can be invoked if there is a selection containing a valid hexadecimal sequence or if the cursor is placed at the right side of a valid hexadecimal sequence. A valid hexadecimal sequence can be composed of 2 to 4 hexadecimal characters and may or may not be preceded by the 0x or 0X prefix. Examples of valid sequences and the characters they will be converted to:

- 0x0045 will be converted to E
- 0X0125 to ĥ
- 265 to ળ
- 2190 to ←

Note:
For more information about finding the hexadecimal value of a character, see Finding the Decimal, Hexadecimal, or Character Entity Equivalent (on page 300).

Refactoring submenu
Contains a series of actions designed to alter the XML structure of the document:

- **Toggle Comment**
  Encloses the currently selected text in an XML comment, or removes the comment if it is commented.

- **Move Up** (Alt + UpArrow (Option + UpArrow on macOS))
  Moves the current node or selected nodes in front of the previous node.

- **Move Down** (Alt + DownArrow (Option + DownArrow on macOS))
  Moves the current node or selected nodes after the subsequent node.

- **Split Element**
  Splits the content of the closest element that contains the position of the cursor. Thus, if the cursor is positioned at the beginning or at the end of the element, the newly created sibling will be empty.

- **Join Elements**
  Joins two adjacent *block elements (on page 2652)* that have the same name. The action is available only when the cursor position is between the two adjacent *block elements*. Also, joining two *block elements* can be done by pressing the **Delete** or **Backspace** keys and the cursor is positioned between the boundaries of these two elements.

- **Surround with Tags** (Alt + Shift + E)
  Allows you to choose a tag to enclose a selected portion of content. If there is no selection, the start and end tags are inserted at the cursor position.

  - If the **Position cursor between tags** option (on page 120) is selected in the **Content Completion** preferences page, the cursor is placed between the start and end tag.
  - If the **Position cursor between tags** option (on page 120) is not selected in the **Content Completion** preferences page, the cursor is placed at the end of the start tag, in an insert-attribute position.

- **Surround with ‘[tag]’** (Alt + Shift + ForwardSlash)
  Surround the selected content with the last tag used.

- **Rename Element**
  The element from the cursor position, and any elements with the same name, can be renamed according with the options from the **Rename** dialog box.

- **Delete Element Tags**
Deletes the tags of the closest element that contains the position of the cursor. This operation is also executed if the start or end tags of an element are deleted by pressing the **Delete** or **Backspace** keys.

**Remove All Markup**

Removes all the XML markup inside the selected block of content and keeps only the text content.

**Remove Text**

Removes the text content of the selected block of content and keeps the markup intact with empty elements.

**Attributes Refactoring Actions**

Contains built-in XML refactoring operations that pertain to attributes with some of the information preconfigured based upon the current context.

- **Add/Change attribute**
  
  Allows you to change the value of an attribute or insert a new one.

- **Convert attribute to element**
  
  Allows you to change an attribute into an element.

- **Delete attribute**
  
  Allows you to remove one or more attributes.

- **Rename attribute**
  
  Allows you to rename an attribute.

- **Replace in attribute value**
  
  Allows you to search for a text fragment inside an attribute value and change the fragment to a new value.

**Comments Refactoring Actions**

Contains built-in XML refactoring operations that pertain to comments with some of the information preconfigured based upon the current context.

- **Delete comments**
  
  Allows you to delete comments found inside one or more elements.

**Elements Refactoring Actions**

Contains built-in XML refactoring operations that pertain to elements with some of the information preconfigured based upon the current context.

- **Delete element**
  
  Allows you to delete elements.
Delete element content
   Allows you to delete the content of elements.

Insert element
   Allows you to insert new elements.

Rename element
   Allows you to rename elements.

Unwrap element
   Allows you to remove the surrounding tags of elements, while keeping the content unchanged.

Wrap element
   Allows you to surround elements with element tags.

Wrap element content
   Allows you to surround the content of elements with element tags.

Fragments Refactoring Actions

Contains built-in XML refactoring operations that pertain to XML fragments with some of the information preconfigured based upon the current context.

Insert XML fragment
   Allows you to insert an XML fragment.

Replace element content with XML fragment
   Allows you to replace the content of elements with an XML fragment.

Replace element with XML fragment
   Allows you to replace elements with an XML fragment.

Review submenu

This submenu includes the following actions:

> Track Changes
   Enables or disables the Track Changes (on page 2659) support for the current document.

✔ Accept Change(s) and Move to Next
   Accepts the Tracked Change (on page 2659) located at the cursor position or all of the changes in a selection and then moves to the next change. If you select a part of a deletion or insertion change, only the selected content is accepted.

✔ Accept All Changes
   Accepts all Tracked Changes (on page 2659) in the current document.
Reject Change(s) and Move to Next

Rejects the Tracked Change (on page 2659) located at the cursor position or all of the changes in a selection and then moves to the next change. If you select a part of a deletion or insertion change, only the selected content is rejected.

Reject All Changes

Rejects all Tracked Changes (on page 2659) in the current document.

Comment Change

Opens a dialog box that allows you to add a comment to an existing Tracked Change (on page 2659). The comment will appear in a callout and a tooltip when hovering over the change. If the action is selected on an existing commented change, the dialog box will allow you to edit the comment.

Highlight

Enables the highlighting tool that allows you to mark text in your document.

Colors

Allows you to select the color for highlighting text.

Stop highlighting

Use this action to deactivate the highlighting tool.

Remove highlight(s)

Use this action to remove highlighting from the document.

Add Comment

Inserts a comment at the cursor position. The comment appears in a callout box and a tooltip (when hovering over the change).

Show/Edit Comment

Opens a dialog box that displays the discussion thread and allows the current user to edit comments that do not have replies. If you are not the author who inserted the original comment, the dialog box just displays the comment without the possibility of editing it.

Remove Comment

Removes a selected comment. If you remove a comment that contains replies, all of the replies will also be removed.

Manage Reviews

Opens the Review view (on page 436).

Folding submenu

This submenu includes the following actions:
Oxygen XML Editor Eclipse Plugin 26.0 | 9 - Built-in Frameworks (Document Types) | 1107

- **Toggle Fold**
  Toggles the state of the current fold.

- **Collapse Other Folds**
  Folds all the elements except the current element.

- **Collapse Child Folds**
  Folds the elements indented with one level inside the current element.

- **Expand Child Folds (Ctrl + NumPad+ (Command + NumPad+ on macOS))**
  Unfolds all child elements of the currently selected element.

- **Expand All**
  Unfolds all elements in the current document.

**About Element > Go to Definition**
Moves the cursor to the definition of the current element.

**Inspect Styles**
Opens the CSS Inspector view (on page 412) that allows you to examine the CSS rules that match the currently selected element.

**Options**
Opens the Author mode preferences page (on page 136) where you can configure various options with regard to the Author editing mode.

**Floating Contextual Toolbar for DITA**

Oxygen XML Editor Eclipse plugin includes a dynamic feature where certain editing contexts will trigger a floating toolbar with common actions that are available in the current editing context.

The floating contextual toolbar is automatically displayed when editing DITA map documents when a `<topicref>` element is selected and it includes actions for moving the topic reference node up or down (or promoting/demoting the node).

**DITA Map Drag/Drop Actions**

Dragging a file from the Project Explorer view (on page 268) or DITA Maps Manager view (on page 2315) and dropping it into a DITA map document that is edited in Author mode creates a link to the dragged file (a `<topicref>` element, `<chapter>`, `<part>`, etc.) at the drop location.

**Opening a Topic from a DITA Map in Author Mode**

If a DITA map is open in the Author visual editing mode, you can open a referenced topic by clicking the icon to the left of the particular topic. The source topic is opened in a new tab in the main editor.
XHTML Document Type (Framework)

The Extensible HyperText Markup Language (XHTML), is a markup language that has the same depth of expression as HTML, but also conforms to XML syntax.

File Definition

A file is considered to be an XHTML document when the root element is `<html>`.

Default Document Templates

There are a variety of default XHTML templates available when creating new documents from templates (on page 252) and they can be found in: Framework Templates > XHTML.

The default templates for XHTML documents are located in the `[OXYGEN_INSTALL_DIR]/frameworks/xhtml/templates/` folder.

Default Schema for Validation and Content Completion

Default schemas that are used if one is not detected in the XHTML file are stored in the following locations:

- **XHTML 1.0** - `[OXYGEN_INSTALL_DIR]/frameworks/xhtml/dtd/` or `[OXYGEN_INSTALL_DIR]/frameworks/xhtml/nvdl/`.
- **XHTML 1.1** - `[OXYGEN_INSTALL_DIR]/frameworks/xhtml11/dtd/` or `[OXYGEN_INSTALL_DIR]/frameworks/xhtml11/schema/`.
- **XHTML 5** - `[OXYGEN_INSTALL_DIR]/frameworks/xhtml/xhtml5 (epub3)/`.

Default CSS

The default CSS files used for rendering XHTML content in Author mode are stored in `[OXYGEN_INSTALL_DIR]/frameworks/xhtml/css/`.

By default, these default CSS files are merged with any that are specified in the document. For more information, see Configuring and Managing Multiple CSS Styles for a Framework (on page 1933).

Default XML Catalogs

The default XML Catalogs (on page 2659) for the XHTML document type are as follows:
Transformation Scenarios

Oxygen XML Editor Eclipse plugin includes built-in transformation scenarios that allow you to transform XHTML documents to several types of DITA document types (topic, task, concept, reference). They can be found in the XHTML section in the Configure Transformation Scenario(s) dialog box (on page 1284).

XHTML Validation

XHTML documents can be validated in Oxygen XML Editor Eclipse plugin using the same validation features as with any other XML document. In addition, Oxygen XML Editor Eclipse plugin includes a built-in validator engine (W3C XHTML Validator) based upon the W3C Nu HTML Checker that can be used to validate HTML or XHTML documents.

To use the W3C XHTML Validator engine:

1. Create or edit a validation scenario (e.g. select the Configure Validation Scenario(s) from the toolbar).
2. Change the File type column to XML Document and select W3C XHTML Validator in the Validation engine column.
3. Click OK and Apply Associated to run the validation.

XHTML Author Mode Actions

A variety of actions are available for XHTML documents that can be found in XHTML menu, toolbar, contextual menu, and the Content Completion Assistant (on page 2653).
XHTML Toolbar Actions

The following default actions are available on the XHTML toolbar when editing in Author mode (by default, they are also available in the XHTML menu and some of them are in various submenus of the contextual menu):

**Bold**

Changes the style of the selected text to *bold* by surrounding it with the `<b>` tag. You can use this action on multiple non-contiguous selections.

**Italic**

Changes the style of the selected text to *italic* by surrounding it with `<i>` tag. You can use this action on multiple non-contiguous selections.

**Underline**

Changes the style of the selected text to *underline* by surrounding it with `<u>` tag. You can use this action on multiple non-contiguous selections.

**Link**

Inserts an `<a>` element with an `@href` attribute at the cursor position. You can type the URL of the reference you want to insert or use the browsing actions in the `Browse` drop-down menu.

**Insert Image**

Inserts a graphic object at the cursor position. This is done by inserting an `<img>` element regardless of the current context. The following graphical formats are supported: GIF, JPG, JPEG, BMP, PNG, SVG.

**Insert Media Resource**

Opens a Choose Media dialog box (on page 517) that allows you to select the URL of a media object to be inserted into a document at the cursor position. The result will be that a reference to the specified video, audio, or embedded HTML frame is inserted and rendered in Author mode so that it can be played directly from there.

**Headings Drop-down Menu**

A drop-down menu that includes actions for inserting `<h1>`, `<h2>`, `<h3>`, `<h4>`, `<h5>`, `<h6>` elements.

**Insert Paragraph**

Insert a new paragraph element at current cursor position.

**Insert Equation**

Opens the XML Fragment Editor that allows you to insert and edit MathML notations (on page 519).

**Insert List Item**

Inserts a list item in the current list type.
Insert Unordered List

Inserts an unordered list at the cursor position. A child list item is also automatically inserted by default. You can also use this action to convert selected paragraphs or other types of lists to an unordered list.

Insert Ordered List

Inserts an ordered list at the cursor position. A child list item is also automatically inserted by default. You can also use this action to convert selected paragraphs or other types of lists to an ordered list.

Insert Definition List

Inserts a definition list (<dl> element) with one list item (a <dt> child element and a <dd> child element). You can also use this action to convert selected paragraphs or other types of lists to a definition list.

Sort

Sorts cells or list items in a table.

Insert Table

Opens a dialog box that allows you to configure and insert a table. You can generate a header and footer, set the number of rows and columns of the table and decide how the table is framed. You can also use this action to convert selected paragraphs, lists, and inline content (mixed content, text plus markup, that is rendered inside a block element (on page 2652)) into a table, with the selected content inserted in the first column, starting from the first row after the header (if a header is inserted).

Note:

If the selection contains a mixture of elements that cannot be converted, you will receive an error message saying that Only lists, paragraphs, or inline content can be converted to tables.

Insert Row

Inserts a new table row with empty cells below the current row. This action is available when the cursor is positioned inside a table.

Insert Row Above

Inserts a new table row with empty cells above the current row. This action is available when the cursor is positioned inside a table.

Insert Column

Inserts a new table column with empty cells after the current column. This action is available when the cursor is positioned inside a table.

Insert Cell
Inserts a new empty cell depending on the current context. If the cursor is positioned between two cells, Oxygen XML Editor Eclipse plugin a new cell at the cursor position. If the cursor is inside a cell, the new cell is created after the current cell.

Delete Column(s)

Deletes the table column located at the cursor position or multiple columns in a selection.

Delete Row(s)

Deletes the table row located at the cursor position or multiple rows in a selection.

Join Cells

Joins the content of the selected cells (both horizontally and vertically).

Split Cell

Splits the cell at the cursor location. If Oxygen XML Editor Eclipse plugin detects more than one option to split the cell, a dialog box will be displayed that allows you to select the number of rows or columns to split the cell into.

**XHTML Contextual Menu Actions**

The following actions are available in the contextual menu when editing in Author mode (most of them are also available in the XHTML menu at the top of the interface):

Edit Attributes

Displays an *in-place attributes editor* (on page 405) that allows you to manage the attributes of an element.

Edit Profiling Attributes

Allows you to change the *profiling attributes* (on page 440) defined on all selected elements.

Cut (Ctrl + X (Command + X on macOS))

Removes the currently selected content from the document and places it in the clipboard.

Copy (Ctrl + C (Command + C on macOS))

Places a copy of the currently selected content in the clipboard.

Paste (Ctrl + V (Command + V on macOS))

Inserts the current clipboard content into the document at the cursor position.

Image Map Editor

This action is available in the contextual menu when it is invoked on an image. This action applies an *image map* to the current image (if one does not already exist) and opens the Image Map Editor dialog box. This feature allows you to create hyperlinks in specific areas of an image that will link to various destinations.

Insert submenu
This submenu includes the following insert actions:

### Insert Table

Opens a dialog box that allows you to configure and insert a table. You can generate a header and footer, set the number of rows and columns of the table and decide how the table is framed. You can also use this action to convert selected paragraphs, lists, and inline content (mixed content, text plus markup, that is rendered inside a *block element (on page 2652)*) into a table, with the selected content inserted in the first column, starting from the first row after the header (if a header is inserted).

**Note:**

If the selection contains a mixture of elements that cannot be converted, you will receive an error message saying that *Only lists, paragraphs, or inline content can be converted to tables.*

### Insert Link

Inserts an `<a>` element with an `@href` attribute at the cursor position. You can type the URL of the reference you want to insert or use the browsing actions in the **Browse** drop-down menu.

### Insert Image

Inserts an image reference *(on page 489)* at the cursor position. Depending on the current location, an image-type element is inserted.

### Insert Media Resource

Opens a *Choose Media* dialog box *(on page 517)* that allows you to select the URL of a media object to be inserted into a document at the cursor position. The result will be that a reference to the specified video, audio, or embedded HTML frame is inserted and rendered in Author mode so that it can be played directly from there.

### Insert Equation

Opens the XML Fragment Editor that allows you to insert and edit MathML notations *(on page 519).*

### Insert Paragraph

Inserts a new paragraph element at current cursor position.

### Headings Drop-down Menu

A drop-down menu that includes actions for inserting `<h1>`, `<h2>`, `<h3>`, `<h4>`, `<h5>`, `<h6>` elements.

### Insert Entity
Allows you to insert a predefined entity or character entity. Surrogate character entities (range \#x10000 to \#x10FFFF) are also accepted. Character entities can be entered in one of the following forms:

- \#<decimal value> - e.g. \#65
- &\#<decimal value> - e.g. &\#65
- \#x<hexadecimal value> - e.g. \#x41
- &\#x<hexadecimal value> - e.g. &\#x41

**Style submenu**

This submenu includes the following text styling actions:

- **Bold**
  Emphasizes the selected text by surrounding it with a *bold* tag. You can use this action on multiple non-contiguous selections.

- **Italic**
  Emphasizes the selected text by surrounding it with an *italic* tag. You can use this action on multiple non-contiguous selections.

- **Underline**
  Emphasizes the selected text by surrounding it with an *underline* tag. You can use this action on multiple non-contiguous selections.

- **Subscript**
  Surrounds the selected text with a *subscript* tag, used for inserting a character (number, letter, or symbol) that will appear slightly below the baseline and slightly smaller than the rest of the text.

- **Superscript**
  Surrounds the selected text with a *superscript* tag, used for inserting a character (number, letter, or symbol) that will appear slightly above the baseline and slightly smaller than the rest of the text.

**Table actions**

The following table editing actions are available in the contextual menu when it is invoked on a table:

- **Insert Rows**
  Opens a dialog box that allows you to insert any number of rows and specify the position where they will be inserted (Above or Below the current row).

- **Delete Row(s)**
  Deletes the table row located at the cursor position or multiple rows in a selection.
Insert Columns

Opens a dialog box that allows you to insert any number of columns and specify the position where they will be inserted (Above or Below the current column).

Delete Column(s)

Deletes the table column located at the cursor position or multiple columns in a selection.

Join Cells

Joins the content of the selected cells (both horizontally and vertically).

Split Cell

Splits the cell at the cursor location. If Oxygen XML Editor Eclipse plugin detects more than one option to split the cell, a dialog box will be displayed that allows you to select the number of rows or columns to split the cell into.

Sort

Sorts cells or list items in a table.

Table Properties

Opens the Table properties dialog box that allows you to configure properties of a table (such as frame borders).

Other Actions submenu

This submenu give you access to all the usual contextual menu actions.

Select submenu

This submenu allows you to select the following:

Element

Selects the entire element at the current cursor position.

Content

Selects the entire content of the element at the current cursor position, excluding the start and end tag. Performing this action repeatedly will result in the selection of the content of the ancestor of the currently selected element content.

Parent

Selects the entire parent element at the current cursor position.

Text submenu

This submenu contains the following actions:

To Lower Case

Converts the selected content to lower case characters.
To Upper Case

Converts the selected content to upper case characters.

Capitalize Sentences

Converts to upper case the first character of every selected sentence.

Capitalize Words

Converts to upper case the first character of every selected word.

Count Words

Counts the number of words and characters (no spaces) in the entire document or in the selection for regular content and read-only content.

Note:
The content marked as deleted with change tracking (on page 2659) is ignored when counting words.

Convert Hexadecimal Sequence to Character (Ctrl + Shift + H (Command + Shift + H on macOS))

Converts a sequence of hexadecimal characters to the corresponding Unicode character (on page 298). The action can be invoked if there is a selection containing a valid hexadecimal sequence or if the cursor is placed at the right side of a valid hexadecimal sequence. A valid hexadecimal sequence can be composed of 2 to 4 hexadecimal characters and may or may not be preceded by the \texttt{0x} or \texttt{0X} prefix. Examples of valid sequences and the characters they will be converted to:

- \texttt{0x0045} will be converted to \texttt{E}
- \texttt{0X0125} to \texttt{ĥ}
- \texttt{265} to \texttt{ɥ}
- \texttt{2190} to \texttt{←}

Note:
For more information about finding the hexadecimal value of a character, see Finding the Decimal, Hexadecimal, or Character Entity Equivalent (on page 300).

Refactoring submenu

Contains a series of actions designed to alter the XML structure of the document:

- Toggle Comment

Encloses the currently selected text in an XML comment, or removes the comment if it is commented.
Move Up (Alt + UpArrow (Option + UpArrow on macOS))

Moves the current node or selected nodes in front of the previous node.

Move Down (Alt + DownArrow (Option + DownArrow on macOS))

Moves the current node or selected nodes after the subsequent node.

Split Element

Splits the content of the closest element that contains the position of the cursor. Thus, if the cursor is positioned at the beginning or at the end of the element, the newly created sibling will be empty.

Join Elements

Joins two adjacent block elements that have the same name. The action is available only when the cursor position is between the two adjacent block elements. Also, joining two block elements can be done by pressing the Delete or Backspace keys and the cursor is positioned between the boundaries of these two elements.

Surround with Tags (Alt + Shift + E)

Allows you to choose a tag to enclose a selected portion of content. If there is no selection, the start and end tags are inserted at the cursor position.

• If the Position cursor between tags option (on page 120) is selected in the Content Completion preferences page, the cursor is placed between the start and end tag.
• If the Position cursor between tags option (on page 120) is not selected in the Content Completion preferences page, the cursor is placed at the end of the start tag, in an insert-attribute position.

Surround with '[tag]' (Alt + Shift + ForwardSlash)

Surround the selected content with the last tag used.

Rename Element

The element from the cursor position, and any elements with the same name, can be renamed according with the options from the Rename dialog box.

Delete Element Tags

Deletes the tags of the closest element that contains the position of the cursor. This operation is also executed if the start or end tags of an element are deleted by pressing the Delete or Backspace keys.

Remove All Markup

Removes all the XML markup inside the selected block of content and keeps only the text content.
Removes the text content of the selected block of content and keeps the markup intact with empty elements.

**Attributes Refactoring Actions**

Contains built-in XML refactoring operations that pertain to attributes with some of the information preconfigured based upon the current context.

**Add/Change attribute**

Allows you to change the value of an attribute or insert a new one.

**Convert attribute to element**

Allows you to change an attribute into an element.

**Delete attribute**

Allows you to remove one or more attributes.

**Rename attribute**

Allows you to rename an attribute.

**Replace in attribute value**

Allows you to search for a text fragment inside an attribute value and change the fragment to a new value.

**Comments Refactoring Actions**

Contains built-in XML refactoring operations that pertain to comments with some of the information preconfigured based upon the current context.

**Delete comments**

Allows you to delete comments found inside one or more elements.

**Elements Refactoring Actions**

Contains built-in XML refactoring operations that pertain to elements with some of the information preconfigured based upon the current context.

**Delete element**

Allows you to delete elements.

**Delete element content**

Allows you to delete the content of elements.

**Insert element**

Allows you to insert new elements.

**Rename element**

Allows you to rename elements.
Unwrap element

Allows you to remove the surrounding tags of elements, while keeping the content unchanged.

Wrap element

Allows you to surround elements with element tags.

Wrap element content

Allows you to surround the content of elements with element tags.

Fragments Refactoring Actions

Contains built-in XML refactoring operations that pertain to XML fragments with some of the information preconfigured based upon the current context.

Insert XML fragment

Allows you to insert an XML fragment.

Replace element content with XML fragment

Allows you to replace the content of elements with an XML fragment.

Replace element with XML fragment

Allows you to replace elements with an XML fragment.

Review submenu

This submenu includes the following actions:

✔ Track Changes

Enables or disables the Track Changes (on page 2659) support for the current document.

✔ Accept Change(s) and Move to Next

Accepts the Tracked Change (on page 2659) located at the cursor position or all of the changes in a selection and then moves to the next change. If you select a part of a deletion or insertion change, only the selected content is accepted.

✔ Accept All Changes

Accepts all Tracked Changes (on page 2659) in the current document.

✗ Reject Change(s) and Move to Next

Rejects the Tracked Change (on page 2659) located at the cursor position or all of the changes in a selection and then moves to the next change. If you select a part of a deletion or insertion change, only the selected content is rejected.

✗✗ Reject All Changes

Rejects all Tracked Changes (on page 2659) in the current document.
Comment Change

Opens a dialog box that allows you to add a comment to an existing Tracked Change (on page 2659). The comment will appear in a callout and a tooltip when hovering over the change. If the action is selected on an existing commented change, the dialog box will allow you to edit the comment.

Highlight

Enables the highlighting tool that allows you to mark text in your document.

Colors

Allows you to select the color for highlighting text.

Stop highlighting

Use this action to deactivate the highlighting tool.

Remove highlight(s)

Use this action to remove highlighting from the document.

Add Comment

Inserts a comment at the cursor position. The comment appears in a callout box and a tooltip (when hovering over the change).

Show/Edit Comment

Opens a dialog box that displays the discussion thread and allows the current user to edit comments that do not have replies. If you are not the author who inserted the original comment, the dialog box just displays the comment without the possibility of editing it.

Remove Comment

Removes a selected comment. If you remove a comment that contains replies, all of the replies will also be removed.

Manage Reviews

Opens the Review view (on page 436).

Folding submenu

This submenu includes the following actions:

Toggle Fold

Toggles the state of the current fold.

Collapse Other Folds

Folds all the elements except the current element.

Collapse Child Folds
Folds the elements indented with one level inside the current element.

Expand Child Folds (Ctrl + NumPad+ (Command + NumPad+ on macOS))

Unfolds all child elements of the currently selected element.

Expand All

Unfolds all elements in the current document.

About Element > Go to Definition

Moves the cursor to the definition of the current element.

Inspect Styles

Opens the CSS Inspector view (on page 412) that allows you to examine the CSS rules that match the currently selected element.

Options

Opens the Author mode preferences page (on page 136) where you can configure various options with regard to the Author editing mode.

XHTML Drag/Drop (or Copy/Paste) Actions

Dragging a file from the Project Explorer view (on page 268) and dropping it into an XHTML document that is edited in Author mode, creates a link to the dragged file (the <a> element with the @href attribute) at the drop location. Copy and paste actions work the same.

You can also drag images or media files from your system explorer or the Project Explorer view (on page 268) and drop them into an XHTML document (or copy and paste). This will insert the appropriate element at the drop or paste location (for example, dropping/pasting an image will insert the <img> element with the @src attribute).

Tip:

For information about customizing Author mode actions for a particular framework (on page 2655) (document type), see the Customizing the Author Mode Editing Experience for a Framework (on page 1933) section.

Related Information:
Customizing the Author Mode Editing Experience for a Framework (on page 1933)

TEI P5 Document Type (Framework)

The TEI (Text Encoding Initiative) document type is an international and interdisciplinary standard that enables libraries, museums, publishers, and individual scholars to represent a variety of literary and linguistic texts for online research, teaching, and preservation.
**File Definition**

A file is considered to be a TEI P5 document when one of the following conditions are true:

- The document namespace is `http://www.tei-c.org/ns/1.0`.
- The public ID of the document is `-//TEI P5`.

**Default Document Templates**

There are a variety of default TEI P5 templates available when creating new documents from templates (on page 252) and they can be found in: Framework Templates > TEI P5.

The default templates for TEI P5 documents are located in the `${OXYGEN_INSTALL_DIR}/frameworks/tei/templates/TEI P5` folder.

**Default Schema for Validation and Content Completion**

The default schema that is used if one is not detected in the TEI P5 document is `tei_all.rng` and it is stored in `${OXYGEN_INSTALL_DIR}/frameworks/tei/xml/tei/custom/schema/relaxng/`.

**Default CSS**

The default CSS files used for rendering TEI content in Author mode are stored in `${OXYGEN_INSTALL_DIR}/frameworks/tei/xml/tei/css/`.

By default, these default CSS files are merged with any that are specified in the document. For more information, see Configuring and Managing Multiple CSS Styles for a Framework (on page 1933).

**Default XML Catalogs**

The default XML Catalogs (on page 2659) for the TEI P5 document type are as follows:

- `${OXYGEN_INSTALL_DIR}/frameworks/tei/xml/tei/schema/dtd/catalog.xml`
- `${OXYGEN_INSTALL_DIR}/frameworks/tei/xml/tei/custom/schema/dtd/catalog.xml`
- `${OXYGEN_INSTALL_DIR}/frameworks/tei/xml/tei/stylesheet/catalog.xml`

**Transformation Scenarios**

Oxygen XML Editor Eclipse plugin includes built-in transformation scenarios that allow you to transform TEI P5 documents to a variety of outputs, such as PDF, XHTML, EPUB, DOCX, and ODT. They can be found in the TEI P5 section in the Configure Transformation Scenario(s) dialog box (on page 1284).

**Resources**

- Oxygen Video Tutorial: Editing TEI Documents in Author Mode
- TEI: P5 Guidelines
Related Information:
Editing XML Documents in Author Mode (on page 365)
Editing XML Documents in Text Mode (on page 306)
Adding Tables in TEI Documents (on page 483)

TEI P5 Author Mode Actions

A variety of actions are available for TEI P5 documents that can be found in TEI P5 menu, toolbar, contextual menu, and the Content Completion Assistant (on page 2653).

TEI P5 Toolbar Actions

The following default actions are available on the TEI P5 toolbar when editing in Author mode (by default, they are also available in the TEI P5 menu and some of them are in various submenus of the contextual menu):

- **Bold**
  Changes the style of the selected text to **bold** by surrounding it with the `<hi>` tag and setting the `@rend` attribute to `bold`. You can use this action on multiple non-contiguous selections.

- **Italic**
  Changes the style of the selected text to *italic* by surrounding it with the `<hi>` tag and setting the `@rend` attribute to `italic`. You can use this action on multiple non-contiguous selections.

- **Underline**
  Changes the style of the selected text to *underline* by surrounding it with the `<hi>` tag and setting the `@rend` attribute to `ul`. You can use this action on multiple non-contiguous selections.

- **Insert Section**
  Inserts a new section or subsection, depending on the current context. For example, if the current context is `div1`, then a `div2` is inserted. By default, this action also inserts a paragraph element as a child node.

- **Insert Paragraph**
  Insert a new paragraph element at current cursor position.

- **Insert Image**
  Inserts an image reference (on page 489) at the cursor position. Depending on the current location, an image-type element is inserted.

- **Insert List Item**
  Inserts a list item in the current list type.

- **Insert Ordered List**
Inserts an ordered list at the cursor position. A child list item is also automatically inserted by default. You can also use this action to convert selected paragraphs or other types of lists to an ordered list.

**Insert Itemized List**

Inserts an itemized list at the cursor position. A child list item is also automatically inserted by default. You can also use this action to convert selected paragraphs or other types of lists to an itemized list.

**Sort**

Sorts cells or list items in a table.

**Insert Table**

Opens a dialog box that allows you to configure and insert a table. You can generate a header and footer, set the number of rows and columns of the table and decide how the table is framed. You can also use this action to convert selected paragraphs, lists, and inline content (mixed content, text plus markup, that is rendered inside a block element (on page 2652)) into a table, with the selected content inserted in the first column, starting from the first row after the header (if a header is inserted).

**Note:**

If the selection contains a mixture of elements that cannot be converted, you will receive an error message saying that only lists, paragraphs, or inline content can be converted to tables.

**Insert Row**

Inserts a new table row with empty cells below the current row. This action is available when the cursor is positioned inside a table.

**Insert Column**

Inserts a new table column with empty cells after the current column. This action is available when the cursor is positioned inside a table.

**Insert Cell**

Inserts a new empty cell depending on the current context. If the cursor is positioned between two cells, Oxygen XML Editor Eclipse plugin a new cell at the cursor position. If the cursor is inside a cell, the new cell is created after the current cell.

**Delete Column(s)**

Deletes the table column located at the cursor position or multiple columns in a selection.

**Delete Row(s)**

Deletes the table row located at the cursor position or multiple rows in a selection.
Join Cells

Joins the content of the selected cells (both horizontally and vertically).

Split Cell

Splits the cell at the cursor location. If Oxygen XML Editor Eclipse plugin detects more than one option to split the cell, a dialog box will be displayed that allows you to select the number of rows or columns to split the cell into.

TEI Contextual Menu Actions

The following actions are available in the contextual menu when editing in Author mode (most of them are also available in the TEI P5 menu at the top of the interface):

- **Edit Attributes**
  
  Displays an in-place attributes editor (on page 405) that allows you to manage the attributes of an element.

- **Edit Profiling Attributes**
  
  Allows you to change the profiling attributes (on page 440) defined on all selected elements.

- **Cut** *(Ctrl + X (Command + X on macOS))*

  Removes the currently selected content from the document and places it in the clipboard.

- **Copy** *(Ctrl + C (Command + C on macOS))*

  Places a copy of the currently selected content in the clipboard.

- **Paste** *(Ctrl + V (Command + V on macOS))*

  Inserts the current clipboard content into the document at the cursor position.

Image Map Editor

This action is available in the contextual menu when it is invoked on an image. This action applies an image map to the current image (if one does not already exist) and opens the Image Map Editor dialog box. This feature allows you to create hyperlinks in specific areas of an image that will link to various destinations.

Insert submenu

This submenu includes the following insert actions:

- **Insert Table**

  Opens a dialog box that allows you to configure and insert a table. You can generate a header and footer, set the number of rows and columns of the table and decide how the table is framed. You can also use this action to convert selected paragraphs, lists, and inline content (mixed content, text plus markup, that is rendered inside a block element (on page 2652)) into a table, with the selected
content inserted in the first column, starting from the first row after the header (if a header is inserted).

**Note:**
If the selection contains a mixture of elements that cannot be converted, you will receive an error message saying that **Only lists, paragraphs, or inline content can be converted to tables.**

**Insert Image**

Inserts an image reference (on page 489) at the cursor position. Depending on the current location, an image-type element is inserted.

**Insert Paragraph**

Inserts a new *paragraph* element at current cursor position.

**Insert Section**

Inserts a new *section* element in the document, depending on the current context.

**Insert Entity**

Allows you to insert a predefined entity or character entity. Surrogate character entities (range #x10000 to #x10FFFF) are also accepted. Character entities can be entered in one of the following forms:

- `#<decimal value>` - e.g. #65
- `&<decimal value>` - e.g. &#65
- `#x<hexadecimal value>` - e.g. #x41
- `&#x<hexadecimal value>` - e.g. &#x41

**Generate IDs**

Oxygen XML Editor Eclipse plugin generates unique IDs for the current element (or elements), depending on how the action is invoked:

- When invoked on a single selection, an ID is generated for the selected element at the cursor position.
- When invoked on a block of selected content, IDs are generated for all top-level elements and elements listed in the *ID Options* dialog box that are found in the current selection.

**Note:**
The *Generate IDs* action does not overwrite existing ID values. It only affects elements that do not already have an `@id` attribute.

**Table actions**
The following table editing actions are available in the contextual menu when it is invoked on a table:

**Insert Rows**

Opens a dialog box that allows you to insert any number of rows and specify the position where they will be inserted (Above or Below the current row).

**Delete Row(s)**

Deletes the table row located at the cursor position or multiple rows in a selection.

**Insert Columns**

Opens a dialog box that allows you to insert any number of columns and specify the position where they will be inserted (Above or Below the current column).

**Delete Column(s)**

Deletes the table column located at the cursor position or multiple columns in a selection.

**Join Cells**

Joins the content of the selected cells (both horizontally and vertically).

**Split Cell**

Splits the cell at the cursor location. If Oxygen XML Editor Eclipse plugin detects more than one option to split the cell, a dialog box will be displayed that allows you to select the number of rows or columns to split the cell into.

**Sort**

Sorts cells or list items in a table.

**Table Properties**

Opens the Table properties dialog box that allows you to configure properties of a table (such as frame borders).

**Other Actions submenu**

This submenu give you access to all the usual contextual menu actions.

**Select submenu**

This submenu allows you to select the following:

**Element**

Selects the entire element at the current cursor position.

**Content**

Selects the entire content of the element at the current cursor position, excluding the start and end tag. Performing this action repeatedly will result in the selection of the content of the ancestor of the currently selected element content.
**Parent**

Selects the entire parent element at the current cursor position.

**Text submenu**

This submenu contains the following actions:

**To Lower Case**

Converts the selected content to lower case characters.

**To Upper Case**

Converts the selected content to upper case characters.

**Capitalize Sentences**

Converts to upper case the first character of every selected sentence.

**Capitalize Words**

Converts to upper case the first character of every selected word.

**Count Words**

Counts the number of words and characters (no spaces) in the entire document or in the selection for regular content and read-only content.

Note:

The content marked as deleted with change tracking (on page 2659) is ignored when counting words.

**Convert Hexadecimal Sequence to Character (Ctrl + Shift + H (Command + Shift + H on macOS))**

Converts a sequence of hexadecimal characters to the corresponding Unicode character (on page 298). The action can be invoked if there is a selection containing a valid hexadecimal sequence or if the cursor is placed at the right side of a valid hexadecimal sequence. A valid hexadecimal sequence can be composed of 2 to 4 hexadecimal characters and may or may not be preceded by the \(0x\) or \(0X\) prefix. Examples of valid sequences and the characters they will be converted to:

- \(0x0045\) will be converted to \(E\)
- \(0X0125\) to \(ĥ\)
- \(265\) to \(ɥ\)
Oxygen XML Editor Eclipse Plugin 26.0 | 9 - Built-in Frameworks (Document Types) | 1129

• 2190 to ←

Note:
For more information about finding the hexadecimal value of a character, see Finding the Decimal, Hexadecimal, or Character Entity Equivalent (on page 300).

Refactoring submenu

Contains a series of actions designed to alter the XML structure of the document:

👉 Toggle Comment

Encloses the currently selected text in an XML comment, or removes the comment if it is commented.

Move Up (Alt + UpArrow (Option + UpArrow on macOS))

Moves the current node or selected nodes in front of the previous node.

Move Down (Alt + DownArrow (Option + DownArrow on macOS))

Moves the current node or selected nodes after the subsequent node.

🔍 Split Element

Splits the content of the closest element that contains the position of the cursor. Thus, if the cursor is positioned at the beginning or at the end of the element, the newly created sibling will be empty.

🔍 Join Elements

Joins two adjacent block elements (on page 2652) that have the same name. The action is available only when the cursor position is between the two adjacent block elements. Also, joining two block elements can be done by pressing the Delete or Backspace keys and the cursor is positioned between the boundaries of these two elements.

🔍 Surround with Tags (Alt + Shift + E)

Allows you to choose a tag to enclose a selected portion of content. If there is no selection, the start and end tags are inserted at the cursor position.

• If the Position cursor between tags option (on page 120) is selected in the Content Completion preferences page, the cursor is placed between the start and end tag.
• If the Position cursor between tags option (on page 120) is not selected in the Content Completion preferences page, the cursor is placed at the end of the start tag, in an insert-attribute position.
Surround with 'tag' (Alt + Shift + ForwardSlash)

Surround the selected content with the last tag used.

Rename Element

The element from the cursor position, and any elements with the same name, can be renamed according with the options from the Rename dialog box.

Delete Element Tags

Deletes the tags of the closest element that contains the position of the cursor. This operation is also executed if the start or end tags of an element are deleted by pressing the Delete or Backspace keys.

Remove All Markup

Removes all the XML markup inside the selected block of content and keeps only the text content.

Remove Text

Removes the text content of the selected block of content and keeps the markup intact with empty elements.

Attributes Refactoring Actions

Contains built-in XML refactoring operations that pertain to attributes with some of the information preconfigured based upon the current context.

Add/Change attribute

Allows you to change the value of an attribute or insert a new one.

Convert attribute to element

Allows you to change an attribute into an element.

Delete attribute

Allows you to remove one or more attributes.

Rename attribute

Allows you to rename an attribute.

Replace in attribute value

Allows you to search for a text fragment inside an attribute value and change the fragment to a new value.

Comments Refactoring Actions

Contains built-in XML refactoring operations that pertain to comments with some of the information preconfigured based upon the current context.

Delete comments
Allows you to delete comments found inside one or more elements.

**Elements Refactoring Actions**

Contains built-in XML refactoring operations that pertain to elements with some of the information preconfigured based upon the current context.

- **Delete element**
  
  Allows you to delete elements.

- **Delete element content**
  
  Allows you to delete the content of elements.

- **Insert element**
  
  Allows you to insert new elements.

- **Rename element**
  
  Allows you to rename elements.

- **Unwrap element**
  
  Allows you to remove the surrounding tags of elements, while keeping the content unchanged.

- **Wrap element**
  
  Allows you to surround elements with element tags.

- **Wrap element content**
  
  Allows you to surround the content of elements with element tags.

**Fragments Refactoring Actions**

Contains built-in XML refactoring operations that pertain to XML fragments with some of the information preconfigured based upon the current context.

- **Insert XML fragment**
  
  Allows you to insert an XML fragment.

- **Replace element content with XML fragment**
  
  Allows you to replace the content of elements with an XML fragment.

- **Replace element with XML fragment**
  
  Allows you to replace elements with an XML fragment.

**Review submenu**

This submenu includes the following actions:

- **Track Changes**
Enables or disables the Track Changes (on page 2659) support for the current document.

✔️ Accept Change(s) and Move to Next

Accepts the Tracked Change (on page 2659) located at the cursor position or all of the changes in a selection and then moves to the next change. If you select a part of a deletion or insertion change, only the selected content is accepted.

✔️ Accept All Changes

Accepts all Tracked Changes (on page 2659) in the current document.

❌ Reject Change(s) and Move to Next

Rejects the Tracked Change (on page 2659) located at the cursor position or all of the changes in a selection and then moves to the next change. If you select a part of a deletion or insertion change, only the selected content is rejected.

❌ Reject All Changes

Rejects all Tracked Changes (on page 2659) in the current document.

✍️ Comment Change

Opens a dialog box that allows you to add a comment to an existing Tracked Change (on page 2659). The comment will appear in a callout and a tooltip when hovering over the change. If the action is selected on an existing commented change, the dialog box will allow you to edit the comment.

✍️ Highlight

Enables the highlighting tool that allows you to mark text in your document.

Colors

Allows you to select the color for highlighting text.

Stop highlighting

Use this action to deactivate the highlighting tool.

Remove highlight(s)

Use this action to remove highlighting from the document.

✉️ Add Comment

 Inserts a comment at the cursor position. The comment appears in a callout box and a tooltip (when hovering over the change).

✉️ Show/Edit Comment

Opens a dialog box that displays the discussion thread and allows the current user to edit comments that do not have replies. If you are not the author who inserted the original comment, the dialog box just displays the comment without the possibility of editing it.
Remove Comment

Removes a selected comment. If you remove a comment that contains replies, all of the replies will also be removed.

Manage Reviews

Opens the Review view (on page 436).

Folding submenu

This submenu includes the following actions:

- **Toggle Fold**
  Toggles the state of the current fold.

- **Collapse Other Folds**
  Folds all the elements except the current element.

- **Collapse Child Folds**
  Folds the elements indented with one level inside the current element.

- **Expand Child Folds** (Ctrl + NumPad+ (Command + NumPad+ on macOS))
  Unfolds all child elements of the currently selected element.

- **Expand All**
  Unfolds all elements in the current document.

About Element > Go to Definition

Moves the cursor to the definition of the current element.

Inspect Styles

Opens the CSS Inspector view (on page 412) that allows you to examine the CSS rules that match the currently selected element.

Options

Opens the Author mode preferences page (on page 136) where you can configure various options with regard to the Author editing mode.

TEI P5 Drag/Drop Actions

Dragging a file from the Project Explorer view (on page 268) and dropping it into a TEI P5 document that is edited in Author mode, creates a link to the dragged file (the `<ptr>` element with the `@target` attribute) at the drop location. Dragging an image file from the default file system application (Windows Explorer on Windows or Finder on macOS, for example) and dropping it into a TEI P5 document inserts a graphic element (the `<graphic>` element with the `@url` attribute) at the drop location, similar to the Insert Image toolbar action.
Tip:
For information about customizing Author mode actions for a particular framework (on page 2655) (document type), see the Customizing the Author Mode Editing Experience for a Framework (on page 1933) section.

Related Information:
Customizing the Author Mode Editing Experience for a Framework (on page 1933)

How to Install a TEI Framework with the Latest Schema and Stylesheets

The TEI framework that is bundled in Oxygen XML Editor Eclipse plugin has the TEI schema and stylesheets that were available at the time of its release. When the TEI Consortium releases a new TEI version (Schema and Stylesheets), they also release a new version of the Oxygen XML Editor Eclipse plugin TEI framework with them.

Warning:
TEI Consortium, who maintains these releases, chose to keep them compatible with Oxygen XML Editor Eclipse plugin version 18.1. This means that some features or improvements that were developed in later versions of Oxygen XML Editor Eclipse plugin might be missing from these frameworks.

The following procedure describes how to install a release of the TEI framework done by TEI Consortium that has a newer version of the TEI Schema and TEI XSL https://github.com/TEIC/oxygen-tei/blob/master/oxygen-tei-plugin.md

1. Go to Help > Install new add-ons.
2. Enter or paste https://www.tei-c.org/release/oxygen/updateSite.oxygen in the Show add-ons from field.
3. Choose the TEI framework that you want to install and click Next.
4. Read the end-user license agreement. Then select the I accept all terms of the end-user license agreement option and click Finish.
5. Restart the application.

TEI ODD Document Type (Framework)

The TEI ODD (Text Encoding Initiative - One Document Does it all) document type is a TEI XML-conformant specification format that allows you to create a custom TEI P5 schema in a literate programming fashion. A system of XSLT stylesheets called Roma was created by the TEI Consortium for manipulating the ODD files.

File Definition

A file is considered to be a TEI ODD document when the following conditions are true:
• The file extension is .odd.
• The document namespace is http://www.tei-c.org/ns/1.0.

Default Document Templates

There is a default TEI ODD document template available when creating new documents from templates (on page 252) and they can be found in: Framework Templates > TEI ODD.

The default template is located in the \OXYGEN_INSTALL_DIR\frameworks/tei/templates/TEI ODD folder.

Default Schema for Validation and Content Completion

The default schema that is used if one is not detected in the TEI ODD document is tei_odds.rng and it is stored in \OXYGEN_INSTALL_DIR\frameworks/tei/xml/tei/custom/schema/relaxng/.

Default CSS

The default CSS files used for rendering TEI ODD content in Author mode are stored in \OXYGEN_INSTALL_DIR\frameworks/tei/xml/tei/css/.

By default, these default CSS files are merged with any that are specified in the document. For more information, see Configuring and Managing Multiple CSS Styles for a Framework (on page 1933).

Default XML Catalogs

The default XML Catalogs (on page 2659) for the TEI ODD document type are as follows:

• \OXYGEN_INSTALL_DIR\frameworks/tei/xml/tei/custom/schema/catalog.xml
• \OXYGEN_INSTALL_DIR\frameworks/tei/xml/tei/schema/catalog.xml

Transformation Scenarios

Oxygen XML Editor Eclipse plugin includes built-in transformation scenarios that allow you to transform TEI ODD documents to a variety of outputs, such as PDF, XHTML, EPUB, DOCX, ODT, RNG, DTD, and XML Schema. They can be found in the TEI ODD section in the Configure Transformation Scenario(s) dialog box (on page 1284).

Related Information:
Editing XML Documents in Author Mode (on page 365)
Editing XML Documents in Text Mode (on page 306)
TEI ODD Author Mode Actions

A variety of actions are available for TEI ODD documents that can be found in TEI ODD menu, toolbar, contextual menu, and the Content Completion Assistant (on page 2653).

TEI ODD Toolbar Actions

The following default actions are available on the TEI ODD toolbar when editing in Author mode (by default, they are also available in the TEI ODD menu and some of them are in various submenus of the contextual menu):

**Bold**

Changes the style of the selected text to *bold* by surrounding it with the `<hi>` tag and setting the `@rend` attribute to *bold*. You can use this action on multiple non-contiguous selections.

**Italic**

Changes the style of the selected text to *italic* by surrounding it with the `<hi>` tag and setting the `@rend` attribute to *italic*. You can use this action on multiple non-contiguous selections.

**Underline**

Changes the style of the selected text to *underline* by surrounding it with the `<hi>` tag and setting the `@rend` attribute to *ul*. You can use this action on multiple non-contiguous selections.

**Insert Section**

Inserts a new section or subsection, depending on the current context. For example, if the current context is `div1`, then a `div2` is inserted. By default, this action also inserts a paragraph element as a child node.

**Insert Paragraph**

Insert a new paragraph element at current cursor position.

**Insert Image**

Inserts an image reference (on page 489) at the cursor position. Depending on the current location, an image-type element is inserted.

**Insert List Item**

Inserts a list item in the current list type.

**Insert Ordered List**

Inserts an ordered list at the cursor position. A child list item is also automatically inserted by default. You can also use this action to convert selected paragraphs or other types of lists to an ordered list.

**Insert Itemized List**
Inserts an itemized list at the cursor position. A child list item is also automatically inserted by default. You can also use this action to convert selected paragraphs or other types of lists to an itemized list.

**Insert Table**

Opens a dialog box that allows you to configure and insert a table. You can generate a header and footer, set the number of rows and columns of the table and decide how the table is framed. You can also use this action to convert selected paragraphs, lists, and inline content (mixed content, text plus markup, that is rendered inside a block element (on page 2652)) into a table, with the selected content inserted in the first column, starting from the first row after the header (if a header is inserted).

**Note:**

If the selection contains a mixture of elements that cannot be converted, you will receive an error message saying that **Only lists, paragraphs, or inline content can be converted to tables.**

**Insert Row**

Inserts a new table row with empty cells below the current row. This action is available when the cursor is positioned inside a table.

**Insert Column**

Inserts a new table column with empty cells after the current column. This action is available when the cursor is positioned inside a table.

**Insert Cell**

Inserts a new empty cell depending on the current context. If the cursor is positioned between two cells, Oxygen XML Editor Eclipse plugin a new cell at the cursor position. If the cursor is inside a cell, the new cell is created after the current cell.

**Delete Column(s)**

Deletes the table column located at the cursor position or multiple columns in a selection.

**Delete Row(s)**

Deletes the table row located at the cursor position or multiple rows in a selection.

**Join Cells**

Joins the content of the selected cells (both horizontally and vertically).

**Split Cell**

Splits the cell at the cursor location. If Oxygen XML Editor Eclipse plugin detects more than one option to split the cell, a dialog box will be displayed that allows you to select the number of rows or columns to split the cell into.
**TEI Contextual Menu Actions**

The following actions are available in the contextual menu when editing in **Author** mode (most of them are also available in the **TEI ODD** menu at the top of the interface):

**Edit Attributes**

Displays an in-place attributes editor *(on page 405)* that allows you to manage the attributes of an element.

**Edit Profiling Attributes**

Allows you to change the profiling attributes *(on page 440)* defined on all selected elements.

**Cut (Ctrl + X (Command + X on macOS))**

Removes the currently selected content from the document and places it in the clipboard.

**Copy (Ctrl + C (Command + C on macOS))**

Places a copy of the currently selected content in the clipboard.

**Paste (Ctrl + V (Command + V on macOS))**

Inserts the current clipboard content into the document at the cursor position.

**Image Map Editor**

This action is available in the contextual menu when it is invoked on an image. This action applies an *image map* to the current image (if one does not already exist) and opens the **Image Map Editor** dialog box. This feature allows you to create hyperlinks in specific areas of an image that will link to various destinations.

**Insert submenu**

This submenu includes the following insert actions that are specific to the DocBook framework:

**Insert Table**

Opens a dialog box that allows you to configure and insert a table. You can generate a header and footer, set the number of rows and columns of the table and decide how the table is framed. You can also use this action to convert selected paragraphs, lists, and inline content (mixed content, text plus markup, that is rendered inside a *block element* *(on page 2652)*) into a table, with the selected content inserted in the first column, starting from the first row after the header (if a header is inserted).

**Note:**

If the selection contains a mixture of elements that cannot be converted, you will receive an error message saying that **Only lists, paragraphs, or inline content can be converted to tables**.
Insert Image

Inserts an image reference (on page 489) at the cursor position. Depending on the current location, an image-type element is inserted.

Insert Paragraph

Inserts a new paragraph element at current cursor position.

Insert Section

Inserts a new section element in the document, depending on the current context.

Insert Entity

Allows you to insert a predefined entity or character entity. Surrogate character entities (range #x10000 to #x10FFFF) are also accepted. Character entities can be entered in one of the following forms:

- #<decimal value> - e.g. #65
- &#<decimal value> - e.g. &#65
- #x<hexadecimal value> - e.g. #x41
- &#x<hexadecimal value> - e.g. &#x41

Generate IDs

Oxygen XML Editor Eclipse plugin generates unique IDs for the current element (or elements), depending on how the action is invoked:

- When invoked on a single selection, an ID is generated for the selected element at the cursor position.
- When invoked on a block of selected content, IDs are generated for all top-level elements and elements listed in the ID Options dialog box that are found in the current selection.

Note:
The Generate IDs action does not overwrite existing ID values. It only affects elements that do not already have an @id attribute.

Table actions

The following table editing actions are available in the contextual menu when it is invoked on a table:

Insert Rows

Opens a dialog box that allows you to insert any number of rows and specify the position where they will be inserted (Above or Below the current row).

Delete Row(s)

Deletes the table row located at the cursor position or multiple rows in a selection.
**Insert Columns**

Opens a dialog box that allows you to insert any number of columns and specify the position where they will be inserted *(Above or Below)* the current column.

**Delete Column(s)**

Deletes the table column located at the cursor position or multiple columns in a selection.

**Join Cells**

Joins the content of the selected cells (both horizontally and vertically).

**Split Cell**

Splits the cell at the cursor location. If Oxygen XML Editor Eclipse plugin detects more than one option to split the cell, a dialog box will be displayed that allows you to select the number of rows or columns to split the cell into.

**Sort**

Sorts cells or list items in a table.

**Table Properties**

Opens the *Table properties* dialog box that allows you to configure properties of a table (such as frame borders).

**Other Actions submenu**

This submenu gives you access to all the usual contextual menu actions.

**Select submenu**

This submenu allows you to select the following:

**Element**

Selects the entire element at the current cursor position.

**Content**

Selects the entire content of the element at the current cursor position, excluding the start and end tag. Performing this action repeatedly will result in the selection of the content of the ancestor of the currently selected element content.

**Parent**

Selects the entire parent element at the current cursor position.

**Text submenu**

This submenu contains the following actions:

**To Lower Case**

Converts the selected content to lower case characters.
To Upper Case

Converts the selected content to upper case characters.

Capitalize Sentences

Converts to upper case the first character of every selected sentence.

Capitalize Words

Converts to upper case the first character of every selected word.

Count Words

Counts the number of words and characters (no spaces) in the entire document or in the selection for regular content and read-only content.

**Note:**
The content marked as deleted with change tracking (on page 2659) is ignored when counting words.

**Convert Hexadecimal Sequence to Character (Ctrl + Shift + H (Command + Shift + H on macOS))**

Converts a sequence of hexadecimal characters to the corresponding Unicode character (on page 298). The action can be invoked if there is a selection containing a valid hexadecimal sequence or if the cursor is placed at the right side of a valid hexadecimal sequence. A valid hexadecimal sequence can be composed of 2 to 4 hexadecimal characters and may or may not be preceded by the `0x` or `0X` prefix. Examples of valid sequences and the characters they will be converted to:

- `0x0045` will be converted to `E`
- `0x0125` to `ĥ`
- `265` to `ɥ`
- `2190` to `←`

**Note:**
For more information about finding the hexadecimal value of a character, see Finding the Decimal, Hexadecimal, or Character Entity Equivalent (on page 300).

**Refactoring submenu**

Contains a series of actions designed to alter the XML structure of the document:

**Toggle Comment**

Encloses the currently selected text in an XML comment, or removes the comment if it is commented.
Move Up (Alt + UpArrow (Option + UpArrow on macOS))

Moves the current node or selected nodes in front of the previous node.

Move Down (Alt + DownArrow (Option + DownArrow on macOS))

Moves the current node or selected nodes after the subsequent node.

Split Element

Splits the content of the closest element that contains the position of the cursor. Thus, if the cursor is positioned at the beginning or at the end of the element, the newly created sibling will be empty.

Join Elements

Joins two adjacent block elements (on page 2652) that have the same name. The action is available only when the cursor position is between the two adjacent block elements. Also, joining two block elements can be done by pressing the Delete or Backspace keys and the cursor is positioned between the boundaries of these two elements.

Surround with Tags (Alt + Shift + E)

Allows you to choose a tag to enclose a selected portion of content. If there is no selection, the start and end tags are inserted at the cursor position.

• If the Position cursor between tags option (on page 120) is selected in the Content Completion preferences page, the cursor is placed between the start and end tag.
• If the Position cursor between tags option (on page 120) is not selected in the Content Completion preferences page, the cursor is placed at the end of the start tag, in an insert-attribute position.

Surround with '[tag]' (Alt + Shift + ForwardSlash)

Surround the selected content with the last tag used.

Rename Element

The element from the cursor position, and any elements with the same name, can be renamed according with the options from the Rename dialog box.

Delete Element Tags

Deletes the tags of the closest element that contains the position of the cursor. This operation is also executed if the start or end tags of an element are deleted by pressing the Delete or Backspace keys.

Remove All Markup

Removes all the XML markup inside the selected block of content and keeps only the text content.
**Remove Text**

Removes the text content of the selected block of content and keeps the markup intact with empty elements.

**Attributes Refactoring Actions**

Contains built-in XML refactoring operations that pertain to attributes with some of the information preconfigured based upon the current context.

- **Add/Change attribute**
  - Allows you to change the value of an attribute or insert a new one.

- **Convert attribute to element**
  - Allows you to change an attribute into an element.

- **Delete attribute**
  - Allows you to remove one or more attributes.

- **Rename attribute**
  - Allows you to rename an attribute.

- **Replace in attribute value**
  - Allows you to search for a text fragment inside an attribute value and change the fragment to a new value.

**Comments Refactoring Actions**

Contains built-in XML refactoring operations that pertain to comments with some of the information preconfigured based upon the current context.

- **Delete comments**
  - Allows you to delete comments found inside one or more elements.

**Elements Refactoring Actions**

Contains built-in XML refactoring operations that pertain to elements with some of the information preconfigured based upon the current context.

- **Delete element**
  - Allows you to delete elements.

- **Delete element content**
  - Allows you to delete the content of elements.

- **Insert element**
  - Allows you to insert new elements.

- **Rename element**
  - Allows you to rename elements.
Unwrap element

Allows you to remove the surrounding tags of elements, while keeping the content unchanged.

Wrap element

Allows you to surround elements with element tags.

Wrap element content

Allows you to surround the content of elements with element tags.

Fragments Refactoring Actions

Contains built-in XML refactoring operations that pertain to XML fragments with some of the information preconfigured based upon the current context.

Insert XML fragment

Allows you to insert an XML fragment.

Replace element content with XML fragment

Allows you to replace the content of elements with an XML fragment.

Replace element with XML fragment

Allows you to replace elements with an XML fragment.

Review submenu

This submenu includes the following actions:

✔ Track Changes

Enables or disables the Track Changes (on page 2659) support for the current document.

✔ Accept Change(s) and Move to Next

Accepts the Tracked Change (on page 2659) located at the cursor position or all of the changes in a selection and then moves to the next change. If you select a part of a deletion or insertion change, only the selected content is accepted.

✔ Accept All Changes

Accepts all Tracked Changes (on page 2659) in the current document.

✘ Reject Change(s) and Move to Next

Rejects the Tracked Change (on page 2659) located at the cursor position or all of the changes in a selection and then moves to the next change. If you select a part of a deletion or insertion change, only the selected content is rejected.

✘✘ Reject All Changes

Rejects all Tracked Changes (on page 2659) in the current document.
Comment Change
Opens a dialog box that allows you to add a comment to an existing Tracked Change (on page 2659). The comment will appear in a callout and a tooltip when hovering over the change. If the action is selected on an existing commented change, the dialog box will allow you to edit the comment.

Highlight
Enables the highlighting tool that allows you to mark text in your document.

Colors
Allows you to select the color for highlighting text.

Stop highlighting
Use this action to deactivate the highlighting tool.

Remove highlight(s)
Use this action to remove highlighting from the document.

Add Comment
Inserts a comment at the cursor position. The comment appears in a callout box and a tooltip (when hovering over the change).

Show/Edit Comment
Opens a dialog box that displays the discussion thread and allows the current user to edit comments that do not have replies. If you are not the author who inserted the original comment, the dialog box just displays the comment without the possibility of editing it.

Remove Comment
Removes a selected comment. If you remove a comment that contains replies, all of the replies will also be removed.

Manage Reviews
Opens the Review view (on page 436).

Folding submenu
This submenu includes the following actions:

- Toggle Fold
  Toggles the state of the current fold.

- Collapse Other Folds
  Folds all the elements except the current element.
Folds the elements indented with one level inside the current element.

**Expand Child Folds** (Ctrl + NumPad+ (Command + NumPad+ on macOS))

Unfolds all child elements of the currently selected element.

**Expand All**

Unfolds all elements in the current document.

About Element > Go to Definition

Moves the cursor to the definition of the current element.

Inspect Styles

Opens the CSS Inspector view (on page 412) that allows you to examine the CSS rules that match the currently selected element.

Options

Opens the Author mode preferences page (on page 136) where you can configure various options with regard to the Author editing mode.

**TEI ODD Drag/Drop Actions**

Dragging a file from the Project Explorer view (on page 268) and dropping it into a TEI ODD document that is edited in Author mode, creates a link to the dragged file (the <ptr> element with the @target attribute) at the drop location.

**Tip:**

For information about customizing Author mode actions for a particular framework (on page 2655) (document type), see the Customizing the Author Mode Editing Experience for a Framework (on page 1933) section.

**Related Information:**

Customizing the Author Mode Editing Experience for a Framework (on page 1933)

**jTEI Document Type (Framework)**

The jTEI (Journal of the Text Encoding Initiative) document type is a highly restrictive customization (only about 80 elements are included) of the TEI P5 framework.

**File Definition**

A file is considered to be a jTEI document when the root element is named TEI, it is in the namespace http://www.tei-c.org/ns/1.0, and the @rend attribute is set to "jTEI".
**Default Document Templates**

There is a default jTEI Article template available when creating new documents from templates (on page 252) and they can be found in Framework Templates > TEI JTEI.

The default template is located in the \[OXYGEN_INSTALL_DIR\]/frameworks/tei/templates/TEI jTEI folder.

**Default Schema for Validation and Content Completion**

The default schema that is used if one is not detected is tei_jtei.rng and it is stored in \[OXYGEN_INSTALL_DIR\]/frameworks/tei/xml/tei/custom/schema/relaxng/.

**Default CSS**

The default CSS file (jtei.css) that is used for rendering jTEI in Author mode is stored in \[OXYGEN_INSTALL_DIR\]/frameworks/tei/xml/tei/css/.

By default, these default CSS files are merged with any that are specified in the document. For more information, see Configuring and Managing Multiple CSS Styles for a Framework (on page 1933).

**Default XML Catalogs**

The default XML Catalogs (on page 2659) for jTEI are as follows:

- \[OXYGEN_INSTALL_DIR\]/frameworks/tei/xml/tei/schema/dtd/catalog.xml
- \[OXYGEN_INSTALL_DIR\]/frameworks/tei/xml/tei/custom/schema/dtd/catalog.xml
- \[OXYGEN_INSTALL_DIR\]/frameworks/tei/xml/tei/stylesheet/catalog.xml

**Transformation Scenarios**

Oxygen XML Editor Eclipse plugin includes built-in transformation scenarios that allow you to transform jTEI documents to PDF and ODT. They can be found in the TEI JTEI section in the Configure Transformation Scenario(s) dialog box (on page 1284).

**Resources**

- Oxygen Video Tutorial: Editing TEI Documents in Author Mode
- jTEI Article Guidelines

**Related Information:**

- Editing XML Documents in Author Mode (on page 365)
- Editing XML Documents in Text Mode (on page 306)
- Adding Tables in TEI Documents (on page 483)
**JATS Document Type (Framework)**

The **JATS** (*NISO Journal Article Tag Suite*) document type is a technical standard that defines an XML format for scientific literature.

**File Definition**

A file is considered to be a JATS document when the PUBLIC ID of the document contains the string `-//NLM//DTD`.

**Default Document Templates**

There are some default JATS templates available when creating new documents from templates *(on page 252)* and they can be found in: Framework Templates > JATSKit - NISO JATS and NLM BITS

The default templates for JATS documents are located in the `[OXYGEN_INSTALL_DIR]/frameworks/jats/templates/` folder.

**Default Schema for Validation and Content Completion**

Default schemas that are used if one is not detected in the JATS document are stored in `[OXYGEN_INSTALL_DIR]/frameworks/jats/lib/schemas/`.

**Default CSS**

The default CSS files used for rendering JATS content in **Author** mode are stored in `[OXYGEN_INSTALL_DIR]/frameworks/jats/lib/author-css/`.

By default, these default CSS files are merged with any that are specified in the document. For more information, see Configuring and Managing Multiple CSS Styles for a Framework *(on page 1933)*.

**Default XML Catalog**

The default **XML Catalog** *(on page 2659)*, `jatskit-catalog.xml`, is stored in `[OXYGEN_INSTALL_DIR]/frameworks/jats/lib/schemas/`.

**Transformation Scenarios**

Oxygen XML Editor Eclipse plugin includes built-in transformation scenarios that allow you to transform JATS documents to a variety of outputs, such as PDF, HTML, and EPUB. They can be found in the JATSKit section in the Configure Transformation Scenario(s) dialog box *(on page 1284)*.

**Resources**

- Oxygen Video Tutorial: Configuring a JATS Framework
- NLM Journal Archiving and Interchange Tag Suite
JATS Author Mode Actions

A variety of actions are available for JATS documents that can be found in JATS menu, toolbar, contextual menu, and the Content Completion Assistant (on page 2653).

JATS Toolbar Actions

The following default actions are available on the JATS toolbar when editing in Author mode (by default, they are also available in the JATS menu and in various submenus of the contextual menu):

Paragraph Level Drop-Down Menu

- Insert Paragraph
  Insert a new paragraph element at current cursor position.

- Insert Unordered List
  Inserts an unordered list at the cursor position. A child list item is also automatically inserted by default. You can also use this action to convert selected paragraphs or other types of lists to an unordered list.

- Insert Ordered List
  Inserts an ordered list at the cursor position. A child list item is also automatically inserted by default. You can also use this action to convert selected paragraphs or other types of lists to an ordered list.

- Boxed Text
  Inserts or wraps content in a box with a shaded background.

- Code
  Inserts or wraps content in a `<code>` element.

- Display Quote
  Inserts or wraps content in a `<disp-quote>` element.

Figure

Inserts a `<fig>` element with a `<title>` (inside a `<caption>` element). This action opens a dialog box that allows you to enter the text for the title for the figure.

Graphic Figure

Inserts a `<fig>` element with a `<title>` (inside a `<caption>` element), and a `<graphic>` element. A dialog box is displayed that allows you to enter the title for the figure,
followed by a dialog box that allows you to select the URL of the graphic to be inserted.

**Bold**

Surrounds the selected text with a `<bold>` tag. You can use this action on multiple non-contiguous selections.

**Italic**

Surrounds the selected text with an `<italic>` tag. You can use this action on multiple non-contiguous selections.

**Underline**

Surrounds the selected text with an `<underline>` tag. You can use this action on multiple non-contiguous selections.

**Monospace**

Inserts or wraps content with a `<monospace>` element.

**Insert Table**

Opens a dialog box that allows you to configure and insert a table. You can generate a header and footer, set the number of rows and columns of the table and decide how the table is framed. You can also use this action to convert selected paragraphs, lists, and inline content (mixed content, text plus markup, that is rendered inside a block element (on page 2652)) into a table, with the selected content inserted in the first column, starting from the first row after the header (if a header is inserted).

**Note:**

If the selection contains a mixture of elements that cannot be converted, you will receive an error message saying that **Only lists, paragraphs, or inline content can be converted to tables.**

**Insert Row**

Inserts a new table row with empty cells below the current row. This action is available when the cursor is positioned inside a table.

**Delete Row(s)**

Deletes the table row located at the cursor position or multiple rows in a selection.

**Insert Column**

Inserts a new table column with empty cells after the current column. This action is available when the cursor is positioned inside a table.

**Delete Column(s)**

Deletes the table column located at the cursor position or multiple columns in a selection.
Join Cells

Joins the content of the selected cells (both horizontally and vertically).

Split Cell

Splits the cell at the cursor location. If Oxygen XML Editor Eclipse plugin detects more than one option to split the cell, a dialog box will be displayed that allows you to select the number of rows or columns to split the cell into.

Insert Image

Inserts an image reference (on page 489) at the cursor position. Depending on the current location, an image-type element is inserted.

Insert List Item

Inserts a list item in the current list type.

Insert MathML

Opens the XML Fragment Editor that allows you to insert and edit MathML notations (on page 519).

Subscript

Surrounds the selected text with a subscript tag, used for inserting a character (number, letter, or symbol) that will appear slightly below the baseline and slightly smaller than the rest of the text.

Superscript

Surrounds the selected text with a superscript tag, used for inserting a character (number, letter, or symbol) that will appear slightly above the baseline and slightly smaller than the rest of the text.

JATS Contextual Menu Actions

The following actions are available in the contextual menu when editing in Author mode (most of them are also available in the JATS menu at the top of the interface):

Edit Attributes

Displays an in-place attributes editor (on page 405) that allows you to manage the attributes of an element.

Edit Profiling Attributes

Allows you to change the profiling attributes (on page 440) defined on all selected elements.

Cut (Ctrl + X (Command + X on macOS))

Removes the currently selected content from the document and places it in the clipboard.

Copy (Ctrl + C (Command + C on macOS))

Places a copy of the currently selected content in the clipboard.
**Paste (Ctrl + V (Command + V on macOS))**

Inserts the current clipboard content into the document at the cursor position.

**Image Map Editor**

This action is available in the contextual menu when it is invoked on an image. This action applies an *image map* to the current image (if one does not already exist) and opens the *Image Map Editor* dialog box. This feature allows you to create hyperlinks in specific areas of an image that will link to various destinations.

**Boxed Text**

Inserts or wraps content in a box with a shaded background.

**Insert submenu**

This submenu includes the following insert actions:

**Figure**

Inserts a `<fig>` element with a `<title>` (inside a `<caption>` element). This action opens a dialog box that allows you to enter the text for the title for the figure.

**Graphic Figure**

Inserts a `<fig>` element with a `<title>` (inside a `<caption>` element), and a `<graphic>` element. A dialog box is displayed that allows you to enter the title for the figure, followed by a dialog box that allows you to select the URL of the graphic to be inserted.

**Display Quote**

Inserts or wraps content in a `<disp-quote>` element.

**Insert Paragraph**

Inserts a new *paragraph* element at current cursor position.

**Insert Image**

Inserts an image reference *(on page 489)* at the cursor position. Depending on the current location, an image-type element is inserted.

**Insert Entity**

Allows you to insert a predefined entity or character entity. Surrogate character entities (range #x10000 to #x10FFFF) are also accepted. Character entities can be entered in one of the following forms:

- `#<decimal value>` - e.g. #65
- `&#<decimal value>` - e.g. &#65
- `#x<hexadecimal value>` - e.g. #x41
- `&#x<hexadecimal value>` - e.g. &#x41
**Style submenu**

This submenu includes the following text styling actions:

- **Monospace**
  Inserts or wraps content with a `<monospace>` element.

- **Bold**
  Emphasizes the selected text by surrounding it with a *bold* tag. You can use this action on multiple non-contiguous selections.

- **Italic**
  Emphasizes the selected text by surrounding it with an *italic* tag. You can use this action on multiple non-contiguous selections.

- **Underline**
  Emphasizes the selected text by surrounding it with an *underline* tag. You can use this action on multiple non-contiguous selections.

- **List > Insert Unordered List**
  Inserts an unordered list at the cursor position. A child list item is also automatically inserted by default. You can also use this action to convert selected paragraphs or other types of lists to an unordered list.

- **List > Insert Ordered List**
  Inserts an ordered list at the cursor position. A child list item is also automatically inserted by default. You can also use this action to convert selected paragraphs or other types of lists to an ordered list.

- **Code**
  Inserts or wraps content in a `<code>` element.

**Select submenu**

This submenu allows you to select the following:

- **Element**
  Selects the entire element at the current cursor position.

- **Content**
  Selects the entire content of the element at the current cursor position, excluding the start and end tag. Performing this action repeatedly will result in the selection of the content of the ancestor of the currently selected element content.

- **Parent**
  Selects the entire parent element at the current cursor position.

**Text submenu**
This submenu contains the following actions:

**To Lower Case**

Converts the selected content to lower case characters.

**To Upper Case**

Converts the selected content to upper case characters.

**Capitalize Sentences**

Converts to upper case the first character of every selected sentence.

**Capitalize Words**

Converts to upper case the first character of every selected word.

**Count Words**

Counts the number of words and characters (no spaces) in the entire document or in the selection for regular content and read-only content.

---

**Convert Hexadecimal Sequence to Character** *(Ctrl + Shift + H (Command + Shift + H on macOS))*

Converts a sequence of hexadecimal characters to the corresponding Unicode character *(on page 298)*. The action can be invoked if there is a selection containing a valid hexadecimal sequence or if the cursor is placed at the right side of a valid hexadecimal sequence. A valid hexadecimal sequence can be composed of 2 to 4 hexadecimal characters and may or may not be preceded by the \(0\x\) or \(0X\) prefix. Examples of valid sequences and the characters they will be converted to:

- \(0x0045\) will be converted to \(E\)
- \(0X125\) to \(ĥ\)
- \(265\) to \(ɥ\)
- \(2190\) to \(←\)

---

**Refactoring submenu**

Contains a series of actions designed to alter the XML structure of the document:
Toggle Comment

Encloses the currently selected text in an XML comment, or removes the comment if it is commented.

Move Up (Alt + UpArrow (Option + UpArrow on macOS))

Moves the current node or selected nodes in front of the previous node.

Move Down (Alt + DownArrow (Option + DownArrow on macOS))

Moves the current node or selected nodes after the subsequent node.

Split Element

Splits the content of the closest element that contains the position of the cursor. Thus, if the cursor is positioned at the beginning or at the end of the element, the newly created sibling will be empty.

Join Elements

Joins two adjacent block elements (on page 2652) that have the same name. The action is available only when the cursor position is between the two adjacent block elements. Also, joining two block elements can be done by pressing the Delete or Backspace keys and the cursor is positioned between the boundaries of these two elements.

Surround with Tags (Alt + Shift + E)

Allows you to choose a tag to enclose a selected portion of content. If there is no selection, the start and end tags are inserted at the cursor position.

- If the Position cursor between tags option (on page 120) is selected in the Content Completion preferences page, the cursor is placed between the start and end tag.
- If the Position cursor between tags option (on page 120) is not selected in the Content Completion preferences page, the cursor is placed at the end of the start tag, in an insert-attribute position.

Surround with ['tag'] (Alt + Shift + ForwardSlash)

Surround the selected content with the last tag used.

Rename Element

The element from the cursor position, and any elements with the same name, can be renamed according with the options from the Rename dialog box.

Delete Element Tags

Deletes the tags of the closest element that contains the position of the cursor. This operation is also executed if the start or end tags of an element are deleted by pressing the Delete or Backspace keys.
Remove All Markup

Removes all the XML markup inside the selected block of content and keeps only the text content.

Remove Text

Removes the text content of the selected block of content and keeps the markup intact with empty elements.

Attributes Refactoring Actions

Contains built-in XML refactoring operations that pertain to attributes with some of the information preconfigured based upon the current context.

Add/Change attribute

Allows you to change the value of an attribute or insert a new one.

Convert attribute to element

Allows you to change an attribute into an element.

Delete attribute

Allows you to remove one or more attributes.

Rename attribute

Allows you to rename an attribute.

Replace in attribute value

Allows you to search for a text fragment inside an attribute value and change the fragment to a new value.

Comments Refactoring Actions

Contains built-in XML refactoring operations that pertain to comments with some of the information preconfigured based upon the current context.

Delete comments

Allows you to delete comments found inside one or more elements.

Elements Refactoring Actions

Contains built-in XML refactoring operations that pertain to elements with some of the information preconfigured based upon the current context.

Delete element

Allows you to delete elements.

Delete element content

Allows you to delete the content of elements.
Allows you to insert new elements.

**Rename element**

Allows you to rename elements.

**Unwrap element**

Allows you to remove the surrounding tags of elements, while keeping the content unchanged.

**Wrap element**

Allows you to surround elements with element tags.

**Wrap element content**

Allows you to surround the content of elements with element tags.

**Fragments Refactoring Actions**

Contains built-in XML refactoring operations that pertain to XML fragments with some of the information preconfigured based upon the current context.

**Insert XML fragment**

Allows you to insert an XML fragment.

**Replace element content with XML fragment**

Allows you to replace the content of elements with an XML fragment.

**Replace element with XML fragment**

Allows you to replace elements with an XML fragment.

**Review submenu**

This submenu includes the following actions:

**Track Changes**

Enables or disables the *Track Changes (on page 2659)* support for the current document.

**Accept Change(s) and Move to Next**

Accepts the *Tracked Change (on page 2659)* located at the cursor position or all of the changes in a selection and then moves to the next change. If you select a part of a *deletion* or *insertion* change, only the selected content is accepted.

**Accept All Changes**

Accepts all *Tracked Changes (on page 2659)* in the current document.

**Reject Change(s) and Move to Next**
Rejects the *Tracked Change* located at the cursor position or all of the changes in a selection and then moves to the next change. If you select a part of a *deletion* or *insertion* change, only the selected content is rejected.

**Reject All Changes**

Rejects all *Tracked Changes* in the current document.

**Comment Change**

Opens a dialog box that allows you to add a comment to an existing *Tracked Change*. The comment will appear in a callout and a tooltip when hovering over the change. If the action is selected on an existing commented change, the dialog box will allow you to edit the comment.

**Highlight**

Enables the highlighting tool that allows you to mark text in your document.

**Colors**

Allows you to select the color for highlighting text.

**Stop highlighting**

Use this action to deactivate the highlighting tool.

**Remove highlight(s)**

Use this action to remove highlighting from the document.

**Add Comment**

Inserts a comment at the cursor position. The comment appears in a callout box and a tooltip (when hovering over the change).

**Show/Edit Comment**

Opens a dialog box that displays the discussion thread and allows the current user to edit comments that do not have replies. If you are not the author who inserted the original comment, the dialog box just displays the comment without the possibility of editing it.

**Remove Comment**

Removes a selected comment. If you remove a comment that contains replies, all of the replies will also be removed.

**Manage Reviews**

Opens the *Review view*.

**Folding submenu**

This submenu includes the following actions:

**Toggle Fold**
Toggles the state of the current fold.

**Collapse Other Folds**
Folds all the elements except the current element.

**Collapse Child Folds**
Folds the elements indented with one level inside the current element.

**Expand Child Folds** *(Ctrl + NumPad+ (Command + NumPad+ on macOS))*
Unfolds all child elements of the currently selected element.

**Expand All**
Unfolds all elements in the current document.

### About Element > Go to Definition
Moves the cursor to the definition of the current element.

### Inspect Styles
Opens the **CSS Inspector view (on page 412)** that allows you to examine the CSS rules that match the currently selected element.

### Options
Opens the **Author mode preferences page (on page 136)** where you can configure various options with regard to the **Author editing mode**.

### JATS Drag/Drop Actions
Dragging a file from the **Project Explorer view (on page 268)** and dropping it into a JATS document that is edited in **Author** mode, creates a link to the dragged file (the `<ext-link>` element with the @xlink:href attribute) at the drop location. Dragging an image file from the default file system application (Windows Explorer on Windows or Finder on macOS, for example) and dropping it into a JATS document inserts an image element (the `<inline-graphic>` element with the @xlink:href attribute) at the drop location, similar to the **Insert Image** toolbar action.

**Tip:**
For information about customizing **Author** mode actions for a particular **framework (on page 2655)** (document type), see the **Customizing the Author Mode Editing Experience for a Framework (on page 1933)** section.

**Related Information:**
Customizing the Author Mode Editing Experience for a Framework (on page 1933)
EPUB Document Type (Framework)

EPUB is an e-book file format that is a ZIP archive and can be downloaded and read on devices such as phones, tablets, computers, or e-readers. You can view the contents and structure of this type of file (on page 1803) in the Project Explorer view or main editing pane.

Three distinct frameworks (on page 2655) are supported for the EPUB document type:

- **NCX** - A declarative global navigation definition.
- **OCF** - The Open Container Format (OCF) defines a mechanism by which all components of an Open Publication Structure (OPS) can be combined into a single file system entity.
- **OPF** - The Open Packaging Format (OPF) defines the mechanism by which all components of a published work that conforms to the Open Publication Structure (OPS) standard (including metadata, reading order, and navigational information) are packaged in an OPS Publication.

**Note:**

Oxygen XML Editor Eclipse plugin supports OPF 2.0, OPF 3.0, and OPF 3.1.

File Definition

A file is considered to be an EPUB document if it has a file extension of `.epub`.

Default Document Templates

There are a variety of default EPUB templates available when creating new documents from templates (on page 252) and they can be found the following folders in Framework Templates: NCX, OCF, OPF 2.0, OPF 3.0, and OPF 3.1.

- The default templates for the NCX document types are located in the `{OXYGEN_INSTALL_DIR}/frameworks/ncx/templates` folder.
- The default templates for the OCF document types are located in the `{OXYGEN_INSTALL_DIR}/frameworks/ocf/templates` folder.
- The default template for the OPF 2.0 document type is located in the `{OXYGEN_INSTALL_DIR}/frameworks/opf/templates/2.0` folder.
- The default template for the OPF 3.0 document type is located in the `{OXYGEN_INSTALL_DIR}/frameworks/opf/templates/3.0` folder.
- The default template for the OPF 3.1 document type is located in the `{OXYGEN_INSTALL_DIR}/frameworks/opf/templates/3.1` folder.

Default Schema

The default schema files for the various types of EPUB document types are located in the following directories:
• The default schema files for the NCX document types are located in the 
  \( [OXYGEN\_INSTALL\_DIR]/frameworks/ncx/schemas \) folder.
• The default schema files for the OCF document types are located in the 
  \( [OXYGEN\_INSTALL\_DIR]/frameworks/ocf/schemas \) folder.
• The default schema files for the OPF 2.0 document type is located in the 
  \( [OXYGEN\_INSTALL\_DIR]/frameworks/opf/schemas/2.0 \) folder.
• The default schema files for the OPF 3.0 document type is located in the 
  \( [OXYGEN\_INSTALL\_DIR]/frameworks/opf/schemas/3.0 \) folder.
• The default schema files for the OPF 3.1 document type is located in the 
  \( [OXYGEN\_INSTALL\_DIR]/frameworks/opf/schemas/3.1 \) folder.

**Related Information:**

### OpenAPI (Swagger) Document Type (Framework)

OpenAPI specification, previously known as Swagger specification, is a specification that defines a standard, programming language-agnostic interface description for HTTP APIs, which allows both humans and computers to discover and understand the capabilities of a service without requiring access to source code, additional documentation, or inspection of network traffic. Use cases for machine-readable API definition documents include interactive documentation, code generation for documentation, automation of test cases, and more. OpenAPI documents describe an API's services and are represented in either YAML or JSON format.

Oxygen XML Editor Eclipse plugin includes three OpenAPI frameworks:

- OpenAPI 2.0
- OpenAPI 3.0
- OpenAPI 3.1

**Editing OpenAPI Documents**

You can edit OpenAPI files in **Text** mode and you have access to all the usual text editing actions and you can also edit them in the visual **Author** editing mode and you have access to the various features and actions that are available when editing XML documents in **Author mode** (on page 365).

When opening a detected OpenAPI document in **Author** mode, you have access to some form controls, collapsible sections, descriptions can be edited inline in a text area that features syntax highlighting, and other features to help you visualize and edit these documents. Also, when editing OpenAPI files in **Author** mode, a + **Markdown Syntax Highlight** CSS style can be selected from the **Styles** drop-down menu (available on the toolbar) to visualize descriptions with Markdown style syntax highlights.
Validation and Content Completion

Validation and content completion is supported in Oxygen XML Editor Eclipse plugin for OpenAPI documents (version 2.0, 3.0, 3.1). The validation and content completion in OpenAPI documents are driven by schemas according to the OpenAPI version in the document. Each of the three frameworks (OpenAPI 2.0, OpenAPI 3.0, and OpenAPI 3.1) have a unique schema specified for content completion and validation. When opening an OpenAPI document (in JSON or YAML format), Oxygen XML Editor Eclipse plugin automatically associates the corresponding schema based on the OpenAPI version of the document.

OpenAPI Test Scenario Document Type (Framework)

Oxygen XML Editor Eclipse plugin includes a specialized framework for working with OpenAPI test scenario files. It includes the usual text editing actions, a visual editing interface, content completion, and automatic validation.

Author Mode Editing

You can edit OpenAPI test scenario files in the visual Author editing mode and you have access to the various features and actions that are available when editing XML documents in Author mode (on page 365).

Default Document Template

There is a default scenario file template available when creating new documents from templates (on page 252) and they can be found in the Framework Templates > OpenAPI Test Scenario.

Content Completion

Oxygen XML Editor Eclipse plugin helps you edit OpenAPI test scenario files through the Content Completion Assistant (on page 2653), offering proposals for properties and values that can be inserted at the cursor position. It can be manually activated with the Ctrl + Space shortcut.
Validation

Oxygen XML Editor Eclipse plugin includes built-in validation for OpenAPI test scenario documents to help you keep them well-formed. The documents are validated automatically as you type against the schema specified in the framework and problems are highlighted within the document.

Resources

- For more details about the OpenAPI Specification, along with example documents, go to [https://spec.openapis.org/oas/latest.html](https://spec.openapis.org/oas/latest.html).
- Video: OpenAPI Document Editing in Oxygen XML Editor
- Webinar: OpenAPI Editing, Testing, and Documenting
- Webinar: OpenAPI/AsyncAPI Support in Oxygen

AsyncAPI Document Type (Framework)

Oxygen XML Editor Eclipse plugin includes a specialized framework for working with AsyncAPI files. The application supports the following AsyncAPI versions: 1.0.0, 1.1.0, 1.2.0, 2.0.0, 2.1.0, 2.2.0, 2.3.0, 2.4.0.

Editing AsyncAPI Documents

You can edit AsyncAPI files in Text mode and you have access to all the usual text editing actions and you can also edit them in the visual Author editing mode and you have access to the various features and actions that are available when editing XML documents in Author mode (on page 365). When editing AsyncAPI files in Author mode, a + Markdown Syntax Highlight CSS style can be selected from the Styles drop-down menu (available on the toolbar) to make it easier to visualize descriptions with Markdown style syntax highlights.

Default Document Templates

There are some default AsyncAPI templates available when creating new documents from templates (on page 252) and they can be found in the Framework Templates > AsyncAPI 1.x and Framework Templates > AsyncAPI 2.x folders. Each of those folders contain a default new document template for a JSON version and a YAML version. Some other useful examples can be found at public AsyncAPI GitHub project.

Content Completion

Oxygen XML Editor Eclipse plugin helps you edit AsyncAPI files through the Content Completion Assistant (on page 265), offering proposals for properties and values that can be inserted at the cursor position. It can be manually activated with the Ctrl + Space shortcut.

Validation

Oxygen XML Editor Eclipse plugin includes built-in validation for AsyncAPI documents to help you keep them well-formed. The documents are validated automatically as you type against the schema specified in the framework and problems are highlighted within the document.
Resources

- For details about the AsyncAPI Specification, go to https://www.asyncapi.com/docs/reference/specification/v2.0.0.
- Webinar: OpenAPI/AsyncAPI Support in Oxygen

JSON-LD Document Type (Framework)

Oxygen XML Editor Eclipse plugin includes a specialized framework for working with JSON-LD files. JSON-LD (JavaScript Object Notation for Linked Data) consists of multi-dimensional arrays and is considered an easy-to-use lightweight Linked Data format.

Editing JSON-LD Documents

You can edit JSON-LD files in the specialized JSON text mode editor (on page 857) and you have access to its various features and actions. You can also edit JSON-LD files in the Author visual editing mode (on page 858) with access to the usual visual editing features for normal JSON documents.

Default Document Template

There are some default JSON-LD templates available when creating new documents from templates (on page 252) and they can be found in: Framework Templates > JSON-LD. Some other useful examples can be found at public JSON-LD GitHub project.

Content Completion

Oxygen XML Editor Eclipse plugin includes an intelligent Content Completion Assistant (on page 2653) that offers proposals for inserting JSON structures that are valid at the current editing location. For more details, see Content Completion Assistant in JSON (on page 869).

Validation

Oxygen XML Editor Eclipse plugin includes built-in validation for JSON-LD documents to help you keep them well-formed. The documents are validated automatically as you type against the schema specified in the framework and problems are highlighted within the document. For more details, see Validating JSON Documents (on page 862).
Oxygen XML Editor Eclipse plugin supports custom frameworks (document types) contributed by the XML community (for example, the S1000D framework (on page 1165)). They provide support for additional functionality and XML vocabularies.

Similar to the built-in frameworks (on page 2655), the additional frameworks may define:

- A default grammar used for validation and content completion in both Author mode and Text mode.
- CSS stylesheets for rendering XML documents in Author mode.
- User actions invoked from toolbars or menus in Author mode.
- Built-in transformation scenarios used for publishing XML documents.
- XML Catalogs (on page 2659) used for mapping resources.
- New document templates to make it easy to create XML documents.
- User-defined extensions for customizing the interaction with the content author in Author mode.

**S1000D Document Type (Framework)**

S1000D is an international specification for the procurement and production of technical publications (mainly used in aerospace and aviation industries). It is an XML-based specification for preparing, managing, and using equipment maintenance and operations information.

S1000D is articulated based on three main notions:

- **Data Module** - It is an XML file that defines a standalone information unit.
- **Data Module Structure** - It defines how a Data Module is divided:
  - The Identification and Status part that identifies the Data Module within the CSDB structure.
  - The Content part that is the detailed information of the Data Module.
- **Common Source DataBase (CSDB)** - It defines how the Data Modules are arranged inside a publication.

Oxygen XML Editor Eclipse plugin does not have default built-in support for S1000D, but a company called Amplexor has developed a framework that can be installed in Oxygen XML Editor Eclipse plugin to add support for S1000D documents.

To install the framework in Oxygen XML Editor Eclipse plugin, follow these steps:
1. Download or clone the framework on GitHub and install it as an additional framework *(on page 90)*.

2. Download the S1000D specifications package that contains samples and schemas at S1000D Downloads.

3. Copy the XML Schema files from [ZIP]\XML Schema Package\xml_schema_flat into the corresponding version of the xml_schema_flat folder.

If you want more advanced S1000D editing features, you can ask some of our partners.
11. Publishing

XML documents can be transformed into a variety of user-friendly output formats that can be viewed by end-users. This process is known as a *transformation*.

Oxygen XML Editor Eclipse plugin includes numerous built-in transformation possibilities to publish XML content in various output formats (such as WebHelp, PDF, CHM, EPUB, JavaHelp, Eclipse Help, XHTML, etc.)

For transformations that are not included in your installed version of Oxygen XML Editor Eclipse plugin, simply install the tool chain required to perform the specific transformation and process the files in accordance with the processor instructions. A multitude of target formats are possible. The basic condition for a transformation to any format is that your source document is well-formed.

**Warning:**
Keep in mind that there could be instances where there are differences between what you see in **Author** mode and what you see in the published output. This is typically due to certain limitations in the publishing engine, especially when the source documents contain complex referencing.

**Transformation Scenarios**

A transformation scenario is a set of complex operations and settings that gives you the possibility to obtain outputs of multiple types (XML, HTML, PDF, EPUB, etc.) from the same source of XML files and stylesheets.

**Note:**
You need to use the appropriate stylesheet according to the source definition and the desired output. For example, if you want to transform into an HTML format using a DocBook stylesheet, your source XML document should conform with the DocBook DTD.

Executing a transformation scenario implies multiple actions, such as:

- Validating the input file.
- Obtaining intermediate output files (for example, formatting objects for the XML to PDF transformation).
- Using transformation engines to produce the output.

Before transforming an XML document in Oxygen XML Editor Eclipse plugin, you need to define a transformation scenario to apply to that document. A scenario is a set of values for various parameters that define a transformation. It is not related to a particular document, but rather to a document type. Oxygen XML
Editor Eclipse plugin includes preconfigured built-in transformation scenarios (on page 1168), but you can also create new transformation scenarios (on page 1201).

When creating new transformation scenarios, the types that are available include:

- **Scenarios that Apply to XML Files** - This type of scenario contains the location of an XSLT stylesheet that is applied on the edited XML document, as well as other transformation parameters. For more information, see XML Transformation with XSLT (on page 1201) and XML Transformation with XQuery (on page 1218).

- **Scenarios that Apply to XSLT Files** - This type of scenario contains the location of an XML document that the edited XSLT stylesheet is applied to, as well as other transform parameters. For more information, see XSLT Transformation (on page 1248).

- **Scenarios that Apply to XQuery Files** - This type of scenario contains the location of an XML source, that the edited XQuery file is applied to, as well as other transform parameters. When the XML source is a native XML database, the XML source field of the scenario is empty because the XML data is read with XQuery-specific functions, such as `document()`. When the XML source is a local XML file, the URL of the file is specified in the XML input field of the scenario. For more information, see XQuery Transformation (on page 1272).

- **Scenarios that Apply to SQL Files** - This type of scenario specifies a database connection for the database server that runs the SQL file that is associated with the scenario. The data processed by the SQL script is located in the database.

- **Scenarios that Apply to XProc Files** - This type of scenario contains the location of an XProc script, as well as other transform parameters. For more information, see SQL Transformation (on page 1280).

- **DITA-OT Scenarios** - This type of scenario provides the parameters for an Ant transformation that executes a DITA-OT build script. Oxygen XML Editor Eclipse plugin includes a built-in version of Ant and a built-in version of DITA-OT, although you can also set other versions in the scenario. For more information, see DITA-OT Transformation (on page 1228).

- **ANT Scenarios** - This type of scenario contains the location of an Ant build script, as well as other transform parameters. For more information, see Ant Transformation (on page 1244).

**Note:**

Status messages generated during the transformation process are displayed in the Console view (on page 303) (the Enable Oxygen consoles option (on page 180) must be selected in the View preferences page (on page 180)).

**Built-in Transformation Scenarios**

Oxygen XML Editor Eclipse plugin includes preconfigured built-in transformation scenarios that are used for common transformations. They can be found in the various sections in the Configure Transformation Scenario(s) dialog box (on page 1284) or Transformation Scenarios view (on page 1290). All the built-in document types (frameworks) (on page 2655) that are included in Oxygen XML Editor Eclipse plugin have
various transformation scenarios in their specific sections, including the most popular frameworks, such as DITA, DocBook, TEI, XHTML, JATS, OOXML, and more.

To obtain the desired output, use one of the following actions from the toolbar or Transform submenu in the contextual menu of the Project Explorer view (on page 268):

- 🎥 **Apply Transformation Scenario(s) (Alt + Shift + T, T (Command + Option + T, T on macOS))** - If you have associated transformation scenarios for the current document, this action will simply apply the association (on page 1283) and begin the transformation process. If an association is not detected, this action will open the Configure Transformation Scenario(s) dialog box (on page 1284) where you can choose the scenarios you want to apply.

- 🔧 **Configure Transformation Scenario(s) (Alt + Shift + T, C (Command + Option + T, C on macOS))** - This action will open the Configure Transformation Scenario(s) dialog box (on page 1284) where you can choose the scenarios you want to apply.

### Note:

- You can apply a transformation even if the current document is not associated with a transformation scenario.
- If the document contains an xml-stylesheet processing instruction that references an XSLT stylesheet (commonly used to display the document in web browsers), Oxygen XML Editor Eclipse plugin prompts you to associate the document with a built-in transformation scenario.
- The default transformation scenario is suggested based on the processing instruction from the edited document.

### Related Information:

- Creating New Transformation Scenarios (on page 1201)
- Editing a Transformation Scenario (on page 1281)
- Configure Transformation Scenario(s) Dialog Box (on page 1284)
- Applying Associated Transformation Scenarios (on page 1283)
- Transformation Scenarios View (on page 1290)

### DITA Map Transformation Scenarios

Built-in transformation scenarios allow you to transform DITA maps (on page 2654) to a variety of outputs, such as WebHelp, PDF, ODF, XHTML, EPUB, CHM, Kindle, and MS Word. Oxygen XML Editor Eclipse plugin also includes a special Run DITA-OT Integrator (on page 1193) that can be used to integrate a DITA-OT plugin and a DITA Map Metrics Report transformation that generates a statistics report for your DITA map. All of them are listed in the DITA Map section in the Configure Transformation Scenario(s) dialog box (on page 1284).

A variety of transformations scenarios are available for DITA maps (on page 2654):
• Built-in transformation scenarios allow you to transform a DITA map to a variety of outputs, such as WebHelp, PDF, ODF, XHTML, EPUB, CHM, Kindle, Metrics Report, and MS Word.
• Run DITA-OT Integrator (on page 1193) - Use this transformation scenario if you want to integrate a DITA-OT plugin (on page 2587). This scenario runs an Ant task that integrates all the plugins from the DITA-OT/plugins directory.

Related Information:
Editing a Transformation Scenario (on page 1281)

DITA Topic Transformation Scenarios (on page 2525)

DITA Map WebHelp Responsive Transformation

DITA content can be transformed into several types of WebHelp Responsive systems (with or without a feedback section). The WebHelp Responsive layout and features (on page 1295) are designed to adapt to any device and screen size to provide an optimal viewing and interaction experience. Oxygen XML Editor Eclipse plugin also provides numerous possibilities for customizing the WebHelp Responsive output (on page 1379).

WebHelp Responsive Transformation Scenario

To publish a DITA map (on page 2654) as WebHelp Responsive output, follow these steps:

1. Select the Configure Transformation Scenario(s) action from the DITA Maps Manager (on page 2315) toolbar.
2. Select the DITA Map WebHelp Responsive scenario from the DITA Map section.
3. If you want to configure the transformation, click the Edit button.

Step Result: This opens an Edit scenario configuration dialog box that allows you to configure various options in the following tabs:

- Templates Tab (on page 2528) - This tab contains a set of built-in publishing templates (on page 1340) that you can use for the layout of your WebHelp system output. You can also create your own publishing templates or edit existing ones (on page 1379).
- Parameters Tab (on page 2534) - This tab includes numerous parameters that can be set to customize your WebHelp system output. See the Parameters section (on page 1171) below for details about the most commonly used parameters for WebHelp Responsive transformations.
- Feedback Tab (on page 2535) - This tab is for those who want to add the Oxygen Feedback comments component at the bottom of each WebHelp page so that you can interact with your readers.
- Filters Tab (on page 2536) - This tab allows you to filter certain content elements from the generated output.
Advanced Tab (on page 2537) - This tab allows you to specify some advanced options for the transformation scenario.

Output Tab (on page 2540) - This tab allows you to configure options that are related to the location where the output is generated.

4. Click **Apply associated** to process the transformation.

**Result:** When the DITA Map WebHelp Responsive transformation is complete, the output is automatically opened in your default browser.

**General Parameters for Customizing WebHelp Responsive Output**

To customize a transformation scenario, you can edit various parameters, including the following most commonly used ones:

- **default.language**
  
  This parameter is used if the language is not detected in the DITA map. The default value is `en-us`.

- **clean.output**
  
  Deletes all files from the output folder before the transformation is performed (only `no` and `yes` values are valid and the default value is `no`).

- **editlink.remote.ditamap.url**
  
  Use this parameter in conjunction with `editlink.web.author.url` to add an **Edit** link next to the topic title in the WebHelp output. When a user clicks the link, the topic is opened in Oxygen XML Web Author where they can make changes that can be saved to a file server. The value should be set as the custom URL of the main DITA map. For example, a GitHub custom URL might look like this: `https://getFileContent/oxyengxml/userguide/master/UserGuide.ditamap`.

- **editlink.web.author.url**
  
  This parameter needs to be used in conjunction with `editlink.remote.ditamap.url` to add an **Edit** link next to the topic title in the WebHelp output. When a user clicks the link, the topic is opened in Oxygen XML Web Author where they can make changes that can be saved to a file server. The value should be set as the URL of the Web Author installation. For example: `https://www.oxygenxml.com/oxygen-xml-web-author/`.

- **editlink.present.only.path.to.topic**
  
  When this parameter is set to “true”, the DITA topic path is displayed to the right of each topic title in the WebHelp Responsive output. Also, when this parameter is used, the `editlink.ditamap.edit.url`, `editlink.remote.ditamap.url`, and `editlink.web.author.url` parameters are ignored.

- **fix.external.refs.com.oxygenxml** (Only supported when the DITA-OT transformation process is started from Oxygen XML Editor Eclipse plugin)
  
  The DITA Open Toolkit usually has problems processing references that point to locations outside of the directory of the processed DITA map. This parameter is used to specify whether
or not the application should try to fix such references in a temporary files folder before the DITA Open Toolkit is invoked on the fixed references. The fix has no impact on your edited DITA content. Allowed values: true or false (default).

**force.unique**

When set to true (default value), the transformation will be forced to create unique output files for each instance of a resource when a map contains multiple references to a single topic.

**use.stemming**

Controls whether or not you want to include stemming search algorithms into the published output (default setting is false).

**webhelp.csh.disable.topicID.fallback**

Specifies whether or not topic ID fallbacks are enabled when computing the mapping of context sensitive help and resourceId information is not available. Possible values are false (default) and true.

**webhelp.custom.resources**

The file path to a directory that contains resources files. All files from this directory will be copied to the root of the WebHelp output.

**webhelp.favicon**

The file path that points to an image to be used as a favicon in the WebHelp output.

**webhelp.reload.stylesheet**

Set this parameter to true if you have out of memory problems when generating WebHelp. It will increase processing time but decrease the memory footprint. The default value is false.

**webhelp.search.custom.excludes.file**

The path of the file that contains name patterns for HTML files that should not be indexed by the WebHelp search engine. Each exclude pattern must be on a new line. The patterns are considered to be relative to the output directory, and they accept wildcards such as ‘*’ (matches zero or more characters) or ‘?’ (matches one character). For more information about the patterns, see https://ant.apache.org/manual/dirtasks.html#patterns.

**webhelp.search.japanese.dictionary**

The file path of the dictionary that will be used by the Kuromoji morphological engine for indexing Japanese content in the WebHelp pages. The encoding for the dictionary must be UTF8.

**webhelp.search.enable.pagination**

Specifies whether or not search results will be displayed on multiple pages. Allowed values are yes or no.

**webhelp.search.index.elements.to.exclude**
Specifies a list of HTML elements that will not be indexed by the search engine. The value of the `@class` attribute can be used to exclude specific HTML elements from indexing. For example, the `div.not-indexed` value will not index all `<div>` elements that have a `@class` attribute with the value of `not-indexed`. Use a comma separator to specify more than one element.

**webhelp.search.page.numberOfItems**

Specifies the number of search results items displayed on each page. This parameter is only used when the `webhelp.search.enable.pagination` parameter is enabled.

**webhelp.search.ranking**

If this parameter is set to `false` then the 5-star rating mechanism is no longer included in the search results that are displayed on the Search tab (default setting is `true`).

**webhelp.search.stop.words.include**

Specifies a list of words that will be ignored by the search engine. Use a comma separator to specify more than one word.

**webhelp.show.changes.and.comments**

When set to `yes`, user comments, replies to comments, and tracked changes are published in the WebHelp output. The default value is `no`.

**webhelp.sitemap.base.url**

Base URL for all the `<loc>` elements in the generated `sitemap.xml` file. If this parameter is specified, the `<loc>` element will contain the value of this parameter plus the relative path to the page. If this parameter is not specified, the `<loc>` element will only contain the relative path of the page (the relative file path from the `@href` attribute of a `<topicref>` element from the DITA map, appended to this base URL value).

**webhelp.sitemap.change.frequency**

The value of the `<changefreq>` element in the generated `sitemap.xml` file. The `<changefreq>` element is optional in `sitemap.xml`. If you leave this parameter set to its default empty value, then the `<changefreq>` element is not added in `sitemap.xml`. Allowed values: `<empty string>` (default), `always`, ` hourly`, `daily`, `weekly`, `monthly`, `yearly`, `never`.

**webhelp.sitemap.priority**

The value of the `<priority>` element in the generated `sitemap.xml` file. It can be set to any fractional number between 0.0 (least important priority) and 1.0 (most important priority). For example, 0.3, 0.5, or 0.8. The `<priority>` element is optional in `sitemap.xml`. If you leave this parameter set to its default empty value, then the `<priority>` element is not added in `sitemap.xml`.

**Parameters Specific to Oxygen WebHelp Responsive**

**webhelp.fragment.feedback**

You can integrate Oxygen Feedback with your WebHelp Responsive output to provide a comments area at the bottom of each page where readers can offer feedback. When you create
an Oxygen Feedback site configuration, an HTML fragment is generated during the final step of the creation process and that fragment should be set as the value for this parameter.

**webhelp.default.collection.type.sequence**

Specifies if the sequence value will be used by default when the @collection-type attribute is not specified. This option is helpful if you want to have Next and Previous navigational buttons generated for all HTML pages. Allowed values are no (default) and yes.

**webhelp.enable.search.autocomplete**

Specifies if the Autocomplete feature is enabled in the WebHelp search text field. The default value is yes.

**webhelp.enable.html.fragments.cleanup**

Enables or disables the automatic conversion of HTML fragments to well-formed XML. If set to true (default), the transformation automatically converts non-well-formed HTML content to a well-formed XML equivalent. If set to false, the transformation will fail if at least one HTML fragment is not well-formed.

**webhelp.enable.scroll.to.search.term**

Specifies whether or not the page should scroll to the first search term when opening the search results page. Possible values are no (default) and true.

**webhelp.fragment.after.body**

This parameter can be used to display a given XHTML fragment after the body in all types of pages. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.after.body.main.page**

This parameter can be used to display a given XHTML fragment after the body in the main page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.after.body.topic.page**

This parameter can be used to display a given XHTML fragment after the body in the topic page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.after.body.search.page**

This parameter can be used to display a given XHTML fragment after the body in the search results page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.after.body.terms.page**

This parameter can be used to display a given XHTML fragment after the body in the index terms page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.
webhelp.fragment.after.logo_and_title

This parameter can be used to display a given XHTML fragment after the logo and title in all types of pages. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.after.search.input

This parameter can be used to display a given XHTML fragment after the search field in all types of pages. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.after.main.page.search (deprecated)

This parameter is deprecated. Use webhelp.fragment.after.search.input.main.page instead.

webhelp.fragment.after.search.input.main.page

This parameter can be used to display a given XHTML fragment after the search field in all the main page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.after.search.input.topic.page

This parameter can be used to display a given XHTML fragment after the search field in all the topic page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.after.search.input.search.page

This parameter can be used to display a given XHTML fragment after the search field in all the search results page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.after.search.input.terms.page

This parameter can be used to display a given XHTML fragment after the search field in all the index terms page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.after.toc_or_tiles

This parameter can be used to display a given XHTML fragment after the table of contents or tiles in the main page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.after.top_menu

This parameter can be used to display a given XHTML fragment after the top menu in all types of pages. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.before.body
This parameter can be used to display a given XHTML fragment before the page body in all types of pages. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.before.body.main.page**

This parameter can be used to display a given XHTML fragment before the page body in the main page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.before.body.topic.page**

This parameter can be used to display a given XHTML fragment before the page body in the topic page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.before.body.search.page**

This parameter can be used to display a given XHTML fragment before the page body in the search results page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.before.body.terms.page**

This parameter can be used to display a given XHTML fragment before the page body in the index terms page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.before.logo_and_title**

This parameter can be used to display a given XHTML fragment before the logo and title. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.before.search.input**

This parameter can be used to display a given XHTML fragment before the search field in all types of pages. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.before.main.page.search (deprecated)**

This parameter is deprecated. Use **webhelp.fragment.before.search.input.main.page** instead.

**webhelp.fragment.before.search.input.main.page**

This parameter can be used to display a given XHTML fragment before the search field in the main page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.before.search.input.topic.page**

This parameter can be used to display a given XHTML fragment before the search field in the topic page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.
webhelp.fragment.before.search.input.search.page

This parameter can be used to display a given XHTML fragment before the search field in the search results page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.before.search.input.terms.page

This parameter can be used to display a given XHTML fragment before the search field in the index terms page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.before.toc_or_tiles

This parameter can be used to display a given XHTML fragment before the table of contents or tiles in the main page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.before.top_menu

This parameter can be used to display a given XHTML fragment before the top menu in all types of pages. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.footer

This parameter can be used to display a given XHTML fragment as the page footer in all types of pages. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

Important:
This parameter should only be used if you are using a valid, purchased license of Oxygen XML Editor Eclipse plugin (do not use it with a trial license).

webhelp.fragment.head

This parameter can be used to display a given XHTML fragment in the header section in all types of pages. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.head.main.page

This parameter can be used to display a given XHTML fragment in the header section in the main page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.head.topic.page

This parameter can be used to display a given XHTML fragment in the header section in the topic page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.head.search.page
This parameter can be used to display a given XHTML fragment in the header section in the search results page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

**webhelp.fragment.head.terms.page**

This parameter can be used to display a given XHTML fragment in the header section in the index terms page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

**webhelp.fragment.welcome**

This parameter can be used to display a given XHTML fragment as a welcome message (or title). The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

**webhelp.fragment.after.header**

This parameter can be used to display a given XHTML fragment after the header section in all types of pages. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

**webhelp.fragment.after.header.main.page**

This parameter can be used to display a given XHTML fragment after the header section in the main page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

**webhelp.fragment.after.header.topic.page**

This parameter can be used to display a given XHTML fragment after the header section in the topic page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

**webhelp.fragment.after.header.search.page**

This parameter can be used to display a given XHTML fragment after the header section in the search results page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

**webhelp.fragment.after.header.terms.page**

This parameter can be used to display a given XHTML fragment after the header section in the index terms page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

**webhelp.fragment.before.search.input**

This parameter can be used to display a given XHTML fragment before the search field in all types of pages. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

**webhelp.fragment.after.search.input**
This parameter can be used to display a given XHTML fragment after the search field in all types of pages. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

**webhelp.fragment.before.main.content.area**

This parameter can be used to display a given XHTML fragment before the main content section in all types of pages. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

**webhelp.fragment.before.main.content.area.main.page**

This parameter can be used to display a given XHTML fragment before the main content section in the main page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

**webhelp.fragment.before.main.content.area.topic.page**

This parameter can be used to display a given XHTML fragment before the main content section in the topic page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

**webhelp.fragment.before.main.content.area.search.page**

This parameter can be used to display a given XHTML fragment before the main content section in the search results page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

**webhelp.fragment.before.main.content.area.terms.page**

This parameter can be used to display a given XHTML fragment before the main content section in the index terms page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

**webhelp.fragment.after.main.content.area**

This parameter can be used to display a given XHTML fragment after the main content section in all types of pages. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

**webhelp.fragment.after.main.content.area.main.page**

This parameter can be used to display a given XHTML fragment after the main content section in the main page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

**webhelp.fragment.after.main.content.area.topic.page**

This parameter can be used to display a given XHTML fragment after the main content section in the topic page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

**webhelp.fragment.before.topic.toolbar**
This parameter can be used to display a given XHTML fragment before the toolbar buttons above the topic content in the topic page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

**webhelp.fragment.after.topic.toolbar**

This parameter can be used to display a given XHTML fragment after the toolbar buttons above the topic content in the topic page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

**webhelp.fragment.before.topic.breadcrumb**

This parameter can be used to display a given XHTML fragment before the breadcrumb component in the topic page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

**webhelp.fragment.after.topic.breadcrumb**

This parameter can be used to display a given XHTML fragment after the breadcrumb component in the topic page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

**webhelp.fragment.before.publication.toc**

This parameter can be used to display a given XHTML fragment before the publication's table of contents component in the topic page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

**webhelp.fragment.after.publication.toc**

This parameter can be used to display a given XHTML fragment after the publication's table of contents component in the topic page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

**webhelp.fragment.before.topic.content**

This parameter can be used to display a given XHTML fragment before the topic's content in the topic page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

**webhelp.fragment.after.topic.content**

This parameter can be used to display a given XHTML fragment after the topic's content in the topic page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

**webhelp.fragment.before.feedback**

This parameter can be used to display a given XHTML fragment before the **Oxygen Feedback** commenting component in the topic page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

**webhelp.fragment.after.feedback**
This parameter can be used to display a given XHTML fragment after the Oxygen Feedback commenting component in the topic page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.before.topic.toc**

This parameter can be used to display a given XHTML fragment before the topic's table of contents component in the topic page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.after.topic.toc**

This parameter can be used to display a given XHTML fragment after the topic's table of contents component in the topic page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.custom.search.engine.results**

This parameter can be used to replace the search results area with custom XHTML content. The value of the parameter is the path to an XHTML file that contains your custom content.

**webhelp.fragment.custom.search.engine.script**

This parameter can be used to replace WebHelp's built-in search engine with your own custom search engine. The value of the parameter is the path to an XHTML file that contains the scripts required for your custom search engine to run.

**webhelp.labels.generation.mode**

Controls whether or not labels are generated in the output. These labels are useful because users can easily search for topics with the same label by simply clicking on the label presented in the output. Possible values are:

- **keywords-label** - Generates labels for each defined `<keyword>` element that has the `@outputclass` attribute value set to `label`.
- **keywords** - Generates labels for each defined `<keyword>` element. If the topic contains `<keyword>` elements with the `@outputclass` attribute value set to `label`, then only these elements will have labels generated for them in the output.
- **disable** - Disables the generation of labels in the Webhelp Responsive output.

**webhelp.merge.nested.topics.related.links**

Specifies if the related links from nested topics will be merged with the links in the parent topic. Thus the links will be moved from the topic content to the related links component and all of the links from the same group (for example, Related Tasks, Related References, Related Information) are merged into a single group. The default value is **yes**.

**webhelp.publication.toc.hide.chunked.topics**

Specifies if the table of contents will contain links for chunked topics. The default value is **yes**.

**webhelp.publication.toc.links**
Specifies which links will be included in the table of contents. The possible values are:

- **chapter** (default) - The TOC will include links for the current topic, its children, its siblings, and its direct ancestor (including the direct ancestor's siblings), and the parent chapter.
- **topic** - The TOC will only include links for the current topic and its direct children.
- **all** - The TOC will include all links.

**webhelp.publication.toc.tooltip.position**

By default, if a topic contains a `<shortdesc>` element, its content is displayed in a tooltip when the user hovers over its link in the table of contents. This parameter controls whether or not this tooltip is displayed and its position relative to the link. The possible values are:

- **left**
- **right** (default)
- **top**
- **bottom**
- **hidden** - The tooltip will not be displayed.

**webhelp.search.default.operator**

Makes it possible to change the default operator for the search engine. Possible values are **and** or **or** (default). If set to **and** while the search query is WORD1 WORD2, the search engine only returns results for topics that contain both WORD1 and WORD2. If set to **or** and the search query is WORD1 WORD2, the search engine returns results for topics that contain either WORD1 or WORD2.

**webhelp.search.stop.words.exclude**

Specifies a list of words that will be excluded from the default list of **stop words** that are filtered out before the search processing. Use comma separators to specify more than one word (for example: *if, for, is*).

**webhelp.show.breadcrumb**

Specifies if the breadcrumb component will be presented in the output. The default value is **yes**.

**webhelp.show.child.links**

Specifies if child links will be generated in the output for all topics that have subtopics. The default value is **no**.

**webhelp.show.indexterms.link**

Specifies if an icon that links to the index terms page will be displayed in the output. The default value is **yes** (meaning the index terms icon is displayed). If set to **false**, the index terms icon is not displayed in the output and the index terms page is not generated.

**webhelp.show.main.page.tiles**

Specifies if the tiles component will be presented in the main page of the output. For a **tree style layout**, this parameter should be set to **no**.
webhelp.show.main.page.toc

Specifies if the table of contents will be presented in the main page of the output. The default value is yes.

webhelp.show.navigation.links

Specifies if navigation links will be presented in the output. The default value is yes.

webhelp.show.print.link

Specifies if a print link or icon will be presented within each topic in the output. The default value is yes.

webhelp.show.related.links

Specifies if the related links component will be presented in the WebHelp Responsive output. The default value is yes. The webhelp.merge.nested.topics.related.links parameter can be used in conjunction with this one to merge the related links from nested topics into the links in the parent topic.

webhelp.show.publication.toc

Specifies if a table of contents will be presented on the left side of each topic in the output. The default value is yes.

webhelp.show.topic.toc

Specifies if a topic table of contents will be presented on the right side of each topic in the output. This table of contents contains links to each <section> within the current topic that contains an @id attribute and the section corresponding to the current scroll position is highlighted. The default value is yes.

webhelp.show.top.menu

Specifies if a menu will be presented at the topic of the main page in the output. The default value is yes.

webhelp.skip.main.page.generation

If set to true, the default main page is not generated in the output. The default value is false.

webhelp.top.menu.activated.on.click

When this parameter is activated (set to yes), clicking an item in the top menu will expand the submenu (if available). You can then click on a submenu item to open the item (topic). You can click outside the menu or press ESC to hide the menu. When set to no (default), hovering over a menu item displays the menu content.

webhelp.top.menu.depth

Specifies the maximum depth level of the topics that will be included in the top menu. The default value is 3. A value of 0 means that the menu has unlimited depth.

webhelp.topic.collapsible.elements.initial.state
Specifies the initial state of collapsible elements (tables with titles, nested topics with titles, sections with titles, index term groups). The possible values are collapsed or expanded (default value).

**Parameters for Adding a Link to PDF Documentation in WebHelp Responsive Output**

The following transformation parameters can be used to generate a PDF link component in the WebHelp Responsive output (for example, it could link to the PDF equivalent of the documentation):

- **webhelp.pdf.link.url**
  Specifies the target URL for the PDF link component.

- **webhelp.pdf.link.text**
  Specifies the text for the PDF link component.

- **webhelp.pdf.link.icon.path**
  Specifies the path or URL of the image icon to be used for the PDF link component. If not specified, a default icon is used.

- **webhelp.show.pdf.link**
  Specifies whether or not the PDF link component is shown in the WebHelp Responsive output. Allowed values are: yes (default) and no.

- **webhelp.pdf.link.anchor.enabled**
  Specifies whether or not the current topic ID should be appended as the name destination at the end of the PDF link. Allowed values are: yes (default) and no.

**DITA Map PDF - based on HTML5 & CSS Transformation**

Oxygen XML Editor Eclipse plugin includes a built-in **DITA Map PDF - based on HTML5 & CSS** transformation scenario based on a DITA-OT CSS-based PDF Publishing plugin that converts DITA maps to PDF using a CSS-based processing engine and an HTML5 intermediate format. Oxygen XML Editor Eclipse plugin comes bundled with a built-in CSS-based PDF processing engine called **Oxygen PDF Chemistry**. Oxygen XML Editor Eclipse plugin also supports some third-party processors.

For those who are familiar with CSS, this makes it very easy to style and customize the PDF output of your DITA projects without having to work with xsl:fo customizations. This transformation also includes some built-in publishing templates that you can use for the layout of your PDF output and you can create your own templates or edit existing ones.

The following CSS-based PDF processors can be used:
• **Oxygen PDF Chemistry** - A built-in processor that is bundled with Oxygen XML Editor Eclipse plugin. For more information, see the [Oxygen PDF Chemistry User Guide](#). This is the supported processor.

• **Prince Print with CSS** (not included in the Oxygen XML Editor Eclipse plugin installation kit) - A third-party component that needs to be purchased from [http://www.princexml.com](http://www.princexml.com).

• **Antenna House Formatter** (not included in the Oxygen XML Editor Eclipse plugin installation kit) - A third-party component that needs to be purchased from [http://www.antennahouse.com/antenna1/formatter/](http://www.antennahouse.com/antenna1/formatter/).

### How to Create the Transformation Scenario

To create a DITA Map PDF - based on HTML5 & CSS transformation scenario, follow these steps:

1. Click the ▶ Configure Transformation Scenario(s) button from the DITA Maps Manager (on page 2315) toolbar.

2. Select the **DITA Map PDF - based on HTML5 & CSS** transformation scenario.

3. If you want to configure the transformation, click the **Edit** button.

**Step Result:** This opens an **Edit scenario** configuration dialog box that allows you to configure various options in the following tabs:

- **Templates Tab (on page 2528)** - This tab contains a set of built-in publishing templates that you can use for the layout of your WebHelp system output. You can also create your own publishing templates by saving one from the gallery and changing it.

**Figure 409. DITA Map to PDF Templates**
Parameters Tab (on page 2534) - This tab includes numerous parameters that can be set to customize the transformation.

Filters Tab (on page 2536) - This tab allows you to filter certain content elements from the generated output.

Advanced Tab (on page 2537) - This tab allows you to specify some advanced options for the transformation scenario.

Output Tab (on page 2540) - This tab allows you to configure options that are related to the location where the output is generated.

4. In the Parameters tab, configure any of the following parameters (if applicable):

- **args.css** - Specifies a path to a custom CSS to be used in addition to those specified in the publishing template. The files must have URL syntax and be separated using semicolons. Also, the dita.css.list parameter must be left empty to use these files in addition to the selection in the Styles drop-down menu.

- **css.processor.type** - This is where you choose the processor type. You can select between Oxygen PDF Chemistry, Prince XML, or Antenna House.

- **css.processor.path.chemistry** (if you are using the Oxygen PDF Chemistry processor) - Specifies the path to the Oxygen PDF Chemistry executable file that will be run to generate the PDF. If this parameter is not set, the transformation will use the processor specified in the CSS-based Processors preferences page (on page 187).

- **css.processor.path.prince** (if you are using the Prince Print with CSS processor) - Specifies the path to the Prince executable file that will be run to produce the PDF. If you installed Prince using its default settings, you can leave this blank.

- **css.processor.path.antenna-house** (if you are using the Antenna House Formatter processor) - Specifies the path to the Antenna House executable file that will be run to produce the PDF. If you installed Antenna House using its default settings, you can leave this blank.

- **show.changes.and.comments** - When set to yes, user comments, replies to comments, and tracked changes are published in the PDF output. The default value is no.

- **figure.title.placement** - Controls the position of the figure title relative to the image. Allowed values are "top" and "bottom", "top" is the default.

5. Click OK and run the transformation scenario.

Customizing the Output

For information about customizing the output, see CSS-based DITA to PDF Customization (on page 1521).

Related Information:
- Editing a Transformation Scenario (on page 1281)
- Configure Transformation Scenario(s) Dialog Box (on page 1284)
- Oxygen PDF Chemistry User Guide
- CSS-based DITA to PDF Customization (on page 1521)
DITA Map PDF - based on XSL-FO Transformation

Oxygen XML Editor Eclipse plugin comes bundled with the DITA Open Toolkit that provides a mechanism for converting DITA maps (on page 2654) to PDF output.

Creating a DITA Map PDF - based on XSL-FO Transformation Scenario

To create a DITA Map PDF - based on XSL-FO transformation scenario, follow these steps:

1. Click the Configure Transformation Scenario(s) button from the DITA Maps Manager (on page 2315) toolbar.
2. Select DITA Map PDF - based on XSL-FO and click the Edit button (or use the Duplicate button if your framework (on page 2655) is read-only).
3. Use the various tabs to configure the transformation scenario. In the Parameters tab, you can use a variety of parameters to customize the output. For example, the following parameters are just a few of the most commonly used ones:
   - show.changes.and.comments - If set to yes, user comments, replies to comments, and tracked changes are published in the PDF output.
   - customization.dir - Specifies the path to a customization directory.
   - editlink.present.only.path.to.topic - When this parameter is set to "true", the DITA topic path is displayed to the right of each topic title in the PDF output.
4. Click OK and then the Apply Associated button to run the transformation scenario.

Related Information:
XSL FO-based DITA to PDF Customization (on page 1782)

DITA Map MS Office Word Transformation

Oxygen XML Editor Eclipse plugin comes bundled with a transformation scenario that allows you to convert DITA maps (on page 2654) to Microsoft Office Word documents. It utilizes the DITA to Word plugin created by Jarno Elovirta. This plugin contains a Word document named Normal.docx (located in: [OXYGEN_INSTALL_DIR]/frameworks/dita/DITA-OT/plugins/com.elovirta.ooxml/resources) that is used by the transformation scenario as a template to generate the final Word document.

Tip:
You can make general modifications to the Normal.docx template file to alter the published output. The Word application used to edit the Normal.docx should be configured with English locale as the style names for each Word element must be in English.

Configuring the Transformation Scenario

To configure a DITA Map to MS Office Word transformation scenario, follow these steps:
1. Open the DITA map in the DITA Maps Manager (on page 2315).
2. Click the Configure Transformation Scenario(s) button from the DITA Maps Manager (on page 2315) toolbar.
3. Select DITA Map MS Office Word.
4. For advanced customizations, in the Parameters tab you can use any of the following parameters that are unique to this transformation scenario to specify paths to files that affect the output in various ways:
   - `dotx.file` - Specifies the path to a Word template file (.docx) that will be used in the transformation to generate the final Word document. Set this parameter if you want to use a different template file other than the Normal.docx file that is used by default.
   - `document.flat.xsl` - Specifies the path to a pre-process clean-up stylesheet.
   - `core.xsl` - Specifies the path to a core metadata stylesheet.
   - `custom.xsl` - Specifies the path to a custom metadata stylesheet.
   - `document.xsl` - Specifies the path to a main document stylesheet.
   - `comments.xsl` - Specifies the path to a comments stylesheet.
   - `numbering.xsl` - Specifies the path to a list and title numbering stylesheet.
   - `footnotes.xsl` - Specifies the path to a footnote stylesheet.
   - `document.xml.xsl` - Specifies the path to a document relations metadata stylesheet.
   - `inkscape.exec` - Specifies the path to an Inkscape (open-source vector graphics editor) executable file.
5. Click OK and run the transformation scenario.

Result: The result of the transformation will automatically be opened in your system's default word processing application (such as Microsoft Word).

Related Information:
- Editing a Transformation Scenario (on page 1281)
- Configure Transformation Scenario(s) Dialog Box (on page 1284)
- Migrating MS Office Documents to DITA (on page 2610)

DITA Map Markdown Transformation

Using the Configure Transformation Scenarios toolbar button, you can create a new transformation scenario of the type DITA-OT transformation and then choose one of the Markdown-specific output types:

- GitHub-flavored Markdown
- Markdown
- GitBook

More information about the Markdown output types is available in the DITA-OT documentation: https://www.dita-ot.org/dev/topics/dita2markdown.html.
The generated Markdown content can be used with a static web site generator (such as MKDocs) to build a web site: https://blog.oxygenxml.com/topics/publishing_dita_content_using_a_markdown_static_web_site_generator.html.

**DITA Map CHM (Compiled HTML Help) Transformation**

To perform a *Compiled HTML Help (CHM)* transformation, Oxygen XML Editor Eclipse plugin needs Microsoft HTML Help Workshop to be installed on your computer. Oxygen XML Editor Eclipse plugin automatically detects if HTML Help Workshop is installed and uses it.

**Note:**

HTML Help Workshop might fail if the files used for transformation contain accents in their names, due to different encodings used when writing the .hhp and .hhc files. If the transformation fails to produce the CHM output but the .hhp (HTML Help Project) file is already generated, you can manually try to build the CHM output using HTML Help Workshop.

**Changing the Output Encoding**

Oxygen XML Editor Eclipse plugin uses the `htmlhelp.locale` parameter to correctly display specific characters of different languages in the output of the *Compiled HTML Help (CHM)* transformation. By default, the **DITA Map CHM** transformation scenario that comes bundled with Oxygen XML Editor Eclipse plugin has the `htmlhelp.locale` parameter set to `en-US`.

To customize this parameter, follow this procedure:

1. Use the **Configure Transformation Scenario(s)** (Alt + Shift + T, C (Command + Option + T, C on macOS)) action from the toolbar or the XML menu.
2. Select the **DITA Map CHM** transformation scenario and click the **Edit** button.
3. In the **Parameter** tab, search for the `htmlhelp.locale` parameter and change its value to the desired language tag.

**Note:**

The format of the `htmlhelp.locale` parameter is `LL-CC`, where `LL` represents the language code (e.g., en) and `CC` represents the country code (e.g., US). The language codes are contained in the ISO 639-1 standard and the country codes are contained in the ISO 3166-1 standard. For further details about language tags, go to http://www.rfc-editor.org/rfc/rfc5646.txt.

**Customizing the CHM Output**

There are several possibilities available for customizing the CHM output:
• You can use a custom CSS stylesheet to customize how the HTML content is rendered in the output:
  1. Create the custom CSS.
  2. Select the DITA Map CHM transformation scenario and click the Edit button.
  3. In the Parameter tab, set the \texttt{args.css} parameter to point to the location of your custom CSS and make sure the \texttt{args.copy.css} parameter is set to \texttt{yes} to instruct the transformation to copy the custom CSS to the output folder.
  4. Run the transformation.

• If you are familiar with XSLT, there are two XSLT stylesheets that are used in the transformation to compile various settings and components in the CHM output. They are found in the following directory:
  \texttt{OXYGEN\_INSTALL\_DIR/frameworks/dita/DITA-OT/plugins/org.dita.htmlhelp/xsl/map2htmlhelp}. The files are as follows:
  ◦ \texttt{map2hhcImpl.xsl} - This file is used to compile the table of contents.
  ◦ \texttt{map2hhpImpl.xsl} - This file contains information for compiling the CHM and various settings that are read by the HTML Help Workshop when creating the output.

DITA Map Kindle Transformation

Oxygen XML Editor Eclipse plugin requires \texttt{KindleGen} to generate Kindle output from \textit{DITA maps (on page 2654)}. To install \texttt{KindleGen} for use by Oxygen XML Editor Eclipse plugin, follow these steps:

  1. Go to \texttt{www.amazon.com/kindleformat/kindlegen} and download the zip file that matches your operating system.
  2. Unzip the file on your local disk.
  3. Start Oxygen XML Editor Eclipse plugin and open a DITA map in the DITA Maps Manager view (on page 2315).
  4. Click the \texttt{Configure Transformation Scenario(s)} button.
  5. Select the DITA Map Kindle transformation and click the Edit button to edit it.
  6. Go to Parameters tab and set the \texttt{kindlegen.executable} parameter as the path to the \texttt{KindleGen} directory.
  7. Accept the changes.

DITA Map Metrics Report Transformation

A DITA Map Metrics Report action is available on the DITA Maps Manager toolbar and in the DITA Maps main menu. It generates an overview report that contains useful statistics for a DITA map.

As an alternate approach, to create a metrics report from a DITA map (on page 2654) using a transformation scenario, follow these steps:

  1. Select the \texttt{Configure Transformation Scenario(s)} action from the DITA Maps Manager (on page 2315) toolbar.
  2. Select the DITA Map Metrics Report scenario from the DITA Map section.
  3. Run the transformation.
The generated HTML report contains information such as:

- The number of processed maps and topics.
- The number of `map/bookmap/topic/task/concept/reference` types in the DITA map.
- Content reuse percentage.
- Number of elements and attributes of different types used in the entire DITA map structure.
- Number of words and characters used in the entire DITA map structure.
- DITA conditional processing attributes used in the DITA maps.
- Processing instructions.
- External links.
- All `@outputclass` attribute values gathered from the DITA project.

**Important:**

If you have cross references that point to content outside the scope of the DITA map, that referenced content is not counted. For example, if you have links to topics that are not included in the DITA map hierarchy, the content in those topics is ignored when generating the statistics.

The metrics report can also be obtained in XML format, making it possible to construct a metrics report evolution between multiple versions of the same DITA project.

**DITA Map Zendesk Publishing**

Oxygen XML Editor Eclipse plugin includes a built-in transformation scenario that provides the ability to publish DITA topics to XHTML output and upload them directly as articles to the Zendesk Help Center.

**Attention:**

This feature is only available in the Enterprise edition of Oxygen XML Editor Eclipse plugin.

To run the transformation, follow these steps:

1. Start Oxygen XML Editor Eclipse plugin and open a DITA map in the DITA Maps Manager view (on page 2315).
2. Click the ⚙ Configure Transformation Scenario(s) button.
3. Create a new DITA-OT transformation scenario and choose the Zendesk Help Center transformation type.
4. Go to Parameters tab and set the following parameters:

   **Host**
   
   The URL reference to the Zendesk Help Center (for example, https://your-domain.zendesk.com).

   **Username**
   
   The username (e-mail address) for the account used to upload the content.
API Token

Article category

The name of the category where the articles are uploaded. The category needs to be created in the Zendesk admin pages: https://support.zendesk.com/hc/en-us/articles/218222877-Organizing-knowledge-base-content-in-categories-and-sections#topic_hjs_t14_kk.

Article section

The name of the section (inside the parent category) where articles are uploaded. The section needs to be created in the Zendesk admin pages: https://support.zendesk.com/hc/en-us/articles/218222877-Organizing-knowledge-base-content-in-categories-and-sections#topic_ysj_wtt_22.

Create article draft

This setting controls whether the articles should be published (if the value is false) or saved as drafts (if the value is true). The default value is false.

Permission group name

The name of the Zendesk permission group that controls who edits and publishes articles: https://support.zendesk.com/hc/en-us/articles/203661966-Creating-managing-and-using-groups.

5. Save the changes and run the transformation.

Important:

There may be cases when the publishing breaks, presenting an error related to HTTPS certificates, similar to this one:

```
Error: org.zendesk.client.v2.ZendeskException: java.net.ConnectException: PKIX path building failed:
sun.security.provider.certpath.SunCertPathBuilderException: unable to find valid certification path to requested target
```

This usually occurs if an HTTPS proxy server is installed in your company's network. In this case, if running on Windows, you can edit the transformation scenario you are using to publish DITA to Zendesk and in the Advanced tab, go to the JVM Arguments field and set this value:

```
-Djavax.net.ssl.trustStoreType=Windows-ROOT -Djavax.net.ssl.trustStore=C:\Windows\win.ini
```
Resources

For more information about publishing content to the Zendesk Help Center, watch the following video demonstration:

https://www.youtube.com/embed/QZ_9Fk_L0k8

Run DITA-OT Integrator Transformation

Oxygen XML Editor Eclipse plugin comes bundled with a transformation scenario designed to integrate DITA-OT plugins (on page 2657). These DITA-OT plugins are used for various customizations. It is called Run DITA-OT Integrator and is found in the DITA Map section of the Configure Transformation Scenario(s) dialog box (on page 1284).

⚠️ Attention:
The integration will be performed on the DITA-OT version specified in the DITA Open Toolkit section of the DITA preferences page (on page 81).

⚠️ CAUTION:
Oxygen XML Editor Eclipse plugin support engineers do not officially offer support and troubleshooting assistance for custom DITA-OT distributions or custom installed DITA-OT plugins. If you discover any issues or inconsistent behavior while using a custom DITA-OT or a DITA-OT that contains custom DITA-OT plugins, you should revert to the default built-in DITA-OT.

Running the Transformation Scenario

To integrate a DITA-OT plugin, follow these steps:

1. If Oxygen XML Editor Eclipse plugin was installed in the default location, you may need to restart and run it as an administrator.
2. Select the Apply Transformation Scenario(s) or Configure Transformation Scenario(s) (on page 1284) action from the DITA Maps Manager toolbar (you could also use the same action on the main toolbar or open the Transformation Scenarios view (on page 1290)).
3. Select the Run DITA-OT Integrator transformation scenario. If the integrator is not visible, select the Show all scenarios action that is available in the Settings drop-down menu.
4. Apply the scenario (on page 1283).
5. Check the Results panel at the bottom of the application to make sure the build was successful.
6. Restart Oxygen XML Editor Eclipse plugin with your normal permissions.
Solving DITA Transformation Errors

If a DITA transformation results in errors or warnings, the information is displayed in the message panel at the bottom of the editor. The information includes the severity, description of the problem, the name of the resource, and the path of the resource.

To help prevent and solve DITA transformation problems, follow these steps:

1. **Validate the DITA map** (on page 2360) by using the ▽ Validate and Check for Completeness action that is available on the DITA Maps Manager (on page 2315) toolbar and in the DITA Maps menu.
2. If this action results in validation errors, solve them prior to executing the transformation. Also, you should pay attention to the warning messages because they may identify problems in the transformation.
3. **Run the DITA transformation scenario** (on page 1228).
4. If the transformation results in errors or warnings, they are displayed in the Results panel (on page 334) at the bottom of the editor. The following information is presented to help you troubleshoot the problems:
   - **Severity** - The first column displays the following icons that indicate the severity of the problem:
     - Informational - The transformation encountered a condition of which you should be aware.
     - Warning - The transformation encountered a problem that should be corrected.
     - Error - The transformation encountered a more severe problem, and the output is affected or cannot be generated.
   - **Info** - Click the See More icon to open a web page that contains more details about DITA-OT error messages.
   - **Description** - A description of the problem.
   - **Resource** - The name of the transformation resource.
   - **System ID** - The path of the transformation resource.
5. Use this information or other resources from the online DITA-OT community to solve the transformation problems before re-executing the transformation scenario.
6. If you need to contact the Oxygen technical support team, they will need you to send the entire transformation scenario execution log. To obtain it:
   a. Go to the Options > Preferences > DITA preferences page and set the Show console output option to Always.
   b. Execute the transformation scenario again. The console output messages are displayed in the DITA-OT view.
c. Copy the entire log, save it in a text file, then send it to the Oxygen technical support team.
d. After your issue has been solved, go back to the Options > Preferences > DITA preferences page and set the Show console output option to When build fails.

Related Information:
Troubleshooting DITA Transformation Problems (on page 2549)

DITA Topic Transformation Scenarios

Oxygen XML Editor Eclipse plugin includes built-in transformation scenarios for transforming individual DITA Topics to HTML5, XHTML, or PDF output. They can be found in the DITA section in the Configure Transformation Scenario(s) dialog box (on page 1284).

The available transformations scenarios for individual DITA topics include:

- **DITA HTML5** - This DITA-OT transformation scenario generates HTML5 output from a single DITA topic.
- **DITA XHTML** - This DITA-OT transformation scenario generates XHTML output from a single DITA topic. This was the first transformation scenario created for the DITA Open Toolkit and it originally served as the basis for all HTML-based transformations.
- **DITA PDF - based on HTML5 & CSS** - This transformation scenario converts individual DITA topics to PDF using a CSS-based processing engine and an HTML5 intermediate format. Oxygen XML Editor Eclipse plugin comes bundled with a built-in CSS-based PDF processing engine called Oxygen PDF Chemistry. Oxygen XML Editor Eclipse plugin also supports some third-party processors.

For those who are familiar with CSS, this makes it very easy to style and customize the PDF output of your DITA projects without having to work with xsl:fo customizations. Another advantage of this transformation scenario is that you can use the same customization CSS (on page 1550) or publishing template (on page 1539) that you use for converting entire DITA maps.

The transformation scenario automatically detects the currently selected context DITA map (root map) (on page 2319) so that keys and references are properly resolved (the detected context map is set as the value of the args.root.map parameter (this can be changed in the Parameters tab). It also automatically detects the currently applied profiling condition set (on page 2564) to be used as the default filtering option in the transformation scenario (this can be changed in the Filters tab).

The transformation scenario also supports a parameter named args.enable.root.map.key.processing that can be used to specify whether or not the values for @keyref and @conkeyref attributes within the transformed topics are resolved. The possible values are:

- **no** - This means that the values for all @keyref and @conkeyref attributes are ignored in the transformation. This results in lower processing times.
- **yes** - This means that the values for any @keyref and @conkeyref attributes found in the transformed topic are processed and resolved using the value of the args.root.map parameter.
- **auto** - This means that the process will search for any `@keyref` and `@conkeyref` attributes within the transformed topic and if any are found, the values will be processed and resolved using the value of the `args.root.map` parameter. If none are found, the `@keyref` and `@conkeyref` attributes are ignored.

- **DITA PDF - based on XSL-FO** - This DITA-OT transformation scenario converts individual DITA topics to PDF using an `xsl:fo` processor.

**Related Information:**
- Editing a Transformation Scenario *(on page 1281)*
- Configure Transformation Scenario(s) Dialog Box *(on page 1284)*
- Applying Associated Transformation Scenarios *(on page 1283)*
- DITA Map Transformation Scenarios *(on page 2501)*

**DocBook Transformation Scenarios**

Built-in transformation scenarios allow you to transform DocBook documents to a variety of outputs, such as WebHelp, PDF, HTML, HTML Chunk, XHTML, XHTML Chunk, and EPUB. Oxygen XML Editor Eclipse plugin also includes a DocBook 5.1 transformation scenario for Assembly documents. All of them are listed in the [DocBook 4](#) and [DocBook 5](#) sections in the [Configure Transformation Scenario(s)](#) dialog box *(on page 1284)*.

**Related Information:**
- Editing a Transformation Scenario *(on page 1281)*
- Configure Transformation Scenario(s) Dialog Box *(on page 1284)*
- Applying Associated Transformation Scenarios *(on page 1283)*

**DocBook to WebHelp Classic Transformation (Deprecated)**

DocBook documents can be transformed into several types of WebHelp systems (with or without a feedback section). The [WebHelp Classic layout and features](#) are designed for desktop systems and include a familiar classical style. Oxygen XML Editor Eclipse plugin also provides numerous possibilities for customizing the WebHelp Classic output *(on page 1495)*.

**WebHelp Classic Transformation Scenario (Deprecated)**

To publish a DocBook document as a **WebHelp Classic** system, follow these steps:

1. Click the ![Configure Transformation Scenario(s)](#) action from the toolbar.
2. Select the **DocBook WebHelp Classic (Deprecated)** scenario from the **DocBook 4** or **DocBook 5** section.
3. Click **Apply associated**.

**Result:** When the transformation is complete, the output is automatically opened in your default browser.
Customizing DocBook WebHelp Transformation Scenarios

To customize a DocBook WebHelp transformation scenario, you can edit various parameters, including the following most commonly used ones:

```xml
<webhelp.favicon>
  <div id="facebook">
    <div id="fb-root"/>
    <script type="text/javascript">
      (function(d, s, id) {
        var js, fjs = d.getElementsByTagName(s)[0];
        if (d.getElementById(id)) return;
        js = d.createElement(s); js.id = id;
        js.src = "http://connect.facebook.net/en_US/sdk.js#xfbml=1&version=v2.0";
        fjs.parentNode.insertBefore(js, fjs); }
    </script>
  </div>
</webhelp.favicon>
```
webhelp.footer.include

Specifies whether or not to include footer in each WebHelp page. Possible values: yes, no. If set to no, no footer is added to the WebHelp pages. If set to yes and the webhelp.footer.file parameter has a value, then the content of that file is used as footer. If the webhelp.footer.file has no value then a default Oxygen footer is inserted in each WebHelp page.

webhelp.logo.image.target.url

Specifies a target URL that is set on the logo image. When you click the logo image, you will be redirected to this address.

webhelp.logo.image

Specifies a path to an image displayed as a logo in the left side of the output header.

webhelp.product.id (available only for Feedback-enabled systems)

This parameter specifies a short name for the documentation target, or product (for example, mobile-phone-user-guide, hvac-installation-guide).

Note:
You can deploy documentation for multiple products on the same server.

Restriction:
The following characters are not allowed in the value of this parameter: < > / \ * ( ) { } = ; * & + .

webhelp.product.version (available only for Feedback-enabled systems)

Specifies the documentation version number (for example, 1.0, 2.5, etc.). New user comments are bound to this version.

Note:
Multiple documentation versions can be deployed on the same server.

Restriction:
The following characters are not allowed in the value of this parameter: < > / \ * ( ) { } = ; * & + .

webhelp.search.ranking
If this parameter is set to `false` then the 5-star rating mechanism is no longer included in the search results that are displayed on the Search tab (default setting is `true`).

**webhelp.skin.css**

Path to a CSS file that sets the style theme in the WebHelp Classic output. It can be one of the built-in skin CSS from the `OXYGEN_INSTALL_DIR\frameworks\docbook\xsl\com.oxygenxml.webhelp.classic\predefined-skins` directory, or it can be a custom skin CSS generated with the Oxygen Skin Builder web application.

---

**DocBook to DITA Transformation**

Oxygen XML Editor Eclipse plugin includes a built-in transformation scenario that is designed to convert DocBook content to DITA. This transformation scenario is based upon a DITA Open Toolkit plugin that is available at sourceforge.net.

To convert a DocBook document to DITA, follow these steps:

1. Use one of the following two methods to begin the transformation process:
   - To apply the transformation scenario to a newly opened file, use the [Apply Transformation Scenario(s) (Alt + Shift + T, T (Command + Option + T, T on macOS))] action from the toolbar or the XML menu.
   - To customize the transformation or change the scenario that is associated with the document, use the [Configure Transformation Scenario(s) (Alt + Shift + T, C (Command + Option + T, C on macOS))] action from the toolbar or the XML menu.

2. Select the **DocBook to DITA** transformation scenario in the **DocBook 4** or **DocBook 5** section.

3. Click the **Apply associated** button to run the transformation.

   **Step Result:** The transformation will convert as many of the DocBook elements into equivalent DITA elements as it can recognize in its mapping process. For elements that cannot be mapped, the transformation will insert XML comments so that you can see which elements could not be converted.

4. Adjust the resulting DITA composite to suit your needs. You may have to remove comments, fix validation errors, adjust certain attributes, or split the content into individual topics.

---

**Related Information:**

- [Editing a Transformation Scenario (on page 1281)]
- [Configure Transformation Scenario(s) Dialog Box (on page 1284)]
DocBook to PDF Transformation

Oxygen XML Editor Eclipse plugin includes a built-in transformation scenario that is designed to convert DocBook content to PDF.

To convert a DocBook document to PDF, follow these steps:

1. Use one of the following two methods to begin the transformation process:
   - To apply the transformation scenario to a newly opened file, use the **Apply Transformation Scenario(s)** (Alt + Shift + T, T (Command + Option + T, T on macOS)) action from the toolbar or the XML menu.
   - To customize the transformation or change the scenario that is associated with the document, use the **Configure Transformation Scenario(s)** (Alt + Shift + T, C (Command + Option + T, C on macOS)) action from the toolbar or the XML menu.

2. Select the **DocBook PDF** transformation scenario in the DocBook 4 or DocBook 5 section.

3. Click the Apply associated button to run the transformation.

For information about customizing the PDF output for DocBook content, see **DocBook to PDF Output Customization (on page 1794)**.

Related Information:
- Editing a Transformation Scenario (on page 1281)
- Configure Transformation Scenario(s) Dialog Box (on page 1284)
- DocBook to PDF Output Customization (on page 1794)

DocBook to EPUB Transformation

Oxygen XML Editor Eclipse plugin includes a built-in transformation scenario that is designed to convert DocBook content to EPUB. The EPUB specification recommends the use of OpenType fonts (recognized by their .otf file extension) whenever possible. To use a specific font, follow these steps:

1. Declare it in your CSS file, as in the following example:

   ```
   @font-face {
     font-family: "MyFont";
     font-weight: bold;
     font-style: normal;
     src: url(fonts/MyFont.otf);
   }
   ```

2. In the CSS, specify where this font is used. To set it as default for `<h1>` elements, use the font-family rule, as in the following example:

   ```
   h1 {
     font-size: 20pt;
     margin-bottom: 20px;
   }
   ```
3. Open the **Configure Transformation Scenario(s)** dialog box *(on page 1284)*, select the **DocBook EPUB** transformation scenario in the **DocBook 4 or DocBook 5** section, and click **Edit**.

4. In the **Parameters** tab, set the `epub.embedded.fonts` parameter to `fonts/MyFont.otf`. If you need to provide more files, use commas to separate their file paths.

   **Note:** The `html.stylesheet` parameter allows you to include a custom CSS in the output EPUB.

5. Run the transformation scenario.

**DocBook PDF (Show Change Tracking and Comments)**

Oxygen XML Editor Eclipse plugin includes a built-in transformation scenario that is designed to show tracked changes and comment in DocBook to PDF output.

To include comments and **tracked changes** (stored within your DocBook 5 documents) in the PDF output, follow these steps:

1. Click the **Configure Transformation Scenario(s)** button.
2. Select **DocBook PDF (Show Change Tracking and Comments)** in the **DocBook 5** section.
3. If you need to configure the transformation, click the **Edit** *(on page 1281)* or **Duplicate** *(on page 1283)* button, make your changes to the scenario, and click **OK**.
4. Click the **Apply Associated** button to run the transformation scenario.

**Result:** Comment threads and tracked changes will now appear in the PDF output. Details about each comment or change will be available in the footer section for each page.

**Creating New Transformation Scenarios**

Defining a transformation scenario is the first step in the process of transforming a document. This section includes information on the types of new scenarios that are available in Oxygen XML Editor Eclipse plugin and how to create each type of transformation.

**XML Transformation with XSLT**

This type of transformation specifies the transformation parameters and location of an XSLT stylesheet that is applied to the edited XML document. This scenario is useful when you develop an XML document and the XSLT document is in its final form.

To create an **XML transformation with XSLT** scenario, use one of the following methods:
• Use the Configure Transformation Scenario(s) (Alt + Shift + T, C (Command + Option + T, C on macOS)) action from the toolbar or the XML menu. Then click the New button and select XML transformation with XSLT.

• Go to Window > Show View and select Transformation Scenarios to display this view (on page 1290). Click the New Scenario drop-down menu button and select XML transformation with XSLT.

Both methods open the New Scenario dialog box.

The upper part of the dialog box allows you to specify the Name of the transformation scenario.

The lower part of the dialog box contains several tabs that allow you to configure the options that control the transformation.

**XSLT Tab**

When you create a new transformation scenario (on page 1201) or edit an existing one (on page 1281), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The XSLT tab contains the following options:

**XML URL**

Specifies the source XML file. You can specify the path by using the text field, its history drop-down, the Insert Editor Variables (on page 218) button, or the browsing actions in the Browse drop-down list. This URL is resolved through the catalog resolver. If the catalog does not have a mapping for the URL, then the file is used directly from its remote location.

**Note:**

If the transformer engine is Saxon 9.x and a custom URI resolver is configured in the advanced Saxon preferences page (on page 212), the XML input of the transformation is passed to that URI resolver. If the transformer engine is one of the built-in XSLT 2.0 / 3.0 engines and the name of an initial template (on page 1203) is specified in the scenario, the XML URL field can be empty. The XML URL field can also be empty if you use external XSLT processors (on page 1217). Otherwise, a value is mandatory in this field.

**XSL URL**

Specifies the source XSL file that the transformation will use. You can specify the path by using the text field, its history drop-down, the Insert Editor Variables (on page 218) button, or the browsing actions in the Browse drop-down list. This URL is resolved through the catalog resolver. If the catalog does not have a mapping for the URL, the file is used directly from its remote location.

Use "xml-stylesheet" declaration
If selected, the scenario applies the stylesheet specified explicitly in the XML document with the xml-stylesheet processing instruction. By default, this option is deselected and the transformation applies the XSLT stylesheet that is specified in the XSL URL field.

**Transformer**

This drop-down menu presents all the transformation engines available to Oxygen XML Editor Eclipse plugin for performing a transformation. These include the built-in engines and the external engines defined in the Custom Engines preferences page (on page 199). The engine you choose is used as the default transformation engine. Also, if an XSLT or XQuery document does not have an associated validation scenario, this transformation engine is used in the validation process (if it provides validation support).

**Advanced options**

Allows you to configure the advanced options of the Saxon HE/PE/EE engine (on page 1205) for the current transformation scenario. To configure the same options globally, go to the Saxon-HE/PE/EE preferences page (on page 210). For the current transformation scenario, these Advanced options override the options configured in that preferences page.

**Parameters**

Opens a Configure parameters dialog box (on page 1203) that allows you to configure the XSLT parameters used in the current transformation. In this dialog box, you can also configure the parameters for additional XSLT stylesheets (on page 1203). If the XSLT transformation engine is custom-defined, you cannot use this dialog box to configure the parameters sent to the custom engine. Instead, you can copy all parameters from the dialog box using contextual menu actions and edit the custom XSLT engine to include the necessary parameters in the command line that starts the transformation process.

**Extensions**

Opens a dialog box for configuring the XSLT extension JARS or classes (on page 1205) that define extension Java functions or extension XSLT elements used in the transformation.

**Additional XSLT stylesheets**

Opens a dialog box for adding XSLT stylesheets (on page 1205) that are applied on the main stylesheet specified in the XSL URL field. This is useful when a chain of XSLT stylesheets must be applied to the input XML document.

**XSLT Parameters**

The global parameters of the XSLT stylesheet used in a transformation scenario can be configured by using the Parameters button in the XSLT tab of a new or edited transformation scenario dialog box.

The resulting dialog box includes a table that displays all the parameters of the current XSLT stylesheet, all imported and included stylesheets, and all additional stylesheets (on page 1205), along with their descriptions and current values. You can also add, edit, and remove parameters, and you can use the Filter
text box to search for a specific term in the entire parameters collection. Note that edited parameters are displayed with their name in bold.

If the XPath column is selected, the parameter value is evaluated as an XPath expression before starting the XSLT transformation.

**Example:**

For example, you can use expressions such as:

```xml
doc('test.xml')//entry
//person[@atr='val']
```

**Note:**

1. The `doc` function solves the argument relative to the XSL stylesheet location. You can use full paths or editor variables (on page 218) (such as `${cfdu}` [current file directory]) to specify other locations: `doc('${cfdu}/test.xml')//*`
2. You cannot use XSLT Functions. Only XPath functions are allowed.

Below the table, the following actions are available for managing the parameters:

- **New**
  
  Opens the Add Parameter dialog box that allows you to add a new parameter to the list. An editor variable (on page 218) can be inserted in the text box using the `Insert Editor Variables` button. If the Evaluate as XPath option is selected, the parameter will be evaluated as an XPath expression.

- **Edit**
  
  Opens the Edit Parameter dialog box that allows you to edit the selected parameter. An editor variable (on page 218) can be inserted in the text box using the `Insert Editor Variables` button. If the Evaluate as XPath option is selected, the parameter will be evaluated as an XPath expression.

- **Unset**
  
  Resets the selected parameter to its default value. Available only for edited parameters with set values.

- **Delete**
  
  Removes the selected parameter from the list. It is available only for new parameters that have been added to the list.

The bottom panel presents the following:
• The default value of the parameter selected in the table.
• A description of the parameter, if available.
• The system ID of the stylesheet that declares it.

**Related Information:**
Editor Variables *(on page 218)*

**XSLT Extensions**

The **Extensions** button opens a dialog box that allows you to specify the **JARS (on page 2655)** and classes that contain extension functions called from the XSLT file of the current transformation scenario. You can use the **Add**, **Edit**, and **Remove** buttons to configure the extensions.

**Tip:**
You can specify the path to the resources using wildcards (for example, `${oxygenHome}/lib/*.jar`).

An extension function called from the XSLT file of the current transformation scenario will be searched, in the specified extensions, in the order displayed in this dialog box. To change the order of the items, select the item to be moved and click the **Move up** or **Move down** buttons.

**Additional XSLT Stylesheets**

Use the **Additional XSLT Stylesheets** button in the **XSLT** tab to display a list of additional XSLT stylesheets to be used in the transformation and you can add files to the list or edit existing entries. The following actions are available:

**Add**

Adds a stylesheet in the **Additional XSLT stylesheets** list using a file browser dialog box. You can type an **editor variable (on page 218)** in the file name field of the browser dialog box. The name of the stylesheet will be added in the list after the current selection.

**Remove**

Deletes the selected stylesheet from the **Additional XSLT stylesheets** list.

**Up**

Moves the selected stylesheet up in the list.

**Down**

Moves the selected stylesheet down in the list.

**Advanced Saxon HE/PE/EE XSLT Transformation Options**

The XSLT transformation scenario allows you to configure advanced options that are specific for the Saxon HE (Home Edition), PE (Professional Edition), and EE (Enterprise Edition) engines. They are the same options as those in the Saxon HE/PE/EE preferences page *(on page 210)* but they are configured as a specific set of
transformation options for each transformation scenario, while the values set in the preferences page apply as global options. The advanced options configured in a transformation scenario override the global options defined in the preferences page.

Saxon-HE/PE/EE Options

The advanced options for Saxon 12.3 Home Edition (HE), Professional Edition (PE), and Enterprise Edition (EE) are as follows:

Mode ("-im")

A Saxon-specific option that sets the initial mode for the transformation. If this value is also specified in a configuration file (on page 1206), the value in this option takes precedence.

Template ("-it")

A Saxon-specific option that sets the name of the initial XSLT template to be executed. If this value is also specified in a configuration file (on page 1206), the value in this option takes precedence.

Tip:

If your stylesheet includes <xsl:template name="xsl:initial-template">, Oxygen XML Editor Eclipse plugin will automatically detect and use it as the initial template, so this option is not needed in this case.

Use a configuration file ("-config")

Select this option if you want to use a Saxon 12.3 configuration file that will be executed for the XSLT transformation and validation processes. You can specify the path to the configuration file by entering it in the URL field, or by using the Insert Editor Variables button, or using the browsing actions in the Browse drop-down list.

Debugger trace into XPath expressions (applies to debugging sessions)

Instructs the XSLT Debugger (on page 1909) to step into XPath expressions.

Enable Optimizations ("-opt")

This option is selected by default, which means that optimization is enabled. If not selected, the optimization is suppressed, which is helpful when reducing the compiling time is important, optimization conflicts with debugging, or optimization causes extension functions with side-effects to behave unpredictably.

Line numbering ("-l")

Line numbers where errors occur are included in the output messages.

Expand attributes defaults ("-expand")

Specifies whether or not the attributes defined in the associated DTD or XML Schema are expanded in the output of the transformation you are executing.

DTD validation of the source ("-dtd")
Specifies whether or not the source document will be validated against their associated DTD. You can choose from the following:

- **On** - Requests DTD validation of the source file and of any files read using the `document()` function.
- **Off** - (default setting) Suppresses DTD validation.
- **Recover** - Performs DTD validation but treats the errors as non-fatal.

**Note:**
Any external DTD is likely to be read even if not used for validation, since DTDs can contain definitions of entities.

**Strip whitespaces ("-strip")**

Specifies how the *strip whitespaces* operation is handled. You can choose one of the following values:

- **All** ("all") - Strips all whitespace text nodes from source documents before any further processing, regardless of any `@xml:space` attributes in the source document.
- **Ignore** ("ignorable") - Strips all ignorable whitespace text nodes from source documents before any further processing, regardless of any `@xml:space` attributes in the source document. Whitespace text nodes are ignorable if they appear in elements defined in the DTD or schema as having element-only content.
- **None** ("none") - Strips no whitespace before further processing.

**Enable profiling ("-TP")**

If selected, profiling of the execution time in a stylesheet is enabled. The corresponding text field is used to specify the path to the output file where the profiling information will be saved. As long as the option is selected, and the output file specified, it will gather timed tracing information and create a profile report to the specified file.

**Saxon-PE/EE Options**

The following advanced options are specific for Saxon 12.3 Professional Edition (PE) and Enterprise Edition (EE) only:

**Register Saxon-JS extension functions and instructions**

Registers the Saxon-CE extension functions and instructions when compiling a stylesheet using the Saxon 12.3 processors.

**Note:**
Saxon-CE, being JavaScript-based, was designed to run inside a web browser. This means that you will use Oxygen XML Editor Eclipse plugin only for developing the Saxon-
CE stylesheet, leaving the execution part to a web browser. See more details about executing such a stylesheet on Saxonica's website.

Allow calls on extension functions ("-ext")

If selected, the stylesheet is allowed to call external Java functions. This does not affect calls on integrated extension functions, including Saxon and EXSLT extension functions. This option is useful when loading an untrusted stylesheet (such as from a remote site using http://[URL]). It ensures that the stylesheet cannot call arbitrary Java methods and thus gain privileged access to resources on your machine.

Enable assertions ("-ea")

In XSLT 3.0, you can use the `<xsl:assert>` element to make assertions in the form of XPath expressions, causing a dynamic error if the assertion turns out to be false. If this option is selected, XSLT 3.0 `<xsl:assert>` instructions are enabled. If it is not selected (default), the assertions are ignored.

Saxon-EE Options

The advanced options that are specific for Saxon 12.3 Enterprise Edition (EE) are as follows:

XML Schema version

Use this option to change the default XML Schema version for this transformation. To change the default XML Schema version globally, open the Preferences dialog box (on page 70) and go to XML > XML Parser > XML Schema and use the Default XML Schema version option (on page 195).

Validation of the source file ("-val")

Requests schema-based validation of the source file and of any files read using `document()` or similar functions. It can have the following values:

- **Schema validation ("strict")** - This mode requires an XML Schema and allows for parsing the source documents with strict schema-validation enabled.
- **Lax schema validation ("lax")** - If an XML Schema is provided, this mode allows for parsing the source documents with schema-validation enabled but the validation will not fail if, for example, element declarations are not found.
- **Disable schema validation** - This specifies that the source documents should be parsed with schema-validation disabled.

Validation errors in the result tree treated as warnings ("-outval")

Normally, if validation of result documents is requested, a validation error is fatal. Selecting this option causes such validation failures to be treated as warnings.

Write comments for non-fatal validation errors of the result document
The validation messages for non-fatal errors are written (wherever possible) as a comment in the result document itself.

Enable streaming mode

Selecting this option will allow an XSLT to run in streaming mode. It is not selected by default. However, in certain instances, the Saxon XSLT processor may auto detect and use streaming even if this option is not selected.

Other Options

Initializer class

Equivalent to the \(-\text{init}\) Saxon command-line argument. The value is the name of a user-supplied class that implements the \textit{net.sf.saxon.lib.Initializer} interface. This initializer is called during the initialization process, and may be used to set any options required on the configuration programmatically. It is particularly useful for tasks such as registering extension functions, collations, or external object models, especially in Saxon-HE where the option cannot be set via a configuration file. Saxon only calls the initializer when running from the command line, but the same code may be invoked to perform initialization when running user application code.

Using Saxon Integrated Extension Functions

Saxon, the transformation and validation engine used by Oxygen XML Editor Eclipse plugin, can be customized by adding custom functions (called Integrated Extension Functions) that can be called from XPath.

To define such a function, follow these steps:

1. Create a file with a Java class that extends \textit{net.sf.saxon.lib.ExtensionFunctionDefinition}. Here is an example:

```java
private static class ShiftLeft extends ExtensionFunctionDefinition {
    @Override
    public StructuredQName getFunctionQName() {
        return new StructuredQName("eg", "http://example.com/saxon-extension", "shift-left");
    }

    @Override
    public SequenceType[] getArgumentTypes() {
        return new SequenceType[] {SequenceType.SINGLE_INTEGER, SequenceType.SINGLE_INTEGER};
    }

    @Override
    public SequenceType getResultType(SequenceType[] suppliedArgumentTypes) {
        return SequenceType.SINGLE_INTEGER;
    }
}
```
```java
@override
public ExtensionFunctionCall makeCallExpression() {
    return new ExtensionFunctionCall() {
        public SequenceIterator call(SequenceIterator[] arguments, XPathContext context)
            throws XPathException {
            long v0 = ((IntegerValue)arguments[0].next()).longValue();
            long v1 = ((IntegerValue)arguments[1].next()).longValue();
            long result = v0<<v1;
            return Value.asIterator(Int64Value.makeIntegerValue(result));
        }
    };
}
```

2. Compile the class and add it to a JAR file.
3. Add a file called `net.sf.saxon.lib.ExtensionFunctionDefinition` that contains the fully qualified name of
   the Java class in the `META-INF/services/` folder of the JAR file.

**Note:**
To add more function definitions in the same JAR file, you need to add their fully qualified
names on different lines.

To enable Oxygen XML Editor Eclipse plugin to pick up your custom function definition, the JAR file should be
added to the classpath of the transformer. Here are some possibilities:

- If you develop a framework, you just need to link the JAR file in the Classpath tab (on page 95).
- In a validation scenario (on page 556), you can use the Extensions button to open a dialog box where
  you can add libraries.
- In a transformation scenario, you can use the Extensions button in the XSLT tab (on page 1203) to
  open a dialog box where you can add libraries.

### FO Processor Tab (XSLT Transformations)

When you create a new transformation scenario (on page 1201) or edit an existing one (on page 1281), a
configuration dialog box is displayed that allows you to customize the transformation with various options in
several tabs.

The FO Processor tab contains the following options:

- **Perform FO Processing**
  Specifies whether or not an FO processor is applied (either the built-in Apache FOP engine or an
  external engine defined in Preferences) during the transformation.

- **Input**
  Choose between the following options to specify which input file to use:
• **XSLT result as input** - The FO processor is applied to the result of the XSLT transformation that is defined in the XSLT tab.

• **XML URL as input** - The FO processor is applied to the input XML file.

**Method**

The output format of the FO processing. The available options depend on the selected processor type.

**Processor**

Specifies the FO processor to be used for the transformation. It can be the built-in Apache FOP processor or an external processor (*on page 183)*.

**Output Tab (XSLT Transformations)**

When you create a new transformation scenario (*on page 1201*) or edit an existing one (*on page 1281*), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The **Output** tab contains the following options:

**Prompt for file**

At the end of the transformation, a file browser dialog box is displayed for specifying the path and name of the file that stores the transformation result.

**Save As**

The path of the file where the result of the transformation is stored. You can specify the path by using the text field, the ➤ **Insert Editor Variables** (*on page 218*) button, or the ➔ **Browse** button.

**Open in Browser/System Application**

If selected, Oxygen XML Editor Eclipse plugin automatically opens the result of the transformation in a system application associated with the file type of the result (for example, in Windows PDF files are often opened in Acrobat Reader).

**Note:**

To set the web browser that is used for displaying HTML/XHTML pages, go to Window ➤ Preferences ➤ General ➤ Web Browser and specify it there.
**Output file** - When **Open in Browser/System Application** is selected, you can use this button to automatically open the default output file at the end of the transformation.

**Other location** - When **Open in Browser/System Application** is selected, you can use this option to open the file specified in this field at the end of the transformation. You can specify the path by using the text field, the **Insert Editor Variables (on page 218)** button, or the **Browse** button.

**Open in editor**
When this is option is selected, at the end of the transformation, the default output file is opened in a new editor panel with the appropriate built-in editor type (for example, if the result is an XML file it is opened in the built-in XML editor, or if it is an XSL-FO file it is opened with the built-in FO editor).

**Show in results view as**
You can choose to view the results in one of the following:

- **XML** - If this is selected, Oxygen XML Editor Eclipse plugin displays the transformation result in an XML viewer panel at the bottom of the application window with syntax highlighting (on page 176).
- **XHTML** - This option is only available if **Open in Browser/System Application** is not selected. If selected, Oxygen XML Editor Eclipse plugin displays the transformation result in a built-in XHTML browser panel at the bottom of the application window.

**Important:**
When transforming very large documents, you should be aware that selecting this option may result in very long processing times. This drawback is due to the built-in Java XHTML browser implementation. To avoid delays for large documents, if you want to see the XHTML result of the transformation, you should use an external browser by selecting the **Open in Browser/System Application** option instead.

- **Image URLs are relative to** - If **Show in results view as XHTML** is selected, this option specifies the path used to resolve image paths contained in the transformation result. You can specify the path by using the text field, the **Insert Editor Variables (on page 218)** button, or the **Browse** button.
Attention:

If your input XSLT contains `<xsl:result-document>` elements, then the secondary results will be saved to the specified URIs while the principal result is specified in this Output tab. For more information, see: https://www.w3.org/TR/xslt-30/#element-result-document.

Oxygen XML Editor Eclipse plugin Browser View

The Oxygen XML Editor Eclipse plugin Browser view is automatically displayed in the views pane of the Eclipse window to display HTML output from XSLT transformations. It contains a tab for each file with HTML results displayed in the view.

![Browser View](image)

Oxygen XML Editor Eclipse plugin Text View

The Oxygen XML Editor Eclipse plugin Text view is automatically displayed in the views pane of the Eclipse window to display text output from XSLT transformations, FO processor info, warnings, and error messages. It contains a tab for each file with text results displayed in the view.

![Text View](image)

Text View Contextual Menu Actions

The following actions are available when the contextual menu is invoked in this view:
Configuring an XSLT Processor for Generating Output

This section explains how to configure an XSLT processor and extensions for such a processor in Oxygen XML Editor Eclipse plugin.

Supported XSLT Processors

Oxygen XML Editor Eclipse plugin includes the following XSLT processors:

- **Xalan 2.7.2** - Xalan-Java is an XSLT processor for transforming XML documents into HTML, text, or other XML document types. It implements XSL Transformations (XSLT) Version 1.0 and XML Path Language (XPath) Version 1.0.

- **Saxon 6.5.5** - Saxon 6.5.5 is an XSLT processor that implements the Version 1.0 XSLT and XPath with a number of powerful extensions. This version of Saxon also includes many of the new features that were first defined in the XSLT 1.1 working draft, but for conformance and portability reasons these are not available if the stylesheet header specifies `version="1.0"`.

- **Saxon 12.3 Home Edition (HE), Professional Edition (PE)** - Saxon-HE/PE implements the basic conformance level for XSLT 2.0 / 3.0 and XQuery 1.0. The term **basic XSLT 2.0 / 3.0 processor** is defined in the draft XSLT 2.0 / 3.0 specifications. It is a conformance level that requires support for all features of the language other than those that involve schema processing. The HE product remains open source, but removes some of the more advanced features that are present in Saxon-PE.

- **Saxon 12.3 Enterprise Edition (EE)** - Saxon EE is the schema-aware edition of Saxon and it is one of the built-in processors included in Oxygen XML Editor Eclipse plugin. Saxon EE includes an XML Schema processor, and schema-aware XSLT, XQuery, and XPath processors.

The validation in schema aware transformations is done according to the XML Schema 1.0 or 1.1. This can be configured in Preferences *(on page 195)*.
Note:
Oxygen XML Editor Eclipse plugin implements a Saxon framework that allows you to create Saxon configuration files. Two templates are available: Saxon collection catalog and Saxon configuration. Both of these templates support content completion, element annotation, and attribute annotation.

Note:
Saxon can use the ICU-J localization library (saxon9-icu.jar) to add support for sorting and date/number formatting in a wide variety of languages. This library is not included in the Oxygen XML Editor Eclipse plugin installation kit. However, Saxon will use the default collation and localization support available in the currently used JRE. To enable this capability, follow these steps:

2. Unpack the downloaded archive.
3. Create a new XSLT transformation scenario (or edit an existing one). In the XSLT tab, click the Extensions button to open the list of additional libraries used by the transformation process.
4. Click Add and browse to the folder where you unpacked the downloaded archive and choose the saxon9-icu.jar file.

Note that the saxon9-icu.jar should NOT be added to the application library folder because it will conflict with another version of the ICU-J library that comes bundled with Oxygen XML Editor Eclipse plugin.

- **Saxon-CE (Client Edition)** is Saxonica's implementation of XSLT 2.0 for use on web browsers. Oxygen XML Editor Eclipse plugin provides support for editing stylesheets that contain Saxon-CE extension functions and instructions. This support improves the validation, content completion, and syntax highlighting.

Note:
Saxon-CE, being JavaScript-based, was designed to run inside a web browser. This means that you will use Oxygen XML Editor Eclipse plugin only for developing the Saxon-CE stylesheet, leaving the execution part to a web browser. See more details about executing such a stylesheet on Saxonica's website.

Note:
A specific template, named **Saxon-CE stylesheet**, is available in the New from Templates wizard (on page 252).
• **Xsltproc (libxslt)** - **Libxslt** is the XSLT C library developed for the Gnome project. **Libxslt** is based on *libxml2*, the XML C library developed for the Gnome project. It also implements most of the EXSLT set of processor-portable extensions, functions, and some of Saxon's evaluate and expression extensions.

Oxygen XML Editor Eclipse plugin uses **Libxslt** through its command-line tool (**Xsltproc**). Depending on your operating system, you must download the Libxslt libraries on your machine from [http://xmlsoft.org/XSLT/downloads.html](http://xmlsoft.org/XSLT/downloads.html) and place them in a local folder. Then you need to update the **PATH** environmental variable to contain the parent folder where the **xsltproc** executable is located.

Tip:

As an example, a Windows installation of the Xsltproc engine would follow these steps:

2. Unzip all of them into the same folder of your choice.

3. Edit the **PATH** environment variable and add the **bin** folder for all four archives:

   ```plaintext
   Edit environment variable
   
   D:\apache-maven-3.1.1\bin
   D:\Python27
   %PATH%
   C:\Users\r\Desktop\abc\libxslt-1.1.26.win32\bin
   C:\Users\r\Desktop\abc\libxml2-2.7.8.win32\bin
   C:\Users\r\Desktop\abc\iconv-1.9.2.win32\bin
   C:\Users\r\Desktop\abc\zlib-1.2.5\bin
   ```

4. Restart Oxygen XML Editor Eclipse plugin.

**Result:** You can now use the **xsltproc** processor as an XSLT engine in the XSLT transformation scenario.

Note:
The Xsltproc processor can be configured from the **XSLTPROC options page** (on page 213).

**CAUTION:**

There is a known problem where file paths that contain spaces are not handled correctly in the LIBXML processor. For example, the built-in **XML Catalog** (on page 2659) files of the built-in document types (DocBook, TEI, DITA, etc.) are not handled properly by LIBXML if Oxygen XML Editor Eclipse plugin is installed in the default location on Windows (C:\Program Files). This is because the built-in **XML catalog** files are stored in the
Oxygen XML Editor Eclipse plugin allows you to configure custom processors to be used for running XSLT and XQuery transformations.

**Configuring Custom XSLT Processors**

Oxygen XML Editor Eclipse plugin allows you to configure custom processors to be used for running XSLT and XQuery transformations.

• **MSXML 4.0 (Legacy)** - MSXML 4.0 is available only on Windows platforms. It can be used for transformation *(on page 1201)* and validation of XSLT stylesheets *(on page 655)*.

Oxygen XML Editor Eclipse plugin uses the Microsoft XML parser through its command-line tool msxsl.exe.

Since msxsl.exe is only a wrapper, Microsoft Core XML Services (MSXML) must be installed on the computer. Otherwise, you will get a corresponding warning. You can get the latest Microsoft XML parser from Microsoft web-site.

• **MSXML .NET (Legacy)** - MSXML .NET is available only on Windows platforms. It can be used for transformation *(on page 1201)* and validation of XSLT stylesheets *(on page 655)*.

Oxygen XML Editor Eclipse plugin performs XSLT transformations and validations using the .NET Framework XSLT implementation (*System.Xml.Xsl.XslTransform* class) through the nxslt command-line utility. The nxslt version included in Oxygen XML Editor Eclipse plugin is 1.6.

You should have the .NET Framework version 1.0 already installed on your system. Otherwise, you will get the following warning: MSXML.NET requires .NET Framework version 1.0 to be installed. Exit code: 128.

You can get the .NET Framework version 1.0 from the Microsoft website.

• **.NET 1.0 (Legacy)** - A transformer based on the *System.Xml* 1.0 library available in the .NET 1.0 and .NET 1.1 frameworks from Microsoft. It is available only on Windows.

You should have the .NET Framework version 1.0 or 1.1 already installed on your system. Otherwise, you will get the following warning: MSXML.NET requires .NET Framework version 1.0 to be installed. Exit code: 128.

You can get the .NET Framework version 1.0 from the Microsoft website.

• **.NET 2.0 (Legacy)** - A transformer based on the *System.Xml* 2.0 library available in the .NET 2.0 Framework from Microsoft. It is available only on Windows.

You should have the .NET Framework version 2.0 already installed on your system. Otherwise, you will get the following warning: MSXML.NET requires .NET Framework version 2.0 to be installed. Exit code: 128.

You can get the .NET Framework version 2.0 from the Microsoft website.
To add a new custom processor, follow these steps:

1. **Open the Preferences dialog box** *(on page 70)* and go to XML > XSLT-XQuery > Custom Engines.
2. Click the **New** button at the bottom of the dialog box.
3. **Configure the parameters for the custom engine** *(on page 199).*
4. Click **OK**.

**Note:**

You can not use these custom engines in the Debugger perspective *(on page 189).*

The output messages of a custom processor are displayed in an output view at the bottom of the application window. If an output message follows the format of an Oxygen XML Editor Eclipse plugin linked message *(on page 553)*, clicking it highlights the location of the message in an editor panel containing the file referenced in the message.

**Related Information:**

Custom Engines Preferences *(on page 199)*

**Configuring the XSLT Processor Extensions Paths**

The Xalan and Saxon processors support the use of extension elements and extension functions. Unlike a literal result element, which the stylesheet simply transfers to the result tree, an extension element performs an action. The extension is usually used because the XSLT stylesheet fails in providing adequate functions for accomplishing a more complex task.

For more information about how to use extensions, see the following links:

- **Saxon 6.5.5** - [http://saxon.sourceforge.net/saxon6.5.5/extensions.html](http://saxon.sourceforge.net/saxon6.5.5/extensions.html)

To set an XSLT processor extension (a directory or a **jar** file), use the **Extensions button** *(on page 1203)* in the **Edit scenario** dialog box.

**XML Transformation with XQuery**

This type of transformation specifies the transform parameters and location of an XQuery file that is applied to the edited XML document.

Use the **XML transformation with XQuery** scenario to apply a transformation to have an XQuery file query an XML file for the output results.

To create an **XML transformation with XQuery** scenario, use one of the following methods:
• Use the Configure Transformation Scenario(s) (Alt + Shift + T, C (Command + Option + T, C on macOS)) action from the toolbar or the XML menu. Then click the New button and select XML transformation with XQuery.

• Go to Window > Show View and select Transformation Scenarios to display this view (on page 1290). Click the New Scenario drop-down menu button and select XML transformation with XQuery.

Both methods open the New Scenario dialog box.

The upper part of the dialog box allows you to specify the Name of the transformation scenario.

The lower part of the dialog box contains several tabs that allow you to configure the options that control the transformation.

**XQuery Tab**

When you create a new transformation scenario (on page 1201) or edit an existing one (on page 1281), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The XQuery tab contains the following options:

**XML URL**

Specifies the source XML file. You can specify the path by using the text field, its history drop-down, the Insert Editor Variables (on page 218) button, or the browsing actions in the Browse drop-down list. This URL is resolved through the catalog resolver. If the catalog does not have a mapping for the URL, then the file is used directly from its remote location.

**Note:**

If the transformer engine is Saxon 9.x and a custom URI resolver is configured in the advanced Saxon preferences page (on page 212), the XML input of the transformation is passed to that URI resolver.

**XQuery URL**

Specifies the source XQuery file to be used for the transformation. You can specify the path by using the text field, its history drop-down, the Insert Editor Variables (on page 218) button, or the browsing actions in the Browse drop-down list. This URL is resolved through the catalog resolver. If the catalog does not have a mapping for the URL, the file is used directly from its remote location.

**Transformer**

This drop-down menu presents all the transformation engines available to Oxygen XML Editor Eclipse plugin for performing a transformation. These include the built-in engines and the external engines defined in the Custom Engines preferences page (on page 199). The engine you choose is used as the default transformation engine. Also, if an XSLT or XQuery document does
not have an associated validation scenario, this transformation engine is used in the validation process (if it provides validation support).

**Advanced options**

Allows you to configure the advanced options of the Saxon HE/PE/EE engine (on page 1222) for the current transformation scenario. To configure the same options globally, go to the Saxon-HE/PE/EE preferences page (on page 210). For the current transformation scenario, these Advanced options override the options configured in that preferences page.

**Parameters**

Opens the Configure parameters dialog box (on page 1220) for configuring the XQuery parameters. You can use the buttons in this dialog box to add, edit, or remove parameters. If the XQuery transformation engine is custom-defined, you can not use this dialog box to set parameters. Instead, you can copy all parameters from the dialog box using contextual menu actions and edit the custom XQuery engine to include the necessary parameters in the command line that starts the transformation process.

**Extensions**

Opens a dialog box for configuring the XQuery extension JARS or classes (on page 1221) that define extension Java functions or extension XSLT elements used in the transformation.

**XQuery Parameters**

The global parameters of the XQuery file used in a transformation scenario can be configured by using the Parameters button in the XQuery tab.

The resulting dialog box includes a table that displays all the parameters of the current XQuery file, along with their descriptions and current values. You can also add, edit, and remove parameters, and use the Filter text box to search for a specific term in the entire parameters collection. Note that edited parameters are displayed with their name in bold.

If the XPath column is selected, the parameter value is evaluated as an XPath expression before starting the XQuery transformation.

**Example:**

For example, you can use expressions such as:

```
//person[@atr='val']
```
**Note:**

1. The `doc` function solves the argument relative to the XQuery file location. You can use full paths or editor variables (on page 218) (such as `{{cfdu}}` [current file directory]) to specify other locations: `doc('{{cfdu}}/test.xml')/*`

2. Only XPath functions are allowed.

Below the table, the following actions are available for managing the parameters:

**New**

Opens the **Add Parameter** dialog box that allows you to add a new parameter to the list. An editor variable (on page 218) can be inserted in the text box using the ![Insert Editor Variables](on page 218). If the **Evaluate as XPath** option is selected, the parameter will be evaluated as an XPath expression.

**Edit**

Opens the **Edit Parameter** dialog box that allows you to edit the selected parameter. An editor variable (on page 218) can be inserted in the text box using the ![Insert Editor Variables](on page 218). If the **Evaluate as XPath** option is selected, the parameter will be evaluated as an XPath expression.

**Unset**

Resets the selected parameter to its default value. Available only for edited parameters with set values.

**Delete**

Removes the selected parameter from the list. It is available only for new parameters that have been added to the list.

The bottom panel presents the following:

- The default value of the parameter selected in the table.
- A description of the parameter, if available.
- The system ID of the stylesheet that declares it.

**Related Information:**

- [Editor Variables](on page 218)

**XQuery Extensions**

The **Extensions** button is used to specify the JAR (on page 2655) and classes that contain extension functions called from the XQuery file of the current transformation scenario. You can use the **Add**, **Edit**, and **Remove** buttons to configure the extensions.
An extension function called from the XQuery file of the current transformation scenario will be searched, in the specified extensions, in the order displayed in this dialog box. To change the order of the items, select the item to be moved and click the **Move up** or **Move down** buttons.

**Advanced Saxon HE/PE/EE XQuery Transformation Options**

The XQuery transformation scenario allows you to configure advanced options that are specific for the Saxon HE (Home Edition), PE (Professional Edition), and EE (Enterprise Edition) engines. They are the same options as those in the Saxon HE/PE/EE preferences page (on page 204) but they are configured as a specific set of transformation options for each transformation scenario, while the values set in the preferences page apply as global options. The advanced options configured in a transformation scenario override the global options defined in the preferences page.

**Saxon-HE/PE/EE Options**

The advanced options for Saxon 12.3 Home Edition (HE), Professional Edition (PE), and Enterprise Edition (EE) are as follows:

**Use a configuration file ("-config")**

Sets a Saxon 12.3 configuration file that is used for XQuery transformation and validation scenarios.

**Enable Optimizations ("-opt")**

This option is selected by default, which means that optimization is enabled. If not selected, the optimization is suppressed, which is helpful when reducing the compiling time is important, optimization conflicts with debugging, or optimization causes extension functions with side-effects to behave unpredictably.

**Use linked tree model ("-tree:linked")**

This option activates the linked tree model.

**Strip whitespaces ("-strip")**

Specifies how the *strip whitespaces* operation is handled. You can choose one of the following values:

- **All ("all")** - Strips all whitespace text nodes from source documents before any further processing, regardless of any `@xml:space` attributes in the source document.
- **Ignore ("ignorable")** - Strips all ignorable whitespace text nodes from source documents before any further processing, regardless of any `@xml:space` attributes in the source document. Whitespace text nodes are ignorable if they appear in elements defined in the DTD or schema as having element-only content.
- **None ("none")** - Strips no whitespace before further processing.

**Enable profiling ("-TP")**
If selected, profiling of the execution time in a query is enabled. The corresponding text field is used to specify the path to the output file where the profiling information will be saved. As long as the option is selected, and the output file specified, it will gather timed tracing information and create a profile report to the specified file.

**Note:**
The profiling support works only if the **Present as a sequence transformation option (on page 1225)** is not set.

**Saxon-PE/EE Options**

The following advanced options are specific for Saxon 12.3 Professional Edition (PE) and Enterprise Edition (EE) only:

**Allow calls on extension functions ("-ext")**

If selected, calls on external functions are allowed. Selecting this option is not recommended in an environment where untrusted stylesheets may be executed. It also disables user-defined extension elements and the writing of multiple output files, both of which carry similar security risks.

**Saxon-EE Options**

The advanced options that are specific for Saxon 12.3 Enterprise Edition (EE) are as follows:

**Validation of the source file ("-val")**

Requests schema-based validation of the source file and of any files read using `document()` or similar functions. It can have the following values:

- **Schema validation ("strict")** - This mode requires an XML Schema and allows for parsing the source documents with strict schema-validation enabled.
- **Lax schema validation ("lax")** - If an XML Schema is provided, this mode allows for parsing the source documents with schema-validation enabled but the validation will not fail if, for example, element declarations are not found.
- **Disable schema validation** - This specifies that the source documents should be parsed with schema-validation disabled.

**Validation errors in the result tree treated as warnings ("-outval")**

Normally, if validation of result documents is requested, a validation error is fatal. Selecting this option causes such validation failures to be treated as warnings.

**Write comments for non-fatal validation errors of the result document**

The validation messages for non-fatal errors are written (wherever possible) as a comment in the result document itself.

**Enable XQuery update ("-update:(on|off)")**
This option controls whether or not XQuery update syntax is accepted. The default value is off.

**Backup files updated by XQuery** ("-backup:(on|off)"

If selected, backup versions for any XML files updated with an XQuery Update are generated. This option is available when the Enable XQuery update option is selected.

**Other Options**

**Initializer class**

Equivalent to the `-init` Saxon command-line argument. The value is the name of a user-supplied class that implements the `net.sf.saxon.lib.Initializer` interface. This initializer is called during the initialization process, and may be used to set any options required on the configuration programmatically. It is particularly useful for tasks such as registering extension functions, collations, or external object models, especially in Saxon-HE where the option cannot be set via a configuration file. Saxon only calls the initializer when running from the command line, but the same code may be invoked to perform initialization when running user application code.

**FO Processor Tab (XQuery Transformations)**

When you create a new transformation scenario (on page 1201) or edit an existing one (on page 1281), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The **FO Processor** tab contains the following options:

**Perform FO Processing**

Specifies whether or not an FO processor is applied (either the built-in Apache FOP engine or an external engine defined in Preferences) during the transformation.

**Input**

Choose between the following options to specify which input file to use:

- **XQuery result as input** - The FO processor is applied to the result of the XQuery transformation that is defined in the XQuery tab.
- **XML URL as input** - The FO processor is applied to the input XML file.

**Method**

The output format of the FO processing. The available options depend on the selected processor type.

**Processor**

Specifies the FO processor to be used for the transformation. It can be the built-in Apache FOP processor or an external processor (on page 183).
Output Tab (XQuery Transformations)

When you create a new transformation scenario (on page 1201) or edit an existing one (on page 1281), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The Output tab contains the following options:

**Present as a sequence**

Selecting this option will reduce the time necessary to fetch the full results, as it will only fetch the first chunk of the results.

**Prompt for file**

At the end of the transformation, a file browser dialog box is displayed for specifying the path and name of the file that stores the transformation result.

**Save As**

The path of the file where the result of the transformation is stored. You can specify the path by using the text field, the Insert Editor Variables (on page 218) button, or the Browse button.

**Open in Browser/System Application**

If selected, Oxygen XML Editor Eclipse plugin automatically opens the result of the transformation in a system application associated with the file type of the result (for example, in Windows PDF files are often opened in Acrobat Reader).

Note: To set the web browser that is used for displaying HTML/XHTML pages, go to Window > Preferences > General > Web Browser and specify it there.

- **Output file** - When Open in Browser/System Application is selected, you can use this button to automatically open the default output file at the end of the transformation.
- **Other location** - When Open in Browser/System Application is selected, you can use this option to open the file specified in this field at the end of the transformation. You can specify the path by using the text field, the Insert Editor Variables (on page 218) button, or the Browse button.

**Open in editor**

When this option is selected, at the end of the transformation, the default output file is opened in a new editor panel with the appropriate built-in editor type (for example, if the result is an XML file it is opened in the built-in XML editor, or if it is an XSL-FO file it is opened with the built-in FO editor).
Show in results view as

You can choose to view the results in one of the following:

- **XML** - If this is selected, Oxygen XML Editor Eclipse plugin displays the transformation result in an XML viewer panel at the bottom of the application window with syntax highlighting (on page 176).
- **XHTML** - This option is only available if Open in Browser/System Application is not selected. If selected, Oxygen XML Editor Eclipse plugin displays the transformation result in a built-in XHTML browser panel at the bottom of the application window.

**Important:**

When transforming very large documents, you should be aware that selecting this option may result in very long processing times. This drawback is due to the built-in Java XHTML browser implementation. To avoid delays for large documents, if you want to see the XHTML result of the transformation, you should use an external browser by selecting the Open in Browser/System Application option instead.

- **Image URLs are relative to** - If Show in results view as XHTML is selected, this option specifies the path used to resolve image paths contained in the transformation result. You can specify the path by using the text field, the Insert Editor Variables (on page 218) button, or the Browse button.

**XML to PDF Transformation with CSS**

This type of transformation uses the Oxygen PDF Chemistry processing engine to obtain PDF output by applying CSS styling to the edited XML document. This scenario is useful for those who are familiar with CSS and want to obtain PDF output as its final form.

To create an XML to PDF transformation with CSS scenario, use one of the following methods:

- Use the Configure Transformation Scenario(s) (Alt + Shift + T, C (Command + Option + T, C on macOS)) action from the toolbar or the XML menu. Then click the New button and select XML to PDF transformation with CSS.
- Go to Window > Show View and select Transformation Scenarios to display this view (on page 1290). Click the New Scenario drop-down menu button and select XML to PDF transformation with CSS.

Both methods open the New Scenario dialog box.

The upper part of the dialog box allows you to specify the Name of the transformation scenario.

The lower part of the dialog box contains several tabs that allow you to configure the options that control the transformation.
For more information about the Oxygen PDF Chemistry processing engine and numerous tips for customizing the output, see the Oxygen Chemistry User Guide.

CSS Tab (XML to PDF Transformation with CSS)

When you create a new transformation scenario (on page 1201) or edit an existing one (on page 1281), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The CSS tab contains the following options:

**XML URL**

Specifies the source XML file. You can specify the path by using the text field, its history drop-down, the Insert Editor Variables (on page 218) button, or the browsing actions in the Browse drop-down list. This URL is resolved through the catalog resolver. If the catalog does not have a mapping for the URL, then the file is used directly from its remote location.

**CSS URL**

Optionally, you can use this option to specify the location of a custom CSS file to be applied to the transformation. If this option is left blank, only the CSS referenced directly from the document will be applied. You can specify the path by using the text field, its history drop-down, the Insert Editor Variables (on page 218) button, or the browsing actions in the Browse drop-down list.

**Apply CSS stylesheets set in the current framework**

If selected, CSS stylesheets that are specified in the framework (in the Document Type configuration CSS subtab (on page 96)) are applied to the transformation in addition to any CSS referenced directly in the document or specified in the CSS URL field (on page 1227).

**Note:**

If CSS files are specified in multiple ways, the transformation applies the CSS in the following order (from lowest priority to highest):

- CSS files that are specified in the framework (in the Document Type configuration CSS subtab (on page 96)).
- CSS files referenced directly in the document.
- CSS files specified in the CSS URL field (on page 1227).

**Processor options link**

Opens the CSS-based Processors preferences page (on page 187) where you can configure some options for generating PDF output.
Output Tab (XML to PDF Transformation with CSS)

When you create a new transformation scenario (on page 1201) or edit an existing one (on page 1281), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The **Output** tab contains the following options:

**Output File section**

**Save As**

The path of the file where the result of the transformation is stored. You can specify the path by using the text field, the ✉️ **Insert Editor Variables** (on page 218) button, or the 📦 **Browse** button.

**Open in Browser/System Application**

If selected, Oxygen XML Editor Eclipse plugin automatically opens the result of the transformation in a system application associated with the PDF file type (for example, in Windows PDF files are often opened in Acrobat Reader).

**Debugging section**

**Dump the intermediate annotated XML**

Select this option to include (dump) the intermediate, annotated XML file in the same location as the output file. This can be used for debugging purposes.

**Dump the FO file**

Select this option to include (dump) the FO file (before it is converted to PDF) in the same location as the output file. This can be used for debugging purposes.

**Console options link**

Opens the **CSS-based Processors** preferences page (on page 187) where you can configure some options for generating PDF output.

**DITA-OT Transformation**

This type of transformation specifies the parameters for an Ant transformation that executes a DITA-OT build script. Oxygen XML Editor Eclipse plugin includes a built-in version of Ant and a built-in version of DITA-OT, but other versions can be set in the scenario.

To create a **DITA-OT Transformation** scenario, use one of the following methods:

- Use the 🕒 **Configure Transformation Scenario(s)** (Alt + Shift + T, C (Command + Option + T, C on macOS)) action from the DITA Maps Manager toolbar, main toolbar, or the XML menu. Then click the **New** button and select **DITA-OT Transformation**.
- Go to Window > Show View and select 🕒 **Transformation Scenarios** to display this view (on page 1290). Click the ✉️ **New Scenario** drop-down menu button and select **DITA-OT Transformation**.
Both methods open the **DITA Transformation Type** dialog box that presents the list of possible outputs.

![DITA Transformation Type Dialog Box](image)

Select the desired type of output and click **OK**. This opens the **New Scenario** dialog box.

The upper part of the dialog box allows you to specify the **Name** of the transformation scenario.

The lower part of the dialog box contains several tabs that allow you to configure the options that control the transformation.

**Skins Tab (DITA-OT Transformations)**

When you create a new transformation scenario *(on page 1201)* or edit an existing one *(on page 1281)*, a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The **Skins** tab is available for DITA-OT transformations with the **WebHelp Classic** output type and it provides a set of built-in skins that you can use as a base for your WebHelp system output.

A **skin** is a collection of CSS properties that can alter the look of the output by changing colors, font types, borders, margins, and paddings. This allows you to rapidly adapt the look and feel of your output.
The **Skins** tab includes the following sections:

**Built-In Skins**

This section presents the built-in skins that are included in Oxygen XML Editor Eclipse plugin. The built-in skins cover a wide range of chromatic themes, ranging from a very light one to a high-contrast variant. To see how the skin looks when applied on a sample documentation project that is stored on the Oxygen XML Editor Eclipse plugin website, click the **Online preview** link.

**Custom Skins**

You can use this section to customize the look of the output.

**CSS File**

You can set this field to point to a custom CSS stylesheet or customized skin. A custom CSS file will overwrite a skin selection.

---

**Note:**

The output can also be styled by setting the `args.css` parameter in the **Parameters tab**. The properties taken from the stylesheet referenced in this parameter take precedence over the properties declared in the skin set in the **Skins tab**.
Create custom skin

Use this link to open the WebHelp Skin Builder (on page 1495) tool.

Templates Tab (DITA-OT Transformations)

When you create a new transformation scenario (on page 1201) or edit an existing one (on page 1281), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The Templates tab is available for DITA-OT transformations with WebHelp Responsive or PDF - based on HTML5 & CSS output types and it provides a set of built-in publishing templates (on page 1340). You can use one of them to publish your documentation or as a starting point for a new publishing template.

Filtering and Previewing Templates

You can click on the tags at the top of the pane to filter the templates and narrow your search. Each built-in template also includes an Online preview icon in the bottom-right corner that opens a webpage in your default browser providing a sample of how the main page will look when that particular template is used to generate the output.

Built-in Templates Locations

Oxygen XML Editor Eclipse plugin scans the following locations to find the built-in templates to display in the dialog box:
• **WebHelp Responsive Templates** - All built-in WebHelp Responsive publishing templates are stored in the following directory: `DITA-OT-DIR/plugins/com.oxygenxml.webhelp.responsive/templates`.

• **PDF - based on HTML5 & CSS** - All built-in PDF publishing templates are stored in the following directories:
  - `DITA-OT-DIR/plugins/com.oxygenxml.pdf.css/templates`
  - `DITA-OT-DIR/plugins/com.oxygenxml.webhelp.responsive/templates`

### Custom Templates Locations

Oxygen XML Editor Eclipse plugin scans the locations specified in the [DITA > Publishing preferences page](on page 86) to find custom templates to display in the dialog box. You can access that preferences page directly from the **Template** tab by clicking on the **Configure Publishing Templates Gallery** link.

### Selecting Custom Templates

Once you are finished configuring your template, you can click the **Choose Custom Publishing Template** link to select your template.

You can also add your custom templates (on page 1383) to the list of templates displayed in the **Templates** tab. To do this, store them in a directory, then click the **Configure Publishing Templates Gallery** link to open the [DITA > Publishing preferences page](on page 86) where you can add that directory to the list. All the templates contained in your template directory will be displayed in the preview pane along with all the built-in templates.

### Save Template As Button

You can use the **Save template as** button (at the bottom-left of the transformation dialog box) to export the currently selected template into a new template package that can be used as a starting point to create your own custom template (on page 1546). Clicking this button will open a **template package configuration dialog box** (on page 2530) that contains some options and displays the parameters that will be exported to your template package.

### Template Errors

When the **Templates** tab is opened, all templates (built-in and custom) are loaded and validated. Specifically, certain elements in the template descriptor file are checked for validity. If errors are encountered that prevents the template from loading, the following message will be displayed toward the bottom of the dialog box:

⚠️ Some templates could not be loaded. [More details](#)

If you click the **More details** link, a window will open with more information about the encountered error. For example, it might offer a hint that the element is missing from the expected descriptor file structure.
Also, if a template could be loaded, but certain elements could not be found in the descriptor file, a warning icon (⚠️) will be displayed on the template's image (in the Templates tab of the transformation dialog box). For example, this happens if a valid preview-image element cannot be found.

**Sharing Publishing Template**

To share a publishing template with others, following these steps:

1. Copy your template in a new folder.
2. Go to Options > Preferences > DITA > Publishing (on page 86) and add that new folder to the list.
3. Switch the option as the bottom of that preferences page to Project Options.
4. Share your project file (.xpr).

**Resources**

For more information about customizing publishing templates, watch our video demonstration:

https://www.youtube.com/embed/zNmXfKWXwO8

**Related Information:**

- Publishing Templates (on page 1340)
- Publishing Template Package Contents for PDF Customizations (on page 1540)
- Publishing Template Package Contents for WebHelp Responsive Customizations (on page 1343)

**Template Package Configuration Dialog Box**

The **Save template as** button (at the bottom-left of the transformation dialog box for WebHelp Responsive or PDF - based on HTML5 & CSS transformations) can be used to export the currently selected template into a new template package that can be used as a starting point to create your own custom template (on page 1546). The result will be a ZIP archive that contains a template descriptor file and other resources (such as CSS files) that were attached to the selected template.

Clicking the **Save template as** button opens a template package configuration dialog box contains the following options and components:

**Name**

Required field used to specify the name for the new template. This will become the text value of the `<name>` element in the template descriptor file. This information is displayed as the name of the template in the transformation scenario dialog box.

**Description**

Optional field used to specify a template description. This will become the text value of the `<description>` element in the template descriptor file. This information is displayed when the user hovers over the template in the transformation scenario dialog box.

**Parameter Table**
This table displays the parameters that will be exported. Only certain relevant parameters are exported. The parameters and their values will be inserted in the `<parameters>` section of the template descriptor file. If any of the parameter values point to a file path that references a template resource (such as CSS files, custom HTML fragments, images), those resources will automatically be copied to the new template package and their references will be changed accordingly.

**Note:**
Additional resources that are referenced in CSS files or other resources will not be copied to the new template package, so you will need to copy them manually and update their references in the template descriptor file.

**Include WebHelp Customization**

The same publishing template package can contain both a WebHelp Responsive and PDF customization and you can use the same template in both types of transformations ([DITA Map WebHelp Responsive](on page 1170) or [DITA Map to PDF - based on HTML5 & CSS](on page 1184)). This option specifies that the custom template will include a WebHelp Responsive customization.

**Include HTML Page Layout Files**

For **WebHelp Responsive** customizations, select this option if you want to copy the default [HTML Page Layout Files](on page 1359) into your template package. They are helpful if you want to change the structure of the generated HTML pages.

**Include PDF Customization**

The same publishing template package can contain both a WebHelp Responsive and PDF customization and you can use the same template in both types of transformations ([DITA Map WebHelp Responsive](on page 1170) or [DITA Map to PDF - based on HTML5 & CSS](on page 1184)). This option specifies that the custom template will include a PDF customization.

**Save as**

Use this field to specify the name and path of the ZIP file where the template will be saved.

FO Processor Tab (DITA-OT Transformations)

When you create a new transformation scenario (on page 1201) or edit an existing one (on page 1281), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The **FO Processor** tab is available for DITA-OT transformations with a **PDF** output type.

This tab allows you to select an FO Processor to be used for the transformation.
You can choose one of the following processors:

**Apache FOP**

The default processor that comes bundled with Oxygen XML Editor Eclipse plugin.

**XEP**

The *RenderX* XEP processor. If XEP is already installed, Oxygen XML Editor Eclipse plugin displays the detected installation path under the drop-down menu. XEP is considered installed if it was detected in one of the following sources:

- XEP was configured as an external FO Processor in the FO Processors option page (on page 183).
- The system property `com.oxygenxml.xep.location` was set to point to the XEP executable file for the platform (for example: `xep.bat` on Windows).
- XEP was installed in the `DITA-OT-DIR/plugins/org.dita.pdf2/lib` directory of the Oxygen XML Editor Eclipse plugin installation directory.

**Antenna House**

The *Antenna House* (AH Formatter) processor. If Antenna House is already installed, Oxygen XML Editor Eclipse plugin displays the detected installation path under the drop-down menu. Antenna House is considered installed if it was detected in one of the following sources:

- Environment variable set by Antenna House installation (the newest installation version will be used).
- Antenna House was added as an external FO Processor in the Oxygen XML Editor Eclipse plugin preferences pages.
To further customize the PDF output obtained from the Antenna House processor, follow these steps:

1. Edit the transformation scenario.
2. Open the Parameters tab (on page 2534).
3. Add the env.AXF_OPT parameter and point to the Antenna House configuration file.

Related information

- FO Processors Preferences (on page 183)
- XSL-FO (Apache FOP) Processor for Generating PDF Output (on page 1263)

Parameters Tab (DITA-OT Transformations)

When you create a new transformation scenario (on page 1201) or edit an existing one (on page 1281), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The Parameters tab allows you to configure the parameters sent to the DITA-OT build file.

The table in this tab displays all the parameters that the DITA-OT documentation specifies as available for each chosen type of transformation (for example, XHTML or PDF), along with their description and current values. You can find more information about each parameter in the DITA-OT Documentation. You can also add, edit, and remove parameters, and you can use the text box to filter or search for a specific term in the entire parameters collection. Note that edited parameters are displayed with their name in bold.

Depending on the type of a parameter, its value can be one of the following:

- A simple text field for simple parameter values.
- A combo box with some predefined values.
- A file chooser and an editor variable (on page 218) selector to simplify setting a file path as the value of a parameter.

Note:

To input parameter values at runtime, use the ask editor variable (on page 219) in the Value column.

Below the table, the following actions are available for managing parameters:

**New**

Opens the Add Parameter dialog box that allows you to add a new parameter to the list. You can specify the Value of the parameter by using the Insert Editor Variables (on page 218) button or the Browse button.

**Unset**
Resets the selected parameter to its default value. Available only for edited parameters with set values.

**Edit**

Opens the Edit Parameter dialog box that allows you to change the value of the selected parameter or its description.

**Delete**

Removes the selected parameter from the list. It is available only for new parameters that have been added to the list.

### Parameters Contributed by an Oxygen Publishing Template

Transformation parameters that are defined in an Oxygen Publishing Template (on page 1539) descriptor file are displayed in italics. After creating a publishing template (on page 1546) and adding it to the templates gallery (on page 1383), when you select the template in the Templates tab (on page 2528), the Parameters tab will automatically be updated to include the parameters defined in the template descriptor file.

**Related Information:**

DITA Open Toolkit Documentation

### Feedback Tab (DITA-OT Transformations)

When you create a new transformation scenario (on page 1201) or edit an existing one (on page 1281), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The Feedback tab is for those who want to provide a way for users to offer feedback and ask questions in the published output and it is available for the DITA Map WebHelp Responsive transformation type. To add a comments component in the output, you need to use Oxygen Feedback to create a site configuration for the website where your WebHelp output is published and use this Feedback tab to instruct the transformation to install the comments component at the bottom of each WebHelp page.

When you create a site configuration in the Oxygen Feedback administration interface, an HTML fragment is generated during the final step of the creation process. You need to click the Edit button at the bottom-right of this tab to open a dialog box where you will paste the generated HTML fragment. The HTML fragment can also be set in an Oxygen Publishing Template (on page 1539), either as an HTML fragment extension point (on page 1350) or as a transformation parameter (on page 1348) (the webhelp.fragment.feedback parameter). If the fragment is specified in multiple places, the order of precedence (from highest to lowest) is:

- The fragment specified directly in the Feedback tab.
- The fragment specified in a publishing template as an HTML fragment extension point.
- The fragment specified in a publishing template as a transformation parameter.
Filters Tab (DITA Transformations)

When you create a new transformation scenario (on page 1201) or edit an existing one (on page 1281), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The Filters tab allows you to add filters to remove certain content elements from the generated output.

Figure 417. Edit Filters Tab

You can choose one of the following options to define filters:

**Use DITAVAL file**

If you already have a DITAVAL file associated with the DITA map (on page 2654), you can specify the file to be used when filtering content. You can specify the path by using the text field, its history drop-down, the Insert Editor Variables (on page 218) button, or the browsing actions in the Browse drop-down list. You can find out more about constructing a DITAVAL file in the DITA Documentation.

Note:

If a filter file is specified in the args.filter parameter (in the Parameters tab (on page 2534)), the filters are combined (neither file takes precedence over the other).

**Use profiling condition set**
Sets the profiling condition set (on page 2564) that will be applied to your transformation.

**Exclude from output all elements with any of the following attributes**

By using the + New, ✎ Edit, or ✗ Delete buttons at the bottom of the pane, you can configure a list of attributes (name and value) to exclude all elements that contain any of these attributes from the output.

**Note:**
The colors and styles of the profiled content (on page 2569) settings are used for rendering it in Author mode but are not applied in the output.

**Advanced Tab (DITA-OT Transformations)**

When you create a new transformation scenario (on page 1201) or edit an existing one (on page 1281), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The Advanced tab allows you to specify advanced options for the transformation scenario.
You can specify the following options:

**Prefer using the "dita" command**

When selected, Oxygen XML Editor Eclipse plugin will attempt to use the `dita.bat` executable script (`dita.sh` for macOS and Linux) that is bundled with DITA-OT to run the transformation. If not selected, the transformation will run as an ANT process. Also, when this option is selected, other options (**Custom build file, Build target, Ant Home**) become unavailable. This setting is checked by default in newly created DITA-OT transformation scenario.

**Note:**

Even when this option is selected, the `dita.bat` (`dita` for macOS and Linux) executable cannot be used in some cases. For example, if the DITA Map is published from a remote location or if the `fix.external.refs` parameter is enabled in the **Parameters** tab, the transformation is started as an ANT process instead of using the executable.
If you use a custom DITA-OT build file, you can specify the path to the customized build file. If empty, the `build.xml` file from the `dita.dir` parameter that is configured in the **Parameters tab** *(on page 2534)* is used. You can specify the path by using the text field, the ![Insert Editor Variables](on page 218) button, or the ![Browse](button).

**Build target**

Optionally, you can specify a build target for the build file. If no target is specified, the default `init` target is used.

**Additional Ant arguments**

You can specify additional **Ant-specific** command-line arguments (such as `-diagnostics`).

**Ant Home**

You can choose between the default or custom Ant installation to run the transformation.

**Java Home**

You can choose between the default or custom Java installation to run the transformation. The default path is the Java installation that is used by Oxygen XML Editor Eclipse plugin.

---

**Note:**

It may be possible that the used Java version is incompatible with the DITA Open Toolkit engine. If you encounter related errors running the transformation, consider installing a Java VM that is supported by the DITA-OT publishing engine and using it in the **Java Home** text field.

---

**JVM Arguments**

This parameter allows you to set specific parameters for the Java Virtual Machine used by Ant. When performing a large transformation, you may want to increase the memory allocated to the Java Virtual Machine. This will help avoid **Out of Memory** error messages (**OutOfMemoryError**). For example, if it is set to `-Xmx2g`, the transformation process is allowed to use a maximum 2 gigabytes of memory. If you do not specify an `-Xmx` value in this field, by default, the application will use a maximum of about a quarter of the total memory available on the machine.

**Libraries**

By default, Oxygen XML Editor Eclipse plugin adds libraries (as high priority) that are not transformation-dependent and also patches for certain DITA Open Toolkit bugs. You can use this button to specify additional libraries (**JAR** *(on page 2655)* files or additional class paths) to be used by the transformer.

---

**Tip:**

You can specify the path to the additional libraries using wildcards (for example, `${oxygenHome}/lib/*.*.jar`).
Output Tab (DITA-OT Transformations)

When you create a new transformation scenario (on page 1201) or edit an existing one (on page 1281), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The **Output** tab allows you to configure options that are related to the location where the output is generated.

![Figure 419. Output Settings Tab](image)

You can specify the following parameters:

**Base directory**

All the relative paths that appear as values in parameters are considered relative to the base directory. The default value is the directory where the transformed map is located. You can specify the path by using the text field, the [Insert Editor Variables](on page 218) button, or the [Browse](image) button.

**Temporary files directory**
This directory is used to store pre-processed temporary files until the final output is obtained. You can specify the path by using the text field, the Insert Editor Variables button, or the Browse button.

**Output directory**

The folder where the content of the final output is stored. You can specify the path by using the text field, the Insert Editor Variables button, or the Browse button.

**Note:**

If the DITA map or topic is opened from a remote location or a ZIP file, the parameters must specify absolute paths.

**Open in Browser/System Application**

If selected, Oxygen XML Editor Eclipse plugin automatically opens the result of the transformation in a system application associated with the file type of the result (for example, in Windows PDF files are often opened in Acrobat Reader).

**Note:**

To set the web browser that is used for displaying HTML/XHTML pages, go to Window > Preferences > General > Web Browser and specify it there.

- **Output file** - When Open in Browser/System Application is selected, you can use this button to automatically open the default output file at the end of the transformation.

- **Other location** - When Open in Browser/System Application is selected, you can use this option to open the file specified in this field at the end of the transformation. You can specify the path by using the text field, the Insert Editor Variables button, or the Browse button.

**Open in editor**

When this is option is selected, at the end of the transformation, the default output file is opened in a new editor panel with the appropriate built-in editor type (for example, if the result is an XML file it is opened in the built-in XML editor, or if it is an XSL-FO file it is opened with the built-in FO editor).

**Ant Transformation**

This type of transformation allows you to configure the options and parameters of an Ant build script.

An Ant transformation scenario is usually associated with an Ant build script. Oxygen XML Editor Eclipse plugin runs an Ant transformation scenario as an external process that executes the Ant build script with the
built-in Ant distribution (*Apache Ant* (on page 2652) version 1.9.8) that is included with the application, or optionally with a custom Ant distribution configured in the scenario.

**Tip:**
Certain Ant tasks require additional JAR libraries (for example, Ant *mail* tasks). The additional libraries can be added by editing the Ant transformation scenario, and in the Output tab, click the Libraries button (on page 1245) in the bottom right corner. This opens a dialog box where you can add JAR libraries. For a list of library dependencies, see https://ant.apache.org/manual/install.html#librarydependencies.

To create an Ant transformation scenario, use one of the following methods:

- Use the Configure Transformation Scenario(s) (Alt + Shift + T, C (Command + Option + T, C on macOS)) action from the toolbar or the XML menu. Then click the New button and select ANT transformation.
- Go to Window > Show View and select Transformation Scenarios to display this view (on page 1290). Click the New Scenario drop-down menu button and select ANT transformation.

Both methods open the transformation configuration dialog box.

The upper part of the dialog box allows you to specify the Name of the transformation scenario.

The lower part of the dialog box contains several tabs that allow you to configure the options that control the transformation.

**Options Tab (Ant Transformations)**

When you create a new transformation scenario (on page 1201) or edit an existing one (on page 1281), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The Options tab allows you to specify the following options:

**Working directory**

The path of the current directory of the Ant external process. You can specify the path by using the text field, the Insert Editor Variables (on page 218) button, or the Browse button.

**Build file**

The Ant script file that is the input of the Ant external process. You can specify the path by using the text field, the Insert Editor Variables (on page 218) button, or the Browse button.

**Build target**

Optionally, you can specify a build target for the Ant script file. If no target is specified, the Ant target that is specified as the default in the Ant script file is used.

**Additional Ant arguments**
You can specify additional Ant-specific command-line arguments (such as -diagnostics).

**Ant Home**

You can choose between the default or custom Ant installation to run the transformation.

**Java Home**

You can choose between the default or custom Java installation to run the transformation. The default path is the Java installation that is used by Oxygen XML Editor Eclipse plugin.

**JVM Arguments**

This parameter allows you to set specific parameters for the Java Virtual Machine used by Ant. When performing a large transformation, you may want to increase the memory allocated to the Java Virtual Machine. This will help avoid Out of Memory error messages (OutOfMemoryError). For example, if it is set to -Xmx2g, the transformation process is allowed to use a maximum of 2 gigabytes of memory. If you do not specify an -Xmx value in this field, by default, the application will use a maximum of about a quarter of the total memory available on the machine.

**Libraries**

By default, Oxygen XML Editor Eclipse plugin adds libraries (as high priority) that are not transformation-dependent and also patches for certain DITA Open Toolkit bugs. You can use this button to specify additional libraries (JAR files or additional class paths) to be used by the transformer.

**Tip:**

You can specify the path to the additional libraries using wildcards (for example, ${oxygenHome}/lib/*.jar).

---

**Parameters Tab (Ant Transformations)**

When you create a new transformation scenario (on page 1201) or edit an existing one (on page 1281), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The Parameters tab allows you to configure the parameters that are accessible as Ant properties in the Ant build script.

The table displays all the parameters that are available in the Ant build script, along with their description and current values. You can also add, edit, and remove parameters, and use the Filter text box to search for a specific term in the entire parameters collection. Note that edited parameters are displayed with their name in bold.

Depending on the type of a parameter, its value can be one of the following:
• A simple text field for simple parameter values.
• A combo box with some predefined values.
• A file chooser and an editor variable (on page 218) selector to simplify setting a file path as the value of a parameter.

Note: To input parameter values at runtime, use the ask editor variable (on page 219) in the Value column.

Below the table, the following actions are available for managing parameters:

New
Opens the Add Parameter dialog box that allows you to add a new parameter to the list. You can specify the Value of the parameter by using the Insert Editor Variables (on page 218) button or the Browse button.

Edit
Opens the Edit Parameter dialog box that allows you to change the value of the selected parameter or its description.

Delete
Removes the selected parameter from the list. It is available only for new parameters that have been added to the list.

Output Tab (Ant Transformations)

When you create a new transformation scenario (on page 1201) or edit an existing one (on page 1281), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The Output tab contains the following options:

Open
Allows you to specify the file to open automatically when the transformation is finished. This is usually the output file of the Ant process. You can specify the path by using the text field, the Insert Editor Variables (on page 218) button, or the Browse button.

• In System Application - The file specified in the Open text box is opened in the system application that is set in the operating system as the default application for that type of file (for example, in Windows PDF files are often opened in Acrobat Reader).
• In Editor - The file specified in the Open text box is opened in a new editor panel with the appropriate built-in editor type (for example, if the result is an XML file it is opened in the built-in XML editor).

Show console output
Allows you to specify when to display the console output log in the message panel at the bottom of the editor. The following options are available:

- **When build fails** - Displays the console output log only if the build fails.
- **Always** - Displays the console output log, regardless of whether or not the build fails.

### XSLT Transformation

This type of transformation specifies the parameters and location of an XML document that the edited XSLT stylesheet is applied on. This scenario is useful when you develop an XSLT document and the XML document is in its final form.

To create an **XSLT transformation** scenario, use one of the following methods:

- Use the Configure Transformation Scenario(s) (Alt + Shift + T, C (Command + Option + T, C on macOS)) action from the toolbar or the XML menu. Then click the New button and select XSLT transformation.
- Go to Window > Show View and select Transformation Scenarios to display this view (on page 1290). Click the New Scenario drop-down menu button and select XSLT transformation.

Both methods open the **New Scenario** dialog box.

The upper part of the dialog box allows you to specify the Name of the transformation scenario.

The lower part of the dialog box contains several tabs that allow you to configure the options that control the transformation.

#### XSLT Tab

When you create a new transformation scenario (on page 1201) or edit an existing one (on page 1281), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The **XSLT** tab contains the following options:

**XML URL**

Specifies the source XML file. You can specify the path by using the text field, its history dropdown, the Insert Editor Variables (on page 218) button, or the browsing actions in the Browse drop-down list. This URL is resolved through the catalog resolver. If the catalog does not have a mapping for the URL, then the file is used directly from its remote location.

**Note:**

If the transformer engine is Saxon 9.x and a custom URI resolver is configured in the advanced Saxon preferences page (on page 212), the XML input of the transformation is passed to that URI resolver. If the transformer engine is one of the built-in XSLT 2.0 / 3.0 engines and the name of an initial template (on page 1249) is specified in the scenario, the XML URL field can be empty. The XML URL field can
also be empty if you use external XSLT processors (on page 1217). Otherwise, a value is mandatory in this field.

**XSL URL**

Specifies the source XSL file that the transformation will use. You can specify the path by using the text field, its history drop-down, the Insert Editor Variables (on page 218) button, or the browsing actions in the Browse drop-down list. This URL is resolved through the catalog resolver. If the catalog does not have a mapping for the URL, the file is used directly from its remote location.

**Use “xml-stylesheet” declaration**

If selected, the scenario applies the stylesheet specified explicitly in the XML document with the xml-stylesheet processing instruction. By default, this option is deselected and the transformation applies the XSLT stylesheet that is specified in the XSL URL field.

**Transformer**

This drop-down menu presents all the transformation engines available to Oxygen XML Editor Eclipse plugin for performing a transformation. These include the built-in engines and the external engines defined in the Custom Engines preferences page (on page 199). The engine you choose is used as the default transformation engine. Also, if an XSLT or XQuery document does not have an associated validation scenario, this transformation engine is used in the validation process (if it provides validation support).

**Advanced options**

Allows you to configure the advanced options of the Saxon HE/PE/EE engine (on page 1205) for the current transformation scenario. To configure the same options globally, go to the Saxon-HE/PE/EE preferences page (on page 210). For the current transformation scenario, these Advanced options override the options configured in that preferences page.

**Parameters**

Opens a Configure parameters dialog box (on page 1203) that allows you to configure the XSLT parameters used in the current transformation. In this dialog box, you can also configure the parameters for additional XSLT stylesheets (on page 1249). If the XSLT transformation engine is custom-defined, you cannot use this dialog box to configure the parameters sent to the custom engine. Instead, you can copy all parameters from the dialog box using contextual menu actions and edit the custom XSLT engine to include the necessary parameters in the command line that starts the transformation process.

**Extensions**

Opens a dialog box for configuring the XSLT extension JARS or classes (on page 1205) that define extension Java functions or extension XSLT elements used in the transformation.

**Additional XSLT stylesheets**
Opens a dialog box for adding XSLT stylesheets (on page 1205) that are applied on the main stylesheet specified in the XSL URL field. This is useful when a chain of XSLT stylesheets must be applied to the input XML document.

**XSLT Parameters**

The global parameters of the XSLT stylesheet used in a transformation scenario can be configured by using the **Parameters** button in the **XSLT** tab of a new or edited transformation scenario dialog box.

The resulting dialog box includes a table that displays all the parameters of the current XSLT stylesheet, all imported and included stylesheets, and all additional stylesheets (on page 1205), along with their descriptions and current values. You can also add, edit, and remove parameters, and you can use the **Filter** text box to search for a specific term in the entire parameters collection. Note that edited parameters are displayed with their name in bold.

If the **XPath** column is selected, the parameter value is evaluated as an XPath expression before starting the XSLT transformation.

**Example:**

For example, you can use expressions such as:

```
<param value="$test.xml"/>
<param value="/entry
<param value="/person[@atr='val']"/>
```

**Note:**

1. The **doc** function solves the argument relative to the XSL stylesheet location. You can use full paths or editor variables (on page 218) (such as `-${cfdu}` [current file directory]) to specify other locations: **doc(`-${cfdu}/test.xml`)**

2. You cannot use XSLT Functions. Only XPath functions are allowed.

Below the table, the following actions are available for managing the parameters:

**New**

Opens the **Add Parameter** dialog box that allows you to add a new parameter to the list. An editor variable (on page 218) can be inserted in the text box using the **Insert Editor Variables** button. If the **Evaluate as XPath** option is selected, the parameter will be evaluated as an XPath expression.

**Edit**

Opens the **Edit Parameter** dialog box that allows you to edit the selected parameter. An editor variable (on page 218) can be inserted in the text box using the **Insert Editor Variables** button. If the **Evaluate as XPath** option is selected, the parameter will be evaluated as an XPath expression.
Unset

Resets the selected parameter to its default value. Available only for edited parameters with set values.

Delete

Removes the selected parameter from the list. It is available only for new parameters that have been added to the list.

The bottom panel presents the following:

• The default value of the parameter selected in the table.
• A description of the parameter, if available.
• The system ID of the stylesheet that declares it.

Related Information:
Editor Variables (on page 218)

XSLT Extensions

The Extensions button opens a dialog box that allows you to specify the JARS (on page 2655) and classes that contain extension functions called from the XSLT file of the current transformation scenario. You can use the Add, Edit, and Remove buttons to configure the extensions.

Tip:
You can specify the path to the resources using wildcards (for example, ${oxygenHome}/lib/*.jar).

An extension function called from the XSLT file of the current transformation scenario will be searched, in the specified extensions, in the order displayed in this dialog box. To change the order of the items, select the item to be moved and click the Move up or Move down buttons.

Additional XSLT Stylesheets

Use the Additional XSLT Stylesheets button in the XSLT tab to display a list of additional XSLT stylesheets to be used in the transformation and you can add files to the list or edit existing entries. The following actions are available:

Add

Adds a stylesheet in the Additional XSLT stylesheets list using a file browser dialog box. You can type an editor variable (on page 218) in the file name field of the browser dialog box. The name of the stylesheet will be added in the list after the current selection.

Remove

Deletes the selected stylesheet from the Additional XSLT stylesheets list.

Up
Moves the selected stylesheet up in the list.

**Down**

Moves the selected stylesheet down in the list.

**Advanced Saxon HE/PE/EE XSLT Transformation Options**

The XSLT transformation scenario allows you to configure advanced options that are specific for the Saxon HE (Home Edition), PE (Professional Edition), and EE (Enterprise Edition) engines. They are the same options as those in the Saxon HE/PE/EE preferences page (on page 210) but they are configured as a specific set of transformation options for each transformation scenario, while the values set in the preferences page apply as global options. The advanced options configured in a transformation scenario override the global options defined in the preferences page.

**Saxon-HE/PE/EE Options**

The advanced options for Saxon 12.3 Home Edition (HE), Professional Edition (PE), and Enterprise Edition (EE) are as follows:

**Mode ("-im")**

A Saxon-specific option that sets the initial mode for the transformation. If this value is also specified in a configuration file (on page 1252), the value in this option takes precedence.

**Template ("-it")**

A Saxon-specific option that sets the name of the initial XSLT template to be executed. If this value is also specified in a configuration file (on page 1252), the value in this option takes precedence.

### Tip:

If your stylesheet includes `<xsl:template name="xsl:initial-template">`, Oxygen XML Editor Eclipse plugin will automatically detect and use it as the initial template, so this option is not needed in this case.

**Use a configuration file ("-config")**

Select this option if you want to use a Saxon 12.3 configuration file that will be executed for the XSLT transformation and validation processes. You can specify the path to the configuration file by entering it in the URL field, or by using the Insert Editor Variables button, or using the browsing actions in the Browse drop-down list.

**Debugger trace into XPath expressions (applies to debugging sessions)**

Instructs the XSLT Debugger (on page 1909) to step into XPath expressions.

**Enable Optimizations ("-opt")**

This option is selected by default, which means that optimization is enabled. If not selected, the optimization is suppressed, which is helpful when reducing the compiling time is important,
optimization conflicts with debugging, or optimization causes extension functions with side-
effects to behave unpredictably.

**Line numbering ("-l")**

Line numbers where errors occur are included in the output messages.

**Expand attributes defaults ("-expand")**

Specifies whether or not the attributes defined in the associated DTD or XML Schema are
expanded in the output of the transformation you are executing.

**DTD validation of the source ("-dtd")**

Specifies whether or not the source document will be validated against their associated DTD.
You can choose from the following:

- **On** - Requests DTD validation of the source file and of any files read using the `document()`
  function.
- **Off** - (default setting) Suppresses DTD validation.
- **Recover** - Performs DTD validation but treats the errors as non-fatal.

**Note:**

Any external DTD is likely to be read even if not used for validation, since DTDs
can contain definitions of entities.

**Strip whitespaces ("-strip")**

Specifies how the *strip whitespaces* operation is handled. You can choose one of the following
values:

- **All** (*all*) - Strips all whitespace text nodes from source documents before any further
  processing, regardless of any `@xml:space` attributes in the source document.
- **Ignore** (*ignorable*) - Strips all ignorable whitespace text nodes from source documents
  before any further processing, regardless of any `@xml:space` attributes in the source
  document. Whitespace text nodes are ignorable if they appear in elements defined in the
  DTD or schema as having element-only content.
- **None** (*none*) - Strips no whitespace before further processing.

**Enable profiling ("-TP")**

If selected, profiling of the execution time in a stylesheet is enabled. The corresponding text field
is used to specify the path to the output file where the profiling information will be saved. As long
as the option is selected, and the output file specified, it will gather timed tracing information and
create a profile report to the specified file.
Saxon-PE/EE Options

The following advanced options are specific for Saxon 12.3 Professional Edition (PE) and Enterprise Edition (EE) only:

**Register Saxon-JS extension functions and instructions**

Registers the Saxon-CE extension functions and instructions when compiling a stylesheet using the Saxon 12.3 processors.

**Note:**

Saxon-CE, being JavaScript-based, was designed to run inside a web browser. This means that you will use Oxygen XML Editor Eclipse plugin only for developing the Saxon-CE stylesheet, leaving the execution part to a web browser. See more details about executing such a stylesheet on Saxonica's website.

**Allow calls on extension functions ("-ext")**

If selected, the stylesheet is allowed to call external Java functions. This does not affect calls on integrated extension functions, including Saxon and EXSLT extension functions. This option is useful when loading an untrusted stylesheet (such as from a remote site using http://[URL]). It ensures that the stylesheet cannot call arbitrary Java methods and thus gain privileged access to resources on your machine.

**Enable assertions ("-ea")**

In XSLT 3.0, you can use the `<xsl:assert>` element to make assertions in the form of XPath expressions, causing a dynamic error if the assertion turns out to be false. If this option is selected, XSLT 3.0 `<xsl:assert>` instructions are enabled. If it is not selected (default), the assertions are ignored.

Saxon-EE Options

The advanced options that are specific for Saxon 12.3 Enterprise Edition (EE) are as follows:

**XML Schema version**

Use this option to change the default XML Schema version for this transformation. To change the default XML Schema version globally, open the Preferences dialog box (on page 70) and go to XML > XML Parser > XML Schema and use the Default XML Schema version option (on page 195).

**Validation of the source file ("-val")**

Requests schema-based validation of the source file and of any files read using `document()` or similar functions. It can have the following values:
Oxygen XML Editor Eclipse Plugin 26.0 | 11 - Publishing | 1255

- **Schema validation ("strict")** - This mode requires an XML Schema and allows for parsing the source documents with strict schema-validation enabled.
- **Lax schema validation ("lax")** - If an XML Schema is provided, this mode allows for parsing the source documents with schema-validation enabled but the validation will not fail if, for example, element declarations are not found.
- **Disable schema validation** - This specifies that the source documents should be parsed with schema-validation disabled.

**Validation errors in the result tree treated as warnings ("-outval")**

Normally, if validation of result documents is requested, a validation error is fatal. Selecting this option causes such validation failures to be treated as warnings.

**Write comments for non-fatal validation errors of the result document**

The validation messages for non-fatal errors are written (wherever possible) as a comment in the result document itself.

**Enable streaming mode**

Selecting this option will allow an XSLT to run in streaming mode. It is not selected by default. However, in certain instances, the Saxon XSLT processor may auto detect and use streaming even if this option is not selected.

**Other Options**

**Initializer class**

Equivalent to the `-init` Saxon command-line argument. The value is the name of a user-supplied class that implements the `net.sf.saxon.lib.Initializer` interface. This initializer is called during the initialization process, and may be used to set any options required on the configuration programmatically. It is particularly useful for tasks such as registering extension functions, collations, or external object models, especially in Saxon-HE where the option cannot be set via a configuration file. Saxon only calls the initializer when running from the command line, but the same code may be invoked to perform initialization when running user application code.

**Using Saxon Integrated Extension Functions**

Saxon, the transformation and validation engine used by Oxygen XML Editor Eclipse plugin, can be customized by adding custom functions (called Integrated Extension Functions) that can be called from XPath.

To define such a function, follow these steps:

1. Create a file with a Java class that extends `net.sf.saxon.lib.ExtensionFunctionDefinition`. Here is an example:

```java
private static class ShiftLeft extends ExtensionFunctionDefinition {
    @Override
    public StructuredQName getFunctionQName() {
        // Implementation...
    }
}
```
```java
    public SequenceType[] getArgumentTypes() {
        return new SequenceType[]{SequenceType.SINGLE_INTEGER, SequenceType.SINGLE_INTEGER};
    }

    public SequenceType getResultType(SequenceType[] suppliedArgumentTypes) {
        return SequenceType.SINGLE_INTEGER;
    }

    public ExtensionFunctionCall makeCallExpression() {
        return new ExtensionFunctionCall() {
            public SequenceIterator call(SequenceIterator[] arguments, XPathContext context)
                throws XPathException {
                long v0 = ((IntegerValue)arguments[0].next()).longValue();
                long v1 = ((IntegerValue)arguments[1].next()).longValue();
                long result = v0<<v1;
                return Value.asIterator(Int64Value.makeIntegerValue(result));
            }
        };
    }

2. Compile the class and add it to a JAR file.
3. Add a file called net.sf.saxon.lib.ExtensionFunctionDefinition that contains the fully qualified name of
   the Java class in the META-INF/services/ folder of the JAR file.

   Note:
   To add more function definitions in the same JAR file, you need to add their fully qualified
   names on different lines.

To enable Oxygen XML Editor Eclipse plugin to pick up your custom function definition, the JAR file should be
added to the classpath of the transformer. Here are some possibilities:

- If you develop a framework, you just need to link the JAR file in the Classpath tab (on page 95).
- In a validation scenario (on page 556), you can use the Extensions button to open a dialog box where
  you can add libraries.
- In a transformation scenario, you can use the Extensions button in the XSLT tab (on page 1203) to
  open a dialog box where you can add libraries.
FO Processor Tab (XSLT Transformations)

When you create a new transformation scenario (on page 1201) or edit an existing one (on page 1281), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The FO Processor tab contains the following options:

**Perform FO Processing**

Specifies whether or not an FO processor is applied (either the built-in Apache FOP engine or an external engine defined in Preferences) during the transformation.

**Input**

Choose between the following options to specify which input file to use:

- **XSLT result as input** - The FO processor is applied to the result of the XSLT transformation that is defined in the XSLT tab.
- **XML URL as input** - The FO processor is applied to the input XML file.

**Method**

The output format of the FO processing. The available options depend on the selected processor type.

**Processor**

Specifies the FO processor to be used for the transformation. It can be the built-in Apache FOP processor or an external processor (on page 183).

Output Tab (XSLT Transformations)

When you create a new transformation scenario (on page 1201) or edit an existing one (on page 1281), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The Output tab contains the following options:

**Prompt for file**

At the end of the transformation, a file browser dialog box is displayed for specifying the path and name of the file that stores the transformation result.

**Save As**

The path of the file where the result of the transformation is stored. You can specify the path by using the text field, the Insert Editor Variables (on page 218) button, or the Browse button.

**Open in Browser/System Application**
If selected, Oxygen XML Editor Eclipse plugin automatically opens the result of the transformation in a system application associated with the file type of the result (for example, in Windows PDF files are often opened in Acrobat Reader).

Note:
To set the web browser that is used for displaying HTML/XHTML pages, go to Window > Preferences > General > Web Browser and specify it there.

- **Output file** - When Open in Browser/System Application is selected, you can use this button to automatically open the default output file at the end of the transformation.
- **Other location** - When Open in Browser/System Application is selected, you can use this option to open the file specified in this field at the end of the transformation. You can specify the path by using the text field, the Insert Editor Variables (on page 218) button, or the Browse button.

**Open in editor**

When this is option is selected, at the end of the transformation, the default output file is opened in a new editor panel with the appropriate built-in editor type (for example, if the result is an XML file it is opened in the built-in XML editor, or if it is an XSL-FO file it is opened with the built-in FO editor).

**Show in results view as**

You can choose to view the results in one of the following:

- **XML** - If this is selected, Oxygen XML Editor Eclipse plugin displays the transformation result in an XML viewer panel at the bottom of the application window with syntax highlighting (on page 176).
- **XHTML** - This option is only available if Open in Browser/System Application is not selected. If selected, Oxygen XML Editor Eclipse plugin displays the transformation result in a built-in XHTML browser panel at the bottom of the application window.

**Important:**

When transforming very large documents, you should be aware that selecting this option may result in very long processing times. This drawback is due to the built-in Java XHTML browser implementation. To avoid delays for large documents, if you want to see the XHTML result of the transformation, you should use an external browser by selecting the Open in Browser/System Application option instead.
• **Image URLs are relative to** - If Show in results view as XHTML is selected, this option specifies the path used to resolve image paths contained in the transformation result. You can specify the path by using the text field, the 📖 Insert Editor Variables (on page 218) button, or the 📎 Browse button.

⚠️ **Attention:**
If your input XSLT contains `<xsl:result-document>` elements, then the secondary results will be saved to the specified URIs while the principal result is specified in this **Output** tab. For more information, see: https://www.w3.org/TR/xslt-30/#element-result-document.

## Configuring an XSLT Processor for Generating Output

This section explains how to configure an XSLT processor and extensions for such a processor in Oxygen XML Editor Eclipse plugin.

## Supported XSLT Processors

Oxygen XML Editor Eclipse plugin includes the following XSLT processors:

- **Xalan 2.7.2** - Xalan-Java is an XSLT processor for transforming XML documents into HTML, text, or other XML document types. It implements XSL Transformations (XSLT) Version 1.0 and XML Path Language (XPath) Version 1.0.

- **Saxon 6.5.5** - Saxon 6.5.5 is an XSLT processor that implements the Version 1.0 XSLT and XPath with a number of powerful extensions. This version of Saxon also includes many of the new features that were first defined in the XSLT 1.1 working draft, but for conformance and portability reasons these are not available if the stylesheet header specifies version="1.0".

- **Saxon 12.3 Home Edition (HE), Professional Edition (PE)** - Saxon-HE/PE implements the basic conformance level for XSLT 2.0 / 3.0 and XQuery 1.0. The term **basic XSLT 2.0 / 3.0 processor** is defined in the draft XSLT 2.0 / 3.0 specifications. It is a conformance level that requires support for all features of the language other than those that involve schema processing. The HE product remains open source, but removes some of the more advanced features that are present in Saxon-PE.

- **Saxon 12.3 Enterprise Edition (EE)** - Saxon EE is the schema-aware edition of Saxon and it is one of the built-in processors included in Oxygen XML Editor Eclipse plugin. Saxon EE includes an XML Schema processor, and schema-aware XSLT, XQuery, and XPath processors.

The validation in schema aware transformations is done according to the XML Schema 1.0 or 1.1. This can be configured in Preferences (on page 195).

🔗 **Note:**
Oxygen XML Editor Eclipse plugin implements a Saxon **framework** that allows you to create Saxon configuration files. Two templates are available: Saxon **collection catalog** and Saxon **
configuration. Both of these templates support content completion, element annotation, and attribute annotation.

Note:
Saxon can use the ICU-J localization library (saxon9-icu.jar) to add support for sorting and date/number formatting in a wide variety of languages. This library is not included in the Oxygen XML Editor Eclipse plugin installation kit. However, Saxon will use the default collation and localization support available in the currently used JRE. To enable this capability, follow these steps:

2. Unpack the downloaded archive.
3. Create a new XSLT transformation scenario (or edit an existing one). In the XSLT tab, click the Extensions button to open the list of additional libraries used by the transformation process.
4. Click Add and browse to the folder where you unpacked the downloaded archive and choose the saxon9-icu.jar file.

Note that the saxon9-icu.jar should NOT be added to the application library folder because it will conflict with another version of the ICU-J library that comes bundled with Oxygen XML Editor Eclipse plugin.

• Saxon-CE (Client Edition) is Saxonica's implementation of XSLT 2.0 for use on web browsers. Oxygen XML Editor Eclipse plugin provides support for editing stylesheets that contain Saxon-CE extension functions and instructions. This support improves the validation, content completion, and syntax highlighting.

Note:
Saxon-CE, being JavaScript-based, was designed to run inside a web browser. This means that you will use Oxygen XML Editor Eclipse plugin only for developing the Saxon-CE stylesheet, leaving the execution part to a web browser. See more details about executing such a stylesheet on Saxonica's website.

Note:
A specific template, named Saxon-CE stylesheet, is available in the New from Templates wizard (on page 252).

• Xsltproc (libxslt) - Libxslt is the XSLT C library developed for the Gnome project. Libxslt is based on libxml2, the XML C library developed for the Gnome project. It also implements most of the EXSLT set of processor-portable extensions, functions, and some of Saxon's evaluate and expression extensions.
Oxygen XML Editor Eclipse plugin uses Libxslt through its command-line tool (Xsltproc). Depending on your operating system, you must download the Libxslt libraries on your machine from [http://xmlsoft.org/XSLT/downloads.html](http://xmlsoft.org/XSLT/downloads.html) and place them in a local folder. Then you need to update the PATH environmental variable to contain the parent folder where the xsltproc executable is located.

**Tip:**
As an example, a Windows installation of the Xsltproc engine would follow these steps:

2. Unzip all of them into the same folder of your choice.
3. Edit the PATH environment variable and add the bin folder for all four archives:

   ![Edit environment variable](image)

4. Restart Oxygen XML Editor Eclipse plugin.

**Result:** You can now use the xsltproc processor as an XSLT engine in the XSLT transformation scenario.

**Note:**
The Xsltproc processor can be configured from the XSLTPROC options page (on page 213).

**CAUTION:**
There is a known problem where file paths that contain spaces are not handled correctly in the LIBXML processor. For example, the built-in XML Catalog (on page 2659) files of the built-in document types (DocBook, TEI, DITA, etc.) are not handled properly by LIBXML if Oxygen XML Editor Eclipse plugin is installed in the default location on Windows (C:\Program Files). This is because the built-in XML catalog files are stored in the [OXYGEN_INSTALL_DIR]/frameworks subdirectory of the installation directory, and in this case it contains a space character.
• **MSXML 4.0 (Legacy)** - MSXML 4.0 is available only on Windows platforms. It can be used for transformation (*on page 1201*) and validation of XSLT stylesheets (*on page 655*).

Oxygen XML Editor Eclipse plugin uses the Microsoft XML parser through its command-line tool `msxsl.exe`.

Since `msxsl.exe` is only a wrapper, Microsoft Core XML Services (MSXML) must be installed on the computer. Otherwise, you will get a corresponding warning. You can get the latest Microsoft XML parser from Microsoft web-site.

• **MSXML .NET (Legacy)** - MSXML .NET is available only on Windows platforms. It can be used for transformation (*on page 1201*) and validation of XSLT stylesheets (*on page 655*).

Oxygen XML Editor Eclipse plugin performs XSLT transformations and validations using the .NET Framework XSLT implementation (`System.Xml.Xsl.XslTransform` class) through the `nxslt` command-line utility. The `nxslt` version included in Oxygen XML Editor Eclipse plugin is 1.6.

You should have the .NET Framework version 1.0 already installed on your system. Otherwise, you will get the following warning: `MSXML.NET requires .NET Framework version 1.0 to be installed. Exit code: 128`.

You can get the .NET Framework version 1.0 from the Microsoft website.

• **.NET 1.0 (Legacy)** - A transformer based on the `System.Xml` 1.0 library available in the .NET 1.0 and .NET 1.1 frameworks from Microsoft. It is available only on Windows.

You should have the .NET Framework version 1.0 or 1.1 already installed on your system. Otherwise, you will get the following warning: `MSXML.NET requires .NET Framework version 1.0 to be installed. Exit code: 128`.

You can get the .NET Framework version 1.0 from the Microsoft website.

• **.NET 2.0 (Legacy)** - A transformer based on the `System.Xml` 2.0 library available in the .NET 2.0 Framework from Microsoft. It is available only on Windows.

You should have the .NET Framework version 2.0 already installed on your system. Otherwise, you will get the following warning: `MSXML.NET requires .NET Framework version 2.0 to be installed. Exit code: 128`.

You can get the .NET Framework version 2.0 from the Microsoft website.

**Configuring Custom XSLT Processors**

Oxygen XML Editor Eclipse plugin allows you to configure custom processors to be used for running XSLT and XQuery transformations.

To add a new custom processor, follow these steps:
1. Open the Preferences dialog box (on page 70) and go to XML > XSLT-XQuery > Custom Engines.
2. Click the + New button at the bottom of the dialog box.
3. Configure the parameters for the custom engine (on page 199).
4. Click OK.

Note: You can not use these custom engines in the Debugger perspective (on page 1891).

The output messages of a custom processor are displayed in an output view at the bottom of the application window. If an output message follows the format of an Oxygen XML Editor Eclipse plugin linked message (on page 553), clicking it highlights the location of the message in an editor panel containing the file referenced in the message.

Related Information:
Custom Engines Preferences (on page 199)

Configuring the XSLT Processor Extensions Paths

The Xalan and Saxon processors support the use of extension elements and extension functions. Unlike a literal result element, which the stylesheet simply transfers to the result tree, an extension element performs an action. The extension is usually used because the XSLT stylesheet fails in providing adequate functions for accomplishing a more complex task.

For more information about how to use extensions, see the following links:

- Saxon 6.5.5 - http://saxon.sourceforge.net/saxon6.5.5/extensions.html

To set an XSLT processor extension (a directory or a jar file), use the Extensions button (on page 1203) in the Edit scenario dialog box.

XSL-FO (Apache FOP) Processor for Generating PDF Output

The Oxygen XML Editor Eclipse plugin installation package is distributed with the Apache FOP that is a Formatting Objects processor for transforming your XML documents to PDF. FOP is a print and output independent formatter driven by XSL Formatting Objects. FOP is implemented as a Java application that reads a formatting object tree and renders the resulting pages to a specified output.

To see the version of the built-in XSL-FO processor for your installation, go to Help > About > Libraries and search for Apache FOP.

Other FO processors can be configured in the FO Processors preferences page (on page 183).
Add a Font to the Built-in FO Processor - Simple Version

If the font that must be set to Apache FOP is one of the fonts that are installed in the operating system you should follow the next steps for creating and setting a FOP configuration file that looks for the font that it needs in the system fonts. It is a simplified version of the procedure for setting a custom font in Apache FOP (on page 1265).

1. Register the font in FOP configuration. (This is not necessary for DITA PDF transformations, skip to the next step)
   a. Create a FOP configuration file that specifies that FOP should look for fonts in the installed fonts of the operating system.

```
<fop version="1.0">
  <renderers>
    <renderer mime="application/pdf">
      <fonts>
        <auto-detect/>
      </fonts>
    </renderer>
  </renderers>
</fop>
```

b. Open the Preferences dialog box (on page 70), go to XML > PDF Output > FO Processors, and enter the path of the FOP configuration file in the Configuration file text field.

2. Set the font on the document content.
   This is done usually with XSLT stylesheet parameters and depends on the document type processed by the stylesheet.
   ◦ For DocBook documents you can start with the built-in scenario called DocBook PDF, edit the XSLT parameters (on page 1201) and set the font name (for example, Arial Unicode MS) to the body.font.family and title.font.family parameters.
   ◦ For TEI documents you can start with the built-in scenario called TEI PDF, edit the XSLT parameters (on page 1201) and set the font name (for example, Arial Unicode MS) to the bodyFont and sansFont parameters.
   ◦ For DITA transformations to PDF using DITA-OT you should modify the following two files:
     - `DITA-OT-DIR/plugins/org.dita.pdf2/cfg/fo/font-mappings.xml`
       The `<font-face>` element included in each `<physical-font>` element that has the `charset="default"` attribute must contain the name of the font (for example, Arial Unicode MS)
     - `DITA-OT-DIR/plugins/org.dita.pdf2.fop/fop/conf/fop.xconf`
       An `<auto-detect>` element must be inserted in the `<fonts>` element, which is inside the `<renderer>` element that has the `mime="application/pdf"` attribute:

```
<renderer mime="application/pdf">
  . . .
```
Add a Font to the Built-in FO Processor - Advanced Version

If an XML document is transformed to PDF using the built-in Apache FOP processor but it contains some Unicode characters that cannot be rendered by the default PDF fonts, then a special font that is capable to render these characters must be configured and embedded in the PDF result.

Important:
On Windows, fonts are located into the C:\Windows\Fonts directory. On macOS, they are placed in /Library/Fonts. To install a new font on your system, it is enough to copy it in the Fonts directory. If a special font is installed in the operating system, there is a simple way of telling FOP to look for it. See the simplified procedure for adding a font to FOP (on page 1264).

1. Locate the font.
   First, find out the name of a font that has the glyphs for the special characters you used. One font that covers most characters, including Japanese, Cyrillic, and Greek, is Arial Unicode MS.

2. Register the font in the FOP configuration.

   Note:
   DITA PDF transformations have their own fop.xconf (DITA-OT-DIR/plugins/org.dita.pdf2.fop/fop/conf/fop.xconf). If the font is not installed in the system, it needs to be referenced in the fop.xconf.

   a. For information about registering the font in the FOP Configuration, see: https://xmlgraphics.apache.org/fop/2.3/fonts.html.
   b. Open the Preferences dialog box (on page 70), go to XML > PDF Output > FO Processors, and enter the path of the FOP configuration file in the Configuration file text field.

3. Set the font on the document content.
   This is usually done with XSLT stylesheet parameters and depends on the document type processed by the stylesheet.

   DocBook Example: For DocBook documents, you can start with the built-in scenario called DocBook PDF, edit the XSLT parameters (on page 1201), and set the font name (for example, Arialuni) to the body.font.family and title.font.family parameters.
**TEI Example:** For TEI documents, you can start with the built-in scenario called **TEI PDF**, edit the **XSLT parameters (on page 1201)**, and set the font name (for example, Arial uni) to the **bodyFont** and **sansFont** parameters.

**DITA Example:** For DITA to PDF transformations using DITA-OT modify the following two files:

- **DITA-OT-DIR/plugins/org.dita.pdf2/cfg/fo/font-mappings.xml** - The `<font-face>` element included in each `<physical-font>` element that has the `char-set="default"` attribute must contain the name of the font.
- **DITA-OT-DIR/plugins/org.dita.pdf2/fop/conf/fop.xconf** - A `<font>` element must be inserted in the `<fonts>` element, which is inside the `<renderer>` element that has the `mime="application/pdf"` attribute.

For more information, see: [https://xmlgraphics.apache.org/fop/2.1/fonts.html](https://xmlgraphics.apache.org/fop/2.1/fonts.html).

### Adding Libraries to the Built-in FO Processor (XML with XSLT and FO)

Starting with Oxygen XML Editor Eclipse plugin version 20.0, both hyphenation and PDF image support are enabled by default in the built-in Apache FO processor. For older version of Oxygen XML Editor Eclipse plugin, use the following procedures to enable such support.

#### Adding Hyphenation Support for XML with XSLT Transformation Scenarios

If you want to add newer hyphenation libraries or you are using an older version of Oxygen XML Editor Eclipse plugin, follow this procedure:

1. Create a folder called `fop` in the `[OXYGEN_INSTALL_DIR]/lib` folder.
2. Download the compiled **JAR (on page 2655) from OFFO**.
3. Copy the `fop-hyph.jar` file into the `[OXYGEN_INSTALL_DIR]/lib/fop` folder.
4. Restart Oxygen XML Editor Eclipse plugin.

#### Adding Support for PDF Images

To add support for PDF images in an older version of Oxygen XML Editor Eclipse plugin, follow these steps:

1. Create a folder called `fop` in the `[OXYGEN_INSTALL_DIR]/lib` folder.
2. Download the **fop-pdf-images JAR libraries**.
3. Copy the libraries into the `[OXYGEN_INSTALL_DIR]/lib/fop` folder.
4. Restart Oxygen XML Editor Eclipse plugin.

### How to Enable Debugging for FO Processor Transformations

If you encounter errors when running PDF transformations that use an FO processor, it is possible to enable debugging/logging to help you identify the problem. To enable debugging/logging for FO processing, follow this procedure:
1. Locate and edit the following configuration file: 
   \[OXYGEN_INSTALL_DIR\]/tools/config/logback.xml.

   **Note:**
   You need write access to this folder, so if you do not have administrator permissions, you might first need to copy the file to another location where you have write access.

2. Edit the `<root>` element (inside the `<configuration>` element), change its level to `debug`, and save the file.
3. Restart Oxygen XML Editor Eclipse plugin and re-run the transformation.

   **Tip:**
   To make it easier to analyze the data in the logs, it is recommended that you use a small input file when trying to reproduce the problem.

4. Once you are finished with the debugging session, remember to edit the logback.xml file and change the `<root>` element back to its original value. Otherwise, performance could be affected.

**XProc Transformation**

This type of transformation specifies the parameters and location of an XProc script.

A sequence of transformations described by an XProc script can be executed with an XProc transformation scenario. To create an XProc transformation scenario, use one of the following methods:

- Use the Configure Transformation Scenario(s) (Alt + Shift + T, C (Command + Option + T, C on macOS)) action from the toolbar or the XML menu. Then click the New button and select XProc transformation.
- Go to Window > Show View and select Transformation Scenarios to display this view (on page 1290). Click the New Scenario drop-down menu button and select XProc transformation.

Both methods open the New Scenario dialog box.

The upper part of the dialog box allows you to specify the Name of the transformation scenario.

The lower part of the dialog box contains several tabs that allow you to configure the options that control the transformation.

**Related Information:**

- Integrating an External XProc Engine (on page 1271)
- Editing XProc Scripts (on page 937)
XProc Tab

When you create a new transformation scenario (on page 1201) or edit an existing one (on page 1281), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The XProc tab contains the following options:

**XProc URL**

Specify the source XProc file to be used by the transformation. You can specify the path by using the text field, its history drop-down, the Insert Editor Variables (on page 218) button, or the browsing actions in the Browse drop-down list. This URL is resolved through the catalog resolver. If the catalog does not have a mapping for the URL, the file is used directly from its remote location.

**Processor**

Allows you to select the XProc engine to be used for the transformation. You can select the Add-on for Calabash XProc engine or a custom engine that is configured in the XProc Preferences page (on page 197).

Inputs Tab (XProc Transformations)

When you create a new transformation scenario (on page 1201) or edit an existing one (on page 1281), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The Inputs tab contains a list with the ports that the XProc script uses to read input data. Use the Filter text box to search for a specific term in the entire ports collection.

Each input port has an assigned name in the XProc script. The XProc engine reads data from the URL specified in the URL column.

The following actions are available for managing the input ports:

**New**

Opens an Edit dialog box that allows you to add a new port and its URL. The built-in editor variables (on page 218) and custom editor variables (on page 227) can be used to specify the URL.

**Edit**

Opens an Edit dialog box that allows you to modify the selected port and its URL. The built-in editor variables (on page 218) and custom editor variables (on page 227) can be used to specify the URL.

**Delete**

Removes the selected port from the list. It is available only for new ports that have been added to the list.
Parameters Tab (XProc Transformations)

When you create a new transformation scenario (on page 1201) or edit an existing one (on page 1281), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The Parameters tab presents a list of ports and parameters collected from the XProc script. The tab is divided into three sections:

**List of Ports**

In this section, you can use the New and Delete buttons to add or remove ports.

**List of Parameters**

This section presents a list of parameters for each port and includes columns for the parameter name, namespace URI, and its value. Use the Filter text box to search for a specific term in the entire parameters collection. You can use the New and Delete buttons to add or remove parameters. You can edit the value of each cell in this table by double-clicking the cell. You can also sort the parameters by clicking the column headers.

**Editor Variable Information**

The built-in editor variables (on page 218) and custom editor variables (on page 227) can be used for specifying the URI. The message pane at the bottom of the dialog box provides more information about the editor variables that can be used.

Outputs Tab (XProc Transformations)

When you create a new transformation scenario (on page 1201) or edit an existing one (on page 1281), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The Outputs tab displays a list of output ports (along with the URL) collected from the XProc script. Use the Filter text box to search for a specific term in the entire ports collection. You can also sort the columns by clicking the column headers.

The following actions are available for managing the output ports:

**New**

Opens an Edit dialog box that allows you to add a new output port and its URL. An editor variable (on page 218) can be inserted for the URL by using the Insert Editor Variables button. There is also a Show in transformation results view option that allows you to select whether or not the results will be displayed in the output Results view (on page 334).

**Edit**

Opens an Edit dialog box that allows you to edit an existing output port and its URL. An editor variable (on page 218) can be inserted for the URL by using the Insert Editor Variables button.
button. There is also a Show in transformation results view option that allows you to select whether or not the results will be displayed in the output Results view (on page 334).

Delete

Removes the selected output port from the list. It is available only for new ports that have been added to the list.

Additional options that are available at the bottom of this tab include:

Open in Editor

If this option is selected, the XProc transformation result is automatically opened in an editor panel.

Open in Browser/System Application

If this option is selected, you can specify a file to be opened at the end of the XProc transformation in the browser or system application that is associated with the file type. You can specify the path by using the text field, its history drop-down, the Insert Editor Variables (on page 218) button, or the browsing actions in the Browse drop-down list.

Results

The result of the XProc transformation can be displayed as a sequence in an output view with two sections:

- A list with the output ports on the left side.
- The content that correspond to the selected output port on the right side.

Figure 420. XProc Transformation Results View

Options Tab (XProc Transformations)

When you create a new transformation scenario (on page 1201) or edit an existing one (on page 1281), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The Options tab displays a list of the options collected from the XProc script. The tab is divided into two sections:
List of Options

This section presents a list of options and includes columns for the option name, namespace URI, and its value. Use the Filter text box to search for a specific term in the entire options collection. You can use the New and Delete buttons to add or remove options. You can edit the value of each cell in this table by double-clicking the cell. You can also sort the parameters by clicking the column headers. The names of edited options are displayed in bold.

Editor Variable Information

The built-in editor variables (on page 218) and custom editor variables (on page 227) can be used for specifying the URI. This section provides more information about the editor variables that can be used.

Calabash XProc Processor for Generating PDF Output

To generate PDF output from your XProc pipeline (when using the Calabash XProc processor), follow these steps:

2. Uncomment the \<system-property name="com.xmlcalabash.fo-processor" value="com.xmlcalabash.util.FoXEP"/> System property.
3. Uncomment the \<system-property name="com.renderx.xep.CONFIG" file="../../../tools/xep/xep.xml"/> System property. Edit the @file attribute to point to the configuration file that is usually located in the XEP installation folder.
4. Uncomment the references to the XEP libraries. Edit them to point to the matching library names from the XEP installation directory.
5. Restart Oxygen XML Editor Eclipse plugin.

Integrating an External XProc Engine

Oxygen XML Editor Eclipse plugin includes a bundled version of the Calabash XProc engine that can be used for XProc transformations and validation, but you can also integrate other external XProc engines. When you edit an XProc transformation scenario, there is a Processor drop-down menu where you can select the XProc engine to be used for the transformation.

If you do not need the external XProc engine to be used for automatic validation or pass parameters/ports and it is not Java-based, you can simply add the external engine by using the XProc preferences page (on page 197). Otherwise, if the external engine is Java-based, or it has validation support, or it can receive parameters or ports passed from the transformation, you need to integrate it using the plugin extension procedure below.

For example, there is a public project on GitHub that is an implementation for integrating Morgana XProc with Oxygen XML Editor Eclipse plugin: https://github.com/xml-project/support-for-xmleditor. Also, the Javadoc documentation of the XProc API is available for download from the application website as a zip file: xprocAPI.zip.

To create an XProc integration project, follow these steps:
1. Move the `oxygen.jar` file from `{OXYGEN_INSTALL_DIR}/lib` to the `lib` folder of your project.
2. Implement the `ro.sync.xml.transformer.xproc.api.XProcTransformerInterface` interface.
3. Create a Java archive (JAR) (on page 2655) from the classes you created.
4. Create an `engine.xml` file according to the `engine.dtd` file. The attributes of the `<engine>` element are as follows:
   a. `name` - The name of the XProc engine.
   b. `description` - A short description of the XProc engine.
   c. `class` - The complete name of the class that implements `ro.sync.xml.transformer.xproc.api.XProcTransformerInterface`.
   d. `version` - The version of the integration.
   e. `engineVersion` - The version of the integrated engine.
   f. `vendor` - The name of the vendor / implementer.
   g. `supportsValidation` - true if the engine supports validation (otherwise, false).

   The `<engine>` element has only one child, `<runtime>`. The `<runtime>` element contains several `<library>` elements with the `@name` attribute containing the relative or absolute location of the libraries necessary to run this integration.

5. Create a new folder (for example, named `MyXprocEngine`) and place the `engine.xml` and all the libraries necessary to run the new integration in that folder.
6. Place that new folder (e.g. `MyXprocEngine`) inside a new plugin folder. This new plugin folder should also contain a `plugin.xml` file that points to the new engine folder (e.g. `MyXprocEngine`).

   The `plugin.xml` file would look like this:

   ```xml
   <plugin
     id="morgana.xproc.addon"
     name="Contribute Morgana XProc"
     description="Contribute Morgana XProc"
     version="1.0"
     vendor="Syncro Soft"
     class="ro.sync.exml.plugin.Plugin"
     classLoaderType="preferReferencedResources">
     <extension type="AdditionalXProcEngine" path="MyXprocEngine/"/>
   </extension>
   </plugin>
   ```

**Related Information:**
- Editing XProc Scripts (on page 937)
- Creating an XProc Transformation Scenario (on page 1267)

### XQuery Transformation

This type of transformation specifies the parameters and location of an XML source that the edited XQuery file is applied on.
To create an XQuery transformation scenario, use one of the following methods:

- Use the Configure Transformation Scenario(s) (Alt + Shift + T, C (Command + Option + T, C on macOS)) action from the toolbar or the XML menu. Then click the New button and select XQuery transformation.
- Go to Window > Show View and select Transformation Scenarios to display this view (on page 1290). Click the New Scenario drop-down menu button and select XQuery transformation.

Both methods open the New Scenario dialog box.

The upper part of the dialog box allows you to specify the Name of the transformation scenario.

The lower part of the dialog box contains several tabs that allow you to configure the options that control the transformation.

**XQuery Tab**

When you create a new transformation scenario (on page 1201) or edit an existing one (on page 1281), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The XQuery tab contains the following options:

**XML URL**

Specifies the source XML file. You can specify the path by using the text field, its history drop-down, the Insert Editor Variables (on page 218) button, or the browsing actions in the Browse drop-down list. This URL is resolved through the catalog resolver. If the catalog does not have a mapping for the URL, then the file is used directly from its remote location.

**Note:**

If the transformer engine is Saxon 9.x and a custom URI resolver is configured in the advanced Saxon preferences page (on page 212), the XML input of the transformation is passed to that URI resolver.

**XQuery URL**

Specifies the source XQuery file to be used for the transformation. You can specify the path by using the text field, its history drop-down, the Insert Editor Variables (on page 218) button, or the browsing actions in the Browse drop-down list. This URL is resolved through the
catalog resolver. If the catalog does not have a mapping for the URL, the file is used directly from its remote location.

**Transformer**

This drop-down menu presents all the transformation engines available to Oxygen XML Editor Eclipse plugin for performing a transformation. These include the built-in engines and the external engines defined in the Custom Engines preferences page *(on page 199)*. The engine you choose is used as the default transformation engine. Also, if an XSLT or XQuery document does not have an associated validation scenario, this transformation engine is used in the validation process (if it provides validation support).

‖ Advanced options

Allows you to configure the advanced options of the Saxon HE/PE/EE engine *(on page 1222)* for the current transformation scenario. To configure the same options globally, go to the Saxon-HE/PE/EE preferences page *(on page 210)*. For the current transformation scenario, these **Advanced options** override the options configured in that preferences page.

**Parameters**

Opens the **Configure parameters** dialog box *(on page 1220)* for configuring the XQuery parameters. You can use the buttons in this dialog box to add, edit, or remove parameters. If the XQuery transformation engine is custom-defined, you can not use this dialog box to set parameters. Instead, you can copy all parameters from the dialog box using contextual menu actions and edit the custom XQuery engine to include the necessary parameters in the command line that starts the transformation process.

**Extensions**

Opens a dialog box for configuring the XQuery extension JARS or classes *(on page 1221)* that define extension Java functions or extension XSLT elements used in the transformation.

**XQuery Parameters**

The global parameters of the XQuery file used in a transformation scenario can be configured by using the **Parameters** button in the **XQuery** tab.

The resulting dialog box includes a table that displays all the parameters of the current XQuery file, along with their descriptions and current values. You can also add, edit, and remove parameters, and use the **Filter** text box to search for a specific term in the entire parameters collection. Note that edited parameters are displayed with their name in bold.

If the **XPath** column is selected, the parameter value is evaluated as an XPath expression before starting the XQuery transformation.

**Example:**

For example, you can use expressions such as:
Note:

1. The `doc` function solves the argument relative to the XQuery file location. You can use full paths or editor variables *(on page 218)* (such as `$cfdu` [current file directory]) to specify other locations: `doc('$cfdu/test.xml')//*`

2. Only XPath functions are allowed.

Below the table, the following actions are available for managing the parameters:

**New**

Opens the **Add Parameter** dialog box that allows you to add a new parameter to the list. An editor variable *(on page 218)* can be inserted in the text box using the **Insert Editor Variables** button. If the **Evaluate as XPath** option is selected, the parameter will be evaluated as an XPath expression.

**Edit**

Opens the **Edit Parameter** dialog box that allows you to edit the selected parameter. An editor variable *(on page 218)* can be inserted in the text box using the **Insert Editor Variables** button. If the **Evaluate as XPath** option is selected, the parameter will be evaluated as an XPath expression.

**Unset**

Resets the selected parameter to its default value. Available only for edited parameters with set values.

**Delete**

Removes the selected parameter from the list. It is available only for new parameters that have been added to the list.

The bottom panel presents the following:

- The default value of the parameter selected in the table.
- A description of the parameter, if available.
- The system ID of the stylesheet that declares it.

**Related Information:**

Editor Variables *(on page 218)*
XQuery Extensions

The Extensions button is used to specify the JAR (on page 2655) and classes that contain extension functions called from the XQuery file of the current transformation scenario. You can use the Add, Edit, and Remove buttons to configure the extensions.

An extension function called from the XQuery file of the current transformation scenario will be searched, in the specified extensions, in the order displayed in this dialog box. To change the order of the items, select the item to be moved and click the Move up or Move down buttons.

Advanced Saxon HE/PE/EE XQuery Transformation Options

The XQuery transformation scenario allows you to configure advanced options that are specific for the Saxon HE (Home Edition), PE (Professional Edition), and EE (Enterprise Edition) engines. They are the same options as those in the Saxon HE/PE/EE preferences page (on page 204) but they are configured as a specific set of transformation options for each transformation scenario, while the values set in the preferences page apply as global options. The advanced options configured in a transformation scenario override the global options defined in the preferences page.

Saxon-HE/PE/EE Options

The advanced options for Saxon 12.3 Home Edition (HE), Professional Edition (PE), and Enterprise Edition (EE) are as follows:

Use a configuration file ("-config")

Sets a Saxon 12.3 configuration file that is used for XQuery transformation and validation scenarios.

Enable Optimizations ("-opt")

This option is selected by default, which means that optimization is enabled. If not selected, the optimization is suppressed, which is helpful when reducing the compiling time is important, optimization conflicts with debugging, or optimization causes extension functions with side-effects to behave unpredictably.

Use linked tree model ("-tree:linked")

This option activates the linked tree model.

Strip whitespaces ("-strip")

Specifies how the strip whitespaces operation is handled. You can choose one of the following values:

- All ("all") - Strips all whitespace text nodes from source documents before any further processing, regardless of any @xml:space attributes in the source document.
- Ignore ("ignorable") - Strips all ignorable whitespace text nodes from source documents before any further processing, regardless of any @xml:space attributes in the source
document. Whitespace text nodes are ignorable if they appear in elements defined in the DTD or schema as having element-only content.

- **None** ("none") - Strips no whitespace before further processing.

**Enable profiling 
(“-TP”)**

If selected, profiling of the execution time in a query is enabled. The corresponding text field is used to specify the path to the output file where the profiling information will be saved. As long as the option is selected, and the output file specified, it will gather timed tracing information and create a profile report to the specified file.

**Note:**
The profiling support works only if the **Present as a sequence** transformation option (on page 1225) is not set.

**Saxon-PE/EE Options**

The following advanced options are specific for Saxon 12.3 Professional Edition (PE) and Enterprise Edition (EE) only:

- **Allow calls on extension functions ("-ext")**
  
  If selected, calls on external functions are allowed. Selecting this option is not recommended in an environment where untrusted stylesheets may be executed. It also disables user-defined extension elements and the writing of multiple output files, both of which carry similar security risks.

**Saxon-EE Options**

The advanced options that are specific for Saxon 12.3 Enterprise Edition (EE) are as follows:

- **Validation of the source file ("-val")**
  
  Requests schema-based validation of the source file and of any files read using `document()` or similar functions. It can have the following values:

  - **Schema validation ("strict")** - This mode requires an XML Schema and allows for parsing the source documents with strict schema-validation enabled.
  
  - **Lax schema validation ("lax")** - If an XML Schema is provided, this mode allows for parsing the source documents with schema-validation enabled but the validation will not fail if, for example, element declarations are not found.
  
  - **Disable schema validation** - This specifies that the source documents should be parsed with schema-validation disabled.

- **Validation errors in the result tree treated as warnings ("-outval")**
  
  Normally, if validation of result documents is requested, a validation error is fatal. Selecting this option causes such validation failures to be treated as warnings.
Write comments for non-fatal validation errors of the result document

The validation messages for non-fatal errors are written (wherever possible) as a comment in the result document itself.

Enable XQuery update (“-update:(on|off)“)

This option controls whether or not XQuery update syntax is accepted. The default value is off.

Backup files updated by XQuery (“-backup:(on|off)“)

If selected, backup versions for any XML files updated with an XQuery Update are generated. This option is available when the Enable XQuery update option is selected.

Other Options

Initializer class

Equivalent to the -init Saxon command-line argument. The value is the name of a user-supplied class that implements the net.sf.saxon.lib.Initializer interface. This initializer is called during the initialization process, and may be used to set any options required on the configuration programmatically. It is particularly useful for tasks such as registering extension functions, collations, or external object models, especially in Saxon-HE where the option cannot be set via a configuration file. Saxon only calls the initializer when running from the command line, but the same code may be invoked to perform initialization when running user application code.

FO Processor Tab (XQuery Transformations)

When you create a new transformation scenario (on page 1201) or edit an existing one (on page 1281), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The FO Processor tab contains the following options:

Perform FO Processing

Specifies whether or not an FO processor is applied (either the built-in Apache FOP engine or an external engine defined in Preferences) during the transformation.

Input

Choose between the following options to specify which input file to use:

- XQuery result as input - The FO processor is applied to the result of the XQuery transformation that is defined in the XQuery tab.
- XML URL as input - The FO processor is applied to the input XML file.

Method

The output format of the FO processing. The available options depend on the selected processor type.

Processor
Specifies the FO processor to be used for the transformation. It can be the built-in Apache FOP processor or an external processor (on page 183).

**Output Tab (XQuery Transformations)**

When you create a new transformation scenario (on page 1201) or edit an existing one (on page 1281), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The **Output** tab contains the following options:

- **Present as a sequence**
  Selecting this option will reduce the time necessary to fetch the full results, as it will only fetch the first chunk of the results.

- **Prompt for file**
  At the end of the transformation, a file browser dialog box is displayed for specifying the path and name of the file that stores the transformation result.

- **Save As**
  The path of the file where the result of the transformation is stored. You can specify the path by using the text field, the Insert Editor Variables (on page 218) button, or the Browse button.

- **Open in Browser/System Application**
  If selected, Oxygen XML Editor Eclipse plugin automatically opens the result of the transformation in a system application associated with the file type of the result (for example, in Windows PDF files are often opened in Acrobat Reader).

**Note:**
To set the web browser that is used for displaying HTML/XHTML pages, go to Window > Preferences > General > Web Browser and specify it there.

- **Output file** - When Open in Browser/System Application is selected, you can use this button to automatically open the default output file at the end of the transformation.
- **Other location** - When Open in Browser/System Application is selected, you can use this option to open the file specified in this field at the end of the transformation. You can specify the path by using the text field, the Insert Editor Variables (on page 218) button, or the Browse button.

**Open in editor**
When this option is selected, at the end of the transformation, the default output file is opened in a new editor panel with the appropriate built-in editor type (for example, if the result is an XML file it is opened in the built-in XML editor, or if it is an XSL-FO file it is opened with the built-in FO editor).

**Show in results view as**

You can choose to view the results in one of the following:

- **XML** - If this is selected, Oxygen XML Editor Eclipse plugin displays the transformation result in an XML viewer panel at the bottom of the application window with syntax highlighting (on page 176).

- **XHTML** - This option is only available if Open in Browser/System Application is not selected. If selected, Oxygen XML Editor Eclipse plugin displays the transformation result in a built-in XHTML browser panel at the bottom of the application window.

**Important:**

When transforming very large documents, you should be aware that selecting this option may result in very long processing times. This drawback is due to the built-in Java XHTML browser implementation. To avoid delays for large documents, if you want to see the XHTML result of the transformation, you should use an external browser by selecting the Open in Browser/System Application option instead.

- **Image URLs are relative to** - If Show in results view as XHTML is selected, this option specifies the path used to resolve image paths contained in the transformation result. You can specify the path by using the text field, the Insert Editor Variables button, or the Browse button.

**SQL Transformation**

This type of transformation specifies a database connection for the database server that runs the SQL file associated with the scenario. The data processed by the SQL script is located in the database.

To create an SQL transformation scenario, use one of the following methods:

- Use the Configure Transformation Scenario(s) (Alt + Shift + T, C (Command + Option + T, C on macOS)) action from the toolbar or the XML menu. Then click the New button and select SQL transformation.

- Go to Window > Show View and select Transformation Scenarios to display this view (on page 1290). Click the New Scenario drop-down menu button and select SQL transformation.

Both methods open the New Scenario dialog box. This dialog box allows you to configure the following options that control the transformation:

**Name**
The unique name of the SQL transformation scenario.

**SQL URL**

Allows you to specify the URL of the SQL script. You can specify the path by using the text field, its history drop-down, the Insert Editor Variables (on page 218) button, or the browsing actions in the Browse drop-down list.

**Connection**

Allows you to select a connection from a drop-down list. To configure a connection, use the Advanced options button to open the Data Source preferences page (on page 74).

**Parameters**

Allows you to add or configure parameters for the transformation.

**Editing a Transformation Scenario**

Editing a transformation scenario is useful if you need to configure some of its parameters.

*Note:*

Since transformation scenarios that are associated with built-in frameworks (on page 2655) are read-only, to edit one of these scenarios you will need to duplicate it and edit the duplicated scenario (on page 1283).

To configure an existing transformation scenario, follow these steps:

1. Select the Configure Transformation Scenario(s) (Alt + Shift + T, C (Command + Option + T, C on macOS)) action from the toolbar or the XML menu.

   **Step Result:** The Configure Transformation Scenario(s) dialog box (on page 1284) is opened.

2. Select the particular transformation scenario and click the Edit button at the bottom of the dialog box or from the contextual menu.

   **Tip:**

   You could also select the scenario and the Edit button in the Transformation Scenarios view (on page 1290) to achieve the same result.

   **Result:** This will open an Edit scenario configuration dialog box that allows you to configure various options in several tabs, depending on the type of transformation scenario that was selected.
Transformation Types

The Configure Transformation Scenario(s) dialog box (on page 1284) contains a Type column that shows you the transformation type for each of the listed scenarios. Each type of transformation contains some tabs with various configuration options.

The following is a list of the transformation types and their particular tabs (click the name of each tab below to see details about all the options that are available):

- **DITA-OT** - This type of transformation includes configurable options in the following tabs:
  - Templates Tab (on page 2528)
  - FO Processor Tab (on page 2532) (Available for PDF output)
  - Parameters Tab (on page 2534)
  - Filters Tab (on page 2536)
  - Advanced Tab (on page 2537)
  - Output Tab (on page 2540)

- **ANT** - This type of transformation includes configurable options in the following tabs:
  - Options Tab (on page 1245)
  - Parameters Tab (on page 1246)
  - Output Tab (on page 1247)

- **XSLT** - This type of transformation includes configurable options in the following tabs:
  - XSLT Tab (on page 1202)
  - FO Processor Tab (on page 1210)
  - Output Tab (on page 1211)

- **XProc** - This type of transformation includes configurable options in the following tabs:
  - XProc Tab (on page 1268)
  - Inputs Tab (on page 1268)
  - Parameters Tab (on page 1269)
Duplicating a Transformation Scenario

Duplicating a transformation scenario is useful for creating a scenario that is similar to an existing one or to edit a built-in transformation scenario.

To configure an existing transformation scenario, follow these steps:

1. Select the Configure Transformation Scenario(s) (Alt + Shift + T, C (Command + Option + T, C on macOS)) action from the toolbar or the XML menu.

   **Step Result:** The Configure Transformation Scenario(s) dialog box (on page 1284) is opened.

2. Select the particular transformation scenario and click the Duplicate button at the bottom of the dialog box or from the contextual menu.

   **Tip:**
   You could also select the scenario and the Duplicate button in the Transformation Scenarios view (on page 1290) to achieve the same result.

**Result:** This will open an Edit scenario configuration dialog box that allows you to configure various options in several tabs, depending on the type of transformation scenario that was selected. For information about all the specific options in the various tabs, see the Transformation Types section (on page 1282).

**Related Information:**
Creating New Transformation Scenarios (on page 1201)
Editing a Transformation Scenario (on page 1281)

Applying Associated Transformation Scenarios

If you have associated transformation scenarios for the current document (in the Configure Transformation Scenario(s) dialog box (on page 1284) or Transformation Scenarios view (on page 1290)), Oxygen XML

---

- Outputs Tab (on page 1269)
- Options Tab (on page 1270)
- **XQuery** - This type of transformation includes configurable options in the following tabs:
  - XQuery Tab (on page 1219)
  - FO Processor Tab (on page 1224)
  - Output Tab (on page 1225)
Editor Eclipse plugin included an **Apply Transformation Scenario(s)** action that allows you to quickly apply the associated transformation scenarios on the current document. Note that if an association is not detected, this action will open the **Configure Transformation Scenario(s)** dialog box (on page 1284) where you can choose the scenarios you want to apply.

The **Apply Transformation Scenario(s)** action can be initiated from any of the following methods:

- Use the **Alt + Shift + T, T (Command + Option + T, T on macOS)** keyboard shortcut.
- Click the **Apply Transformation Scenario(s)** button on the main toolbar.
- Click the **Apply Transformation Scenario(s)** button on the toolbar in the **Transformation Scenarios view (on page 1290)**.
- Right-click a file in the **Project Explorer view (on page 268)** and select **Transform > Apply Transformation Scenario(s)**.
- Use the **Apply Associated** button in the **Configure Transformation Scenario(s)** dialog box (on page 1284).

**Related Information:**
- Creating New Transformation Scenarios (on page 1201)
- Editing a Transformation Scenario (on page 1281)
- Configure Transformation Scenario(s) Dialog Box (on page 1284)
- Transformation Scenarios View (on page 1290)

**Configure Transformation Scenario(s) Dialog Box**

You can use the **Configure Transformation Scenarios(s)** dialog box for editing existing transformation scenarios (on page 1281) or creating new ones (on page 1201).

To open this dialog box, use the **Configure Transformation Scenario(s) (Alt + Shift + T, C (Command + Option + T, C on macOS))** action from the toolbar or the **XML** menu.
Figure 422. Configure Transformation Scenario(s) Dialog Box

The dialog box includes the following options and features:

**Search Filter Field**

You can begin typing text in the search field at the top of the dialog box to filter the scenarios shown in the table below this field.

**Settings**

Use this drop-down to access the following options:

- **Show all scenarios**
  Select this option to display all the available scenarios, regardless of the document they are associated with.

- **Show only the scenarios available for the editor**
  Select this option to only display the scenarios that Oxygen XML Editor Eclipse plugin can apply for the current document type.

- **Show associated scenarios**
  Select this option to only display the scenarios associated with the document you are editing.

- **Import scenarios**
This option opens the **Import scenarios** dialog box that allows you to select the `scenarios` file that contains the scenarios you want to import. If one of the scenarios you import is identical to an existing scenario, Oxygen XML Editor Eclipse plugin ignores it. If a conflict appears (an imported scenario has the same name as an existing one), you can choose between two options:

- Keep or replace the existing scenario.
- Keep both scenarios.

**Note:**

When you keep both scenarios, Oxygen XML Editor Eclipse plugin adds `imported` to the name of the imported scenario.

Export selected scenarios

Use this option to export selected scenarios individually. Oxygen XML Editor Eclipse plugin creates a `scenarios` file that contains the exported scenarios. This is useful if you want to share scenarios with others or export them to another computer.

Scenarios Table Section

The middle section of the dialog box is a table that displays the scenarios that you can apply to the current document. The table includes following sortable columns:

- **Association** - The checkboxes in this column mark whether or not a transformation scenario is associated with the current document.
- **Scenario** - This column presents the names of the transformation scenarios.
- **Type** - If the **Show Type** contextual menu option is selected, this column displays the type of the transformation scenario. For further details about the types of transformation scenarios that are available in Oxygen XML Editor Eclipse plugin, see the Transformation Types section (on page 1282).

If you right-click in the header area, the following options are accessible:

**Show Type**

Use this option to display the transformation type of each scenario.

**Show Storage**

Use this option to display the storage location of the scenarios.

**Group by Type**

Select this option to group the scenarios by their type.

**Group by Storage**

Select this option to group the scenarios by their storage location.
Ungroup all

Select this option to ungroup all the scenarios.

Reset Layout

Select this option to restore the default settings of the layout.

If you right-click any particular transformation scenario, the following actions are accessible:

Edit

This button opens the Edit Scenario configuration dialog box (on page 1281) that allows you to configure the options of the transformations scenario.

Duplicate

Use this button to create a duplicate transformation scenario (on page 1283).

Remove

Use this button to remove custom transformation scenarios.

Import scenarios

This option opens the Import scenarios dialog box that allows you to select the scenarios file that contains the scenarios you want to import. If one of the scenarios you import is identical to an existing scenario, Oxygen XML Editor Eclipse plugin ignores it. If a conflict appears (an imported scenario has the same name as an existing one), you can choose between two options:

• Keep or replace the existing scenario.
• Keep both scenarios.

Note:

When you keep both scenarios, Oxygen XML Editor Eclipse plugin adds imported to the name of the imported scenario.

Export selected scenarios

Use this option to export selected scenarios individually. Oxygen XML Editor Eclipse plugin creates a scenarios file that contains the exported scenarios. This is useful if you want to share scenarios with others or export them to another computer.

Bottom Section

The bottom section of the dialog box contains the following actions and options:

New

This button allows you to create a new transformation scenario (on page 1201).
Edit

This button opens the **Edit Scenario** dialog box that allows you to configure the options of the transformations scenario. For information about all the specific options in the various tabs, see the **Transformation Types section (on page 1282)**.

**Note:**

If you try to edit a transformation scenario associated with a defined document type, Oxygen XML Editor Eclipse plugin displays a warning message to inform you that this is not possible and gives you the option to create a duplicate transformation scenario (on page 1283) to edit instead.

Duplicate

Use this button to create a duplicate transformation scenario (on page 1283).

Remove

Use this button to remove transformation scenarios.

**Note:**

Removing scenarios associated with a defined document type is not allowed.

Association follows selection

Select this checkbox to automatically associate selected transformation scenarios with the current document. This option can also be used for multiple selections.

**Note:**

When this option is selected, the **Association** column is hidden.

Run in parallel (DITA-OT or Ant scenarios)

This option is available if you select multiple DITA-OT or Ant type scenarios. Selecting this option results in the transformations being done in parallel, instead of sequentially. It should help to reduce the amount of time it takes for the publishing to finish when transforming large projects.

**Attention:**

If multiple selected DITA-OT scenarios have the same output or temporary files folder, this option is not available since the process would need to read and write content to the same folder in this case.

Associated scenarios section
Displays the scenarios that are associated with the current document. Selecting a checkbox in the **Association** column in the list of scenarios will add that scenario to this section. To remove a scenario from being associated with the current document, simply click the remove icon (×) to the right of the scenario name.

**Save and close**

Saves the current configuration and closes the dialog box.

**Apply associated**

Use this button to apply the associated scenarios and run the transformation on the current document.

**Cancel**

Cancels any changes made in the dialog box and reverts to the previously saved association.

---

**Batch Transformations**

A transformation action can be applied on a batch of selected files from the contextual menu of the **Project Explorer view (on page 272)** without having to open the files involved in the transformation. You can apply the same scenario to a batch of files or multiple scenarios to a single file or batch of files.

1. Select the files you want to transform and from the contextual menu, select **Transform ➤ Configure Transformation Scenario(s)** to choose one or more transformation scenarios to be applied on all the files in the logical folder.

2. Use Oxygen XML Editor Eclipse plugin **editor variables (on page 218)** to specify the input and output files. This ensures that each file from the selected set of resources is processed and that the output is not overwritten by the subsequent processing.

   a. Edit the transformation scenario to make sure the appropriate **editor variable (on page 218)** is assigned for the input file. For example, for a **DocBook PDF transformation**, make sure the **XML URL** input box is set to the **$\{currentFileURL\}** editor variable (on page 224). For a DITA PDF
transformation, make sure the `args.input` parameter is set to the `{$cf}` editor variable (on page 224).

b. Edit the transformation scenario to make sure the appropriate editor variable is assigned for the output file. For example, for an XML transformation with XSLT, switch to the Output tab and set the path of the output file using a construct of editor variables (on page 218), such as `{$cfd}/{$cfn}.html`.

3. Now that the logical folder has been associated with one or more transformation scenarios, whenever you want to apply the same batch transformation, you can select Transform > Transform with from the contextual menu and the same previously associated scenario(s) will be applied.

4. If you want a different type of transformation to be applied to each file inside the logical folder, associate individual scenarios for each file and select Transform > Apply Transformation Scenario(s) from the contextual menu of the logical folder.

Related Information:
Editor Variables (on page 218)

Sharing Transformation Scenarios

The transformation scenarios and their settings can be shared with other users by exporting them to a specialized scenarios file (on page 217) that can then be imported.

Transformation Scenarios View

You can manage the transformation scenarios by using the Transformation Scenarios view. To open this view, select Window > Show View > Transformation Scenarios.
Oxygen XML Editor Eclipse plugin supports multiple scenarios association. To associate multiple scenarios with a document, select the checkboxes in front of each scenario. You can also associate multiple scenarios with a document from the **Configure Transformation Scenario(s)** dialog box *on page 1284*.

By default, Oxygen XML Editor Eclipse plugin presents the items in the following order:

1. Scenarios that match the current framework *on page 2655*.
2. Scenarios that match the current project.
3. Scenarios that match other frameworks.

**Toolbar/Contextual Menu Actions and Options**

The following actions and options are available on the toolbar or in the contextual menu:

- **Apply selected scenarios**
  
  Select this option to run the current transformation scenario.

- **Debug selected scenario**
Select this option to switch to the Debugger perspective (on page 2656) and initialize it with the parameters from the scenario (the XML, XSLT, or XQuery input, the transformation engine, the XSLT parameters).

**New**

This drop-down menu contains a list of the scenarios that you can create (on page 1201). Oxygen XML Editor Eclipse plugin determines the most appropriate scenarios for the current type of file and displays them at the beginning of the list, followed by the rest of the scenarios.

**Duplicate**

Adds a new scenario to the list that is a duplicate of the current scenario. It is useful for creating a scenario that is similar to an existing one.

**Edit**

Opens the dialog box that allows you to configure various options in several tabs, depending on the type of transformation scenario that was selected. For information about all the specific options in the various tabs, see the Transformation Types section (on page 1282).

**Remove**

Removes the current scenario from the list. This action is also available by using the Delete key.

**Import scenarios**

This option opens the Import scenarios dialog box that allows you to select the scenarios file that contains the scenarios you want to import. If one of the scenarios you import is identical to an existing scenario, Oxygen XML Editor Eclipse plugin ignores it. If a conflict appears (an imported scenario has the same name as an existing one), you can choose between two options:

- Keep or replace the existing scenario.
- Keep both scenarios.

**Note:**

When you keep both scenarios, Oxygen XML Editor Eclipse plugin adds imported to the name of the imported scenario.

**Export selected scenarios**

Use this option to export transformation and validation scenarios individually. Oxygen XML Editor Eclipse plugin creates a scenarios file that contains the scenarios that you export.

**Settings**

This drop-down menu allows you to configure the following options (many of these options are also available if you right-click the name of a column):

- Show all scenarios
Select this option to display all the available scenarios, regardless of the document they are associated with.

**Show only the scenarios available for the editor**

Select this option to only display the scenarios that Oxygen XML Editor Eclipse plugin can apply for the current document type.

**Show associated scenarios**

Select this option to only display the scenarios associated with the document you are editing.

**Import scenarios**

This option opens the Import scenarios dialog box that allows you to select the scenarios file that contains the scenarios you want to import. If one of the scenarios you import is identical to an existing scenario, Oxygen XML Editor Eclipse plugin ignores it. If a conflict appears (an imported scenario has the same name as an existing one), you can choose between two options:

- Keep or replace the existing scenario.
- Keep both scenarios.

**Note:**
When you keep both scenarios, Oxygen XML Editor Eclipse plugin adds imported to the name of the imported scenario.

**Export selected scenarios**

Use this option to export selected scenarios individually. Oxygen XML Editor Eclipse plugin creates a scenarios file that contains the exported scenarios. This is useful if you want to share scenarios with others or export them to another computer.

**Show Type**

Use this option to display the transformation type of each scenario.

**Show Storage**

Use this option to display the storage location of the scenarios.

**Group by Type**

Select this option to group the scenarios by their type.

**Group by Storage**

Select this option to group the scenarios by their storage location.

**Ungroup all**

Select this option to ungroup all the scenarios.
Reset Layout

Select this option to restore the default settings of the layout.

Your selections in the Transformation Scenarios view are persistent so the configured associations for the current document will be remembered whenever the document is opened.

WebHelp Output Customization

Oxygen XML WebHelp provides the ability to generate two different types of output, WebHelp Responsive and WebHelp Classic. Each type has its own set of options and features. The WebHelp Responsive variant is available for DITA documents while the WebHelp Classic variants are available for DocBook.

WebHelp Responsive Output for DITA

**WebHelp Responsive** features a very flexible layout, is designed to adapt to any screen size to provide an optimal viewing and interaction experience. It is based upon the *Bootstrap* responsive front-end framework and is available for DITA document types.

WebHelp Responsive output can be generated by using the **DITA Map WebHelp Responsive (on page 1170)** transformation scenario.

For an in-depth look at WebHelp Responsive features and the publishing process, watch our Webinar: **DITA Publishing and Feedback with Oxygen Tools**.

**Layout and Features**

This section contains information about the layout and features of the WebHelp Responsive output.

**Layout of the Responsive Page Types**

You can select from several different styles of layouts (for example, by default, you can select either a *tiles* or *tree* style of layout). Furthermore, each layout includes a collection of skins that you can choose from, or you can customize your own.

![WebHelp Responsive Output on a Normal Screen](image_url)
Main Page

The Main Page is the home page generated in the WebHelp Responsive output. The main function of the home page is to display top-level information and provide links that help you easily navigate to any of the top-level topics of the publication. These links can be rendered in either a Tiles or Tree style of layout. The main page also consists of various other components, such as a logo, title, menu, search field, or index link.

Main Page - Tiles Layout

In the tiles presentation mode, a tile component is created for each chapter (first-level topic) in the publication. The tile presents a link to the topic and its short description.
Figure 426. Main Page - Tiles Layout

1. Logo Component (on page 1298)
2. Title Component (on page 1298)
3. Search Input Component (on page 1299)
4. Menu Component (on page 1299)
5. Index Terms Link Component (on page 1299)
6. Topic Tiles Component (on page 1299)
7. Footer Component (on page 1299)

Main Page - Tree Layout

In the tree presentation mode, links to the first and second level topics in the publication are displayed using a tree-like component.
Main Page Components

The layout components displayed in the main page are:

**Publication Title**

The title of the publication. It is usually taken from the DITA map title.

**Logo**

Displays a logo associated with the publication. Additionally, you can set a target URL that will be opened when you click on the logo image.
The logo image can be specified using the `webhelp.logo.image` transformation parameter *(on page 1471)*. For the target URL, use the `webhelp.logo.image.target.url` parameter *(on page 1471)*.

**Menu**

Helps you to navigate to your documentation. This component presents a set of links to all topics from your publication. For information about customizing the menu, see *How to Customize the Menu* *(on page 1402)* topic.

**Index Terms Link**

Presents a link to the index terms page. You can control if this component is displayed by using the `webhelp.show.indexterms.link` parameter *(on page 1480)*.

**Search Input**

An input text field where you can enter search queries.

**Topic Tiles**

A tile associated with a main topic. Each topic tile has three sections that correspond to the topic title, short description, and image.

**Topic Tile Title**

Presents the navigation title of the associated topic.

**Topic Tile Short Description**

Presents the short description of the topic. It may be collected either from the topic or from the DITA map topic meta.

**Topic Tile Image**

Presents an image associated with the topic. The image association *(on page 1402)* is done in the DITA map.

**Tree Table of Contents**

An area that contains first and second-level topic titles from your publication.

**Page Footer**

WebHelp Responsive output footer.

**Topic Page**

The *Topic Page* is the page generated for each DITA topic in the WebHelp Responsive output. The HTML pages produced for each topic consist of the topic content along with various other additional components, such as a title, menu, navigation breadcrumb, print icon, or side table of contents.
Figure 428. Topic Page

1. Logo Component (on page 1301)
2. Title Component (on page 1300)
3. Search Input Component (on page 1301)
4. Menu Component (on page 1301)
5. Index Terms Link Component (on page 1301)
6. Expand/Collapse All Sections Component (on page 1301)
7. Navigation Links Component (on page 1301)
8. Print Link Component (on page 1301)
9. Breadcrumb Component (on page 1301)
10. Publication Table of Contents Component (on page 1302)
11. Topic Content Component (on page 1301)
12. Topic Table of Contents Component (on page 1302)

**Topic Page Components**

The layout components displayed in this page are:

**Publication Title**

The title of the publication. It is usually taken from the DITA map title.
Logo

Displays a logo associated with the publication. Additionally, you can set a target URL that will be opened when you click on the logo image.

The logo image can be specified using the `webhelp.logo.image` transformation parameter (on page 1471). For the target URL, use the `webhelp.logo.image.target.url` parameter (on page 1471).

Menu

Helps you to navigate to your documentation. This component presents a set of links to all topics from your publication. For information about customizing the menu, see How to Customize the Menu (on page 1402) topic.

Index Terms Link

Presents a link to the index terms page. You can control if this component is displayed by using the `webhelp.show.indexterms.link` parameter (on page 1480).

Search Input

An input text field where you can enter search queries.

Navigation Links

The navigation links (Previous / Next arrows) can be used to navigate to the previous or next topic. These navigation links are controlled by the `collection-type` attribute. For example, if you set `collection-type="sequence"` on a parent topic reference, navigation links will be generated in the output for that topic and all of its child topics. You can also use the `webhelp.default.collection.type.sequence` parameter and set its value to `yes` to generate navigation links for all topics, regardless of whether or not the `collection-type` attribute is present.

Tip:

To hide the navigation links, you can edit the transformation scenario and set the value of the `webhelp.show.navigation.links` parameter to `no`.

Expand/Collapse Sections Button

Icon that expands or collapses sections listed in the side table of contents within a topic.

Print Link

A print icon that opens the print dialog box for your particular browser.

Breadcrumb

Presents the path of the current displayed DITA topic.

Topic Content

Presents the content of the associated DITA topic.
Publication Table of Contents

A Table of Content for the publication displayed in the left side of the screen. You can use the \(<\) button to collapse the table of contents ( or the \(\rangle\) button to expand it).

Topic Table of Contents (On this page links)

A table of contents for the topic displayed on the right side with a heading named On this page and it contains links to each section within the current topic and the section corresponding to the current scroll position is highlighted. This component is generated for any topic that contains at least two \(<\text{section}>\) elements and each \(<\text{section}>\) must have an \(@\text{id}>\) attribute. You can use the \(\rangle\) button to collapse the table of contents ( or the \(<\) button to expand it).

Page Footer

WebHelp Responsive output footer.

Search Results Page

The Search Page presents search results in the WebHelp Responsive output. The HTML page consists of a search results component along with various other additional components, such as a title, menu, or index link.

When you enter search terms in the Search field, the results are displayed in a results page. When you click on a result, the topic is opened in the main pane and the search results are highlighted. If you want to remove the colored highlights, click the \(\text{Toggle Highlights}\) button at the top-right side of the page. The Search field also includes an autocomplete feature.
Figure 429. Search Results Page

The layout components displayed in the search page are:

1. Logo Component (on page 1303)
2. Title Component (on page 1303)
3. Search Input Component (on page 1304)
4. Menu Component (on page 1304)
5. Index Terms Link Component (on page 1304)
6. Search Results Component (on page 1304)
7. Footer Component (on page 1304)

Search Results Page Components

The title of the publication. It is usually taken from the DITA map title.

Logo

Displays a logo associated with the publication. Additionally, you can set a target URL that will be opened when you click on the logo image.
The logo image can be specified using the `webhelp.logo.image` transformation parameter (*on page 1471*). For the target URL, use the `webhelp.logo.image.target.url` parameter (*on page 1471*).

**Menu**

Helps you to navigate to your documentation. This component presents a set of links to all topics from your publication. For information about customizing the menu, see *How to Customize the Menu (on page 1402)* topic.

**Index Terms Link**

Presents a link to the index terms page. You can control if this component is displayed by using the `webhelp.show.indexterms.link` parameter (*on page 1480*).

**Search Input**

An input text field where you can enter search queries.

**Search Results**

Each result includes the topic title that can be clicked to open that page. Under the title, a breadcrumb is displayed that shows the path of the topic and you can click any of the topics in the breadcrumb to open that particular page.

**Page Footer**

WebHelp Responsive output footer.

**Auto-complete Suggestions in the Search Input Field**

When you are typing in the search input field, proposals are presented to help you to compute the search query. The information proposed when you are typing is collected from:

- The search queries from the history of the previous searches.
- The titles collected from your documentation.
- Documentation index terms and keywords. For example, in a DITA topic, the keywords and index terms are specified in the topic prolog section like this:

```
<prolog>
  <metadata>
    <keywords><indexterm>databases</indexterm></keywords>
    <keyword>installing</keyword>
    <keyword>uninstalling</keyword>
    <keyword>prerequisites</keyword>
  </metadata>
</prolog>
```
Missing Terms

If you enter multiple search terms (other than stop words), for any result that the search engine found at least one term but not one or more of the other terms, the Missing terms will be listed below each result.

Related information
WebHelp Responsive Search Engine (on page 1306)

Index Terms Page

The Index Terms Page page consists of an index terms section along with various other additional components, such as a title, menu, or search field.

An alphabet that contains the first letter of the documentation index terms is generated at the top of the index page. Each letter represents a link to a specific indices section. The indexes are presented in multiple columns to make it easier to read this page.

Figure 430. Index Terms Page

1. Logo Component (on page 1306)
2. Title Component (on page 1306)
3. Menu Component (on page 1306)
4. Index Terms Link Component (on page 1306)
5. Index Terms Component (on page 1306)
6. Alphabet Links Component (on page 1306)
7. Footer Component (on page 1306)

Index Terms Page Components

The layout components displayed in this page are:

Publication Title
The title of the publication. It is usually taken from the DITA map title.

Logo
Displays a logo associated with the publication. Additionally, you can set a target URL that will be opened when you click on the logo image.

The logo image can be specified using the webhelp.logo.image transformation parameter (on page 1471). For the target URL, use the webhelp.logo.image.target.url parameter (on page 1471).

Menu
Helps you to navigate to your documentation. This component presents a set of links to all topics from your publication. For information about customizing the menu, see How to Customize the Menu (on page 1402) topic.

Index Terms Link
Presents a link to the index terms page. You can control if this component is displayed by using the webhelp.show.indexterms.link parameter (on page 1480).

Index Terms Alphabet
An alphabet that contains the first letter of index terms. Each letter represents a link to a specific indices section.

Index Terms
The first letter of the index along with the list of index terms.

Page Footer
WebHelp Responsive output footer.

Built-in JavaScript-based Search Engine

The client-side JavaScript-based search engine comes preconfigured in the WebHelp responsive plugin. It is enabled by default when you run the WebHelp Responsive transformation.

Search Index
The search index is created when you publish your documentation to WebHelp by traverses all HTML pages (for DITA topics) from output folder to gather information.

Search interface
This component is an interface between the user and the *search index*. It helps the user to search through the *search index* and displays results in the search page.

**Search Field and Results Page**

When you enter search terms in the **Search** field, the results are displayed in a results page. When you click on a result, the topic is opened in the main pane and the search results are highlighted. If you want to remove the colored highlights, click the ✪ Toggle Highlights button at the top-right side of the page. The **Search** field also includes an *autocomplete* feature.

Each result includes the topic title that can be clicked to open that page. Under the title, a breadcrumb is displayed that shows the path of the topic and you can click any of the topics in the breadcrumb to open that particular page.

If you enter multiple search terms (other than *stop words*), for any result that the search engine found at least one term but not one or more of the other terms, the **Missing** terms will be listed below each result.

**Tip:** You can use the **searchQuery** URL parameter to perform a search operation when WebHelp is loaded. This opens the Search Results page with the specified search query processed. The URL should look something like this:

```
http://localhost/webhelp/search.html?searchQuery=deploying%20feedback
```

**5-Star Rating Mechanism and Sorting**

The **Search** feature is also enhanced with a rating mechanism that computes scores for every result that matches the search criteria. These scores are then translated into a 5-star rating scheme and the stars are displayed to the right of each result. The search results are sorted depending on the following:

- Search entries that satisfy the phrase search criterion are presented first.
- The number of keywords found in a single page (the higher the number, the better).
- The context (for example, a word found in a title, scores better than a word found in unformatted text).

The search ranking order, sorted by relevance is as follows:

- The search term is included in a meta keyword.
- The search term is in the title of the page.
- The search term is in bold text in a paragraph.
- The search term is in normal text in a paragraph.

**Tag Element Scoring Values**

HTML tag elements are also assigned a scoring value and these values are evaluated for the search results. For information about editing these values, see **How to Change Element Scoring in Search Results** (on page 1413).
Search Rules

Rules that are applied during a search include:

- You can use quotes to perform an exact search for multiple word phrases (for example, "grow flowers" will only return results if both words are found consecutively and exactly as they are typed in the search field). This type of search is known as a phrase search.
- *Boolean Search* is supported using the following operators: *and*, *or*, *not*. When there are two adjacent search terms without an operator, *or* is used as the default search operator (for example, *grow flowers* is the same as *grow or flowers*).
- The space character separates keywords (an expression such as *grow flowers* counts as two separate keywords).
- Words composed by merging two or more words with colon (":"), minus ("-"), underline ("_"), or dot ("." ) characters count as a single word.
- Your search terms should contain two or more characters (note that stop words will be ignored). This rule does not apply to CJK (Chinese, Japanese, Korean) languages.
- When searching for multiple words in CJK (Chinese, Japanese, Korean) languages that often have them appear in strings without a space separator, you need to add a space to separate the words. Otherwise, WebHelp will not find results. For example, Chinese uses a specialized character for space separators, but the current WebHelp implementation cannot detect such specialized characters, so to search for 开始之前 (it translates as "before you begin" or "before start"), you have to enter 开始 之前 (notice the space between the second and third symbols) in the search field.

**Note:**

Phrase searches (two or more consecutive words in an exact order) do not work for CJK (Chinese, Japanese, Korean) languages.

**Tip:**

The `<indexterm>` and `<keywords>` DITA elements are an effective way to increase the ranking of a page (for example, content inside a `keywords` element weighs more than an `H1` HTML element).

Excluded Terms

To improve performance, the **Search** feature excludes certain *stop words*. For example, the English version of the stop words includes: *a, an, and, are, as, at, be, but, by, for, if, in, into, is, it, no, not, of, on, or, such, that, the, their, then, there, these, they, this, to, was, will, with.*

**Related Information:**

WebHelp Responsive HTML5 Pages: Search Page (on page 1302)
Context-Sensitive Help System

Context-sensitive help systems assist users by providing specific informational topics for certain components of a user interface, such as a button or window. This mechanism works based on mappings between a unique ID defined in the topic and a corresponding HTML page.

Generating Context-Sensitive Help

When WebHelp Responsive output is generated, the transformation process produces an XML mapping file called `context-help-map.xml` and copies it in the output folder of the transformation. This XML file maps an ID to a corresponding HTML page through an `<appContext>` element, as in the following example:

```
<map productID="oxy-webhelp" productVersion="1.1">
  <appContext helpID="myapp-functionid1" path="tasks/app-help1.html"/>
  <appContext helpID="myapp-functionid2" path="tasks/app-help1.html"/>
  ...
</map>
```

The possible attributes are as follows:

**helpID**

A Unique ID provided by a topic from two possible sources (`<resourceid>` element or `@id` attribute):

**resourceid**

The `<resourceid>` element is mapped into the `<appContext>` element and can be specified in either the `<topicref>` within a DITA map or in a `<prolog>` within a DITA topic. The `<resourceid>` element accepts the following attributes:

- **appname** - A name for the external application that references the topic. If this attribute is not specified, its value is considered to be empty ("").
- **appid** - An ID used by an application to identify the topic.
- **id** - Specifies a value that is used by a specific application to identify the topic, but this attribute is ignored if an `appid` attribute is used.

**Note:**

Multiple `appid` values can be associated with a single `appname` value (and multiple `appname` values can be associated with a single `appid` value), but the values for both attributes work in combination to specify a specific ID for a specific application, and therefore each combination of values for the `appid` and `appname` attributes should be unique within the context of a single root map (on page 2658). For example, suppose that you need two different functions of an application to both open the same WebHelp page.
Example: The `<resourceid>` Element Specified in a DITA Map

The `<resourceid>` element can be specified in a `<topicmeta>` element within a `<topicref>`.

```xml
<map title="App Help">
  <topicref href="app-help1.dita" type="task">
    <topicmeta>
      <resourceid appname="myapp" appid="functionid1"/>
      <resourceid appname="myapp" appid="functionid2"/>
    </topicmeta>
  </topicref>
</map>
```

Example: The `<resourceid>` Element Specified in a DITA Topic

The `<resourceid>` element can be specified in a `<prolog>` element within a DITA topic.

```xml
<task id="app-help1">
  <title>My App Help</title>
  <prolog>
    <resourceid appname="myapp" appid="functionid1"/>
    <resourceid appname="myapp" appid="functionid2"/>
  </prolog>
  ...
</task>
```

For more information about the `<resourceid>` element, see DITA Specifications: `<resourceid>`.

id

If a `<resourceid>` element is not declared in the DITA map or DITA topic (as described above), the `id` attribute that is set on the topic root element is mapped into the `<appContext>` element.

⚠️ Important:

You should ensure that these defined IDs are unique in the context of the entire DITA project. If the IDs are not unique, the transformation scenario will display warning messages in the transformation console output and the help system will not work properly.

path

The path to a corresponding WebHelp page. This path is relative to the location of the `context-help-map.xml` mapping file.

There are two ways of implementing context-sensitive help in your system:
• The XML mapping file can be loaded by a PHP script on the server side. The script receives the `contextId` value and will look it up in the XML file.

• Invoke the `cshelp.html` WebHelp system file and pass the `contextId` parameter with a specific value. The WebHelp system will automatically open the help page associated with the value of the `contextId` parameter.

```cshelp.html?contextId=myDITATopic```

**Note:**
The `contextId` parameter is not case-sensitive.

**Attention:**
Prior to version 24.1, the method was to invoke the `index.html` file. The system still works using this method but it has been deprecated and its functionality will be removed in a future version.

### Context-Sensitive Queries

You can use the URL field in your browser to search for topics in a context-sensitive WebHelp system with the assistance of the following parameters:

- **contextId**
  
The WebHelp JavaScript engine will look for this value in the `context-help-map.xml` mapping file and load the corresponding help page.

  ```
  Note:
  You can use an anchor (on page 2652) in the contextId parameter to jump to a specific section in a document. For example, contextId=topicID#anchor.
  ```

- **appname**
  
You can use this parameter in conjunction with `contextId` to search for this value in the corresponding `appname` attribute value in the mapping file.

  ```
  http://localhost/webhelp/cshelp.html?contextId=topicID&appname=myApplication
  ```

**Tip:**
The `webhelp.csh.disable.topicID.fallback` parameter (on page 1471) can be set `true` to use a topic ID fallback when `resourceid` information is not available when computing the mapping for context sensitive help.
Accessibility

Oxygen XML WebHelp Responsive output is compliant with the Section 508 accessibility standard, making the output accessible for people with visual impairment and other disabilities. Documentation and interface components are considered accessible when they have support in place that allows those with disabilities to use assistive technologies to understand the content.

Generally speaking, the WebHelp Responsive output has two major parts: topic content and WebHelp Responsive-related components (publication TOC, breadcrumb, menu). While the WebHelp Responsive components are designed to comply with the accessibility rules, it is important to adhere to some rules when you write DITA topics so that the content is also accessible.

Writing Guidelines for Accessible Documentation

To create accessible content, good authoring practices involve following guidelines, such as marking table headers, using semantic elements where available, and using alternative text for images.

Accessible Images

Images must have text alternatives that describe the information or function represented by them.

Short Text Equivalents for Images

When using the `<image>` element, specify a short alternative text with the `<alt>` element.

```xml
<image href="puffin.jpg">
  <alt>Puffin figure</alt>
</image>
```

Long Descriptions of Images

For complex images, when a short text equivalent does not suffice to adequately convey the function or role of an image, provide additional information in a file designated by the `<longdesc>` element.

```xml
<image href="puffin.jpg">
  <alt>Puffin figure</alt>
  <longdesc href="http://www.example.org/birds/puffin.html"
    scope="external"
    format="html"/>
</image>
```

Accessible Image Maps

For image maps, text alternatives are needed on both the `<image>` element itself (to describe the informative context) and on each of the `<area>` elements (to convey the link destination or the action that will be initiated if the link is followed). The `<xref>` content within the `<area>` element contains the intended alternative text or hover text for that image map area.

```xml
<imagemap id="gear_pump_map">
  <image href="../images/Gear_pump_exploded.png" id="gear_pump_exploded">
    <alt>Gear Pump</alt>
  </image>
  <area>
    <shape>circle</shape>
    <coords>172, 265, 14</coords>
    <xref href="parts/bushings.dita#bushings_topic/bushings" format="dita">Bushings</xref>
  </area>
  <area>
    <shape>circle</shape>
    <coords>324, 210, 14</coords>
    <xref href="parts/ports.dita#ports_topic/suction_port" format="dita">Suction Port</xref>
  </area>
</imagemap>
```

Darwin Information Typing Architecture (DITA) Specification `<imagemap>` element

Accessible Tables

Accessible HTML tables need markup that indicates header cells and data cells and defines their relationship. Header cells must be marked with `<th>`, and data cells with `<td>`, to make tables accessible. For more complex tables, explicit associations may be needed using `@scope`, `@id`, and `@headers` attributes.

When you implement the table, it is best to use the `<table>` element (CALS table or OASIS Table Exchange Model). The `<table>` element includes all that you need to make a fully accessible table.

```xml
<table>
  <thead>
    <tr>
      <th>Header 1</th>
      <th>Header 2</th>
    </tr>
  </thead>
  <tbody>
    <tr>
      <td>Data 1</td>
      <td>Data 2</td>
    </tr>
    <tr>
      <td>Data 3</td>
      <td>Data 4</td>
    </tr>
  </tbody>
</table>
```

WebHelp Responsive VPAT Accessibility Conformance Report

International Edition

VPAT® Version 2.3 – April 2019

Product Name/Version

Oxygen XML WebHelp Responsive

Product Description

Oxygen XML WebHelp Responsive enables you to publish DITA content on the web and present it in a user-friendly interface that is easy to navigate. You can design your WebHelp Responsive output to be available on desktop systems or various mobile devices. With Oxygen XML WebHelp Responsive, your published content is accessible, interactive, and convenient.
Date
May 2019

Contact Information
support@oxygenxml.com

Notes
Oxygen XML WebHelp Responsive has been designed and enhanced to adhere to the U.S. Government Section 508 accessibility standards and the Web Content Accessibility Guidelines (WCAG). For details, see WebHelp Responsive Accessibility (on page 1312).

Evaluation Methods Used:
The following applications were used for testing Oxygen XML WebHelp Responsive:

• Desktop browsers: Chrome, Firefox, Safari, Edge.
• Assistive technologies: NVDA, VoiceOver, JAWS, Microsoft Narrator.

Applicable Standards/Guidelines
This report covers the degree of conformance for the following accessibility standards/guidelines:

<table>
<thead>
<tr>
<th>Standard/Guideline</th>
<th>Included In Report</th>
</tr>
</thead>
<tbody>
<tr>
<td>Web Content Accessibility Guidelines 2.0</td>
<td>Level A - Yes</td>

<td>EN 301 549 Accessibility requirements suitable for public procurement of ICT products and services in Europe - V2.1.2 (2018-08)</td>
<td>No</td>
</tr>
</tbody>
</table>

Terms
The terms used in the Conformance Level information are defined as follows:
• **Supports**: The functionality of the product has at least one method that meets the criterion without known defects or meets with equivalent facilitation.

• **Partially Supports**: Some functionality of the product does not meet the criterion.

• **Does Not Support**: The majority of product functionality does not meet the criterion.

• **Not Applicable**: The criterion is not relevant to the product.

• **Not Evaluated**: The product has not been evaluated against the criterion. This can be used only in WCAG 2.0 Level AAA.

**WCAG 2.x Report**

Tables 1 and 2 also document conformance with:

Revised Section 508: Chapter 5 – 501.1 Scope, 504.2 Content Creation or Editing, and Chapter 6 – 602.3 Electronic Support Documentation.

![Note:](image)

When reporting on conformance with the WCAG 2.x Success Criteria, they are scoped for full pages, complete processes, and accessibility-supported ways of using technology as documented in the [WCAG 2.0 Conformance Requirements](url).

### 2.1.1 Keyboard (Level A)

**Also applies to:**

Revised Section 508

- 501 (Web)(Software)
- 504.2 (Authoring Tool)
- 602.3 (Support Docs)

**Partially Supports**

Most of the content is operable through a keyboard interface, with exceptions that include:

- The submenus (the user cannot tab to the submenus).
- The top-level links in the main page accordion cannot be accessed.
- The facets component does not have full keyboard support.

### 2.1.2 No Keyboard Trap (Level A)

**Also applies to:**

Revised Section 508

- 501 (Web)(Software)
- 504.2 (Authoring Tool)
- 602.3 (Support Docs)

**Supports**

The product does not contain content that traps the keyboard focus.

### 2.1.4 Character Key Shortcuts (Level A 2.1 only)

**Also applies to:**

Revised Section 508 – Does not apply

**Supports**

The product does not include character key shortcuts.

### 2.2.1 Timing Adjustable (Level A)

**Also applies to:**

Revised Section 508

**Supports**

The product does not include time limits.

### Publishing Templates

An **Oxygen Publishing Template** defines all aspects of the layout and styles for output obtained from the following transformation scenarios:

- **WebHelp Responsive**
- **DITA Map PDF - based on HTML5 & CSS**

It is a self-contained customization package stored as a ZIP archive or folder that can easily be shared with others. It provides the primary method for customizing the output.

**Tip:**

You can start creating publishing templates by using the **Oxygen Styles Basket**. [https://styles.oxygenxml.com](https://styles.oxygenxml.com)

Some possible customization methods include:

- Add additional template resources to customize the output (such as logos, *Favicons*, or CSS files).
- Extend the default processing by specifying one or more XSLT extension points.
- Specify one or more transformation parameters to customize the output.
- Customize various aspects of the output through simple CSS styling.
- For **WebHelp Responsive** output, change the layout of the main page or topic pages by customizing which components will be displayed and where they will be positioned in the page.

The following graphics are possible sample structures for **Oxygen Publishing Template** packages:
For information about creating and customizing publishing templates, and how to adjust the WebHelp and PDF output through CSS styling and other customization methods, watch our Webinar: Creating Custom Publishing Templates for WebHelp and PDF Output. The Webinar slides and sample project are also available from that webpage.

- How to Share a Publishing Template *(on page 1550)*

**Publishing Templates Gallery**

Oxygen XML Editor Eclipse plugin comes bundled with a variety of built-in templates. You can use one of them to publish your documentation or as a starting point for a new publishing template.
Built-in Templates

There are two categories of templates, **Tiles** and **Tree**. You can see the built-in templates in the **Templates** tab when editing a WebHelp Responsive transformation scenario in **Oxygen XML Editor/Author**. Each one also includes an [Online preview](#) icon in the bottom-right corner that opens a webpage in your default browser that provides a sample of how the main page will look when that particular template is used to generate the output.

**Tiles Templates**

The main page in the WebHelp output presents a tile for each main topic (chapter) of the documentation.

![Tiles Templates](image)

**Tree Templates**

The main page in the WebHelp output presents a tree-like table of contents.

![Tree Templates](image)
Built-in Templates Location

All built-in templates are stored in the following directory: `DITA-OT-DIR/plugins/com.oxygenxml.webhelp.responsive/templates`.

Custom Templates

You can use a built-in template as a starting point for creating your own custom template (on page 1546). You can store all of your custom templates in a particular directory. Then, go to Options > Preferences > DITA > Publishing and add your directory to the list, and all the templates stored in that directory will be displayed in the preview pane in the transformation scenario's Template tab along with all the built-in templates.

Sharing Publishing Template

To share a publishing template with others, follow these steps:

1. Copy your template in a new folder.
2. Go to Options > Preferences > DITA > Publishing and add that new folder to the list.
3. Switch the option as the bottom of that preferences page to Project Options.
4. Share your project file (.xpr).

Publishing Template Package Contents for WebHelp Responsive Customizations

An Oxygen Publishing Template package for WebHelp output must contain a template descriptor file and at least one CSS file, and may contain other resources (such as graphics, XHTML files, XSLT files, etc.). All the template resources can be stored in either a ZIP archive or in a folder. It is recommended to use a ZIP archive because it is easier to share with others.

Template Descriptor File

Each publishing template includes a descriptor file that defines the meta-data associated with the template. It is an XML file that defines all the resources included in a template (such as CSS files, images, JS files, and transformation parameters).

The template descriptor file must have the .opt file extension and must be located in the template's root folder.

A template descriptor might look like this:

```xml
<publishing-template>
  <name>Flowers</name>

  <webhelp>
    <tags>
      <tag>tree</tag>
      <tag>light</tag>
    </tags>
  </webhelp>
</publishing-template>
```
<tags>
<preview-image file="flowers-tree.png"/>

<!-- Resources (CSS, favicon, logo and others) -->
<resources>
<!-- Main CSS file -->
<css file="flowers.css"/>

<!-- Resources to copy to the output folder -->
<fileset>
  <include name="resources/**/**"/>
  <exclude name="resources/**/.svn"/>
  <exclude name="resources/**/.git"/>
</fileset>
</resources>

<parameters>
  <parameter name="webhelp.show.main.page.tiles" value="no"/>
  <parameter name="webhelp.show.main.page.toc" value="yes"/>
  <parameter name="webhelp.top.menu.depth" value="3"/>
</parameters>
</webhelp>
</publishing-template>

Tip:
It is recommended to edit the template descriptor in Oxygen XML Editor/Author because it provides content completion and validation support.

Template Name and Description

Each template descriptor file requires a <name> element. This information is displayed as the name of the template in the transformation scenario dialog box.

 Optionally, you can include a <description> and it displayed when the user hovers over the template in the transformation scenario dialog box.

<publishing-template>
  <name>Lorem Ipsum</name>
  <description>Lorem ipsum dolor sit amet, consectetur adipiscing elit</description>
  ...
</publishing-template>
Template Author

Optionally, you can include author information in the descriptor file and it displayed when the user hovers over the template in the transformation scenario dialog box. This information might be useful if users run into an issue or have questions about a certain template.

If you include the `<author>` element, a `<name>` is required and optionally you can include `<email>`, `<organization>`, and `<organizationUrl>` information.

```xml
<publishing-template>
  ...
  <author>
    <name>John Doe</name>
    <email>jdoe@example.com</email>
    <organization>ACME</organization>
    <organizationUrl>http://www.example.com/jdoe</organizationUrl>
  </author>
  ...
</publishing-template>
```

Webhelp Element

The `<webhelp>` element contains various details that define the WebHelp Responsive output. It is a required element if you intend on using a WebHelp Responsive transformation scenario. The elements that are allowed in this `<webhelp>` section specify the template tags (on page 1346), template preview image (on page 1346), resources (on page 1346) (such as CSS, JS, fonts, logos), transformation parameters (on page 1348), HTML fragment extensions (on page 1350) (used to add fragments to placeholders), XSLT extensions (on page 1349), or HTML page layout files (on page 1359).

```xml
<webhelp>
  <tags>...
  </tags>
  <preview-image file="MyPreview.png"/>
  <resources>...
  </resources>
  <html-page-layouts>...
  </html-page-layouts>
  <parameters>...
</webhelp>
```
Template Tags

The `<tags>` section provides meta information about the template (such as layout type or color theme). Each tag is displayed at the top of the Templates tab window in the transformation scenario dialog box and they help the user filter and find particular templates.

```xml
<tags>
  <tag>tree</tag>
  <tag>dark</tag>
</tags>
```

Template Preview Image

The `<preview-image>` element is used to specify an image that will be displayed in the transformation scenario dialog box. It provides a visual representation of the template to help the user select the right template. The image dimensions should be 200 × 115 pixels and the supported image formats are: JPEG, PNG, or GIF.

You can also include an `<online-preview-url>` element to specify the URL of a published sample of your template. This will display an Online preview icon in the bottom-right corner the image in the transformation scenario dialog box and if the user clicks that icon, it will open the specified URL in their default browser.

```xml
<online-preview-url>https://www.example.com/samples/tiles/ashes</online-preview-url>
```

Template Resources

The `<resources>` section of the descriptor file specifies a set of resources (CSS, JS, fonts, logos, graphics, etc.) that are used to customize various components in the generated output. These resources will be copied to the output folder during the transformation process. At least one CSS file must be included, while the other types of resources are optional.

⚠️ Warning:
All paths set in the @file attribute must be relative.

This section is defined using the `resources` element and the types of resources that can be specified include:
• **CSS files** - One or more CSS files that will define the styles of all generated HTML pages. They are referenced using the `<css>` element.

• **Favicon** - You can specify the path to an image for the favicon associated with your website. It is referenced using the `<favicon>` element.

• **Logo** - You can specify the path to a logo image that will be displayed in the left side of the output header. It is referenced using the `<logo>` element. Optionally, you can also specify:
  - `<target-url>` - will redirect the user to the specified URL if they click the logo in the output.
  - `<alt>` - provides an alternate text for the logo image.

• **Additional Resources (graphics, JS, fonts, folders)** - For other resources (such as images referenced in CSS, JavaScript, fonts, entire folders, etc.) that need to be included in the output, you need to instruct the transformation to include them in the output folder. You can specify one or more sets of additional resources to be copied to the output folder by using the `<fileset>` element and you can use one or more `<include>` and `<exclude>` elements. This semantic is similar to the ANT FileSet.

```xml
<publishing-template>
  ...
  <webhelp>
    ...
    <resources>
      <css file="css/custom_styles.css"/>
      <css file="css/custom_fonts.css"/>
      <favicon file="images/favicon.png"/>
      <logo file="images/logo.png" target-url="http://www.example.com" alt="Alternate text for the logo image"/>
      <js-amd-module file="js/template-main.js"/>
      <fileset>
        <include name="common/**/*"/>
        <include name="JS/**/*"/>
        <exclude name="**/*.svn"/>
        <exclude name="**/*.git"/>
      </fileset>
    </resources>
  </webhelp>
</publishing-template>
```

**Note:**
All relative paths specified in the descriptor file are relative to the template root folder.
The resources specified in the template descriptor are copied to the following output folder: [WebHelp_OUTPUT_DIR]/oxygen-webhelp/template. The following graphic illustrates the mapping between the template resources and the location where they will be copied to the output folder:

Figure 433. Template Resources Mapping

Transformation Parameters

You can also set one or more WebHelp transformation parameters in the descriptor file.

```xml
<publishing-template>
  ...
  <webhelp>
    ...
    <parameters>
      <parameter
        name="webhelp.show.main.page.toc"
        value="yes"/>
      <parameter
        name="webhelp.top.menu.depth"
        value="3"/>
      <parameter
        name="webhelp.fragment.welcome"
        value="html-fragment/webhelp.fragment.welcome.html"
        type="filePath"/>
    </parameters>
  </webhelp>
</publishing-template>
```

The following information can be specified in the `<parameter>` element:

Parameter name
The name of the parameter. It may be one of the WebHelp Responsive transformation parameters (on page 1470) or a DITA-OT HTML-based output parameter.

**Note:**
It is not recommended to specify an input/output parameter in the descriptor file (such as the input Map, DITAVAL file, or temporary directory).

**Attention:**
JVM arguments like -Xmx cannot be specified as a transformation parameter.

**Parameter Value**
The value of the parameter. It should be a relative path to the template root folder for file paths parameters.

**Parameter Type**
The type of the parameter: string or filepath. The string value is default.

After creating a publishing template (on page 1546) and adding it to the templates gallery (on page 1383), when you select the template in the transformation scenario dialog box, the Parameters tab will automatically be updated to include the parameters defined in the descriptor file. These parameters are displayed in italics.

**XSLT Extension Points**
The publishing templates can include one or more supported XSLT extension points (on page 1484). They are helpful when you want to change the structure of the HTML pages that are primarily generated from XSLT processing. They can be specified using the `<xslt>` element in the descriptor file using the following structure:

```xml
<publishing-template>
  ...
  <webhelp>
    ...
    <xslt>
      <extension
        id="com.oxygenxml.webhelp.xsl.dita2webhelp"
        file="xsl/customDita2webhelp.xsl"/>
      <extension
        id="com.oxygenxml.webhelp.xsl.createMainPage"
        file="xsl/customMainPage.xsl"/>
    </xslt>
  </webhelp>
</publishing-template>
```

For a full list of the supported extension points, see: XSLT-Import and XSLT-Parameter Extension Points (on page 1484).
Note:
You can read the value of a WebHelp transformation parameter from your XSLT extension stylesheets by using the `getParameter(param.name)` function from the `http://www.oxygenxml.com/functions` namespace.

**HTML Fragment Placeholders**

The HTML pages contain component placeholders that can be used to insert custom HTML fragments either by specifying a **well-formed** XHTML fragment or referencing a path to a file that contains a **well-formed** XHTML fragment (for details on how the file or fragment needs to be constructed, see [How to Insert Custom HTML Content](on page 1393)).

These fragments and their placeholder location are defined in the descriptor file using a `<fragment>` element inside the `<html-fragments>` section. You can specify one or more HTML fragment extension points in the descriptor file using the following structure:

```xml
<publishing-template>
  ...
  <webhelp>
    ...
    <html-fragments>
      <fragment
        file="html-fragments/webhelp_fragment_welcome.html"
        placeholder="webhelp.fragment.welcome"/>
      <fragment
        file="html-fragments/webhelp_fragment_footer.html"
        placeholder="webhelp.fragment.footer"/>
    </html-fragments>
  </webhelp>
  ...
</publishing-template>
```

Some of these placeholders are left empty in the default output configurations, but you can use them to insert custom content.

Each placeholder has an associated parameter value in the transformation. Some of the placeholder parameters are global and can be used in all type of pages (main page, topic page, search results page, index terms page), while others are applicable for certain type of pages. The following diagram illustrates the predefined placeholders that are global (can be used in any of the types of pages).
Figure 434. Global Predefined Placeholders Diagram

1. Header (on page 1351)
2. After Header (on page 1351)
3. Before Body (on page 1351)
4. Before Logo and Title (on page 1352)
5. After Logo and Title (on page 1352)
6. Before Top Menu (on page 1352)
7. After Top Menu (on page 1352)
8. Before Search Input (on page 1352)
9. After Search Input (on page 1352)
10. Before Main Content (on page 1352)
11. After Main Content (on page 1352)
12. Footer (on page 1352)
13. After Body (on page 1352)

Global Placeholder Parameters

The following placeholder parameters can be used in any of the type of pages (main page, topic page, search results page, index terms page). The parameter values can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment:

- 1 = webhelp.fragment.head - Displays the specified XHTML fragment in the header section.
- 2 = webhelp.fragment.after.header - Displays the specified XHTML fragment after the header section.
- 3 = webhelp.fragment.before.body - Displays the specified XHTML fragment before the body.
• 4 = webhelp.fragment.before.logo_and_title - Displays the specified XHTML fragment before the logo and title.
• 5 = webhelp.fragment.after.logo_and_title - Displays the specified XHTML fragment after the logo and title.
• 6 = webhelp.fragment.before.top_menu - Displays the specified XHTML fragment before the top menu.
• 7 = webhelp.fragment.after.top_menu - Displays the specified XHTML fragment after the top menu.
• 8 = webhelp.fragment.before.search.input - Displays the specified XHTML fragment before the search input component.
• 9 = webhelp.fragment.after.search.input - Displays the specified XHTML fragment after the search input component.
• 10 = webhelp.fragment.before.main.content.area - Displays the specified XHTML fragment before the main content area.
• 11 = webhelp.fragment.after.main.content.area - Displays the specified XHTML fragment after the main content area.
• 12 = webhelp.fragment.footer - Displays the specified XHTML fragment in the footer section.
• 13 = webhelp.fragment.after.body - Displays the specified XHTML fragment after the body.

Main Page Placeholder Parameters

The following placeholder parameters can be used in the main page. The parameter values can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment:

• webhelp.fragment.head.main.page - Displays the specified XHTML fragment in the header section.
• webhelp.fragment.after.header.main.page - Displays the specified XHTML fragment after the header section.
• webhelp.fragment.before.body.main.page - Displays the specified XHTML fragment before the body.
• webhelp.fragment.before.search.input.main.page - Displays the specified XHTML fragment before the search input component.
• webhelp.fragment.after.search.input.main.page - Displays the specified XHTML fragment after the search input component.
• webhelp.fragment.before.main.content.area.main.page - Displays the specified XHTML fragment before the main content area.
• webhelp.fragment.after.main.content.area.main.page - Displays the specified XHTML fragment after the main content area.
• webhelp.fragment.after.body.main.page - Displays the specified XHTML fragment after the body.
• webhelp.fragment.before.toc_or_tiles - Displays the specified XHTML fragment before the main table of contents or tiles component on the main page.
• webhelp.fragment.after.toc_or_tiles - Displays the specified XHTML fragment after the main table of contents or tiles component on the main page.

Topic Page Placeholder Parameters

The following placeholder parameters can be used in the topic page. The parameter values can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment:
• **webhelp.fragment.head.topic.page** - Displays the specified XHTML fragment in the header section.
• **webhelp.fragment.after.header.topic.page** - Displays the specified XHTML fragment after the header section.
• **webhelp.fragment.before.body.topic.page** - Displays the specified XHTML fragment before the body.
• **webhelp.fragment.before.search.input.topic.page** - Displays the specified XHTML fragment before the search input component.
• **webhelp.fragment.after.search.input.topic.page** - Displays the specified XHTML fragment after the search input component.
• **webhelp.fragment.before.main.content.area.topic.page** - Displays the specified XHTML fragment before the main content area.
• **webhelp.fragment.after.main.content.area.topic.page** - Displays the specified XHTML fragment after the main content area.
• **webhelp.fragment.after.body.topic.page** - Displays the specified XHTML fragment after the body.
• **webhelp.fragment.before.topic.toolbar** - Displays the specified XHTML fragment before the toolbar buttons above the topic content in the topic page.
• **webhelp.fragment.after.topic.toolbar** - Displays the specified XHTML fragment after the toolbar buttons above the topic content in the topic page.
• **webhelp.fragment.before.topic.breadcrumb** - Displays the specified XHTML fragment before the breadcrumb component in the topic page.
• **webhelp.fragment.after.topic.breadcrumb** - Displays the specified XHTML fragment after the breadcrumb component in the topic page.
• **webhelp.fragment.before.publication.toc** - Displays the specified XHTML fragment before the publication's table of contents component in the topic page.
• **webhelp.fragment.after.publication.toc** - Displays the specified XHTML fragment after the publication's table of contents component in the topic page.
• **webhelp.fragment.before.topic.content** - Displays the specified XHTML fragment before the topic's main content in the topic page.
• **webhelp.fragment.after.topic.content** - Displays the specified XHTML fragment after the topic's main content in the topic page.
• **webhelp.fragment.before.feedback** - Displays the specified XHTML fragment before the Oxygen Feedback commenting component in the topic page.
• **webhelp.fragment.after.feedback** - Displays the specified XHTML fragment after the Oxygen Feedback commenting component in the topic page.
• **webhelp.fragment.before.topic.toc** - Displays the specified XHTML fragment before the topic's table of contents component in the topic page.
• **webhelp.fragment.after.topic.toc** - Displays the specified XHTML fragment after the topic's table of contents component in the topic page.

**Search Results Page Placeholder Parameters**

The following placeholder parameters can be used in the search results page. The parameter values can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment:
• `webhelp.fragment.head.search.page` - Displays the specified XHTML fragment in the header section.
• `webhelp.fragment.after.header.search.page` - Displays the specified XHTML fragment after the header section.
• `webhelp.fragment.before.body.search.page` - Displays the specified XHTML fragment before the body.
• `webhelp.fragment.before.search.input.search.page` - Displays the specified XHTML fragment before the search input component.
• `webhelp.fragment.after.search.input.search.page` - Displays the specified XHTML fragment after the search input component.
• `webhelp.fragment.before.main.content.area.search.page` - Displays the specified XHTML fragment before the main content area.
• `webhelp.fragment.after.main.content.area.search.page` - Displays the specified XHTML fragment after the main content area.
• `webhelp.fragment.before.body.search.page` - Displays the specified XHTML fragment after the body.
• `webhelp.google.search.script` - Replaces the search input component with a Google search component.

**Index Terms Page Placeholder Parameters**

The following placeholder parameters can be used in the search results page. The parameter values can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment:

• `webhelp.fragment.head.terms.page` - Displays the specified XHTML fragment in the header section.
• `webhelp.fragment.after.header.terms.page` - Displays the specified XHTML fragment after the header section.
• `webhelp.fragment.before.body.terms.page` - Displays the specified XHTML fragment before the body.
• `webhelp.fragment.before.search.input.terms.page` - Displays the specified XHTML fragment before the search input component.
• `webhelp.fragment.after.search.input.terms.page` - Displays the specified XHTML fragment after the search input component.
• `webhelp.fragment.before.main.content.area.terms.page` - Displays the specified XHTML fragment before the main content area.
• `webhelp.fragment.after.main.content.area.terms.page` - Displays the specified XHTML fragment after the main content area.
• `webhelp.fragment.after.body.terms.page` - Displays the specified XHTML fragment after the body.

**Using String Values in Placeholder Parameter Values**

If you use strings for values of HTML fragment placeholder parameter values, the string values are written to files in the transformation's temporary directory. The values of the associated parameters reference the paths of the temporary files. This means that the HTML fragments will have a uniform processing in the *WebHelp's XSLT Module*.

**Example:**

Suppose the placeholder parameter has the following string value:
# String value
webhelp.fragment.welcome = \(\text{This is an HTML paragraph.}\)

A new file that contains the parameter's value is created:

\([\text{temp-dir}]/\text{whr-html-fragments/webhelp_fragment_welcome.xml}\)

\(\text{This is an HTML paragraph.}\)

The parameter's value then becomes:

# Absolute file path as value
webhelp.fragment.welcome= \([\text{temp-dir}]/\text{whr-html-fragments/webhelp_fragment_welcome.xml}\)

Related Information:
How to Insert Custom HTML Content (on page 1393)

WebHelp Responsive Macros

You can use the \texttt{whc:macro} layout component to specify a macro value (a variable that will be expanded when the output files are generated).

A macro has the following syntax:

\${macro-name}

or

\${macro-name(macro-parameter)}

A macro name can accept any alphanumeric characters, as well as the following characters: - (minus), _ (underscore), . (dot), : (colon). The value of a parameter may contain any character except the } (close curly bracket) character.

Implementations

The following \textit{macros} are supported:

\textbf{i18n}

For localizing a string.

\${i18n(string.id)}

\textbf{param}

Returns the value of a transformation parameter.

\${param(webhelp.show.main.page.tiles)}

\textbf{env}

Returns the value of an environment variable.
system-property

Returns the value of a system property.

${system-property(os.name)}

timestamp

Can be used to format the current date and time. Accepts a string (as a parameter) that determines how the date and time will be formatted (format string or picture string as it is known in the XSLT specification). The format string must comply with the rules of the XSLT dateTime function specification.

${timestamp([h1]:[m01] [/][P] [/][M01]/[/][D01]/[/][Y0001])}

path

Returns the path associated with the specified path ID. The following paths IDs are supported:

- **oxygen-webhelp-output-dir** - The path to the output directory. The path is relative to the current HTML file.
- **oxygen-webhelp-assets-dir** - The path to the oxygen-webhelp subdirectory from the output directory. The path is relative to the current HTML file.
- **oxygen-webhelp-template-dir** - The path to the template directory. The path is relative to the current HTML file.

${path(oxygen-webhelp-template-dir)}

Note:
New paths IDs can be added by overriding the wh-macro-custom-path template from com.oxygenxml.webhelp.responsive\xsl\template\macroExpander.xsl:

```xml
<!-- Extension template for expanding a custom path macro. -->
<xsl:template name="wh-macro-custom-path">
  <xsl:param name="pathId"/>
  <xsl:value-of select="$pathId"/>
</xsl:template>
```

map-xpath

Can be used to execute an XPath expression over the DITA map file from the temporary directory.

Tip:
Available in all template layout HTML pages.

${map-xpath(/map/title)}
topic-xpath

Can be used to execute an XPath expression over the current topic.

ℹ️ Tip:
Available only in the topic HTML page template (wt_topic.html).

```{topic-xpath(string-join(//shortdesc//text(), ' '))}
```

**oxygen-webhelp-build-number**

Returns the current WebHelp distribution ID (build number).

```{oxygen-webhelp-build-number}
```

**Extensibility**

To add new **macros**, you can add an XSLT extension to overwrite the `wh-macro-extension` template from the `com.oxygenxml.webhelp.responsive\xsl\template\macroExpander.xsl` file.

```xml
<!-- Extension template for expanding custom macro constructs -->
<xsl:template name="wh-macro-extension">
  <xsl:param name="name"/>
  <xsl:param name="params"/>
  <xsl:param name="contextNode"/>
  <xsl:param name="matchedString"/>

  <xsl:choose>
    <xsl:when test="$contextNode instance of attribute()">
      <xsl:value-of select="$matchedString"/>
    </xsl:when>
    <xsl:otherwise>
      <xsl:copy-of select="$contextNode"/>
    </xsl:otherwise>
  </xsl:choose>
</xsl:template>
```

The `wh-macro-extension` template has the following parameters:

- **name** - The name of the current macro.
- **params** - List of parameters of the current macro as a string sequence. The current macros parsing mechanism only allows macros with a maximum of one parameter. Consequently, this list will contain at most one element.
- **contextNode** - The current element or attribute where the macro was declared.
- **matchedString** - The entire value of the matched macro as specified in the HTML template page.
Combining WebHelp Responsive and PDF Customizations in a Template Package

An Oxygen Publishing Template package can contain both a WebHelp Responsive and PDF customization in the same template package and you can use that same template in both types of transformations. The template descriptor file can define the customization for both types by including both a `<webhelp>` and `<pdf>` element and some of the resources can be reused. Resources referenced in elements in the `<webhelp>` element will only be used for WebHelp transformations, and resources referenced in the elements in the `<pdf>` element will only be used in PDF transformations.

```xml
<publishing-template>
  <name>Flowers</name>
  <description>Flowers themed light-colored template</description>

  <webhelp>
    <tags>
      <tag>purple</tag>
      <tag>light</tag>
    </tags>
    <preview-image file="flowers-preview.png"/>
    <resources>
      <css file="flowers-wh.css"/>
      <css file="flowers-page-styling.css"/>
    </resources>
    <parameters>
      <parameter name="webhelp.show.main.page.tiles" value="no"/>
      <parameter name="webhelp.show.main.page.toc" value="yes"/>
    </parameters>
  </webhelp>

  <pdf>
    <tags>
      <tag>purple</tag>
      <tag>light</tag>
    </tags>
    <preview-image file="flowers-preview.png"/>
    <resources>
      <css file="flowers-pdf.css"/>
      <css file="flowers-page-styling.css"/>
    </resources>
    <parameters>
      <parameter name="show.changes.and.comments" value="yes"/>
    </parameters>
  </pdf>
</publishing-template>
```
HTML Page Layout Files

The HTML page layout files define the default layout of the generated pages in the output for the built-in template. There are four types of pages (main, search, topic, index) and each type of page is a simple HTML file. Each page type has various components that appear by default and each component has a corresponding element and when that element is included in the HTML file, the corresponding components will appear in the output.

**Warning:**
It is no longer recommended for you to customize these files because if you upgrade to a newer version of Oxygen, those files may no longer produce the desired results and if new components have been added, you won't have access to them. Instead, use any of the other methods described in Publishing Template Package Contents for WebHelp Responsive Customizations (on page 1343).

If you do choose to customize these HTML files, each type of page is defined inside an `<html-page-layout-files>` element in the descriptor file.

```xml
<publishing-template>
  ...
  <webhelp> ...
  <!-- HTML page layout files -->
  <html-page-layout-files>
    <page-layout-file page="main" file="page-templates/wt_index.html"/>
    <page-layout-file page="search" file="page-templates/wt_search.html"/>
    <page-layout-file page="topic" file="page-templates/wt_topic.html"/>
    <page-layout-file page="index-terms" file="page-templates/wt_terms.html"/>
  </html-page-layout-files>
</publishing-template>
```

If you do use the `html-page-layout-files` element, you must specify all four types of pages (main, search, topic, index). When not specified, the files from the `DITA-OT-DIR/plugins/com.oxygenxml.webhelp.responsive/oxygen-webhelp/page-templates` folder will be used to define the layout of each type of page.

**HTML Page Components**

Each type of page contains various components that control the layout of that page. The rendering of each component depends on the context where it is placed and its content depends on the transformed DITA map (on page 2654).
Some of the components can be used in all four types of pages, while some are only available for certain pages. For instance, the Publication Title component can be used in all pages, but the Navigation Breadcrumb component can only be used in the Topic Page.

To include a component in the output of a particular type of page, you have to reference a specific element in that particular HTML file. All the elements associated with a component should belong to the http://www.oxygenxml.com/webhelp/components namespace.

Every component can contain custom content or reference another component. To specify where the component content will be located in the output, you can use the <whc:component_content> element as a descendant of the component element. It can specify the location as before, after, or it can wrap the component content. The following snippet contains an example of each:

```xml
<whc:webhelp_search_input class="navbar-form wh_main_page_search"
   role="form" >
   <div class="custom-content-before">Enter search terms here:</div>
   <div class="custom-wrapper">
     <whc:component_content/>
   </div>
   <div class="custom-content-after">Results will be displayed in a new window.</div>
</whc:webhelp_search_input>
```

Main Page

The Main Page is the home page generated in the WebHelp Responsive output. The name of the HTML file that defines this page is wt_index.html and it is located in the following directory: DITA-OT-DIR/plugins/com.oxygenxml.webhelp.responsive/oxygen-webhelp/page-templates.

The main function of the home page is to display top-level information and provide links that help you easily navigate to any of the top-level topics of the publication. These links can be rendered in either a Tiles or Tree style of layout. The HTML page produced for the home page also consists of various other components, such as a logo, title, menu, search field, or index link.
Figure 435. Examples of Main Page Components for a Tiles Style of Layout

1. Publication Logo (on page 1362)
2. Publication Title (on page 1362)
3. Search Input (on page 1363)
4. Main Menu (on page 1363)
5. Index Terms Link (on page 1364)
6. Topic Tiles (on page 1363)
7. Print Link (on page 1363)
Figure 436. Examples of Main Page Components for a Tree Style of Layout

1. Publication Logo (on page 1362)
2. Publication Title (on page 1362)
3. Search Input (on page 1363)
4. Main Menu (on page 1363)
5. Index Terms Link (on page 1364)
6. Table of Contents (on page 1364)
7. Print Link (on page 1363)

The following components can be referenced in the Main Page (wt_index.html) file:

**Publication Title (webhelp_publication_title)**

This component generates the publication title in the output. To generate this component, the `<whc:webhelp_publication_title>` element must be specified in the HTML file as in the following example:

```xml
<whc:webhelp_publication_title
```

In the output, you will find an element with the class: `wh_publication_title`.

**Publication Logo (webhelp_logo)**

This component generates a logo image in the output. To generate this component, the `<whc:webhelp_logo>` element must be specified in the HTML file as in the following example:
In addition, you must also specify the path of the logo image in the `webhelp.logo.image` transformation parameter (in the Parameters tab in the transformation scenario). You can set the `webhelp.logo.image.target.url` parameter to generate a link to a URL when you click the logo image.

In the output, you will find an element with the class: `wh_logo`.

**Search Input (webhelp_search_input)**

This component is used to generate the input widget associated with search function in the output. To generate this component, the `<whc:webhelp_search_input>` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_search_input
```

In the output, you will find an element with the class: `wh_search_input`.

**Print Link (webhelp_print_link)**

This component is used to generate a print icon that opens the print dialog box for your particular browser. To generate this component, the `<whc:webhelp_print_link>` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_print_link
```

In the output, you will find an element with the class: `wh_print_link`.

**Main Menu (webhelp_top_menu)**

This component generates a menu with all the documentation topics. To generate this component, the `<whc:webhelp_top_menu>` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_top_menu
```

In the output, you will find an element with the class: `wh_top_menu`.

You can control the maximum level of topics that will be included in the menu using the `webhelp.top.menu.depth` transformation parameter (in the Parameters tab of the transformation scenario).

For information about customizing the menu, see How to Customize the Menu (on page 1402).

**Main Page Topic Tiles (webhelp_tiles)**
This component generates the tiles section in the main page. This section will contain a tile for each root topic of the published documentation. Each topic tile has three sections that correspond to the topic title, short description, and image. To generate this component, the `<whc:webhelp_tiles>` element must be specified in the HTML file as in the following example:

```html
<whc:webhelp_tiles
```

In the output, you will find an element with the class: `wh_tiles`.

If you want to control the HTML structure that is generated for a WebHelp tile you can also specify the template for a tile by using the `<whc:webhelp_tile>` component, as in the following example:

```html
<whc:webhelp_tile class="col-md-4">
    <!-- Place holder for tile's image -->
    <whc:webhelp_tile_image/>

    <div class="wh_tile_text">
        <!-- Place holder for tile's title -->
        <whc:webhelp_tile_title/>

        <!-- Place holder for tile's shordesc -->
        <whc:webhelp_tile_shortdesc/>
    </div>
</whc:webhelp_tile>
```

For information about customizing the tiles, see [How to Configure the Tiles on the WebHelp Responsive Main Page](#) (on page 1406).

**Main Page Table of Contents (webhelp_main_page_toc)**

This component generates a simplified Table of Contents. It is simplified because it contains only two levels from the documentation hierarchy. To generate this component, the `<whc:webhelp_main_page_toc>` element must be specified in the HTML file as in the following example:

```html
<whc:webhelp_main_page_toc
```

In the output, you will find an element with the class: `wh_main_page_toc`.

**Index Terms Link (webhelp_indexterms_link)**

This component can be used to generate a link to the index terms page (`indexterms.html`). If the published documentation does not contain any index terms, then the link will not be generated. To generate this component, the `<whc:webhelp_indexterms_link>` element must be specified in the HTML file as in the following example:
In the output, you will find an element with the class: `wh_indexterms_link`. This component will contain a link to the `indexterms.html` page.

**Link to Skins Resources (`webhelp_skin_resources`)**

This component can be used to add a link to resources for the current WebHelp skin (such as the CSS file). To generate this component, the `<whc:webhelp_skin_resources>` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_skin_resources/>
```

In the output, you will find a link to the skin resources.

**Topic Page**

The *Topic Page* is the page generated for each DITA topic in the WebHelp Responsive output. The name of the HTML file that defines this page is `wt_topic.html` and it is located in the following directory: `DITA-OT-DIR/plugins/com.oxygenxml.webhelp.responsive/oxygen-webhelp/page-templates`.

The HTML pages produced for each topic consist of the topic content along with various other additional components, such as a title, menu, navigation breadcrumb, print icon, or side table of contents.
Figure 437. Examples of Topic Page Components

1. Publication Logo (on page 1367)
2. Publication Title (on page 1366)
3. Search Input (on page 1367)
4. Main Menu (on page 1369)
5. Index Terms Link (on page 1369)
6. Expand/Collapse All Sections (on page 1369)
7. Navigation Links (on page 1367)
8. Print Link (on page 1368)
9. Breadcrumb (on page 1367)
10. Publication Table of Contents (on page 1368)
11. Topic Content (on page 1368)
12. Topic Table of Contents (on page 1368)

The following components can be referenced in the Topic Page (wt_topic.html) file:

Publication Title (webhelp_publication_title)
This component generates the publication title in the output. To generate this component, the `<whc:webhelp_publication_title>` element must be specified in the HTML file as in the following example:

```xml
<wehc:webhelp_publication_title
```

In the output, you will find an element with the class: `wh_publication_title`.

**Publication Logo (webhelp_logo)**

This component generates a logo image in the output. To generate this component, the `<whc:webhelp_logo>` element must be specified in the HTML file as in the following example:

```xml
<wwhc:webhelp_logo
```

In addition, you must also specify the path of the logo image in the `webhelp.logo.image` transformation parameter (in the Parameters tab in the transformation scenario). You can set the `webhelp.logo.image.target.url` parameter to generate a link to a URL when you click the logo image.

In the output, you will find an element with the class: `wh_logo`.

**Search Input (webhelp_search_input)**

This component is used to generate the input widget associated with search function in the output. To generate this component, the `<whc:webhelp_search_input>` element must be specified in the HTML file as in the following example:

```xml
<w whc:webhelp_search_input
```

In the output, you will find an element with the class: `wh_search_input`.

**TopicBreadcrumb (webhelp_breadcrumb)**

This component generates a breadcrumb that displays the path of the current topic. To generate this component, the `<whc:webhelp_breadcrumb>` element must be specified in the HTML file as in the following example:

```xml
<w whc:webhelp_breadcrumb
```

In the output, you will find an element with the class: `wh_breadcrumb`. This component will contain a list with items that correspond to the topics in the path. The first item in the list has a link to the main page with the `home` class. The last item in the list corresponds to the current topic and has the `active` class set.

**Navigation Links (webhelp_navigation_links)**
This component generates navigation links to the next and previous topics. To generate this component, the `<whc:webhelp_navigation_links>` element must be specified in the HTML file as in the following example:

```xml
<whc:webhelp_navigation_links
```

In the output, you will find an element with the class: `wh_navigation_links`. This component will contain the links to the next and previous topics.

**Print Link** (`webhelp_print_link`)

This component is used to generate a print icon that opens the print dialog box for your particular browser. To generate this component, the `<whc:webhelp_print_link>` element must be specified in the HTML file as in the following example:

```xml
<whc:webhelp_print_link
```

In the output, you will find an element with the class: `wh_print_link`.

**Topic Content** (`webhelp_topic_content`)

This component generates the content of a topic and it represent the content of the HTML files as they are produced by the DITA-OT processor. To generate this component, the `<whc:webhelp_topic_content>` element must be specified in the HTML file as in the following example:

```xml
<whc:webhelp_topic_content
```

In the output, you will find an element with the class: `wh_topic_content`.

**Publication TOC** (`webhelp_publication_toc`)

This component generates a mini table of contents for the current topic (on the left side). It will contain links to the children of the current topic, its siblings, and all of its ancestors. To generate this component, the `<whc:webhelp_publication_toc>` element must be specified in the HTML file as in the following example:

```xml
<whc:webhelp_publication_toc
```

In the output, you will find an element with the class: `wh_publication_toc`. This component will contain links to the topics referenced in the DITA map. It also includes an expand/collapse button (either `<` to collapse or the `>` to expand).

**Topic TOC** (`webhelp_topic_toc`)

This component generates a topic table of contents for the current topic (on the right side) with a heading named **On this page**. It contains links to each section within the current topic and
the section corresponding to the current scroll position is highlighted. The topic must contain at least two <section> elements and each <section> must have an @id attribute. To generate this component, the <whc:webhelp_topic_toc> element must be specified in the HTML file as in the following example:

```html
<whc:webhelp_topic_toc
```

In the output, you will find an element with the class: wh_topic_toc. This component will contain links to the sections within the current topic. It also includes an expand/collapse button (either ▶️ to collapse or the ◀️ to expand).

**Expand/Collapse Sections (webhelp_expand-collapse-sections)**

This component is used to generate an icon that expands or collapses sections listed in the side table of contents within a topic. To generate this component, the <whc:webhelp_expand-collapse-sections> element must be specified in the HTML file as in the following example:

```html
<whc:webhelp_expand-collapse-sections
```

In the output, you will find an element with the class: webhelp_expand-collapse-sections.

**Topic Feedback (webhelp-feedback)**

This component generates a placeholder for where the comments section will be presented. To generate this component, the <whc:webhelp-feedback> element must be specified in the HTML file as in the following example:

```html
<whc:webhelp-feedback
```

**Main Menu (webhelp-top-menu)**

This component generates a menu with all the documentation topics. To generate this component, the <whc:webhelp-top-menu> element must be specified in the HTML file as in the following example:

```html
<whc:webhelp-top-menu
```

In the output, you will find an element with the class: wh_top.

You can control the maximum level of topics that will be included in the menu using the webhelp.top.menu.depth transformation parameter (in the Parameters tab of the transformation scenario).

For information about customizing the menu, see How to Customize the Menu (on page 1402).

**Index Terms Link (webhelp-index-terms-link)**
This component can be used to generate a link to the index terms page (indexterms.html). If the published documentation does not contain any index terms, then the link will not be generated. To generate this component, the `<whc:webhelp_indexterms_link>` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_indexterms_link
```

In the output, you will find an element with the class: `wh_indexterms_link`. This component will contain a link to the indexterms.html page.

**Child Links** (`webhelp_child_links`)

For all topics with subtopics (child topics), this component generates a list of links to each child topic. To generate this component, the `<whc:webhelp_child_links>` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_child_links
```

**Related Links** (`webhelp_related_links`)

For all topics that contain related links, this component generates a list of related links that will appear in the output. To generate this component, the `<whc:webhelp_related_links>` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_related_links
```

**Link to Skins Resources** (`webhelp_skin_resources`)

This component can be used to add a link to resources for the current WebHelp skin (such as the CSS file). To generate this component, the `<whc:webhelp_skin_resources>` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_skin_resources/>
```

In the output, you will find a link to the skin resources.

**Search Results Page**

The *Search Results Page* is the page generated that presents search results in the WebHelp Responsive output. The name of the HTML file that defines this page is `wt_search.html` and it is located in the following directory: `DITA-OT-DIR/plugins/com.oxygenxml.webhelp.responsive/oxygen-webhelp/page-templates`.

The HTML page that is produced consists of a search results component along with various other additional components, such as a title, menu, or index link.
Figure 438. Examples of Search Results Page Components

1. Publication Logo (on page 1371)
2. Publication Title (on page 1371)
3. Search Input (on page 1372)
4. Main Menu (on page 1372)
5. Index Terms Link (on page 1373)
6. Search Results (on page 1372)
7. Print Link (on page 1372)

The following components can be referenced in the Search Results Page (wt_search.html) file:

**Publication Title** (webhelp_publication_title)

This component generates the publication title in the output. To generate this component, the `<whc:webhelp_publication_title>` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_publication_title
```

In the output, you will find an element with the class: `wh_publication_title`.

**Publication Logo** (webhelp_logo)
This component generates a logo image in the output. To generate this component, the `<whc:webhelp_logo>` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_logo
```

In addition, you must also specify the path of the logo image in the `webhelp.logo.image` transformation parameter (in the Parameters tab in the transformation scenario). You can set the `webhelp.logo.image.target.url` parameter to generate a link to a URL when you click the logo image.

In the output, you will find an element with the class: `wh_logo`.

### Search Input (webhelp_search_input)

This component is used to generate the input widget associated with search function in the output. To generate this component, the `<whc:webhelp_search_input>` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_search_input
```

In the output, you will find an element with the class: `wh_search_input`.

### Search Results (webhelp_search_results)

This component is used to generate a placeholder to signal where the search results will be presented in the output. To generate this component, the `<whc:webhelp_search_results>` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_search_results
```

In the output, you will find an element with the class: `wh_search_results`.

### Print Link (webhelp_print_link)

This component is used to generate a print icon that opens the print dialog box for your particular browser. To generate this component, the `<whc:webhelp_print_link>` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_print_link
```

In the output, you will find an element with the class: `wh_print_link`.

### Main Menu (webhelp_top_menu)

This component generates a menu with all the documentation topics. To generate this component, the `<whc:webhelp_top_menu>` element must be specified in the HTML file as in the following example:
In the output, you will find an element with the class: `wh_top_menu`.

You can control the maximum level of topics that will be included in the menu using the `webhelp.top.menu.depth` transformation parameter (in the Parameters tab of the transformation scenario).

For information about customizing the menu, see How to Customize the Menu (on page 1402).

**Index Terms Link** *(webhelp_indexterms_link)*

This component can be used to generate a link to the index terms page (`indexterms.html`). If the published documentation does not contain any index terms, then the link will not be generated. To generate this component, the `<whc:webhelp_indexterms_link>` element must be specified in the HTML file as in the following example:

```xml
<whc:webhelp_indexterms_link
```

In the output, you will find an element with the class: `wh_indexterms_link`. This component will contain a link to the `indexterms.html` page.

**Link to Skins Resources** *(webhelp_skin_resources)*

This component can be used to add a link to resources for the current WebHelp skin (such as the CSS file). To generate this component, the `<whc:webhelp_skin_resources>` element must be specified in the HTML file as in the following example:

```xml
<whc:webhelp_skin_resources/>
```

In the output, you will find a link to the skin resources.

**Index Terms Page**

The Index Terms Page is the page generated that presents index terms in the WebHelp Responsive output. The name of the HTML file that defines this page is `wt_terms.html` and it is located in the following directory: `DITA-OT-DIR/plugins/com.oxygenxml.webhelp.responsive/oxygen-webhelp/page-templates`.

The HTML page that is produced consists of an index terms section along with various other additional components, such as a title, menu, or search field.

An alphabet that contains the first letter of the documentation index terms is generated at the top of the index page. Each letter represents a link to a specific indices section.
The following components can be referenced in the Index Terms Page (wt_terms.html) file:

**Publication Title** *(webhelp_publication_title)*

This component generates the publication title in the output. To generate this component, the `<whc:webhelp_publication_title>` element must be specified in the HTML file as in the following example:

```html
<whc:webhelp_publication_title
```

In the output, you will find an element with the class: `wh_publication_title`.

**Publication Logo** *(webhelp_logo)*

This component generates a logo image in the output. To generate this component, the `<whc:webhelp_logo>` element must be specified in the HTML file as in the following example:
In addition, you must also specify the path of the logo image in the `webhelp.logo.image` transformation parameter (in the Parameters tab in the transformation scenario). You can set the `webhelp.logo.image.target.url` parameter to generate a link to a URL when you click the logo image.

In the output, you will find an element with the class: `wh_logo`.

**Search Input (webhelp_search_input)**

This component is used to generate the input widget associated with search function in the output. To generate this component, the `<whc:webhelp_search_input>` element must be specified in the HTML file as in the following example:

```xml
<whc:webhelp_search_input
```

In the output, you will find an element with the class: `wh_search_input`.

**Print Link (webhelp_print_link)**

This component is used to generate a print icon that opens the print dialog box for your particular browser. To generate this component, the `<whc:webhelp_print_link>` element must be specified in the HTML file as in the following example:

```xml
<whc:webhelp_print_link
```

In the output, you will find an element with the class: `wh_print_link`.

**Main Menu (webhelp_top_menu)**

This component generates a menu with all the documentation topics. To generate this component, the `<whc:webhelp_top_menu>` element must be specified in the HTML file as in the following example:

```xml
<whc:webhelp_top_menu
```

In the output, you will find an element with the class: `wh_top_menu`.

You can control the maximum level of topics that will be included in the menu using the `webhelp.top.menu.depth` transformation parameter (in the Parameters tab of the transformation scenario).

For information about customizing the menu, see How to Customize the Menu (on page 1402).

**Index Terms Link (webhelp_indexterms_link)**
This component can be used to generate a link to the index terms page (indexterms.html). If the published documentation does not contain any index terms, then the link will not be generated. To generate this component, the `<whc:webhelp_indexterms_link>` element must be specified in the HTML file as in the following example:

```xml
<whc:webhelp_indexterms_link
```

In the output, you will find an element with the class: `wh_indexterms_link`. This component will contain a link to the `indexterms.html` page.

**Link to Skins Resources (webhelp_skin_resources)**

This component can be used to add a link to resources for the current WebHelp skin (such as the CSS file). To generate this component, the `<whc:webhelp_skin_resources>` element must be specified in the HTML file as in the following example:

```xml
<whc:webhelp_skin_resources/>
```

In the output, you will find a link to the skin resources.

**Generating WebHelp Responsive Output**

The publishing process can be initiated from a transformation scenario within Oxygen XML Editor/Author, from a command line outside Oxygen XML Editor/Author, or from an integration server.

**Running WebHelp Responsive from Oxygen XML Editor/Author**

To publish a DITA map (on page 2654) as WebHelp Responsive output, follow these steps:

1. Select the ✉ Configure Transformation Scenario(s) action from the DITA Maps Manager toolbar.
2. Select the DITA Map WebHelp Responsive scenario from the DITA Map section.
3. If you want to configure the transformation, click the Edit button.

**Step Result:** This opens an Edit scenario configuration dialog box that allows you to configure various options in the following tabs:

- **Templates Tab** - This tab contains a set of built-in skins that you can use for the layout of your WebHelp system output.
- **Parameters Tab** - This tab includes numerous transformation parameters that can be set to customize your WebHelp system output.
- **Feedback Tab** - This tab is for those who want to add the Oxygen Feedback comments component at the bottom of each WebHelp page so that you can interact with your readers.
- **Filters Tab** - This tab allows you to filter certain content elements from the generated output.
- **Advanced Tab** - This tab allows you to specify some advanced options for the transformation scenario.
- **Output Tab** - This tab allows you to configure options that are related to the location where the output is generated.

4. Click **Apply associated** to process the transformation.

**Result:** When the **DITA Map WebHelp Responsive** transformation is complete, the output is automatically opened in your default browser.

**Automating the WebHelp Responsive Output for DITA**

DITA-based WebHelp output can be generated from an automated publishing process using a command line outside of **Oxygen XML Editor/Author** or an automatic publishing system, such as **Jenkins** or **Travis**. However, to do this, you must purchase an additional **Oxygen XML WebHelp license**.

**Adding Oxygen Feedback to WebHelp Responsive Documentation**

You can add Oxygen Feedback in WebHelp Responsive for DITA output to benefit from a modern commenting system, advanced ready-to-use search engine, administrative interface, and **Oxygen XML Editor/Author** integration.

**Comments Component**

A comments component is presented in your WebHelp Responsive output to provide a simple and efficient way for your community to interact and offer feedback. The comments component is contributed by **Oxygen Feedback**, a modern comment management system that can be integrated with your WebHelp Responsive output to provide a comments area at the bottom of each WebHelp page where readers can add new comments or reply to existing ones.

**External Search Engine**

Oxygen Feedback can be **configured as an external search engine** for the **Oxygen WebHelp Responsive** output. This function be enabled from the **Content Indexing and Search** section that is available in the **Version Settings** page.

**Administration Interface**

**Oxygen Feedback** includes a modern, user-friendly administration interface where you can moderate comments, manage users, view statistics, and configure settings. It is very easy to integrate and there are no requirements for installing additional software. You simply need to create an **Oxygen Feedback site configuration in the administration interface**, copy the HTML installation fragment that is generated at the end of the creation process, and paste the generated fragment in the **Feedback** tab in the WebHelp Responsive transformation scenario dialog box (on page 2535).

**Oxygen XML Editor/Author Integration**

An add-on is available that contributes a **Feedback Comments Manager view** in **Oxygen XML Editor/Author** where the documentation team can see all the comments added in your WebHelp
output. This means they can react to user feedback by making corrections and updating the source content without leaving the application.

Deploying the Oxygen Feedback Comments Component

Prerequisite

To install and manage Oxygen Feedback, you will need to obtain a license for the product. This requires that you choose a subscription plan during the installation procedure. To see the subscription plans prior to installing the product, go to: https://www.oxygenxml.com/oxygen_feedback/buy_feedback.html.

Installation Procedure

1. Log in to your Feedback account from the administration login page (https://feedback.oxygenxml.com/login). You can click on Log in with Google or Log in with Facebook to create an account using your Google or Facebook credentials, or click the Sign Up tab to create an account using your name and email address.
2. Click the Add site button to create a site configuration. If you have not already selected a subscription plan, you will be directed to a page where you can choose from several options.
3. In the Settings page, enter a Name and Description for the site configuration. There are some optional settings that can be adjusted according to your needs. For more details, see the Site Settings topic. Click Continue.
4. In the Initial version page, enter the Base URL for your website (you can add additional URLs by clicking the Add button). You can also specify an Initial version if you want it to be something other than 1.0. If you do not plan to have multiple versions, leave the version as 1.0. For more details, see the Initial Version topic.
5. [Optional] To configure Oxygen Feedback as an external search engine check the Enable content indexing option.
6. Click Continue.
7. In the Installation page, choose a site generation option:
   a. If you will generate the documentation using a transformation scenario in Oxygen XML Editor/Author, select the Oxygen XML Editor option and continue with these steps:
      i. Copy the generated HTML fragment and click Finish.
      ii. In Oxygen XML Editor/Author, open the Configure Transformation Scenario(s) dialog box.
      iii. Select and duplicate the DITA Map WebHelp Responsive scenario.
      iv. Go to the Feedback tab.
      v. Click the Edit button and paste the generated installation fragment.
   b. If you will generate the documentation using a command-line script, select the Oxygen XML WebHelp option and continue with these steps:
      i. Copy the generated HTML fragment and click Finish.
      ii. Create an XML file (for example, feedback-install.xml) with the generated installation fragment.
iii. Use the `webhelp.fragment.feedback` parameter in your command-line script to specify the path to the file you just created. For example:

```
dita.bat -Dwebhelp.fragment.feedback=c:\path\to\feedback-install.xml
```

8. [Optional] If you want the Oxygen Feedback comments component to fill the entire page width, contribute a custom CSS file (use the `args.css` parameter to reference it) that contains the following style rule:

```
div.footer {
    float: none;
}
```

For more details about Oxygen Feedback, how to configure settings, moderate comments, view statistics, and much more, see the Oxygen Feedback user guide.

Also, to see a demonstration of Oxygen Feedback being integrated into WebHelp Responsive output, watch our Webinar: DITA Publishing and Feedback with Oxygen Tools.

**Customizing WebHelp Responsive Output**

Oxygen XML Editor Eclipse plugin provides support for customizing the WebHelp Responsive output to suit your specific needs. The WebHelp Responsive output is based upon the Bootstrap responsive front-end framework and is available for DITA document types.

To change the overall appearance of your WebHelp Responsive output, you can use several different customization methods or a combination of methods. If you are familiar with CSS and coding, you can style your WebHelp output through your own custom stylesheets. You can also customize your output by modifying existing templates, create your own layout pages, or by configuring certain options and parameters in the transformation scenario.

This section includes topics that explain various ways to customize your WebHelp Responsive system output, such as how to configure the tiles on the main page, add logos in the title area, integrate with social media, localizing the interface, and much more.

For an in-depth look at WebHelp Responsive features and some customization tips, watch our Webinar: DITA Publishing and Feedback with Oxygen Tools.

**Working with Publishing Templates**

An Oxygen Publishing Template (on page 2656) defines all aspects of the layout and styles of the WebHelp Responsive output. It is a self-contained customization package stored as a ZIP archive or folder that can easily be shared with others. It provides the primary method for customizing the output. The recommended method for customizing the WebHelp Responsive output is to use a custom publishing template.

This section contains topics about how to create, edit, publish, and share publishing templates.
How to Create a Publishing Template

To create a customization, you can start from scratch or from an existing template, and then adapt it according to your needs.

Creating a Publishing Template Starting from Scratch

To create a new Oxygen Publishing Template (on page 2656), follow these steps:

1. Create a folder that will contain all the template files.

2. In Oxygen XML Editor/Author, open the new document wizard (use File > New or the New toolbar button), then choose the Publishing Template Descriptor template.

3. Save the .opt file into your customization directory.

4. Open the .opt file in the editor and customize it to suit your needs.

Creating a Publishing Template Starting from an Existing Template

If you are using a DITA Map WebHelp Responsive or DITA Map PDF - based on HTML5 & CSS transformation, the easiest way to create a new Oxygen Publishing Template (on page 2656) is to select an existing template
in the transformation scenario dialog box and use the **Save template as** button to save that template into a new template package that can be used as a starting point.

To create a new *Oxygen Publishing Template*, follow these steps:

1. Open the transformation scenario dialog box and select the publishing template you want to export and use as a starting point.

2. **Optional:** You can set one or more transformation parameters from the **Parameters** tab and the edited parameters will be exported along with the selected template. You will see which parameters will be exported in the dialog box that is displayed after the next step.

3. Click the **Save template as** button.

   **Step Result:** This opens a template package configuration dialog box that contains some options and displays the parameters that will be exported to your template package.

4. Specify a name for the new template.

5. **Optional:** Specify a template description.

6. **Optional:** The same publishing template package can contain both a WebHelp Responsive and PDF customization and you can use the same template in both types of transformations (**DITA Map WebHelp Responsive** or **DITA Map to PDF - based on HTML5 & CSS**). You can use the **Include WebHelp customization** and **Include PDF customization** options to specify whether your custom template will include both types of customizations.

7. **Optional:** For **WebHelp Responsive** customizations, you can select the **Include HTML Page Layout Files** option if you want to copy the default **HTML Page Layout Files (on page 1359)** in your template package. They are helpful if you want to change the structure of the generated HTML pages.

8. In the **Save as** field, specify the name and path of the ZIP file where the template will be saved.

   **Step Result:** A new ZIP archive will be created on disk in the specified location with the specified name.

9. Open the `.opt` file in the editor and customize it to suit your needs.

**Creating a Publishing Template Using the Oxygen Styles Basket**

Another way to create an *Oxygen Publishing Template (on page 2656)* is to use the **Oxygen Styles Basket**. This tool is a handy free-to-use web-based visual tool that helps you create your own *Publishing Template Package* to customize your **DITA Map WebHelp Responsive** transformation scenarios.

It is based on galleries that you can visit to pick styling aspects to create a custom look and feel. Various different types of styles can be selected (such as fonts, tables, lists, spacing, code) and all changes can be seen in the **Preview** pane. You can also click the **See Results** button to generate a preview of either WebHelp or PDF output.
It is possible to Download the current template or Upload a previously generated template for further customization.

**Figure 441. Oxygen Styles Basket Interface**

Resources

For more information about the **Oxygen Styles Basket**, see the following resources:

- Video: Introducing the New Oxygen Styles Basket
- Webinar: Using Oxygen Styles Basket to Create CSS Customization from Scratch

**Related information**

- Publishing Template Package Contents for WebHelp Responsive Customizations *(on page 1343)*

**How to Edit a Packed Publishing Template**

To edit an existing **Oxygen Publishing Template (on page 2656)** package, follow these steps:

1. Unzip the ZIP archive associated with the **Oxygen Publishing Template** in a separate folder.
2. Link the folder associated with the template in the **Project Explorer** view.
3. Using the **Project Explorer** view, you can modify the resources (CSS, JS, fonts) within the **Oxygen Publishing Template** folder to fit your needs.
4. Open the publishing template descriptor file (`.opt` extension) in the editor and modify it to suit your needs.
5. Optional: Once you finish your customization, you can archive the folder as a ZIP file.
How to Add a Publishing Template to the Publishing Templates Gallery

To add the publishing template to your templates gallery, follow these steps:

1. Open the transformation scenario dialog box by editing a WebHelp Responsive transformation.
2. In the Templates tab, click the Configure Publishing Templates Gallery link to.
   This will open the preferences page.
3. Click the Add button and specify the location of your template directory.
   Your template directory is now added to the Additional Publishing Templates Galleries list.
4. Click OK to return to the transformation scenario dialog box.
   All the templates contained in your template directory will be displayed in the preview pane along with all the built-in templates.

How to Use a Publishing Template from a Command Line

Before you run the transformation, you need to know if the publishing template has a single template descriptor file or multiple descriptor files (on page 1343). If you don't know, open the ZIP archive or folder and check for files with the .opt extension.

Using a Publishing Template with a Single Descriptor

A template with a single descriptor is used for a single customization.

To run from a command line, you need to use the webhelp.publishing.template parameter (on page 1470). This parameter specifies the path to the ZIP archive (or root folder) that contains your custom WebHelp Responsive template.

Command-Line Example:

- **Windows**:

  dita.bat
  ```
  --format=webhelp-responsive
  --input=c:\path\to\mySample.ditamap
  --output=c:\path\to\output
  -Dwebhelp.publishing.template=custom-template
  ```

- **Linux/macOS**:

  dita
  ```
  --format=webhelp-responsive
  --input=/path/to/mySample.ditamap
  ```
Tip:
You can also start the `dita` process by passing it a DITA OT Project File. Inside the project file you can specify as parameters for the `webhelp-responsive` transformation type the WebHelp-related parameters.

Using a Publishing Template with Multiple Descriptors

A template with multiple descriptors contains multiple customizations.

Because the publishing template is self-contained, it is used to reuse resources that are common to multiple publications.

To run from a command line, you need to use the `webhelp.publishing.template` (on page 1470) and `webhelp.publishing.template.descriptor` (on page 1470) parameters.

The `webhelp.publishing.template` (on page 1470) parameter specifies the path to the ZIP archive (or root folder) while the `webhelp.publishing.template.descriptor` (on page 1470) parameter specifies the name of the descriptor you want to use.

**Command-Line Example:**

- **Windows:**

  ```bash
  dita.bat
  --format=webhelp-responsive
  --input=c:\path\to\mySample.ditamap
  --output=c:\path\to\output
  -Dwebhelp.publishing.template=custom-template
  -Dwebhelp.publishing.template.descriptor=flowers.opt
  ```

- **Linux/macOS:**

  ```bash
  dita
  --format=webhelp-responsive
  --input=/path/to/mySample.ditamap
  --output=/path/to/output
  -Dwebhelp.publishing.template=custom-template
  -Dwebhelp.publishing.template.descriptor=flowers.opt
  ```
Tip:

You can also start the dita process by passing it a DITA OT Project File. Inside the project file you can specify as parameters for the webhelp-responsive transformation type the WebHelp-related parameters.

How to Share a Publishing Template

To share a publishing template with others, following these steps:

1. Copy your template in a new folder in your project.
2. Go to Options > Preferences > DITA > Publishing and add that new folder to the list.
3. Switch the option as the bottom of that preferences page to Project Options.
4. Share your project file (.xpr).

Troubleshooting: Errors Encountered when Loading Templates

When the Templates tab of a WebHelp Responsive transformation scenario dialog box is opened, all templates (built-in and custom) are loaded and validated. Specifically, certain elements in the template descriptor file (on page 1343) are checked for validity. If errors are encountered that prevents the template from loading, the following message will be displayed toward the bottom of the dialog box:

⚠️ Some templates could not be loaded. More details

If you click the More details link, a window will open with more information about the encountered error. For example, it might offer a hint that the element is missing from the expected descriptor file structure (on page 1343).

Also, if a template could be loaded, but certain elements could not be found in the descriptor file (on page 1343), a warning icon (⚠️) will be displayed on the template's image (in the Templates tab of the transformation dialog box). For example, this happens if a valid preview-image element (on page 1346) cannot be found.

Converting Old Templates to Newer Versions

WebHelp templates that were created in older versions of Oxygen XML Editor Eclipse plugin can be converted to the Publishing Template format that was introduced in Oxygen XML Editor Eclipse plugin version 20.0. This section contains several procedures for converting old templates depending on the version they were created in.

Convert Version 24.1 Publishing Templates to Version 25

If you have a custom Publishing Template that was created in Oxygen XML Editor Eclipse plugin version 24.1, the following conversion procedure is required for the template to be compatible with Oxygen XML Editor Eclipse plugin version 25.0:
1. In the **Project Explorer** view, add the root directory for your custom Publishing Template (you can use a linked folder *(on page 267)* and the easiest way to do this is to drag and drop the folder).

   ![Note]
   If your template is stored as a ZIP archive, you first need to unzip it.

2. Expand your template directory, right-click the **page-templates** subfolder, and select **Refactoring > XML Refactoring**.

3. In the **XML Refactoring** dialog box, scroll to the **Publishing Template** section and select **Migrate HTML Page Layout Files to v25**, then click **Next**.

4. The **Scope** should be left as **Selected project resources**.

5. You can use the **Preview** button to open a comparison panel where you can review all the changes that will be made by the refactoring operation before applying the changes.

6. Click **Finish** to perform the conversion.

**Result:** The converted Publishing Template can now be used in version 25.0.

- Convert Version 20 Publishing Templates to Version 21 *(on page 1389)*
- Convert Version 19 (and Older) Publishing Templates to Version 20 *(on page 1389)*

### Convert Version 24.0 Publishing Templates to Version 24.1

If you have a custom Publishing Template that was created in Oxygen XML Editor Eclipse plugin version 24.0, the following conversion procedure is required for the template to be compatible with Oxygen XML Editor Eclipse plugin version 24.1:

1. In the **Project Explorer** view, add the root directory for your custom Publishing Template (you can use a linked folder *(on page 267)* and the easiest way to do this is to drag and drop the folder).

   ![Note]
   If your template is stored as a ZIP archive, you first need to unzip it.

2. Expand your template directory, right-click the **page-templates** subfolder, and select **Refactoring > XML Refactoring**.

3. In the **XML Refactoring** dialog box, scroll to the **Publishing Template** section and select **Migrate HTML Page Layout Files to v24.1**, then click **Next**.

4. The **Scope** should be left as **Selected project resources**.
5. You can use the **Preview** button to open a comparison panel where you can review all the changes that will be made by the refactoring operation before applying the changes.

6. Click **Finish** to perform the conversion.

**Result:** The converted Publishing Template can now be used in version 24.1.

- Convert Version 20 Publishing Templates to Version 21 *(on page 1389)*
- Convert Version 19 (and Older) Publishing Templates to Version 20 *(on page 1389)*

### Convert Version 23 Publishing Templates to Version 24

If you have a custom Publishing Template that was created in Oxygen XML Editor Eclipse plugin version 23.0 or 23.1, the following conversion procedure is required for the template to be compatible with Oxygen XML Editor Eclipse plugin version 24:

1. In the **Project Explorer** view, add the root directory for your custom Publishing Template (you can use a **linked folder** *(on page 267)* and the easiest way to do this is to drag and drop the folder).

   **Note:**
   
   If your template is stored as a ZIP archive, you first need to unzip it.

2. Expand your template directory, right-click the **page-templates** subfolder, and select **Refactoring > XML Refactoring.**

3. In the **XML Refactoring** dialog box, scroll to the **Publishing Template** section and select **Migrate HTML Page Layout Files to v24.** then click **Next.**

4. The **Scope** should be left as **Selected project resources.**

5. You can use the **Preview** button to open a comparison panel where you can review all the changes that will be made by the refactoring operation before applying the changes.

6. Click **Finish** to perform the conversion.

**Result:** The converted Publishing Template can now be used in version 24.

### Related information

- Convert Version 20 Publishing Templates to Version 21 *(on page 1389)*
- Convert Version 19 (and Older) Publishing Templates to Version 20 *(on page 1389)*
Convert Version 22 Publishing Templates to Version 23

If you have a custom Publishing Template that was created in Oxygen XML Editor Eclipse plugin version 22.0 or 22.1, it is not necessary to convert it to version 23 because there were no structural changes made for the HTML layout files (on page 1359) between the two versions.

Convert Version 21 Publishing Templates to Version 22

If you have a custom Publishing Template that was created in Oxygen XML Editor Eclipse plugin version 21.0 or 21.1, the following conversion procedure is required for the template to be compatible with Oxygen XML Editor Eclipse plugin version 22:

1. In the Project Explorer view, add the root directory for your custom Publishing Template (you can use a linked folder (on page 267) and the easiest way to do this is to drag and drop the folder).

   Note:
   If your template is stored as a ZIP archive, you first need to unzip it.

2. Expand your template directory, right-click the page-templates subfolder, and select Refactoring > XML Refactoring.

3. In the XML Refactoring dialog box, scroll to the Publishing Template section and select Migrate HTML Page Layout Files to v22, then click Next.

4. The Scope should be left as Selected project resources.

5. You can use the Preview button to open a comparison panel where you can review all the changes that will be made by the refactoring operation before applying the changes.

6. Click Finish to perform the conversion.

Result: The converted Publishing Template can now be used in version 22.

- Convert Version 21 Publishing Templates to Version 22 (on page 1388)
- Convert Version 19 (and Older) Publishing Templates to Version 20 (on page 1389)

Convert Version 19 (and Older) Publishing Templates to Version 20

With the introduction of the Publishing Template concept in Oxygen XML Editor Eclipse plugin version 20.0, the old WebHelp output template formats (version 19.1 and older) are no longer supported. However, they can be easily converted to the new format (version 20.0 or 20.1) by following this procedure:

1. Set Oxygen XML Editor Eclipse plugin to point to the DITA-OT distribution that contains your old template:
   a. Go to Options > Preferences > DITA.
   b. Select Custom in the DITA Open Toolkit section and specify the DITA-OT directory that contains your old template.

2. Edit a WebHelp Responsive transformation scenario.

3. Select your old custom template in the Templates tab.
4. Click on the **Save Template as** button, complete the required fields, and save the template.
5. Reset the option set in step 1 to its previous value.
6. Edit the **WebHelp Responsive** transformation scenario again.
7. This time, use the **Choose custom template** button to select your converted template.
8. Save the scenario and use it to generate the WebHelp Responsive output.

**Result:** The converted template is now in a Publishing Template format for version 20.

---

**Convert Version 19 (and Older) Publishing Templates to Version 21**

If you have a custom template that was created in Oxygen XML Editor Eclipse plugin version 19.1 or older and you want to convert it to be compatible with Oxygen XML Editor Eclipse plugin version 21.0 or 21.1, you need to apply two conversion procedures:

1. Convert the old template to a version 20 Publishing Template by using this procedure: **Convert Version 19 (and Older) Publishing Templates to Version 20** *(on page 1389).*
2. Convert that version 20 Publishing Template to version 21 by using this procedure: **Convert Version 20 Publishing Templates to Version 21** *(on page 1389).*

**Result:** The converted Publishing Template can now be used in version 21.0 or 21.1.

---

**Changing the Layout and Styles**

This section contains topics that explain how to customize the output using CSS, inserting HTML fragments, changing the layout of the main page, and more.

**How to Use CSS Styling to Customize the Output**

The most common way to customize WebHelp Responsive output is to use custom CSS styling. This method can be used to make small, simple styling changes or more advanced, precise changes. To implement the styling in your WebHelp output, you simply need to create the custom CSS file and reference it in your
transformation scenario (using an Oxygen Publishing Template (on page 2656) or a transformation parameter). This custom file will be the final CSS to be applied so its content will override the styles in the other pre-existing CSS files.

**Using CSS Inspector to Identify Content for Custom CSS File**

You can use your browser's CSS inspector to identify the pertinent code in the current CSS files and you can even make changes directly in the CSS inspector to test the results so that you know exactly what content to use in your custom CSS file.

In most popular browsers (such as Chrome, Firefox, and Edge), you can access the CSS inspector by using F12 or by selecting Inspect Element (or simply Inspect) from the contextual menu.

**Tip:**
When using Safari on macOS, you must first enable the Develop menu by going to the Advanced settings and selecting Show Develop menu in menu bar. Then you can select Show Web Inspector from the Develop menu or click Command + Option + I.

**Create the Custom CSS**

As a practical example, the following procedure changes the background color of the footer bar in the WebHelp output:

1. Use the browser's CSS inspector to identify the current CSS code that styles the footer bar. In this particular case, the pertinent code that would be identified is:

```css
.wh_footer {
  font-size: 15px;
  line-height: 1.7em;
  background-color: #000;
}
```

2. If you want to test the color you want to apply as the background of this particular element, use the browser's CSS inspector to change the value of the background-color attribute. After you find a suitable color, copy that new code.

3. Create a custom CSS file and paste or enter the copied code. For example:

```css
.wh_footer {
  background-color: #255890;
}
```

4. Save the custom CSS file at a location of your convenience.

5. Reference the CSS file in a WebHelp Responsive transformation using an Oxygen Publishing Template (on page 1392) or the args.css parameter (on page 1392).
Fastpath:
Regenerating the output to see the changes made in the CSS is not required. Instead, you can directly edit the files in WebHelp Output Directory/oxygen-webhelp/template and reload the page in your browser. Once you obtained the desired output, simply copy the stylesheet back to your publishing template folder.

Referencing the CSS Using a Publishing Template

1. If you have not already created a Publishing Template, see How to Create a Publishing Template (on page 1546).
2. Using the Project Explorer view, copy your custom CSS in a folder inside the publishing template root folder (for example, in the custom_footer_template/resources folder).
3. Open the template descriptor file (on page 1343) associated with your publishing template and add your custom CSS in the resources section.

```xml
<publishing-template>
  ...
  <webhelp>
    ...
    <resources>
      ...
      <css file="resources/MyCustom.css"/>
    </resources>
  </webhelp>
  ...
</publishing-template>
```

4. Open the DITA Map WebHelp Responsive transformation scenario.
5. Click the Choose Custom Publishing Template link and select your template.
6. Click OK to save the changes to the transformation scenario.
7. Run the transformation scenario.

Result: Your custom CSS will be applied as a final layer on top of any existing CSS rules and the output will reflect the changes you made.

Referencing the CSS Using the args.css Parameter

1. Edit the DITA Map WebHelp Responsive transformation scenario and open the Parameters tab.
2. Set the args.css parameter to the path of your custom CSS file.
3. Set the args.copycss parameter to yes to automatically copy your custom CSS in the output folder when the transformation scenario is processed.
4. Click OK to save the changes to the transformation scenario.
5. Run the transformation scenario.

Result: Your custom CSS will be applied as a final layer on top of any existing CSS rules and the output will reflect the changes you made.
How to Insert Custom HTML Content

You can add custom HTML content in the WebHelp Responsive output by inserting it in a well-formed XML file (or specifying it in a well-formed XHTML fragment) that will be referenced in the transformation (either from an Oxygen Publishing Template (on page 2656) or using one of the HTML fragment placeholder parameters (on page 1471)). This content may include references to additional JavaScript, CSS, and other types of resources, or such resources can be inserted inline within the HTML content that is inserted in the XML file.

The XML File

There are several things to consider regarding this XML file:

- **Well-Formedness** - If the content of the file is not XML Well-formed (on page 543), the transformation will automatically convert non-well-formed HTML content to a well-formed XML equivalent (assuming the webhelp.enable.html.fragments.cleanup transformation parameter is set to true).

  For example, if the HTML content includes several `<script>` or `<link>` elements, the XML fragment would have multiple root elements and to make it well-formed, it would be wrapped it in an `<html>` element. This element tag will be filtered out and only its children will be copied to the output documents. Similarly, you can wrap your content in `<head>`, `<body>`, `<html/head>`, or `<html/body>` elements.

  **Note:**
  The converted fragments are stored in a file located in the `whr-html-fragments` subfolder of the transformation's temporary directory.

  **Tip:**
  If you do not want the transformation to automatically convert non-well-formed content into well-formed XML content, you can set the webhelp.enable.html.fragments.cleanup transformation parameter to false. This will instead cause the transformation to fail if at least one HTML fragment is not well-formed.

- **Referencing Resources in the XML File** - You can include references to local resources (such as JavaScript or CSS files) by using the built-in `${oxygen-webhelp-output-dir}` macro to specify their paths relative to the output directory:

  ```xml
  <html>
  <script type="text/javascript" src="${oxygen-webhelp-output-dir}/js/test.js"/>
  <link rel="stylesheet" type="text/css" 
    href="${oxygen-webhelp-output-dir}/css/test.css" />
  </html>
  ```

  If you want that the path of your resource to be relative to the templates directory (on page 1340), you can use the `${oxygen-webhelp-template-dir}` macro.
To copy the referenced resources to the output directory, follow the procedure in: How to Copy Additional Resources to Output Directory (on page 1451).

• Inline JavaScript or CSS Content:

JavaScript:

```html
<script type="text/javascript">
 /* Include JavaScript code here. */

 function myFunction() {
  return true;
 }
</script>
```

CSS:

```html
<style>
 /* Include CSS style rules here. */

*{
  color:red
 }
</style>
```

**Note:**

If you have special characters (e.g. &amp;, &lt;) that break the well-formedness of the XML fragment, it is important to place the content inside an XML comment. Otherwise, the WebHelp transformation automatically wraps inline JavaScript or CSS content in an XML comment. Also, if the commented content contains constructs that are not allowed in an XML comment, those constructs are escaped. **[Important]** XML comment tags (both the start and end tags) must be on lines by themselves. If they are on the same line as any of the script's content, it will likely result in a JavaScript error.

```html
<script type="text/javascript">
<!--
 /* Include JavaScript code here. */

 function myFunction() {
  return true;
 }
</script>
```
Using WebHelp Macros

The XML file can use WebHelp macros, which are variables that will be expanded when the content of the HTML fragment file will be copied in the final output.

There are two possibilities for using macros:

- **Directly in attribute values** - For example, if you want to reference a JavaScript file from the Publishing Template directory, you can use the following construct:

  ```html
  <script type="text/javascript" src="${path(oxygen-webhelp-template-dir)}"></script>
  ```

- **In text content** - Using the `<whc:macro>` template component:

  ```html
  <script type="text/javascript">
      var outDirPath = '<whc:macro value="${path(oxygen-webhelp-output-dir)}" xmlns:whc="http://www.oxygenxml.com/webhelp/components"/>
      console.log("The output directory path is: ", outDirPath);
  </script>
  ```

  **Note:**
  When using the `<whc:macro>` element, you should also include the `xmlns:whc="http://www.oxygenxml.com/webhelp/components"` namespace declaration for the `whc` prefix. This is necessary for the XML fragment to be well-formed.

The following **macros** are supported:

- **i18n**
  For localizing a string.
  
  ```html
  ${i18n(string.id)}
  ```

- **param**
  Returns the value of a transformation parameter.
  
  ```html
  ${param(webhelp.show.main.page.tiles)}
  ```

- **env**
  Returns the value of an environment variable.
  
  ```html
  ${env(JAVA_HOME)}
  ```

- **system-property**
  Returns the value of a system property.
**timestamp**

Can be used to format the current date and time. Accepts a string (as a parameter) that determines how the date and time will be formatted (format string or *picture string* as it is known in the XSLT specification). The format string must comply with the rules of the XSLT `format-dateTime` function specification.

```
${timestamp([h1]:[m01] [P] [M01]/[D01]/[Y0001])}
```

**path**

Returns the path associated with the specified path ID. The following paths IDs are supported:

- **oxygen-webhelp-output-dir** - The path to the output directory. The path is relative to the current HTML file.
- **oxygen-webhelp-assets-dir** - The path to the `oxygen-webhelp` subdirectory from the output directory. The path is relative to the current HTML file.
- **oxygen-webhelp-template-dir** - The path to the template directory. The path is relative to the current HTML file.

```
${path(oxygen-webhelp-template-dir)}
```

**Note:**

New paths IDs can be added by overriding the `wh-macro-custom-path` template from `com.oxygenxml.webhelp.responsive\xsl\template\macroExpander.xsl`:

```
<!-- Extension template for expanding a custom path macro. -->
<xsl:template name="wh-macro-custom-path">
  <xsl:param name="pathId"/>
  <xsl:value-of select="$pathId"/>
</xsl:template>
```

**map-xpath**

Can be used to execute an XPath expression over the DITA map file from the temporary directory.

**Tip:**

Available in all template layout HTML pages.

```
${map-xpath(/map/title)}
```

**topic-xpath**

Can be used to execute an XPath expression over the current topic.
Tip:
Available only in the topic HTML page template (wt_topic.html).

${topic-xpath(string-join(//shortdesc//text(), ' '))}

oxygen-webhelp-build-number
Returns the current WebHelp distribution ID (build number).

${oxygen-webhelp-build-number}

Referencing the HTML fragment using a Publishing Template

1. If you have not already created a Publishing Template, see Working with Publishing Templates (on page 1379).
2. Insert the HTML content in a file that is XML well-formed (for example, custom-html.xml).
3. Using the Project Explorer view, copy your custom XML file in a folder inside publishing the template root folder (for example, in the custom_footer_template/html-fragments folder).
4. Open the template descriptor file (on page 1343) associated with your publishing template and add a reference to the custom HTML fragment in the html-fragments section.

```xml
<publishing-template>
  ...
  <webhelp>
    ...
    <html-fragments>
      <fragment
        file="html-fragments/custom-html.xml"
        placeholder="webhelp.fragment.head"/>
    </html-fragments>
  </webhelp>
  ...
</publishing-template>
```

Note:
If you want to insert the content in another location within the output document, you can reference the XML file from any other HTML Fragment extension points (on page 1350).

5. Open the DITA Map WebHelp Responsive transformation scenario.
6. Click the Choose Custom Publishing Template link and select your template.
7. Click OK to save the changes to the transformation scenario.
8. Run the transformation scenario.

Results: Your additional content will be included at the end of the <head> element of your output document.

Referencing the HTML Fragment using a Transformation Parameter

1. Insert the HTML content in a well-formed XML file.
2. Edit the DITA Map WebHelp Responsive transformation scenario and open the Parameters tab.
3. Edit the value of the `webhelp.fragment.head` parameter and set it to the absolute path of your XML file.

**Note:**
If you want to insert the content in another location within the output document, you can reference the XML file from any other HTML Fragment extension points (on page 1350).

4. Click OK to save the changes to the transformation scenario.
5. Run the transformation scenario.

**Results:** Your additional content will be included at the end of the `<head>` element of your output document.

**Related Information:**
- HTML Fragment Placeholders (on page 1350)
- Publishing Template Package Contents for WebHelp Responsive Customizations (on page 1343)

**How to Change Numbering Styles for Ordered Lists**

Ordered lists `<ol>` are usually numbered in XHTML output using numerals. If you want to change the numbering to alphabetical, follow these steps:

1. Define a custom `@outputclass` value and set it as an attribute of the ordered list, as in the following example:

   ```xml
   <ol outputclass="number-alpha">
       <li>A</li>
       <li>B</li>
       <li>C</li>
   </ol>
   ```

2. Add the following code snippet in a custom CSS file:

   ```css
   ol.number-alpha{
       list-style-type:lower-alpha;
   }
   ```

3. Reference the CSS file in a WebHelp Responsive transformation using an Oxygen Publishing Template (on page 1398) or the `args.css` parameter (on page 1399).

**Referencing the Custom CSS from a Publishing Template**

1. If you have not already created a Publishing Template, see How to Create a Publishing Template (on page 1546).
2. Using the Project Explorer view, copy your custom CSS in a folder inside the publishing template root folder (for example, in the `custom_footer_template/resources` folder).
3. Open the template descriptor file (on page 1343) associated with your publishing template and add your custom CSS in the resources section.
4. Open the DITA Map WebHelp Responsive transformation scenario.
5. Click the Choose Custom Publishing Template link and select your template.
6. Click OK to save the changes to the transformation scenario.
7. Run the transformation scenario.

Result: Your custom CSS will be applied as a final layer on top of any existing CSS rules and the output will reflect the changes you made.

Referencing the CSS Using the args.css Parameter

1. Edit the DITA Map WebHelp Responsive transformation scenario and open the Parameters tab.
2. Set the args.css parameter to the path of your custom CSS file.
3. Set the args.copycss parameter to yes to automatically copy your custom CSS in the output folder when the transformation scenario is processed.
4. Click OK to save the changes to the transformation scenario.
5. Run the transformation scenario.

Result: Your custom CSS will be applied as a final layer on top of any existing CSS rules and the output will reflect the changes you made.

How to Add Syntax Highlights for Codeblocks in the Output

Syntax Highlighting makes it easier to read the semantics of the structured content by displaying each type of code (language) in different colors and fonts. The application provides the ability to add syntax highlights in codeblocks for DITA to PDF or HTML-based output through the use of the @outputclass attribute and a variety of predefined values are available.

To provide syntax highlighting in the codeblocks that appear in the output, add the @outputclass attribute on the <codeblock> element and set its value to one of the predefined language values. The Content Completion Assistant offers a list of the possible values when adding the @outputclass attribute in Text mode but there are also two simple ways to set the value in Author mode:

- Select the <codeblock> element in the editor and in the Attributes view, click on the Value cell for the @outputclass attribute and select one of the predefined values (for example, language-xml).
- Select the <codeblock> element in the editor and use the Alt + Enter keyboard shortcut to open the in-place attributes editor window. Then select one of the predefined values from the Value drop-down menu.
The predefined values that can be selected are:

- language-json
- language-yaml
- language-xml
- language-bourne
- language-c
- language-cmd
- language-cpp
- language-csharp
- language-css
- language-dtd
- language-ini
- language-java
- language-javascript
- language-lua
- language-perl
- language-powershell
- language-php
- language-python
- language-ruby
- language-sql
- language-xquery

**Attention:**

It is recommended that you do not add inline elements in the codeblocks when using this `@outputclass` attribute, as it may lead to improper highlighting.

**Tip:**

Starting with version 24.0, the language values can also be set without using the `language-` prefix.

**Example:**

The following codeblock with the `@outputclass` set as `language-css`:

```xml
<codeblock outputclass="language-css" id="codeblock_1">@page preface-page {
    background-color:silver;
    @top-center{
        content: "Custom Preface Header";
    }
}
```
How to Show or Hide Navigation Links in Topic Pages

The topic pages (on page 1299) in WebHelp Responsive output can contain navigation links (Previous / Next arrows) that can be used to navigate to the previous or next topic.

How to Control Which Topic Pages Include Navigation Links

The navigation links are controlled by the @collection-type attribute. For example, if you set collection-type="sequence" on a parent topic reference in your DITA map, navigation links will be generated in the output for all of its child topics (from children to parent, and from child to previous sibling and next sibling).

<pre><map id="example_map" title="Example Map">
  &lt;topicref href="../topics/ParentTopic.dita" collection-type="sequence">
  &lt;topicref href="../topics/Childtopic.dita"/>
&lt;/topicref&gt;
</map></pre>

How to Generate Navigation Links for All Topics (Ignoring the Collection Type Attribute)

You can use the webhelp.default.collection.type.sequence parameter in the transformation and set its value to yes to generate navigation links for all topics, regardless of whether or not the collection-type attribute is present.

How to Hide All Navigation Links

To hide all navigation links, use the webhelp.show.navigation.links parameter in the transformation and set its value to no.

How to Change the Main Page Layout

This section contains topics that explain how to customize the layout of the main page in the WebHelp Responsive output.
How to Customize the Menu

By default, the menu component is displayed in all WebHelp Responsive pages. However, you might want to hide it completely, or only display some of its menu entries.

How to Hide Some of the Menu Entries

There are two methods for doing this. One of them involves editing the DITA map and marking the topics that do not need to be included in the menu, and another one that uses a small CSS customization.

Editing the DITA Map

To edit the metadata in the DITA map to control which topics will not be displayed in the menu, follow these steps:

1. Open the DITA map in the Text editing mode of Oxygen XML Editor Eclipse plugin.
2. Add the following metadata information in the topicref element (or any of its specializations) for each topic you do not want to be displayed in the menu:

   ```xml
   <topicmeta>
     <data name="wh-menu">
       <data name="hide" value="yes"/>
     </data>
   </topicmeta>
   ```

Customizing the CSS

To customize the CSS to control which topics will not be displayed in the menu, follow these steps:

1. Make sure you set an ID on the topic that you do not want to include in the menu.
2. Create a new CSS file that contains a rule that hides the menu entry generated for the topic (identified by the topic ID growing-flowers in the following example). The CSS file should have content that is similar to this:

   ```css
   .wh_top_menu *[data-id='growing-flowers'] {
     display:none;
   }
   ```
3. Reference the CSS file in a WebHelp Responsive transformation using an Oxygen Publishing Template (on page 1392) or the args.css parameter (on page 1392).

How to Hide the Entire Menu

If you do not want to include a main menu in the pages of the WebHelp Responsive output, you can instruct the transformation scenario to skip the menu generation completely.

Using a Publishing Template
To hide the menu using an Oxygen Publishing Template (on page 1340), follow this procedure:

1. If you have not already created a Publishing Template, see How to Create a Publishing Template (on page 1546).
2. Open the template descriptor file (on page 1343) associated with your publishing template and add the webhelp.show.top.menu parameter in the parameters section with its value set to no.

```xml
<publishing-template>
  ...
  <webhelp>
    ...
    <parameters>
      <parameter name="webhelp.show.top.menu" value="no"/>
    </parameters>
  </webhelp>
</publishing-template>
```

3. Open the DITA Map WebHelp Responsive transformation scenario.
4. Click the Choose Custom Publishing Template link and select your template.
5. Click OK to save the changes to the transformation scenario.
6. Run the transformation scenario.

Using a Transformation Scenario in Oxygen XML Editor/Author

To hide the menu using a transformation scenario from within Oxygen XML Editor/Author, follow this procedure:

1. Edit the DITA Map WebHelp Responsive transformation scenario and choose a template.
2. Open the Parameters tab and set the webhelp.show.top.menu parameter to no.
3. Click OK to save the changes to the transformation scenario.
4. Run the transformation scenario.

How to Add a Welcome Message in the WebHelp Responsive Main Page

The main page of the WebHelp Responsive output contains a set of empty placeholders (on page 1350) that can be used to display customized text fragments. These placeholders are available to you through WebHelp Responsive transformation scenario parameters. For example, the placeholder identified through the webhelp.fragment.welcome parameter displays text content above the search box in the main page.

Using a Publishing Template

To add a customized welcome message in the main page of the WebHelp Responsive output using an Oxygen Publishing Template (on page 1340), follow this procedure:
To add a customized welcome message in the main page of the WebHelp Responsive output using a transformation scenario from within Oxygen XML Editor/Author, follow this procedure:

1. Edit the *DITA Map WebHelp Responsive* transformation scenario and choose a template.
2. Open the **Parameters** tab and set the *webhelp.fragment.welcome* parameter with its value set to one of the following:
   - A small well-formed XHTML fragment (such as: `<i>Welcome to the User Guide</i>`).
   - A path to a file that contains well-formed XHTML content.
3. Click **OK** to save the changes to the transformation scenario.
4. Run the transformation scenario.
Result: In the WebHelp output, your custom message will be displayed above the search box in the main page.

How to Create a Custom Footer

The main page of the WebHelp Responsive output contains a set of empty placeholders (on page 1350) that can be used to display customized text fragments. These placeholders are available to you through WebHelp Responsive transformation scenario parameters. For example, the placeholder identified through the webhelp.fragment.footer parameter displays the custom content at the bottom of the page.

Using a Publishing Template

To create a custom footer in the WebHelp Responsive output using an Oxygen Publishing Template (on page 1340), follow this procedure:

1. If you have not already created a Publishing Template, see How to Create a Publishing Template (on page 1546).
2. Open the template descriptor file (on page 1343) associated with your publishing template and add the webhelp.fragment.footer parameter in the html-fragments section with its value set to a path of a file that contains well-formed XHTML content.

```xml
<publishing-template>
  ...
  <webhelp>
    ...
    <html-fragments>
      ...
      <fragment file="html/footer.xhtml" placeholder="webhelp.fragment.footer"/>
    </html-fragments>
  </webhelp>
</publishing-template>
```

Important:
This parameter should only be used if you are using a valid, purchased license of Oxygen XML Editor Eclipse plugin (do not use it with a trial license).

3. Open the DITA Map WebHelp Responsive transformation scenario.
4. Click the Choose Custom Publishing Template link and select your template.
5. Click OK to save the changes to the transformation scenario.
6. Run the transformation scenario.

Result: In the WebHelp output, your custom footer will be displayed at the bottom of the page.

Using a Transformation Scenario in Oxygen XML Editor/Author

Important:
Running WebHelp transformations from a script outside of Oxygen XML Editor/Author requires an additional license and some additional setup:
To create a custom footer in the WebHelp Responsive output using a transformation scenario from within Oxygen XML Editor/Author, follow this procedure:

1. Edit the DITA Map WebHelp Responsive transformation scenario and choose a template.
2. Open the Parameters tab and set the webhelp.fragment.footer parameter with its value set to one of the following:
   - A small well-formed XHTML fragment.
   - A path to a file that contains well-formed XHTML content.
3. Click OK to save the changes to the transformation scenario.
4. Run the transformation scenario.

Result: In the WebHelp output, your custom footer will be displayed at the bottom of the page.

How to Configure the Tiles on the WebHelp Responsive Main Page

The tiles version of the main page of the WebHelp Responsive output displays a tile for each topic found on the first level of the DITA map (on page 2654). However, you might want to customize the way they look or even to hide some of them.

Depending on your particular setup, you can choose to customize the tiles either by setting metadata information in the DITA map or by customizing the CSS that is associated with the DITA map.

How to Hide Some of the Tiles

If your documentation is very large or there is a large number of topics on the first level, you might want to hide some of the tiles. Also, this might be useful if you only want to display the topics in the first page that are most relevant to your intended audience.

There are two methods for doing this. One of them involves editing the DITA map and marking the topics that do not need to be displayed as tiles, and another one that uses a small CSS customization level to hide some tiles identified by the ID of the topic.

Editing the DITA Map

To edit the metadata in the DITA map to control which topics on the first level of the DITA map will not be displayed as a tile, follow these steps:

1. Open the DITA map in the Text editing mode of Oxygen XML Editor Eclipse plugin.
2. Add the following metadata information in the topicref element (or any of its specializations) for each first-level topic that you do not want to be displayed as a tile:
Customizing the CSS

To customize the CSS to control which topics on the first level of the DITA map will not be displayed as a tile, follow these steps:

1. Make sure you set an ID on the topic you want to hide.
2. Create a new CSS file that contains a rule that hides the tile generated for the topic (identified in the following example by the topic ID `growing-flowers`). The CSS file should have content that is similar to this:

   ```css
   .wh_tile [data-id='growing-flowers'] {
       display:none;
   }
   ```

3. Reference the CSS file in a WebHelp Responsive transformation using an Oxygen Publishing Template (on page 1392) or the `args.css` parameter (on page 1392).

How to Add an Image to the Tiles

There are two methods that you can use to add an image to a tile. One of them involves editing the DITA map, and the other uses a CSS customization.

Editing the DITA Map

To edit the metadata in the DITA map to set an image to be displayed in a tile, follow these steps:

1. Open the DITA map in the Text editing mode of Oxygen XML Editor Eclipse plugin.
2. Add the following metadata information in the `<topicref>` element (or any of its specializations) for each first-level topic that will have an image displayed in the corresponding tile:

   ```xml
   <topicmeta>
     <data name="wh-tile">
       <data name="image" href="img/tile-image.png" format="png">
         <data name="attr-width" value="64"/>
         <data name="attr-height" value="64"/>
       </data>
     </data>
   </topicmeta>
   ```
Note:
The @attr-width and @attr-height attributes can be used to control the size of the image, but they are optional.

Customizing the CSS

To customize the CSS to set an image to be displayed in a tile, follow these steps:

1. Make sure you set an ID on the topic that you want the tile to include an image.
2. Create a new CSS file that contains a rule that associates an image with a specific tile. The CSS file should have content that is similar to this:

   ```css
   .wh_tile[data-id='growing-flowers'] > div {
     background-image: url('resources/flower.png');
   }
   ```

3. Reference the CSS file in a WebHelp Responsive transformation using an Oxygen Publishing Template (on page 1392) or the args.css parameter (on page 1392).

Adding Graphics and Media Resources

This section contains topics that explain how to add media resources to the published output or the output directory.

How to Add a Logo Image in the Title Area

You can customize WebHelp Responsive output to include a logo in the title area. It will be displayed before the publication title. You can also specify a URL that can be used to send users to a specific website when they click the logo image.

This customization can be done using an Oxygen Publishing Template or using a transformation scenario from within Oxygen XML Editor/Author.

Using a Publishing Template

To add a logo in the title area of your WebHelp output using an Oxygen Publishing Template (on page 1340), follow this procedure:

1. If you have not already created a Publishing Template, see How to Create a Publishing Template (on page 1546).
2. Open the template descriptor file (on page 1343) associated with your publishing template and add the <logo> element in the <resources> section and set the @file attribute value to the path of your logo.
3. If you also want to add a link to your website when you click the logo image, set its URL in the `@target-url` attribute.

```xml
<publishing-template>
  ...
  <webhelp>
    ...
    <resources>
      <logo
        file="images/logo.png"
        target-url="http://www.example.com"
        alt="Alternate text for the logo image"/>
    </resources>
  </webhelp>
</publishing-template>
```

4. Open the *DITA Map WebHelp Responsive* transformation scenario.
5. Click the *Choose Custom Publishing Template* link and select your template.
6. Click OK to save the changes to the transformation scenario.
7. Run the transformation scenario.

### Using a Transformation Scenario in Oxygen XML Editor/Author

To add a logo in the title area of your WebHelp output using a transformation scenario from within *Oxygen XML Editor/Author*, follow this procedure:

1. Edit the *DITA Map WebHelp Responsive* transformation scenario and choose a template.
2. Open the Parameters tab and set the `webhelp.logo.image` parameter to the path of your logo.
3. If you also want to add a link to your website when you click the logo image, set its URL in the `webhelp.logo.image.target.url` parameter.
4. Click OK to save the changes to the transformation scenario.
5. Run the transformation scenario.

### How to Add a Favicon in WebHelp Systems

You can add a custom favicon to your WebHelp output by simply using a parameter in the transformation scenario to point to your favicon image.

This customization can be done using an *Oxygen Publishing Template* or using a transformation scenario from within *Oxygen XML Editor/Author*.

### Using a Publishing Template

To add a favicon to your WebHelp output using an *Oxygen Publishing Template (on page 1340)*, follow this procedure:
1. If you have not already created a Publishing Template, see Working with Publishing Templates (on page 1379).

2. Open the template descriptor file (on page 1343) associated with your publishing template and add the `<favicon>` element in the `resources` section. The path to the image is relative to the template root folder.

3. Open the DITA Map WebHelp Responsive transformation scenario.

4. Click the Choose Custom Publishing Template link and select your template.

5. Click OK to save the changes to the transformation scenario.

6. Run the transformation scenario.

Result: Browsers that provide favicon support display the favicon (typically in the browser's address bar, in the list of bookmarks, and in the history).

Using a Transformation Scenario in Oxygen XML Editor/Author

To add a favicon to your WebHelp output using a transformation scenario from within Oxygen XML Editor/Author, follow this procedure:

1. Edit the DITA Map WebHelp Responsive transformation scenario and choose a template.
2. Open the Parameters tab and set the `webhelp.favicon` parameter to the path of your image.
3. Click OK to save the changes to the transformation scenario.
4. Run the transformation scenario.

How to Add Video and Audio Objects in DITA WebHelp Output

You can insert references to video and audio media resources (such as videos, audio clips, or embedded HTML frames) in your DITA topics and then publish them to WebHelp output. The media objects can be played directly in all HTML5-based outputs, including WebHelp systems.

To add media objects in the WebHelp output generated from DITA documents, follow the procedures below.

Adding Videos to DITA WebHelp Output

1. Edit the DITA topic and insert a reference to the video through one of the following methods:
   - Use the Insert Media Object toolbar action (on page 2397).
   - Drag (or copy) the video file from your system explorer or the Project Explorer view (on page 268) and drop (or paste) it into your document.
   - Manually add an `<object>` element, as in one of the following examples:
Adding Audio Clips to DITA WebHelp Output

1. Edit the DITA topic and insert a reference to the audio clip through one of the following methods:
   ◦ Use the Insert Media Object toolbar action (on page 2397).
   ◦ Drag (or copy) the audio file from your system explorer or the Project Explorer view (on page 268) and drop (or paste) it into your document.
   ◦ Manually add an <object> element, as in one of the following examples:

```
<object outputclass="audio" type="audio/mpeg" data="MyClip.mp3"/>
```

or, instead of the @data attribute, you can specify the video using a parameter like this:

```
<object outputclass="audio">
    <param name="src" value="audio/MyClip.mp3"/>
</object>
```

2. Apply a DITA to WebHelp transformation to obtain the output.

Result: The transformation converts the <object> element to an HTML5 <audio> element.

```
<audio controls="controls">
    <source type="audio/mpeg" src="MyClip.mp3"></source>
</audio>
```

Adding Embedded HTML Frames (such as YouTube videos) to DITA WebHelp Output

1. Edit the DITA topic and insert a reference to the embedded object by using the Insert Media Object toolbar action (on page 2397) or by manually adding an <object> element, as in one of the following examples:

```
<object outputclass="iframe" data="https://www.youtube.com/embed/m_vv2s5Trn4"/>
```

or, instead of the @data attribute, you can specify the object using a parameter like this:

```
<object outputclass="iframe">
    <param name="src" value="http://www.youtube.com/embed/m_vv2s5Trn4"/>
</object>
```
2. If you want the video to be allowed to play in full screen mode once the document is converted to XHTML output, also add an allowfullscreen parameter and set its value to true:

```xml
<object outputclass="iframe" data="https://www.youtube.com/embed/m_vv2s5Trn4"/>
<param name="allowfullscreen" value="true"/>
</object>
```

**Tip:**
If you copy the embed code from the source and paste it into the Insert Media dialog box (see the specific instructions: here (on page 2400)), the allowfullscreen parameter will automatically be added and all you have to do is set the value to true.

3. Apply a DITA to WebHelp transformation to obtain the output.

**Result:** The transformation converts the `<object>` element to an HTML5 `<iframe>` element.

```html
<iframe controls="controls" src="https://www.youtube.com/embed/m_vv2s5Trn4"></iframe>
```

**Resources**

For more information, see the following video demonstration:

https://www.youtube.com/embed/IIX11gS4WaU

**Related Information:**
Adding Video, Audio, and Embedded HTML Resources in DITA Topics (on page 2397)

**How to Add MathML Equations in WebHelp Output**

Currently, only Firefox can render MathML equations embedded in the HTML code. MathJax is a solution to properly view MathML equations embedded in HTML content in a variety of browsers.

If you have DocBook content that has embedded MathML equations and you want to properly view the equations in published HTML output types (such as WebHelp), you need to add a reference to the MathJax script in the head element of all HTML files that have the equation embedded.

For example:

```html
<script type="text/javascript" src="https://cdnjs.cloudflare.com/ajax/libs/mathjax/2.7.1/MathJax.js?config=TeX-AMS-MML_HTMLorMML"></script>
```

**Result:** The equation should now be properly rendered in the WebHelp output for other browsers.
Searching the Output

This section contains topics that explain how to use some of the search features in WebHelp Responsive output.

Built-in JS Based Search Engine Customizations

How to Change Element Scoring in Search Results

The WebHelp Search feature is enhanced with a rating mechanism that computes scores for every page that matches the search criteria. HTML tag elements are assigned a scoring value and these values are evaluated for the search results. The WebHelp directory includes a properties file that defines the scoring values for tag elements and this file can be edited to customize the values according to your needs.

To edit the scoring values of HTML tag element for enhancing WebHelp search results, follow these steps:

1. Edit the scoring properties file for DITA. The properties file includes instructions and examples to help you with your customization. The file is located in: \DITA-OT-DIR\plugins \com.oxygenxml.webhelp.responsive\indexer\scoring.properties.

   The following values can be edited in the scoring.properties file:

   ```
   h1 = 10
   h2 = 9
   h3 = 8
   h4 = 7
   h5 = 6
   h6 = 5
   b = 5
   strong = 5
   em = 3
   i=3
   u=3
   div.toc=-10
   title=20
   div.ignore=ignored
   meta_keywords = 20
   meta_indexterms = 20
   meta_description = 25
   shortdesc=25
   ```

2. Save your changes to the file.

3. Re-run your WebHelp transformation.
How to Index Japanese Content

To optimize the indexing of Japanese content in WebHelp pages, the *Lucene Kuromoji Japanese analyzer* can be used. This analyzer is included in the *Oxygen XML Editor/Author* installation kit.

**Restriction:**

The *Kuromoji* analyzer does not work if your WebHelp output is accessed locally. In this scenario, a warning message will be displayed informing you that the *Kuromoji* analyzer is disabled. It is possible to hide this warning message by using a transformation parameter named `webhelp.enable.search.kuromoji.js`. By default, its value is *yes*, which means the *Kuromoji* analyzer is enabled by default. To hide the warning message, set the value of that parameter to *no* using either of the methods listed below. When it is set to *no*, the *Kuromoji* analyzer is disabled even if you deploy your WebHelp output on a web server.

**Using a Publishing Template**

To add a logo in the title area of your WebHelp output using an *Oxygen Publishing Template (on page 1340)*, follow this procedure:

1. If you have not already created a Publishing Template, see *How to Create a Publishing Template (on page 1546)*.
2. Open the template descriptor file (on page 1343) associated with your publishing template and add the `default.language` parameter in the `parameters` section with its value set to *ja-*jp.

```xml
<publishing-template>
   ...
   <webhelp>
      ...
      <parameters>
         <parameter name="default.language" value="ja-jp"/>
      </parameters>
   </webhelp>
</publishing-template>
```

3. Open the *DITA Map WebHelp Responsive* transformation scenario.
4. Click the *Choose Custom Publishing Template* link and select your template.
5. Click *OK* to save the changes to the transformation scenario.
6. Run the transformation scenario.

**Using a Transformation Scenario in Oxygen XML Editor/Author**

To activate the Japanese indexing in your WebHelp output using a transformation scenario from within *Oxygen XML Editor/Author*, follow this procedure:
1. Edit a DITA to WebHelp transformation scenario and in the Parameters tab, set the value of the default.language parameter to ja-jp.

**Note:**
Alternatively, you could set the @xml:lang attribute on the root of the DITA map (on page 2654) and the referenced topics to ja-jp. Another alternative for DITA output is to use the webhelp.search.japanese.dictionary parameter to specify a path to a Japanese dictionary that will be used by the Kuromoji morphological engine (note that the encoding for the dictionary must be UTF8).

2. Run the WebHelp transformation scenario to generate the output.

### How to Implement a Custom Search Filter

It is possible to implement a custom search filter (search input component) in your WebHelp Responsive output. The search input component is where users enter search queries to locate certain content within the WebHelp output.

To integrate a custom search filter, follow these steps:

1. If you have not already created a Publishing Template, see How to Create a Publishing Template (on page 1546).
2. Create the following items in the folder that contains your publishing descriptor file (the .opt file):
   - A folder named js.
   - A folder named fragments.
3. In the js folder, create a file named search-filter.js.
4. As a starting point, you can copy the following content to the search-filter.js file:

```javascript
/**
 * Object that implements the methods required by WebHelp to run a search filter.
 */
function CustomSearchFilter() {

/**
 * Method required to run the search filter in webhelp. It is called when the users executes the query in the search page.
 *
 * @param {WebHelpAPI.SearchResult} searchResult The search result for the executed query.
 *
 * @return A list of WebHelpAPI.SearchResult objects
 *
 */
this.filterResults = function (searchResult) {
    // implement filter
}
```

Oxygen XML Editor Eclipse Plugin 26.0 | 11 - Publishing | 1416

return filteredResults;
}
}

// Set the Search Filter to WebHelp
WebHelpAPI.setCustomSearchFilter(new CustomSearchFilter());
...

Note:
See the API Search Objects section (on page 1425) for details on how to create a
WebHelpAPI.SearchResult

object.

5. Implement your custom search filter.
6. In the fragments folder, create a file named search-filter-script-fragment.xml.
7. In the search-filter-script-fragment.xml file, define the scripts that are required for your custom search
filter to run. For example:
<div>
<script src="${oxygen-webhelp-template-dir}/js/search-filter.js"></script>
</div>

8. Copy the js folder to the output folder during the transformation process. For this, open the .opt file
and add the following content in the <resources> section (see Template Resources (on page 1346) for
more details):
<fileset>
<include name="js/**"/>
</fileset>

9. Set the transformation parameters needed to enable the custom search filter. For this, open the .opt
file and add the following content inside the <webhelp> element:
<html-fragments>
<fragment file="fragments/search-filter-script-fragment.xml"
placeholder="webhelp.fragment.head.search.page"/>
</html-fragments>

10. Run the transformation with this publishing template selected.

How to Exclude Certain DITA Topics from Search Results
There are several ways to exclude certain DITA resources from your WebHelp system's search results. This
is useful if you have topics in your DITA map (on page 2654) structure that you do not want to be included
in search results for your WebHelp system. The first method involves setting a parameter in the WebHelp
transformation scenario and the second involves setting an attribute for each DITA topic reference that you
want to exclude.


Transformation Parameter Method

To exclude DITA topics from WebHelp search results using a transformation parameter, follow these steps:

1. Create a simple text file that will contain your excluded file patterns. Each pattern must be on a new line. The patterns are considered to be relative to the output directory and they accept wildcards such as * (matches zero or more characters) or ? (matches one character). For more information about the patterns, see https://ant.apache.org/manual/dirtasks.html#patterns.

   Example: Suppose that in your project, you want to exclude all files located in the resources directory and all files located in the topics directory that have a .bak file extension. You could create a simple text file (for example, named exclude.properties), and add the following lines:

   ```
   resources/*
   topics/*.bak
   ```

2. Set the webhelp.search.custom.excludes.file parameter to specify the path to the file that contains the excluded file patterns (for example, exclude.properties in step 1). The parameter can be specified in the parameters section of the template descriptor file (on page 1348) associated with your publishing template or in the Parameters tab of the transformation scenario dialog box in Oxygen XML Editor/Author.

3. Run the transformation.

Search Attribute Method

The WebHelp Search engine does not index DITA topics that have the @search attribute set to no.

To exclude DITA topics from WebHelp search results using this attribute, follow these steps:

1. Edit the DITA map and for any <topicref> that you want to exclude from search results, set the @search attribute to no. For example:

   ```
   <topicref href="../topics/internal-topic1.dita" search="no"/>
   ```

2. Save your changes to the DITA map.

3. Run your WebHelp system transformation.

Oxygen Feedback Search Engine

How to Configure Faceted Search in WebHelp Output

A faceted search is a powerful tool that allows users to refine search results by selecting filters or facets. Facets are predefined categories that are associated with search results. By selecting one or more facets, users can narrow down their search results to a specific category or set of categories.

Configure Oxygen Feedback as an External Search Engine

To enable faceted searches, you need to have a search engine that supports this functionality. The Oxygen Feedback search engine implements faceted searches and can be easily configured as a search engine for
WebHelp, see Adding Oxygen Feedback to WebHelp Responsive Documentation (on page 1377) for more details.

⚠️ Attention:
The default search engine that comes embedded in the WebHelp Responsive output does not support faceted searches.

## Defining Facets Using a DITA Subject Scheme Map

A **subject scheme map** can be used to define controlled values and subject definitions. *Subject definitions* are classifications and sub-classifications that compose a tree. Subject definitions provide semantics that can be used in conjunction with taxonomies and ontologies.

The `<subjectdef>` element is used to define both a subject category and a list of controlled values. The parent `<subjectdef>` element defines the category, and the children `<subjectdef>` elements define the controlled values.

The following example defines the “Operating system” category, with “Linux” and “Windows” sub-categories. The controlled values (facet values) are: “RedHat Linux”, “SUSE Linux”, “Windows 7”, and “Windows 10”.

```xml
<subjectScheme>
  <subjectdef keys='os' navtitle='Operating system'>
    <subjectdef keys='linux' navtitle='Linux'>
      <subjectdef keys='redhat' navtitle='RedHat Linux'/>
      <subjectdef keys='suse' navtitle='SUSE Linux'/>
    </subjectdef>
    <subjectdef keys='windows' navtitle='Windows'>
      <subjectdef keys='win7' navtitle='Windows 7'/>
      <subjectdef keys='win10' navtitle='Windows 10'/>
    </subjectdef>
  </subjectdef>
</subjectScheme>
```

## Associating Faceted Values With a Topic Using a DITA Classification Map

The **classification domain** provides elements that enable map authors to indicate information about the subject matter of DITA topics. The subjects are defined in subject scheme maps, and the subjects are referenced using the `@keyref` attribute.

The following example shows you how to associate a faceted value with a topic:

```xml
<?xml version='1.0' encoding='UTF-8'?>
<!DOCTYPE map PUBLIC "-//OASIS//DTD DITA Classification Map//EN" "classifyMap.dtd">
<map>
  <title>Classification map</title>
  <topicref keyref="how-to-install-on-suse.dita">
    <topicsubject keyref="linux">
```
Note:
The facet information cascades into child <topicref> elements.

Refining the Search Results by Using Facets in the Search Page

The configured facets are displayed in the search page, allowing you to narrow down the results.

When a user selects a facet, the search results are updated to only include the topics that match the selected facets. If multiple facet values are selected from the same category/facet, the search results display all topics with at least one facet. On the other hand, if multiple facet values from distinct facets are selected, the search results display all topics with all selected facet values.

Adding Oxygen Feedback to WebHelp Responsive Documentation (on page 1377)

How to Add Searchable Labels in WebHelp Output

It is possible to add searchable labels in WebHelp Responsive output that can be clicked to search for topics with that exact same label. Labels are textual words attached to a DITA topic that enables it to be easily found using the search function. These labels can help you organize your topics, making it more accessible to retrieve topics for a specific text.

Configure Oxygen Feedback as an External Search Engine

To enable searchable labels, you need to have a search engine that supports this functionality. The Oxygen Feedback search engine implements searchable labels and can be easily configured as a search engine for WebHelp. See Adding Oxygen Feedback to WebHelp Responsive Documentation (on page 1377) for more details.

Attention:
The default search engine that comes embedded in the WebHelp Responsive output does not support searchable labels. It will simply perform a standard search using the content within the label.
How to Add Searchable Labels in a DITA Topic

The generation of searchable labels in the WebHelp Responsive output is activated by default. You need to insert the desired text (to be displayed in the label in the output) in a `<keyword>` element with an `@outputclass` attribute set to `label` within the prolog of each topic that you want to have that label displayed in the output.

**Note:**
You can right-click anywhere within the topic in **Author** mode and select **Insert > Insert Label** to quickly insert the needed structure in the prolog.

For example:

```xml
<prolog>
  <metadata>
    <keywords>
      <keyword outputclass="label">Customization</keyword>
    </keywords>
  </metadata>
</prolog>
```

This would add a label that contains the text "Customization" in the output for the particular topic. If the user clicks that label, the search engine will search for all topics that have this same label defined.

Transformation Parameters for Generating Searchable Labels

You can have more control over how the labels are generated in the WebHelp Responsive output by using the `webhelp.labels.generation.mode` transformation parameter. The possible values for this parameter are:

- **keywords-label** - Generates labels for each defined `<keyword>` element that has the `@outputclass` attribute value set to `label`.
- **keywords** - Generates labels for each defined `<keyword>` element. If the topic contains `<keyword>` elements with the `@outputclass` attribute value set to `label`, then only these elements will have labels generated for them in the output.
- **disable** - Disables the generation of labels in the WebHelp Responsive output.

**Note:**
The default value for the `webhelp.labels.generation.mode` transformation parameter is `keywords-label`.

Searchable Labels in WebHelp Responsive Output

The WebHelp Responsive transformation will generate a component that renders the text value of the `<keyword>` element. When the user clicks that component, they will be redirected to the search page with the search query populated for them and the search engine will display all topics that have the same text value defined in the prolog.
Custom Search Engine

How to Integrate Google Search in WebHelp Responsive Output

It is possible to integrate the *Google Search Engine* into your *WebHelp Responsive* output and you can specify where you want the results to appear in your WebHelp page.

Using a Publishing Template

To integrate the *Google Search Engine* into your WebHelp Responsive output using an *Oxygen Publishing Template (on page 1340)*, follow this procedure:

1. Go to the *Google Custom Search Engine page* using your Google account.
2. Select the *Create a custom search engine* button.
3. Follow the on-screen instructions to create a search engine component for your site.

**Important:**
For the *Layout*, you must select *Results only* for the *Google Search Engine* to work with *Oxygen XML WebHelp Responsive*.

4. At the end of this process you should obtain a code snippet that looks like this:

```html
<script>
(function() {
  var cx = '000888210889775888983:8mn4x_mf-yg';
  var gcse = document.createElement('script');
gcse.type = 'text/javascript';
gcse.async = true;
  var s = document.getElementsByTagName('script')[0];
  s.parentNode.insertBefore(gcse, s);
})();
</script>
```

5. Save the script into a well-formed HTML file called *googlecse.html*.
6. Open the *template descriptor file (on page 1343)* associated with your publishing template and add the *webhelp.google.search.script* parameter in the *parameters* section with its value set to reference the *googlecse.html* file that you created earlier.

```xml
<publishing-template>
...
</publishing-template>

<webhelp>
...
</webhelp>
```
7. You can also use the `webhelp.google.search.results` parameter to choose where to display the search results.

   a. Create an HTML file with the following content: `<div class="gcse-searchresults-only" data-autoSearchOnLoad="true" data-queryParameterName="searchQuery"></div>` (you must use the HTML5 version for the GCSE). For more information about other supported attributes, see Google Custom Search: Supported Attributes.

   b. Set the value of the `webhelp.google.search.results` parameter to the file path of the file you just created. If this parameter is not specified, the following code is used: `<div class="gcse-searchresults-only" data-autoSearchOnLoad="true" data-queryParameterName="searchQuery"></div>`.

8. Open the DITA Map WebHelp Responsive transformation scenario.

9. Click the Choose Custom Publishing Template link and select your template.

10. Click OK to save the changes to the transformation scenario.

11. Run the transformation scenario.

### Using a Transformation Scenario in Oxygen XML Editor/Author

To integrate the Google Search Engine into your WebHelp Responsive output using a transformation scenario from within Oxygen XML Editor/Author, follow this procedure:

1. Go to the Google Custom Search Engine page using your Google account.
2. Select the Create a custom search engine button.
3. Follow the on-screen instructions to create a search engine for your site.

   **Important:**
   For the Layout, you must select Results only for the Google Search Engine to work with Oxygen XML WebHelp Responsive.

4. At the end of this process you should obtain a code snippet that looks like this:

   ```xml
   <script>
   (function() {
     var cx = '000888210889775888983:8mn4x_mf-yr';
     var gcse = document.createElement('script');
     gcse.type = 'text/javascript';
     gcse.src = 'https://www.google.com/cse/public岁间/v2/cse.js';
     var s = document.getElementsByTagName('script')[0];
     s.parentNode.insertBefore(gcse, s);
   }());
   </script>
   ```
gcse.async = true;

var s = document.getElementsByTagName('script')[0];
s.parentNode.insertBefore(gcse, s);
});
}();
</script>

5. Save the script into a well-formed HTML file called googlecse.html.

6. Edit the DITA Map WebHelp Responsive transformation scenario and choose a template.

7. Switch to the Parameters tab and edit the webhelp.google.search.script parameter to reference the googlecse.html file that you created earlier.

8. You can also use the webhelp.google.search.results parameter to choose where to display the search results.
   a. Create an HTML file with the following content: <div class="gcse-searchresults-only" data-autoSearchOnLoad="true" data-queryParameterName="searchQuery"></div> (you must use the HTML5 version for the GCSE). For more information about other supported attributes, see Google Custom Search: Supported Attributes.
   b. Set the value of the webhelp.google.search.results parameter to the file path of the file you just created. If this parameter is not specified, the following code is used: <div class="gcse-searchresults-only" data-autoSearchOnLoad="true" data-queryParameterName="searchQuery"></div>.

9. Click Ok and run the transformation scenario.

Replacing the Search Engine Only

It is possible to replace the internal search engine that is used by Oxygen XML WebHelp by using a custom JavaScript file. This customization method allows you to replace the search engine but keep the search results presentation.

To replace WebHelp's internal search engine, follow this procedure:

1. If you have not already created a Publishing Template, see How to Create a Publishing Template (on page 1546).

2. Create the following items in the folder that contains your publishing descriptor file (the .opt file):
   - A folder named js.
   - A folder named fragments.

3. In the js folder, create a file named search-engine.js.

4. As a starting point, you can copy the following content to the search-engine.js file:

```javascript
/**
 * Object that implements the methods required by WebHelp to run a search engine.
 */
function CustomSearchEngine() {
```
/**
 * Method required to run the search engine in webhelp. Handler when the user
 * executes the query in the search page.
 * 
 * @param {String} query The search input string from the user.
 * @param {Function} successHandler Needs to be called if the search operation is executed
 * successfully. The parameter needs to have the type of
 * WebHelpAPI.SearchResult
 * @param {Function} errorHandler Needs to be called if the search operation fails to
 * execute successfully. It needs to have the type
 * of String.
 */
this.performSearchOperation = function(query, successHandler, errorHandler) {
  // implement search engine
  // const searchRestult = externalSearchEngine(query);

  // convert the result to WebHelpApi.SearchResult
  // const formattedResult = convert(searchRestult);

  // call successHanlder with the converted result.
  // successHandler(formattedResult)
}

/**
 * Method required to run the search engine in webhelp. Handler when the
 * page is changed in the search page.
 * 
 * @param {Integer} pageToShow The page to be dispalyed.
 * @param {Integer} maxItemsPerPage The maximum # of items that can be displayed on a page.
 * @param {String} query The search input string from the user.
 * @param {Function} successHandler Needs to be called if the search operation is executed
 * successfully. The parameter needs to have the type of
 * WebHelpAPI.SearchResult
 * @param {Function} errorHandler Needs to be called if the search operation fails to
 * execute successfully. It needs to have the type
 * of String.
 */
this.onPageChangedHandler = function(pageToShow, maxItemsPerPage, query, successHandler, errorHandler) {
  // implement search engine
  // const searchRestult = externalSearchEngine(pageToShow, maxItemsPerPage, query);
// convert the result to WebHelpApi.SearchResult
// const formattedResult = convert(searchRestult);

// call successHandler with the converted result.
// successHandler(formattedResult)

// Set the Search Engine to WebHelp
WebHelpAPI.setCustomSearchEngine(new CustomSearchEngine());

Note:
See the API Search Objects section (on page 1425) for details on how to convert your custom search engine results to WebHelpAPI.SearchResult.

5. Implement your search engine.
6. In the fragments folder, create a file named search-engine-script-fragment.xml.
7. In the search-engine-script-fragment.xml file, define the scripts that are required for your search engine to run. For example:

```html
<div>
    <script src="${oxygen-webhelp-template-dir}/js/search-engine.js"></script>
</div>
```

8. Copy the js folder to the output folder during the transformation process. For this, open the .opt file and add the following content in the <resources> section (see Template Resources (on page 1346) for more details):

```xml
<fileset>
    <include name="js/**"/>
</fileset>
```

9. Set the transformation parameters needed to enable the search filter. For this, open the .opt file and add the following content inside the <webhelp> element:

```xml
<html-fragments>
    <fragment file="fragments/search-engine-script-fragment.xml" placeholder="webhelp.fragment.head.search.page"/>
</html-fragments>
```

API Search Objects

To replace the WebHelp Search Engine, you will need to convert your custom search result into WebHelp API Objects that WebHelp will use to render your search result on the search page. To convert your custom search result, you will have to create the following objects:
1. **WebHelpAPI.SearchMeta** is a JavaScript object used to hold additional information for the search result. To create such an object, the following fields are required:
   - **String: searchEngineName** - The name of the search engine used to retrieve the search result.
   - **Integer: totalSearchItems** - The total number of search items the search engine returned.
   - **Integer: currentPage** - The current page to display.
   - **Integer: maxItemsPerPage** - The maximum number of items that can be displayed on a page.
   - **Integer: totalPages** - The number of total pages for the search result.
   - **String: originalSearchExpression** - The query string the user typed in the search input field.

   ```javascript
   const searchMeta = new WebHelpAPI.SearchMeta(searchEngineName, totalSearchItems, currentPage,
   maxItemsPerPage, totalPages, originalSearchExpression);
   ```

2. **WebHelpAPI.SearchDocument** is a JavaScript object used to hold the search result for a single topic/HTML page. To create such an object, the following fields are required:
   - **String: linkLocation** - The URL to the topic.
   - **String: title** - The topic title.
   - **String: shortDescription** - The topic short description.

   ```javascript
   const searchDocument = new WebHelpAPI.SearchDocument(linkLocation, title, shortDescription);
   ```

3. **WebHelpAPI.SearchResult** is a JavaScript object used to display the search results in the search page. To create such an object, the following fields are required:
   - **WebHelpAPI.SearchMeta: searchMeta** - Contains additional information for the search result.
   - **Array[WebHelpAPI.SearchDocument]: documents** - An array with the matching documents (HTML pages) for the search result.

   ```javascript
   const searchMeta = new WebHelpAPI.SearchMeta(searchEngineName, totalSearchItems, currentPage,
   maxItemsPerPage, totalPages, originalSearchExpression);
   const searchDocument = new WebHelpAPI.SearchDocument(linkLocation, title, shortDescription);
   const documents = [searchDocument]; // An array with one element.
   const searchResult = new WebHelpAPI.SearchResult(searchMeta, documents);
   ```

**Replacing the Search Engine and Results Presentation**

It is possible to integrate a custom search engine and replace the search results area into your WebHelp Responsive output. This is done by using the following transformation parameters:

**webhelp.fragment.custom.search.engine.results**

This parameter can be used to replace the search results area with custom XHTML content. The value of the parameter is the path to an XHTML file that contains your custom content.

**webhelp.fragment.custom.search.engine.script**

This parameter can be used to replace WebHelp's built-in search engine with your own custom search engine. The value of the parameter is the path to an XHTML file that contains the scripts required for your custom search engine to run.

To integrate a custom search engine into your WebHelp Responsive output, follow these steps:
1. If you have not already created a Publishing Template, see How to Create a Publishing Template (on page 1546).

2. Create the following items in the folder that contains your publishing descriptor file (the .opt file):
   - A file named `custom-search-results-fragment.xml`.
   - A file named `custom-search-script-fragment.xml`.
   - A folder named `js`.

3. In the `custom-search-results-fragment.xml` file, define the HTML structure that will be used as the search results area. For example:
   ```xml
   <div id="custom-search-results">...</div>
   
   **Note:**
   The custom search engine script will need to find an HTML element from the HTML structure that will be used as the search results area and write the search results inside it. In this example, it is the `<div>` element with the id `custom-search-results`.

4. In the `js` folder, create a file named `custom-search.js`.

5. As a starting point, you can copy the following content to the `custom-search.js` file:
   ```javascript
   document.addEventListener('DOMContentLoaded', (event) => {
     const params = new URLSearchParams(window.location.search);
     const searchQuery = params.get('searchQuery');
     // Implement your custom search engine
     // Display the search results
   });
   
   **Important:**
   The value entered by the user in the search page will be available in the URL's query parameters in a parameter named `searchQuery`.

   **Attention:**
   `URLSearchParams` is not supported on all browsers (it is used as an example). A list with the supported browsers can be found here. A different solution should be used if you need to support other browsers.

6. Implement your custom search engine.

   **Note:**
   The search results should be pushed into the `<div>` element created earlier with the id `custom-search-results`.

7. In the `custom-search-script-fragment.xml` file, define the scripts that are required for your custom search engine to run. For example:
8. Copy the js folder to the output folder during the transformation process. For this, open the .opt file and add the following content in the <resources> section (see Template Resources (on page 1346) for more details):

```xml
<fileset>
  <include name="js/**"/>
</fileset>
```

9. Set the transformation parameters needed to enable the custom search engine. For this, open the .opt file and add the following content inside the <webhelp> element:

```xml
<html-fragments>
  <fragment file="custom-search-script-fragment.xml" placeholder="webhelp.fragment.custom.search.engine.script"/>
  <fragment file="custom-search-results-fragment.xml" placeholder="webhelp.fragment.custom.search.engine.results"/>
</html-fragments>
```

10. Run the transformation with this publishing template selected.

   **Tip:**
   A sample publishing template that overrides WebHelp's default search engine is available to download [here](#). You can use it as a starting point for your customization.

### How to Display Custom Title in Search Results

It is possible to display a custom title for topics in the search results page. This can be achieved by adding the `<searchtitle>` element inside the particular DITA topic (or within the topic reference in the DITA map). The `<searchtitle>` element is used to specify the title that is displayed by search tools that locate the topic. This is useful when the topic has a title that makes sense in the context of a single information set, but may be too general in a list of search results. If the `<searchtitle>` is specified, then the search results page will display the contents inside the `<searchtitle>` as the topic title.

For details about the `<searchtitle>` element (including an example), see [https://docs.oasis-open.org/dita/v1.2/os/spec/langref/searchtitle.html](https://docs.oasis-open.org/dita/v1.2/os/spec/langref/searchtitle.html).

### How to Trigger a Search Query When WebHelp is Loaded

You can use the `searchQuery` URL parameter to perform a search operation when WebHelp is loaded. This opens the search results page with the specified search query processed. The URL should look something like this:

```
http://localhost/webhelp/search.html?searchQuery=deploying%20feedback
```
Configuring the Search Engine Optimization

A DITA Map WebHelp transformation scenario produces a sitemap.xml file that is used by search engines to aid crawling and indexing mechanisms. A sitemap lists all pages of a WebHelp system and allows web admins to provide additional information about each page, such as the date it was last updated, change frequency, and importance of each page in relation to other pages in your WebHelp deployment.

**Important:**

If the webhelp.sitemap.base.url parameter is specified, the loc element will contain the value of this parameter plus the relative path to the page. If the webhelp.sitemap.base.url parameter is not specified, the loc element will only contain the relative path of the page.

You can also set these additional parameters:

- **webhelp.sitemap.change.frequency** - Specifies how frequently the WebHelp pages are likely to change (accepted values are: always, hourly, daily, weekly, monthly, yearly, and never).
- **webhelp.sitemap.priority** - Specifies the priority of each page (a value ranging from 0.0 to 1.0).

The structure of the sitemap.xml file looks like this:

```xml
<urlset xmlns="http://www.sitemaps.org/schemas/sitemap/0.9">
  <url>
    <loc>http://www.example.com/topics/introduction.html</loc>
    <lastmod>2014-10-24</lastmod>
    <changefreq>weekly</changefreq>
    <priority>0.5</priority>
  </url>
  <url>
    <loc>http://www.example.com/topics/care.html#care</loc>
    <lastmod>2014-10-24</lastmod>
    <changefreq>weekly</changefreq>
    <priority>0.5</priority>
  </url>
  ...
</urlset>
```

Each page has a `<url>` element structure containing additional information, such as:

- **loc** - The URL of the page. This URL must begin with the protocol (such as http), if required by your web server. It is constructed from the value of the webhelp.sitemap.base.url parameter from the transformation scenario and the relative path to the page (collected from the href attribute of a topicref element in the DITA map).
Note:
The value must have fewer than 2,048 characters.

- **lastmod** (optional) - The date when the page was last modified. The date format is `YYYY-MM-DD hh:mm:ss`.
- **changefreq** (optional) - Indicates how frequently the page is likely to change. This value provides general information to assist search engines, but may not correlate exactly to how often they crawl the page. Valid values are: always, hourly, daily, weekly, monthly, yearly, and never. The first time the `sitemap.xml` file is generated, the value is set based upon the value of the `webhelp.sitemap.change.frequency` parameter in the DITA WebHelp transformation scenario. You can change the value in each `url` element by editing the `sitemap.xml` file.

Note:
The value `always` should be used to describe documents that change each time they are accessed. The value `never` should be used to describe archived URLs.

- **priority** (optional) - The priority of this page relative to other pages on your site. Valid values range from 0.0 to 1.0. This value does not affect how your pages are compared to pages on other sites. It only lets the search engines know which pages you deem most important for the crawlers. The first time the `sitemap.xml` file is generated, the value is set based upon the value of the `webhelp.sitemap.priority` parameter in the DITA WebHelp transformation scenario. You can change the value in each `url` element by editing the `sitemap.xml` file.

### Creating and Editing the `sitemap.xml` File

Follow these steps to produce a `sitemap.xml` file for your WebHelp system, which can then be edited to fine-tune search engine optimization:

1. **Edit** the transformation scenario you currently use for obtaining your WebHelp output. This opens the **Edit DITA Scenario** dialog box.
2. **Open the Parameters** tab and set a value for the following parameters:
   - **webhelp.sitemap.base.url** - The URL of the location where your WebHelp system is deployed.
     
     Note:
     This parameter is required for Oxygen XML Editor Eclipse plugin to generate the `sitemap.xml` file.
   - **webhelp.sitemap.change.frequency** - How frequently the WebHelp pages are likely to change (accepted values are: always, hourly, daily, weekly, monthly, yearly, and never).
   - **webhelp.sitemap.priority** - The priority of each page (value ranging from 0.0 to 1.0).
3. Run the transformation scenario.
4. Look for the `sitemap.xml` file in the transformation's output folder. Edit the file to fine-tune the parameters of each page, according to your needs.

### Localization

This section contains topics that explain how to use the localization support in WebHelp Responsive output.

#### How to Localize the Interface of WebHelp Responsive Output

Oxygen XML Editor Eclipse plugin comes with support for the following built-in languages: English, French, German, Japanese, and Chinese. It is possible to edit existing localization strings or add a new language.

Static labels used in the WebHelp output are stored in translation files that have the `strings-lang1-lang2.xml` name format, where `lang1` and `lang2` are ISO language codes. For example, the US English labels are kept in the `strings-en-us.xml` file.

These translation files are collected from two locations:

- **DITA-OT-DIR/plugins/org.dita.base/xsl/common** folder - DITA-OT's default translations (generated text for `<note>`, `<fig>`, and `<table>` elements).
- **DITA-OT-DIR/plugins/com.oxygenxml.webhelp.responsive/oxygen-webhelp/resources/localization** folder - These translations are contributed by the WebHelp plugin and extend the default ones provided by DITA-OT. The labels defined in this folder take precedence over the DITA-OT defaults.

There are two major reasons you may want to use modify the translation files: to modify the existing strings or to translate to a new language.

#### Related Information:
- How to Index Japanese Content (on page 1414)
- Customizing Generated Text

#### Modifying the Existing Strings

To modify the generated text for WebHelp transformations, you need to create a DITA-OT extension plugin that uses the `dita.xsl.strings` extension point. The following procedure is for changing English labels, but you can adapt it for any language:

1. Create a `com.oxygenxml.webhelp.localization` plugin directory inside the `DITA-OT-DIR/plugins/` location.
2. Create a `plugin.xml` file inside that `com.oxygenxml.webhelp.localization` directory with the following content:

```xml
<plugin id="com.oxygenxml.webhelp.localization">
  <require plugin="com.oxygenxml.webhelp.responsive"/>
</plugin>
```
3. Create a `webhelp-extension-strings.xml` file with the following content:

```xml
<langlist>
  <lang xml:lang="en" filename="strings-en-us.xml"/>
  <lang xml:lang="en-us" filename="strings-en-us.xml"/>
</langlist>
```

4. Copy the strings you want to change from the translation files (on page 1431) to the `strings-en-us.xml` file. Make sure you leave the name attribute unchanged because this is the key used to look up the string. A sample content might be:

```xml
<strings xml:lang="en-US">
  <str name="Figure">Fig</str>
  <str name="Draft comment">ADDRESS THIS DRAFT COMMENT</str>
</strings>
```

5. Use the Run DITA-OT Integrator transformation scenario (on page 1193) found in the DITA Map section in the Configure Transformation Scenario(s) dialog box (on page 1284).

---

### Adding a New Language

To add a new language for WebHelp transformations, you need to create a DITA-OT extension plugin that uses the `dita.xsl.strings` extension point. The following sample procedure is for adding translation files for the Polish language, but you can adapt it for any language:

1. Create a `com.oxygenxml.webhelp.localization` plugin directory inside the `DITA-OT-DIR/plugins/` location.
2. Create a `plugin.xml` file inside that `com.oxygenxml.webhelp.localization` directory with the following content:

```xml
<plugin id="com.oxygenxml.webhelp.localization">
  <require plugin="com.oxygenxml.webhelp.responsive"/>

  <feature extension="dita.xsl.strings" file="webhelp-extension-strings.xml"/>
</plugin>
```

3. Create a `webhelp-extension-strings.xml` file with the following content:

```xml
<langlist>
  <lang xml:lang="pl" filename="strings-pl-pl.xml"/>
  <lang xml:lang="pl-PL" filename="strings-pl-pl.xml"/>
</langlist>
```

5. In the strings-pl-pl.xml file, change the @xml:lang attribute on the root element that conforms with the new language.

```xml
<strings xml:lang="pl-PL">
  ...
</strings>
```

6. Translate the content of each <str> element (make sure to leave the name attribute unchanged).

```xml
<strings xml:lang="pl-PL">
  ...
  <str name="webhelp.content" js="true" php="false">Polish translation for 'Content'.</str>
  <str name="webhelp.search" js="true" php="false">Polish translation for 'Search'</str>
  ...
</strings>
```

7. Copy the common DITA-OT strings defined in the DITA-OT-DIR/plugins/org.dita.base/xsl/common/strings-en-us.xml file. It defines a set generated text available for HTML-based transformations (such as <note>, <fig>, and <table> elements). Translate the content of each <str> element.

```xml
<strings xml:lang="pl-PL">
  ...
  <str name="webhelp.content" js="true" php="false">Polish translation for 'Content'.</str>
  <str name="webhelp.search" js="true" php="false">Polish translation for 'Search'</str>
  ...
  <str name="Figure">Polish translation for 'Figure'</str>
  <str name="Table">Polish translation for 'Table'</str>
  ...
</strings>
```

8. Use the Run DITA-OT Integrator transformation scenario (on page 1193) found in the DITA Map section in the Configure Transformation Scenario(s) dialog box (on page 1284).

**How to Activate Support for Right-to-Left (RTL) Languages**

To activate support for RTL (right-to-left) languages in WebHelp output, edit the DITA map (on page 2654) and set the @xml:lang attribute on its root element (<map>). The corresponding attribute value can be set for following RTL languages:

- **ar-eg** - Arabic
- **he-il** - Hebrew
- **ur-pk** - Urdu
Integrating Social Media and Google Tools in the WebHelp Output

This section contains topics that explain how to integrate some of the most popular social media sites in WebHelp output.

How to Add a Facebook Like Button in WebHelp Responsive Output

It is possible to integrate Facebook™ into your WebHelp Responsive output and you can specify where you want the widget to appear in your WebHelp page.

Using a Publishing Template

To add a Facebook™ Like widget to your WebHelp output using an Oxygen Publishing Template (on page 1340), follow this procedure:

1. Go to the Facebook Developers website.
2. Fill in the displayed form, then click the Get Code button.
3. Copy the two code snippets and paste them into a `<div>` element inside an XML file called facebook-widget.xml. Make sure you follow these rules:
   - The file must be well-formed.
   - The code for each `<script>` element must be included in an XML comment.
   - The start and end tags for the XML comment must be on a separate line. The content of the XML file should look like this:

   ```xml
   <div id="facebook">
     <div id="fb-root"/>
     <script>
       <!--
         (function(d, s, id) {
           var js, fjs = d.getElementsByTagName(s)[0];
           if (d.getElementById(id)) return;
           js = d.createElement(s); js.id = id;
           js.src = '//connect.facebook.net/en_US/sdk.js#xfbml=1&version=v2.0';
           fjs.parentNode.insertBefore(js, fjs);
         }(document, 'script', 'facebook-jssdk'));
       -->
     </script>
     <div class="fb-like" data-layout="standard" data-action="like"
       data-show-faces="true" data-share="true"/>
   </div>
   ```

4. Open the template descriptor file (on page 1343) associated with your publishing template.
5. Use one of the parameters that begin with webhelp.fragment (on page 1350) in the html-fragments section of the descriptor file. Set the value of that parameter to reference the facebook-widget.xml file that you created earlier.
6. Open the DITA Map WebHelp Responsive transformation scenario.
7. Click the Choose Custom Publishing Template link and select your template.
8. Click OK to save the changes to the transformation scenario.
9. Run the transformation scenario.

Using a Transformation Scenario in Oxygen XML Editor/Author

To add a Facebook™ Like widget to your WebHelp output using a transformation scenario from within Oxygen XML Editor/Author, follow this procedure:

1. Go to the Facebook Developers website.
2. Fill in the displayed form, then click the Get Code button.
3. Copy the two code snippets and paste them into a `<div>` element inside an XML file called `facebook-widget.xml`. Make sure you follow these rules:
   - The file must be well-formed.
   - The code for each `<script>` element must be included in an XML comment.
   - The start and end tags for the XML comment must be on a separate line. The content of the XML file should look like this:

```
<div id="facebook"
    <div id="fb-root"/>
    <script>
      <!--
        (function(d, s, id) {
          var js, fjs = d.getElementsByTagName(s)[0];
          if (d.getElementById(id)) return;
          js = d.createElement(s); js.id = id;
          js.src = '//connect.facebook.net/en_US/sdk.js#xfbml=1&version=v2.0';
          fjs.parentNode.insertBefore(js, fjs);
        })(document, 'script', 'facebook-jssdk');
      -->
    </script>
    <div class="fb-like" data-layout="standard" data-action="like" data-width="300" data-show-faces="false"
```

Oxygen XML Editor Eclipse Plugin 26.0 | 11 - Publishing | 1435
4. Edit the DITA Map WebHelp Responsive transformation scenario and choose a template.
5. Switch to the Parameters tab. Depending on where you want to display the button, edit one of the parameters that begin with webhelp.fragment (on page 1350). Set that parameter to reference the facebook-widget.xml file that you created earlier.
6. Click Ok and run the transformation scenario.

How to Add Tweet Button in WebHelp Responsive Output

It is possible to integrate X™ (formerly known as Twitter) into your WebHelp Responsive output and you can specify where you want the widget to appear in your WebHelp page.

Using a Publishing Template

To add a X™ Tweet widget to your WebHelp Responsive output using an Oxygen Publishing Template (on page 1340), follow this procedure:

1. Go to the Tweet button generator page.
2. Fill in the displayed form. The Preview and code area displays the code that you will need.
3. Copy the code snippet displayed in the Preview and code area and paste it into a <div> element inside an XML file called tweet-button.xml. Make sure you follow these rules:
   - The file must be well-formed.
   - The code for each <script> element must be included in an XML comment.
   - The start and end tags for the XML comment must be on a separate line.

The content of the XML file should look like this:

```xml
<div id="twitter">
  <a href="https://twitter.com/share" class="twitter-share-button">Tweet</a>
  <script>
    !function(d, s, id) {
      var js, fjs = d.getElementsByTagName(s)[0], p = /^http:/.test(d.location) ? 'http' : 'https';
      if (! d.getElementById(id)) {
        js = d.createElement(s);
        js.id = id;
        js.src = p + '://platform.twitter.com/widgets.js';
        fjs.parentNode.insertBefore(js, fjs);
      }
    }
    (document, 'script', 'twitter-wjs');
  </script>
</div>
```
4. Open the template descriptor file (on page 1343) associated with your publishing template.
5. Use one of the parameters that begin with webhelp.fragment (on page 1350) in the html-fragments section of the descriptor file. Set the value of that parameter to reference the tweet-button.xml file that you created earlier.

```xml
<publishing-template>
  ...
  <webhelp>
    ...
    <html-fragments>
      <fragment
        file="HTML-fragments/tweet-button.xml"
        placeholder="webhelp.fragment.after.toc_or_tiles"/>
    </html-fragments>
  </webhelp>
</publishing-template>
```

6. Open the DITA Map WebHelp Responsive transformation scenario.
7. Click the Choose Custom Publishing Template link and select your template.
8. Click OK to save the changes to the transformation scenario.
9. Run the transformation scenario.

### Using a Transformation Scenario in Oxygen XML Editor/Author

To add a X™ Tweet widget to your WebHelp Responsive output using a transformation scenario from within Oxygen XML Editor/Author, follow this procedure:

1. Go to the Tweet button generator page.
2. Fill in the displayed form. The Preview and code area displays the code that you will need.
3. Copy the code snippet displayed in the Preview and code area and paste it into a `<div>` element inside an XML file called tweet-button.xml. Make sure you follow these rules:
   ◦ The file must be well-formed.
   ◦ The code for each `<script>` element must be included in an XML comment.
   ◦ The start and end tags for the XML comment must be on a separate line.

The content of the XML file should look like this:

```xml
<div id="twitter">
  <a href="https://twitter.com/share" class="twitter-share-button"&gt;Tweet&lt;/a&gt;
</div>
<script>
  !function(d, s, id) {
    var js, fjs = d.getElementsByTagName(s)[0], p = /^http:/.test(d.location) && d.location.protocol != "file:"
    js = d.createElement(s); js.id = id; js.src = "//platform.twitter.com/widgets.js"
    fjs.parentNode.insertBefore(js, fjs);
  }("script", "twitter-keyboard", "twitter-keyboard");
</script>
```
4. Edit the DITA Map WebHelp Responsive transformation scenario and choose a template.
5. Switch to the Parameters tab. Depending on where you want to display the button, edit one of the parameters that begin with webhelp.fragment (on page 1350). Set that parameter to reference the tweet-button.xml file that you created earlier.
6. Click Ok and run the transformation scenario.

How to Integrate Google Analytics in WebHelp Responsive Output

You can use Google Analytics to track and report site data for your WebHelp Responsive output.

Using a Publishing Template

To integrate Google Analytics into your WebHelp Responsive output using an Oxygen Publishing Template (on page 1340), follow this procedure:

1. Create a new Google Analytics account (if you do not already have one) and log on.
2. Choose the Analytics solution that best fits the needs of your website.
3. Follow the on-screen instructions to obtain a Tracking Code that contains your Tracking ID. A Tracking Code looks like this:

```html
<script>
(function(i,s,o,r,a,m){i['GoogleAnalyticsObject']=r;i[r]=i[r]||function(){
(i[r].q=i[r].q||[]).push(arguments)},i[r].l=1*new Date();a=s.createElement(o),
m=s.getElementsByTagName(o)[0];a.async=1;a.src=s.location.protocol+'//www.google-analytics.com/analytics.js';a.m=m.parentNode.insertBefore(a,m)
}(window,document,'script','//www.google-analytics.com/analytics.js','ga'));

ga('create', 'UA-XXXXXXXX-X', 'auto');
ga('send', 'pageview');
</script>
```

4. Save the Tracking Code (obtained in the previous step) in a new XML file called googleAnalytics.xml. Note that the file should only contain the tracking code.
5. Open the template descriptor file *(on page 1343)* associated with your publishing template.

6. Use the `webhelp.fragment.after.body` parameter *(on page 1472)* in the `html-fragments` section of the descriptor file. Set the value of that parameter to reference the `googleAnalytics.xml` file that you created earlier. The content of this file will be copied at the end of all generated output pages, right before the ending `<body>` element. This ensures that the page is loaded before the Google Analytics servers are contacted, thus reducing page loading time.

```
<publishing-template>
  ...
  <webhelp>
    ...
    <html-fragments>
      <fragment
        file="HTML-fragments/googleAnalytics.xml"
        placeholder="webhelp.fragment.after.body"/>
    </html-fragments>
  </webhelp>
</publishing-template>
```

7. Open the *DITA Map WebHelp Responsive* transformation scenario.

8. Click the Choose Custom Publishing Template link and select your template.

9. Click OK to save the changes to the transformation scenario.

10. Run the transformation scenario.

Using a Transformation Scenario in Oxygen XML Editor/Author

To integrate *Google Analytics* into your WebHelp Responsive output using a transformation scenario from within *Oxygen XML Editor/Author*, follow this procedure:

1. Create a new Google Analytics account (if you do not already have one) and log on.
2. Choose the Analytics solution that best fits the needs of your website.
3. Follow the on-screen instructions to obtain a Tracking Code that contains your Tracking ID. A Tracking Code looks like this:

```
<script>
  (function(i,s,o,g,r,a,m){i['GoogleAnalyticsObject']=r;i[r]=i[r]||function(){
  (i[r].q=i[r].q||[]).push(arguments)},i[r].l=1*new Date();a=s.createElement(o),
m=s.getElementsByTagName(o)[0];a.async=1;a.src=g;m.parentNode.insertBefore(a,m)
})(window,document,'script','//www.google-analytics.com/analytics.js','ga');

ga('create', 'UA-XXXXXXXX-X', 'auto');
ga('send', 'pageview');
</script>
```

4. Save the Tracking Code (obtained in the previous step) in a new XML file called `googleAnalytics.xml`. Note that the file should only contain the tracking code.

5. Edit the *DITA Map WebHelp Responsive* transformation scenario and choose a template.
6. Switch to the **Parameters** tab. Edit the `webhelp.fragment.after.body` parameter *(on page 1472)* and set it to reference the `googleAnalytics.xml` file that you created earlier. The content of this file will be copied at the end of all generated output pages, right before the ending `<body>` element. This ensures that the page is loaded before the Google Analytics servers are contacted, thus reducing page loading time.

7. Click **Ok** and run the transformation scenario.

### Ant Extensions for WebHelp Responsive

The WebHelp Responsive plugin provides extension points that allow you to implement custom Ant targets to perform additional operations before and after certain processing stages. The following extension points are available in WebHelp Responsive:

- **whr-init-pre**
  - Runs a custom Ant target before the `whr-init` processing stage.

- **whr-init-post**
  - Runs a custom Ant target after the `whr-init` processing stage.

- **whr-collect-indexterms-pre**
  - Runs a custom Ant target before the `whr-collect-indexterms` processing stage.

- **whr-collect-indexterms-post**
  - Runs a custom Ant target after the `whr-collect-indexterms` processing stage.

- **whr-toc-xml-pre**
  - Runs a custom Ant target before the `whr-toc-xml` processing stage.

- **whr-toc-xml-post**
  - Runs a custom Ant target after the `whr-toc-xml` processing stage.

- **whr-context-help-map-pre**
  - Runs a custom Ant target before the `whr-context-help-map` processing stage.

- **whr-context-help-map-post**
  - Runs a custom Ant target after the `whr-context-help-map` processing stage.

- **whr-sitemap-pre**
  - Runs a custom Ant target before the `whr-sitemap` processing stage.

- **whr-sitemap-post**
  - Runs a custom Ant target after the `whr-sitemap` processing stage.

- **whr-copy-resources-pre**
  - Runs a custom Ant target before the `whr-copy-resources` processing stage.

- **whr-copy-resources-post**
  - Runs a custom Ant target after the `whr-copy-resources` processing stage.
whr-create-topic-pages-pre
Runs a custom Ant target before the whr-create-topic-pages processing stage.

whr-create-topic-pages-post
Runs a custom Ant target after the whr-create-topic-pages processing stage.

whr-create-main-page-pre
Runs a custom Ant target before the whr-create-main-page processing stage.

whr-create-main-page-post
Runs a custom Ant target after the whr-create-main-page processing stage.

whr-create-search-page-pre
Runs a custom Ant target before the whr-create-search-page processing stage.

whr-create-search-page-post
Runs a custom Ant target after the whr-create-search-page processing stage.

whr-create-indexterms-page-pre
Runs a custom Ant target before the whr-create-indexterms-page processing stage.

whr-create-indexterms-page-post
Runs a custom Ant target after the whr-create-indexterms-page processing stage.

whr-search-index-pre
Runs a custom Ant target before the whr-search-index processing stage.

whr-search-index-post
Runs a custom Ant target after the whr-search-index processing stage.

To use Ant extension points for WebHelp Responsive, follow these steps:

1. In the DITA-OT-DIR/plugins/ folder, create a folder for this plugin (for example, com.oxygenxml.webhelp.responsive.custom.ant.extensions).

2. Create a plugin.xml file (in the folder you created in step 1) that extends the WebHelp Responsive plugin and specifies an Ant extension point with your custom Ant project file that contains the new build targets. For example:

   ```xml
   <plugin id="com.oxygenxml.webhelp.responsive.custom.ant.extensions">
       <require plugin="com.oxygenxml.webhelp.responsive"/>
       <feature extension="ant.import" file="custom_build_file.xml"/>
   </plugin>
   ```

3. Create the custom_build_file.xml file (in the folder you created in step 1) that contains your custom Ant project implementing one or more extension points:

   ```xml
   <project name="custom.ant.extensions.integrator" basedir=".">
       <target name="custom-whr-init-pre" extensionOf="whr-init-pre">
   ```
<echo>Extension point that executes before whr-init</echo>
</target>
<target name="custom-whr-init-post" extensionOf="whr-init-post">
  <echo>Extension point that executes after whr-init</echo>
</target>
</project>

4. Integrate the plugin into the DITA-OT. In the DITA-OT-DIR/bin directory of the DITA Open Toolkit, run one of the following scripts, depending on your operating system:

- Windows: DITA-OT-DIR/bin/dita.bat --install
- Linux/macOS: sh DOTA-OT-DIR/bin/dita --install

5. Execute a DITA Map to WebHelp Responsive transformation script.

XSLT Extensions for WebHelp Responsive

Since WebHelp Responsive output is primarily obtained by running XSLT transformations over the DITA input files, one customization method would be to override the default XSLT templates that are used by the WebHelp Responsive transformations.

There are two methods available to override the XSLT stylesheets implied by the WebHelp Responsive transformation.

- Use XSLT-import extension points from an Oxygen Publishing Template (on page 2656).

  Note:
  Use this method if you want to affect only the transformations that use this publishing template.

- Use XSLT-import extension points from a DITA-OT extension plugin.

  Note:
  This method will affect all the outputs generated with the WebHelp system.

Related information
WebHelp Responsive XSLT-Import and XSLT-Parameter Extension Points (on page 1484)

How to Use XSLT Extension Points from a Publishing Template

This example demonstrates how to use WebHelp XSLT-import Extension Points from an Oxygen Publishing Template (on page 1539).
Use Case 1: Add Copyright Information Extracted from a DITA Bookmap

Suppose you want to customize the WebHelp Responsive main page by adding information about the legal rights associated with the book in the footer (for example, copyright dates and owner). This information is specified in the bookmap:

```xml
<bookrights>
  <copyrfirst>
    <year>2002</year>
  </copyrfirst>
  <copyrlast>
    <year>2017</year>
  </copyrlast>
  <bookowner>
    <organization>SyncRO Soft SRL</organization>
  </bookowner>
</bookrights>
```

Figure 442. Example: Copyright Information Added in the WebHelp Footer

The XSLT stylesheet that generates the main page is located in: DITA-OT-DIR\plugins\com.oxygenxml.webhelp.responsive\xsl\mainFiles\createMainPage.xsl. This XSLT stylesheet declares the copy_template mode that processes the main page template (on page 1360) to expand its components. The main page template declares a component for the footer section that looks like this:

```xml
<div class="footer-container text-center">
  <whc:include_html href="${webhelp.fragment.footer}"/>
</div>
```

In the following example, the extension stylesheet will add a template that matches this component. It applies the default processing and adds the copyright information at the end.

```xml
<xsl:template match="*:div[contains(@class, 'footer-container')]" mode="copy_template">
  <!-- Apply the default processing -->
  <xsl:next-match/>
  <!-- Add a div containing the copyright information -->
  <div class="copyright_info">
```

```xml
  </div>
```
To add this functionality using a *Oxygen Publishing Template*, follow these steps:

1. If you have not already created a Publishing Template, see How to Create a Publishing Template ([on page 1546](#)).
2. Link the folder associated with the publishing template to your current project in the **Project Explorer** view.
   
   **Step Result:** You should have the `custom_footer_template` folder linked in your project.
3. Using the **Project Explorer** view, create an `xslt` folder inside the project root folder.
   
   **Step Result:** You should have the `custom_footer_template/xsl` folder in your project.
4. Create your customization stylesheet (for example, `custom_mainpage.xsl`) in the `custom_footer_template/xsl` folder. Edit it to override the template that produces the footer section:
5. Open the template descriptor file (on page 1343) associated with your publishing template and set the XSLT stylesheet created in the previous step with the com.oxygenxml.webhelp.xsl.createMainPage XSLT extension point.

```xml
<publishing-template>
  ...
</publishing-template>
```
6. Open the DITA Map WebHelp Responsive transformation scenario.

7. Click the Choose Custom Publishing Template link and select your template.

8. Click OK to save the changes to the transformation scenario.

9. Run the transformation scenario.

Use Case 2: Add Generation Time in the Output Footer

Another possible customization for the main page is to add the generation time in its footer. A transformation parameter is used to control whether or not this customization is active.

Figure 443. Generation Time Added in the WebHelp Footer

To add this functionality, follow these steps:

1. In the customization stylesheet that you just created (for example, custom_mainpage.xsl), modify the template by adding the following XSLT code at the end.

   ```xml
   <xsl:if test="oxyf:getParameter('webhelp.footer.add.generation.time') = 'yes'">
     <div class="generation_time">
       Generation date: <xsl:value-of select="format-dateTime(current-dateTime(),'[h1]:[m01] [P] on [M01]/[D01]/[Y0001].')"/>
     </div>
   </xsl:if>
   ```

2. Open the template descriptor file (on page 1343) associated with your publishing template and set the webhelp.footer.add.generation.time parameter to the default value.

   ```xml
   <publishing-template>
     ...
     <webhelp>
     ...
3. Open the DITA Map WebHelp Responsive transformation scenario.
4. In the Parameters tab, you can change the value of the webhelp.footer.add.generation.time parameter.
5. Click OK to save the changes to the transformation scenario.
6. Run the transformation scenario.

How to Use XSLT Extension Points from a DITA-OT Plugin

In this example, the main page footer is modified by adding copyright information extracted from the DITA bookmap or by adding the output generation time. The first use-case uses an XSLT-Import extension point while the second uses an XSLT-Parameter extension point.

Note:
This customization is available as a GitHub project at: https://github.com/oxygenxml/com.oxygenxml.webhelp.responsive.custom.footer.

Use Case 1: WebHelp XSLT-Import extension point to add copyright information extracted from a DITA Bookmap

Suppose you want to customize the WebHelp Responsive main page by adding information about the legal rights associated with the book in the footer (for example, copyright dates and owner). This information is specified in the bookmap:

```xml
<bookrights>
  <copyrfirst>
    <year>2002</year>
  </copyrfirst>
  <copyrlast>
    <year>2017</year>
  </copyrlast>
  <bookowner>
    <organization>SyncRO Soft SRL</organization>
  </bookowner>
</bookrights>
```
The XSLT stylesheet that generates the main page is located in: \DITA-OT-DIR\plugins\com.oxygenxml.webhelp.responsive\xsl\mainFiles\createMainPage.xsl. This XSLT stylesheet declares the copy_template mode that processes the main page template to expand its components. The main page template (on page 1360) declares a component for the footer section that looks like this:

```xml
<div class="footer-container text-center">
  <whc:include_html href="${webhelp.fragment.footer}"/>
</div>
```

In the following example, the extension stylesheet will add a template that matches this component. It applies the default processing and adds the copyright information at the end.

```xml
<xsl:template match="*:div[contains(@class, 'footer-container')]
  mode="copy_template">
  <!-- Apply the default processing -->
  <xsl:next-match/>
  <!-- Add a div containing the copyright information -->
  <div class="copyright_info">
    <xsl:choose>
      <!-- Adds the start-end years if they are defined -->
      <xsl:when test="exists($toc/*:topicmeta/*:bookrights/*:copyrfirst) and
                   exists($toc/*:topicmeta/*:bookrights/*:copyrlast)"
                   >
        <span class="copyright_years">
          ©<xsl:value-of select="$toc/*:topicmeta/*:bookrights/*:copyrfirst"/>
          -<xsl:value-of select="$toc/*:topicmeta/*:bookrights/*:copyrlast"/>
        </span>
      </xsl:when>
      <!-- Adds only the first year if last is not defined. -->
      <xsl:when test="exists($toc/*:topicmeta/*:bookrights/*:copyrfirst)"
                   >
        <span class="copyright_years">
          ©<xsl:value-of select="$toc/*:topicmeta/*:bookrights/*:copyrfirst"/>
        </span>
      </xsl:when>
    </xsl:choose>
  </div>
</xsl:template>
```
You can implement this functionality with a WebHelp extension plugin that uses the `com.oxygenxml.webhelp.xsl.createMainPage` extension point (on page 1485). This extension point allows you to specify a customization stylesheet that will override the template described above.

To add this functionality as a DITA-OT plugin, follow these steps:

1. In the `DITA-OT-DIR\plugins\` folder, create a folder for this plugin (for example, `com.oxygenxml.webhelp.responsive.custom.footer`).
2. Create a `plugin.xml` file (in the folder you created in step 1) that specifies the extension point and your customization stylesheet. For example:

   ```xml
   <plugin id="com.oxygenxml.webhelp.responsive.custom.footer">
     <feature extension="com.oxygenxml.webhelp.xsl.createMainPage"
              file="custom_mainpage.xsl"/>
   </plugin>
   ```

3. Create your customization stylesheet (for example, `custom_mainpage.xsl`), and edit it to override the template that produces the footer section:

   ```xml
   <xsl:template match="*:div[contains(@class, 'footer-container')]"><xsl:next-match/>
   </xsl:template>

   <!-- Add a div containing the copyright information -->
   <div class="copyright_info">
     <xsl:choose>
       <!-- Adds the start-end years if they are defined -->
       <xsl:when test="exists($toc/*/topicmeta/*/bookrights/*/copyrfirst) and exists($toc/*/topicmeta/*/bookrights/*/copyrlast)"
                 test="exists($toc/*/topicmeta/*/bookrights/*/copyrfirst) and exists($toc/*/topicmeta/*/bookrights/*/copyrlast)"
                 select="#xsl:value-of select="$toc/*/topicmeta/*/bookrights/*/copyrfirst"/>
       <xsl:value-of select="$toc/*/topicmeta/*/bookrights/*/copyrfirst"/>
       <xsl:value-of select="$toc/*/topicmeta/*/bookrights/*/copyrlast"/>
     </xsl:when>
     <span class="copyright_years">©</span>
   </div>
   ```
4. Use the Run DITA-OT Integrator transformation scenario (on page 1193) found in the DITA Map section in the Configure Transformation Scenario(s) dialog box (on page 1284).

5. Run a DITA Map WebHelp Responsive transformation scenario to obtain the customized side TOC.

Use-Case 2: WebHelp XSLT-Parameter Extension Point to Control if Generation Time is Displayed in the Output

Another possible customization for the main page is to add the generation time in its footer. You can use an XSLT-Parameter extension point to control whether or not this customization is active. In this case, you can use the `com.oxygenxml.webhelp.xsl.createMainPage.param` extension point (on page 1486).

Figure 445. Generation Time Added in the WebHelp Footer

To add this functionality, follow these steps:

1. Create a DITA-OT plugin structure by following the first 3 steps in the procedure above (on page 1447).

2. In the customization stylesheet that you just created (for example, `custom_mainpage.xsl`), declare `webhelp.footer.add.generation.time` as a global parameter and modify the template by adding the following XSLT code at the end.
3. Edit the plugin.xml file to specify the com.oxygenxml.webhelp.xsl.createMainPage.param extension point and a custom parameter file by adding the following line:

```xml
<feature extension="com.oxygenxml.webhelp.xsl.createMainPage.param" file="params.xml"/>
```

4. Create a custom parameter file (for example, params.xml). It should look like this:

```xml
<dummy>
  <param name="webhelp.footer.add.generation.time" expression="${webhelp.footer.add.generation.time}" if="webhelp.footer.add.generation.time"/>
</dummy>
```

5. Use the Run DITA-OT Integrator transformation scenario (on page 1193) found in the DITA Map section in the Configure Transformation Scenario(s) dialog box (on page 1284).

6. Edit a DITA Map WebHelp Responsive transformation scenario and in the Parameters tab (on page 2534), specify the desired value (yes or no) for your custom parameter (webhelp.footer.add.generation.time).

7. Run the transformation scenario.

- [DITA-OT] XSLT-Parameter Extension Points

Miscellaneous Customization Topics

This section contains miscellaneous topics about how to customize the WebHelp Responsive output.

How to Copy Additional Resources to Output Directory

You can copy additional resources (such as graphics, JavaScript, CSS, entire folders, or other resources) to the output directory either by using an Oxygen Publishing Template (on page 2656) or the webhelp.custom.resources parameter.

Copying Additional Resources to the Output Directory using a Publishing Template

1. If you have not already created a Publishing Template, see How to Create a Publishing Template (on page 1546).
2. Add a new <fileset> element in the resources section of the template descriptor file (on page 1346).
3. Open the DITA Map WebHelp Responsive transformation scenario.
4. Click the Choose Custom Publishing Template link and select your template.
5. Click OK to save the changes to the transformation scenario.
6. Run the transformation scenario.

**Results:** All files from the custom resources directory will be copied to the WebHelp Output Directory/oxygen-webhelp/template folder.

### Copying Additional Resources to the Output Directory using a Transformation Parameter

1. Place all your resources in the same directory.
2. Edit the DITA Map WebHelp Responsive transformation scenario and open the Parameters tab.
3. Edit the value of the webhelp.custom.resources parameter and set it to the absolute path of the directory in step 1.
4. Click OK to save the changes to the transformation scenario.
5. Run the transformation scenario.

**Results:** All files from the new directory will be copied to the root of the WebHelp output directory.

### How to Add an Edit Link to Launch Oxygen XML Web Author

You can embed Edit links in the DITA WebHelp Responsive output that will automatically launch a particular document in Oxygen XML Web Author. A reviewer can then click the link to open the particular file in Oxygen XML Web Author where they can make or propose changes.

#### Using a Publishing Template

To embed an Edit link in the DITA Map WebHelp Responsive output using an Oxygen Publishing Template (on page 1340), follow this procedure:
1. If you have not already created a Publishing Template, see Working with Publishing Templates (on page 1379).

2. Open the template descriptor file (on page 1343) associated with your publishing template and add the following parameters with their values set to the URLs:
   - **editlink.ditamap.edit.url** - The URL of the DITA map used to publish your content. The easiest way to obtain the URL is to open the map in Web Author and copy the URL from the browser’s address bar.
   - **editlink.additional.query.parameters** - Optional query parameters to be appended to each generated edit link. Each parameter must start with & (e.g. &tags-mode=no-tags).

   ```xml
   <parameters>
     <parameter name="editlink.ditamap.edit.url" value="webdav-https://dav.box.com/dav/my.ditamap"/>
   </parameters>
   ```

3. Open the DITA Map WebHelp Responsive transformation scenario.

4. Click the Choose Custom Publishing Template link and select your template.

5. Click OK to save the changes to the transformation scenario.

6. Run the transformation scenario.

**Result:** In the WebHelp output, all topics will have an **Edit** link to the right side of the title and clicking the link will launch that particular document in Oxygen XML Web Author.

For example:

- **Windows:**
  
  ```cmd
  ```

- **macOS/ Linux:**
  
  ```cmd
  ```

**Using a Transformation Scenario in Oxygen XML Editor/Author**

To embed an **Edit** link in the DITA Map WebHelp Responsive output using a transformation scenario from within Oxygen XML Editor/Author, follow this procedure:

1. Edit a DITA Map WebHelp Responsive transformation scenario and open the Parameters tab.
2. Set values for the following parameters:
- **editlink.ditamap.edit.url** - The URL of the Oxygen XML Web Author that have opened the DITA map for editing.
- **editlink.additional.query.parameters** - Optional query parameters to be appended to each generated edit link. Must start with & (e.g.: \&tags-mode=no-tags).

3. Run the transformation scenario.

**Result:** In the WebHelp output, all topics will have an **Edit** link to the right side of the title and clicking the link will launch that particular document in Oxygen XML Web Author.

### How to Flag DITA Content in WebHelp Output

Flagging content in WebHelp output involves defining a set of images that will be used for marking content across your information set.

To flag DITA content, you need to create a filter file that defines properties that will be applied on elements to be flagged. Generally, flagging is supported for *block elements* [(on page 2652)](#) (such as paragraphs), but not for phrase-level elements within a paragraph. This ensures that the images that will flag the content are easily scanned by the reader, instead of being buried in the text.

### Using a Publishing Template

To flag content in DITA Map to WebHelp output using an **Oxygen Publishing Template** [(on page 1340)](#), follow this procedure:

1. Create a DITA filter file (DITAVAL) and add it in a directory of your choice (for example, named `myFile.ditaval`.
2. Define the property for the elements you want to be flagged. For example, if you want to flag any element that has the `@audience` attribute set to `programmer`, the content of the DITAVAL file should look like this:

   ```xml
   <?xml version="1.0" encoding="UTF-8"?>
   <val>
     <prop att="audience" val="programmer" action="flag" img="D:\resource\delta.gif" alt="sample alt text"/>
   </val>
   ```

**Note:**

For an element to be flagged, at least one attribute-value pair needs to have a property declared in the DITAVAL file.
3. Open the template descriptor file (on page 1343) associated with your publishing template and add the `args.filter` parameter in the `parameters` section with its value set to the path of the DITAVAL file you created.

```xml
<publishing-template>
  ...
  <webhelp>
    ...
    <parameters>
      <parameter name="args.filter" value="/resources/myFile.ditaval"/>
    </parameters>
  </webhelp>
</publishing-template>
```

4. Open the DITA Map WebHelp Responsive transformation scenario.

5. Click the Choose Custom Publishing Template link and select your template.

6. Click OK to save the changes to the transformation scenario.

7. Run the transformation scenario.

Using a Transformation Scenario in Oxygen XML Editor/Author

To flag content in the DITA Map to WebHelp output using a transformation scenario from within Oxygen XML Editor/Author, follow this procedure:

1. Create a DITA filter file (DITAVAL) and add it in a directory of your choice (for example, named `myFile.ditaval`).

2. Define the property for the elements you want to be flagged. For example, if you want to flag any element that has the `@audience` attribute set to `programmer`, the content of the DITAVAL file should look like this:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<val>
  <prop att="audience" val="programmer" action="flag"
    img="D:\resource\delta.gif" alt="sample alt text"/>
</val>
```

**Note:**
For an element to be flagged, at least one attribute-value pair needs to have a property declared in the DITAVAL file.

3. Edit a DITA Map to WebHelp transformation scenario.

4. Specify the DITAVAL file in the Filters tab (with the Use DITAVAL File option).

5. Run the transformation scenario.

**Related Information:**
Filtering Profiling Values with a DITAVAL File (on page 2578)
How to View MathML Equations in HTML Output

By default, only Firefox can render MathML equations embedded in the HTML code. MathJax is a solution to properly view MathML equations embedded in HTML content in a variety of browsers.

If you have DocBook or DITA content that has embedded MathML equations and you want to properly view the equations in published HTML output types (WebHelp, CHM, EPUB, etc.), you need to add a reference to the MathJax script in the head element of all HTML files that have the equation embedded.

For example:

```html
<script type="text/javascript"
src="https://cdnjs.cloudflare.com/ajax/libs/mathjax/2.7.1/MathJax.js?config=TeX-AMS-MML_HTMLorMML">
</script>
```

Alternate Method for DITA

For DITA documents, you can also use the following procedure:

1. Create an XML file that contains a script similar to the one shown in the example above.
2. Edit the DITA Map transformation scenario and open the Parameters tab.
3. Set the following parameter to point to the XML file created in step 1:
   - WebHelp Responsive Systems - Set the webhelp.fragment.head parameter to point to your XML file.
   - WebHelp Classic Systems - Set the webhelp.head.script parameter to point to your XML file.
   - Any other type of HTML-based publishing - Set the args.hdf parameter to point to your XML file.
4. Run the transformation scenario.

Result: The equation should now be properly rendered in other browsers, such as Edge, IE, or Chrome.

How to Disable Caching in WebHelp Responsive Output

In cases where a set of WebHelp Responsive pages need to be updated on a regular basis to deliver the latest version of the documentation, the WebHelp pages should always be requested from the server upon re-loading it in a web browser on the client side, (rather than re-using an outdated cached version in the browser).

To disable caching in WebHelp Responsive output, follow this procedure:

1. Create a new well-formed XML file and add the following code snippet:

   ```xml
   <meta http-equiv="Pragma" content="no-cache" />
   <meta http-equiv="Expires" content="-1" />
   ```

   Note: The code should look like this:
2. Edit the DITA Map WebHelp Responsive transformation scenario and open the Parameters tab.
3. Edit the value of the webhelp.fragment.head parameter and set it to the absolute path of your XML file.
4. Click OK to save the changes to the transformation scenario.
5. Run the transformation scenario.

**Result:** Your additional content is included at the end of the `<head>` element of your output document.

### How to Add a Link to PDF Documentation

It is possible to add a component in your WebHelp output that links to an external PDF resource. For example, it could link to the PDF equivalent of the documentation. This is achieved by configuring some transformation parameters and the link component is added in the header/breadcrumb stripe, next to the navigation links.

The transformation parameters used for generating a PDF link component in the WebHelp Responsive output are:

- `webhelp.pdf.link.url`
  
  Specifies the target URL for the PDF link component.

- `webhelp.pdf.link.text`
  
  Specifies the text for the PDF link component.

- `webhelp.pdf.link.icon.path`
  
  Specifies the path or URL of the image icon to be used for the PDF link component. If not specified, a default icon is used.

- `webhelp.show.pdf.link`
  
  Specifies whether or not the PDF link component is shown in the WebHelp Responsive output. Allowed values are: **yes** (default) and **no**.

- `webhelp.pdf.link.anchor.enabled`
  
  Specifies whether or not the current topic ID should be appended as the name destination at the end of the PDF link. Allowed values are: **yes** (default) and **no**.
How to Add a Custom Component for WebHelp Output

This topic explains how to use several customization methods to define and implement a custom component for WebHelp output pages.

Predefined components

The WebHelp output is based on a set of HTML Page Layout Files (on page 1359) that define the default layout of the generated pages. Each layout file is made of a set of various components. Each component is described using an associated XML element that is processed at the generation time resulting in its associated component being included in the output pages.

Here are a few examples of predefined components: Logo, Title, Menu, Search Input, Topics Tiles, Topic Breadcrumb, Topic Content, Publication Table of Contents. A complete list with all the available components is available here: Layout of the Responsive Page Types (on page 1295).

For example, the page component that is used to define the Search Input field in the WebHelp HTML pages is defined as follows:

```xml
<!-- Search form -->
<whc:webhelp_search_input class="navbar-form wh_topic_page_search search" role="form"/>
```

At publishing time, the above component will be expanded into:

```xml
<div class="wh_search_input navbar-form wh_topic_page_search search">
 <form id="searchForm" method="get" role="search" action="/search.html">
  <input type="search" placeholder="Search "
   class="wh_search_textfield ui-autocomplete-input" id="textToSearch"
   name="searchQuery" aria-label="Search query" required="required"
   autocomplete="off"/>
  <button type="submit" class="wh_search_button" aria-label="Search">
   <span class="search_input_text">Search</span>
  </button>
 </form>
</div>
```

Customization Methods

The most common customization methods for the WebHelp Responsive output include:

- Apply custom CSS styles (on page 1390) to change the default layout and styles.
- Insert additional HTML content (on page 1393) using one of the available HTML Fragment Placeholder parameters (on page 1350).
- Extend the default processing using XSLT Extension Points (on page 1349).
- Configure available Transformation Parameters (on page 1470).
Use Case: Custom Link Component

For the subsequent procedure, suppose you have a DITA project for a User Manual and you also have various video demonstrations available on your website that supplement the documentation. You may want to link a video demonstration for a particular feature to its associated DITA topic in the WebHelp output.

You could simply add a link somewhere in your DITA topic, but this approach would not be very suitable for a printable (PDF) version of your User Manual. Thus, you need to include the link to the associated video demonstration only in the WebHelp output of your User Manual (and not the PDF version).

One way to link a video with its associated topic is to include its URL in the metadata section. For example:

```
<prolog>
  <metadata>
    <othermeta name="video-link" content="https://www.youtube.com/watch?v=zNmXEKWXw08"/>
  </metadata>
</prolog>
```

Next, you need to instruct WebHelp to pick up the URL from the metadata and generate a link in a specific location of the HTML output page. You can achieve this by creating your own WebHelp custom component.

Creating a Custom Component

You can combine several of the available customization methods to define and implement your own WebHelp custom component.

Figure 446. Custom Component

![HTML Fragment](image1.png) ![XSLT Extension](image2.png) ![CSS](image3.png)

To create a custom component that displays a link to the current topic's associated video tutorial, follow these steps:

1. Define your component. For example, it may have the following form:

   ```xml
   <comp:video-link xmlns:comp="http://example.com/custom-components"/>
   ```

   The component is an XML element that belongs to a custom defined namespace.

2. Insert the component in your topic pages. To do this, you will have to save the associated XML element in an HTML Fragment file (for example, named `video-link-fragment.xml`).

3. Reference the HTML Fragment file in your current Publishing Template's descriptor file (on page 1343) and associate it with an HTML Fragment placeholder that is available for the topic pages (webhelp.fragment.before.topic.toolbar in this case):
Note:
The HTML Fragment file is referenced using a path relative to the Publishing Template root directory.

4. Create a custom XSLT file that processes the custom component and picks up the video URL available in the current topic's metadata and generates a link to the page that contains the video:

```xml
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
    xmlns:xs="http://www.w3.org/2001/XMLSchema"
    xmlns:comp="http://example.com/custom-components"
    exclude-result-prefixes="xs comp"
    version="3.0">

    <!-- Custom component implementation -->
    <xsl:template match="comp:video-link" mode="copy_template">
        <xsl:param name="ditaot_topicContent" tunnel="yes"/>
        <!-- Look for a 'video-link' <meta> element in the current topic content -->
        <xsl:variable name="videoLinkMeta" select="$ditaot_topicContent//*:meta[@name='video-link']"/>
        <xsl:if test="exists($videoLinkMeta)">
            <div class="video-link-container">
                <a href="{$videoLinkMeta[1]/@content}" class="video-link" target="_blank" aria-label="Video">
                    <span>Video</span>
                </a>
            </div>
        </xsl:if>
    </xsl:template>
</xsl:stylesheet>
```

The HTML content generated for your component will look like this:

```html
<div class="video-link-container">
    <a href="https://www.youtube.com/watch?v=zNmXfKWXwO8" class="video-link" target="_blank" aria-label="Video">
        <span>Video</span>
    </a>
</div>
```
5. Reference the above XSL file in your Publishing Template’s descriptor file using the XSLT extension point associated with the XSL module that generates an HTML file for each DITA topic:

```xml
<xslt>
  <extension file="component/xsl/video-link-impl.xsl"
             id="com.oxygenxml.webhelp.xsl.dita2webhelp"/>
</xslt>
```

6. Create a custom CSS file that contains the rules for styling the output for your component:

```css
@import url('https://fonts.googleapis.com/icon?family=Material+Icons');

.video-link-container {
  display: flex;
  align-items: center;
  flex-grow: 10;
  justify-content: flex-end;
}

.video-link {
  display: flex;
  align-items: center;
  color: #fff !important;
}

.video-link:before {
  content: "smart_display";
  font-family: 'Material Icons';
  font-size: 20px;
  display: inline-block;
  word-wrap: normal;
  white-space: nowrap;
}

.video-link span {
  display: none;
}

.wh_right_tools {
  padding: 0;
}
```

7. Reference the above CSS file in your Publishing Template’s descriptor file:
<resources>
  <!-- .... -->
  <css file="component/css/video-link.css"/>
</resources>

Result: An icon that is a link to the video appears in the header stripe in the output page.

Figure 447. Custom Link to Video Component

Sample Publishing Template

A sample Publishing Template that contains all the above customizations is available here: https://github.com/oxygenxml/oxygen-publishing-template-samples/tree/master/templates/video-link-custom-component.

How to Generate Google Structured Data

It is possible to generate Google Structured Data (\texttt{<script> elements that contain a JSON-LD object) in the DITA WebHelp Responsive output. Google uses this JSON-LD object to better understand the contents of the page and display special search results in a Google Search.

Tip: For more details, see Google Search Central: Understand how structured data works.

To generate Google Structured Data in WebHelp output, use the following transformation parameter:

\texttt{google.structured.data}

Specifies whether or not Google Structured Data will be generated in the output. If set to \texttt{yes}, the transformation automatically generates Google Structured Data for Questions and Answers topics, DITA Task topics, and from \texttt{<data>} elements found inside a topic that has the \texttt{@name="oxy:question"} construct. If set to \texttt{no} (default value), the transformation will not generate Google Structured Data.

Generating Google Structured Data for DITA Tasks Topics

When Google Structured Data is enabled, the DITA Task \texttt{<title>, <shordesc>, and <step>} elements are mapped to the HowTo JSON-LD object. For example, the following DITA Task topic:
<task id="task_id">
  <title>My task</title>
  <shortdesc>Task description</shortdesc>
  <steps>
    <step>
      <cmd>Step 1 content.</cmd>
    </step>
    <step>
      <cmd>Step 2 content.</cmd>
    </step>
  </steps>
</task>

will generate the following structure in the output:

```xml
<script type="application/ld+json" id="jsonld-howto">
{
    "@context": "https://schema.org",
    "@type": "HowTo",
    "name": "My task",
    "description": "Task description",
    "supply": [],
    "tool": [],
    "step": [
        {
            "@type": "HowToStep",
            "text": "<span class="topic/ph task/cmd ph cmd">Step 1 content.</span>"
        },
        {
            "@type": "HowToStep",
            "text": "<span class="topic/ph task/cmd ph cmd">Step 2 content.</span>"
        }
    ]
}
</script>
```

### Generating for Questions and Answers Topics

When Google Structured Data is enabled, the QA topic `<qatopic>` elements are mapped to the FAQPage JSON-LD object. For example, the following QA topic:

```xml
<qatopic id="qa_id">
  <title>Faq Page 1</title>
  <qabody>
```
<qagroup>
  <question>What is a car engine?</question>
  <answer>The car engine is a device that uses fuel to create mechanical power that can turn the car's wheels.</answer>
</qagroup>
</qatopic>

will generate the following structure in the output:

```html
<script type="application/ld+json" id="jsonld-faq">
  [  
    "@context": "https://schema.org",
    "@type": "FAQPage",
    "mainEntity": [  
      {  
        "@type": "Question",
        "name": "What is a car engine?",
        "acceptedAnswer": {  
          "@type": "Answer",
          "text": "The car engine is a device that uses fuel to create mechanical power that can turn the car's wheels."  
        }  
      }  
    ]
  ]
</script>
```

Generating from data elements found inside a topic

When Google Structured Data is enabled, the WebHelp Responsive transformation will map the <data> elements found inside a topic to a FAQPage JSON-LD object. There are 2 different use cases depending on where the <data> element is found in the document:

- In the <prolog> element. For example, this content:

```xml
<concept id="lawnmowerconcept">
  <title>Lawnmower</title>
  <shortdesc>The lawnmower is a machine used to cut grass in the yard.</shortdesc>
  <prolog>
    <metadata>
      <data name="oxy:question">What tools are necessary to cut the grass?</data>
    </metadata>
  </prolog>
  <conbody>
```
Lawnmowers can be electric, gas-powered, or manual.

Important:
The answer represents the HTML result of the entire content inside the topic.

• Inside the topic body elements. For example, content:

```xml
<title>Morning</title>
<shortdesc>In the morning we have breakfast.</shortdesc>
<body>
<ul>
    <data name="oxy:question">What do people drink in the morning?</data>
    <li>Tea</li>
    <li>Milk</li>
</ul>
</body>
</topic>
```
Important:
The answer represents the HTML result of the entire block where the `<data>` element is located inside.

How to Group Related Links by Type

By default, all links from DITA relationship tables or related link elements within topics are grouped under one "Related information" heading:

```
Related information
  Target Topic
  Target Concept
  Target Task
```

It is possible to group the links by target type (topic type) by setting the `webhelp.rellinks.group.mode=group-by-type` parameter. The output will look like this:

```
Related concepts
  Target Concept

Related tasks
  Target Task

Related information
  Target Topic
```
How to Use a Local Font in WebHelp Responsive Output

It is possible to use a local fonts in WebHelp Responsive output by copying the local font file to the output directory through a Publishing Template and referencing the font files using `@font-face` rules within a custom CSS.

Figure 448. Referencing Local Fonts in a Publishing Template

To use a local font in your WebHelp Responsive output, follow these steps:

1. If you have not already created a Publishing Template, see How to Create a Publishing Template (on page 1546).
2. Add the local font files to the `fonts` folder within your Publishing Template directory structure. For example:
   
   ```
   fonts/roboto-mono/RobotoMono-Italic-VariableFont_wght.ttf
   fonts/roboto-mono/RobotoMono-VariableFont_wght.ttf
   ```

3. Configure WebHelp Responsive to copy the font file to the output directory. Define a `<fileset>` that matches the location of the font files in the `<resources>` section of your Publishing Template's descriptor file.

   ```
   <resources>
   <!-- Copy ttf font files to the output directory. -->
   <fileset>
   ```
4. Create a custom CSS file in your Publishing Template directory.

css/custom-font.css

5. Reference the CSS file in the `<resources>` section of the Publishing Template's descriptor file. This means that the CSS file will be referenced in each HTML page within the WebHelp Responsive output.

```xml
<resources>
  <css file="css/custom-font.css"/>
  <!-- ... -->
</resources>
```

6. Add `@font-face` definitions that reference the font files in your custom CSS file. The font files can be referenced using relative URLs since the CSS and the font files included in the Publishing Template package will be copied together in the output folder.

```css
@font-face {
    font-family: 'Roboto Mono';
    font-style: normal;
    src: url('..//fonts/roboto-mono/RobotoMono-VariableFont_wght.ttf') format('truetype');
}

@font-face {
    font-family: 'Roboto Mono';
    font-style: italic;
    src: url('..//fonts/roboto-mono/RobotoMono-Italic-VariableFont_wght.ttf') format('truetype');
}
```

7. Add a CSS rule that applies the custom font on all elements.

```css
body {
    font-family: 'Roboto Mono', sans-serif;
}
```

8. Run the transformation with the publishing template selected.
How to Use JQuery in WebHelp Responsive Output

The JQuery library that comes bundled with WebHelp is accessible in the browser's global context so that developers have access to use it.

To use the JQuery library in your WebHelp Responsive output, follow these steps:

1. If you have not already created a Publishing Template, see How to Create a Publishing Template.
2. Create the following items in the folder that contains your publishing template's descriptor file (the .opt file):
   - A folder named js
   - A folder named fragments
3. In the js folder, create a file named custom.js.
4. As a starting point, you can copy the following content to the custom.js file:

   ```javascript
   $(document).ready(function () {
     // Your JQuery code.
   });
   ```

5. In the fragments folder, create a file named jquery-scripts.html with the following content:
Important:
Make sure that the @defer attribute is present on the <script> element.

6. Copy the js folder to the output folder during the transformation process. For this, open the .opt file and add the following content in the <resources> section (see Template Resources for more details):

```xml
<fileset>
   ...
   <include name="js/**"/>
   ...
</fileset>
```

7. Include the jquery-scripts.html file in your WebHelp Responsive output by opening the .opt file and add the following content inside the <webhelp> element:

```xml
<html-fragments>
   <fragment file="jquery-scripts.html" placeholder="webhelp.fragment.head"/>
</html-fragments>
```

8. Run the transformation with your publishing template selected.

**WebHelp Responsive Transformation Parameters**

In addition to the common DITA-OT transformation parameters and the HTML-based Output Parameters, there are numerous other supported parameters that are specific to the WebHelp Responsive output.

**Publishing Template Parameters**

- **webhelp.publishing.template**
  
  Specifies the path to the ZIP archive (or root folder) that contains your custom WebHelp Responsive template.

  **Note:**
  The built-in templates are stored in the DITA-OT-DIR/plugins/com.oxygenxml.webhelp.responsive/templates folder.

  **Note:**
  Relative paths are resolved based on the current working directory.

- **webhelp.publishing.template.descriptor**
Specifies the name of the descriptor to be loaded from the WebHelp Responsive template package. If it is not specified, the first encountered descriptor will be automatically loaded.

**Custom Resource Parameters**

- **webhelp.custom.resources**
  
  The file path to a directory that contains resources files. All files from this directory will be copied to the root of the WebHelp output.

- **webhelp.favicon**
  
  The file path that points to an image to be used as a favicon in the WebHelp output.

- **webhelp.logo.image.target.url**
  
  Specifies a target URL that is set on the logo image. When you click the logo image, you will be redirected to this address.

- **webhelp.logo.image**
  
  Specifies a path to an image displayed as a logo in the left side of the output header.

- **webhelp.logo.image.alt**
  
  Specifies a value that will be set in the @alt attribute of the logo image. If the parameter is not specified, the @alt attribute will contain the publication title. Note that this parameter makes sense only in conjunction with the webhelp.logo.image parameter.

**Oxygen Feedback Parameter**

- **webhelp.fragment.feedback**
  
  You can integrate Oxygen Feedback with your WebHelp Responsive output to provide a comments area at the bottom of each page where readers can offer feedback. When you create an Oxygen Feedback site configuration, an HTML fragment is generated during the final step of the creation process and that fragment should be set as the value for this parameter.

**Context Sensitive Help Parameter**

- **webhelp.csh.disable.topicID.fallback**
  
  Specifies whether or not topic ID fallbacks are enabled when computing the mapping of context sensitive help and resourceId information is not available. Possible values are false (default) and true.

**HTML Fragment Extension Parameters**

- **webhelp.enable.html.fragments.cleanup**
  
  Enables or disables the automatic conversion of HTML fragments to well-formed XML. If set to true (default), the transformation automatically converts non-well-formed HTML content to a well-formed XML equivalent. If set to false, the transformation will fail if at least one HTML fragment is not well-formed.
**webhelp.enable.scroll.to.search.term**

Specifies whether or not the page should scroll to the first search term when opening the search results page. Possible values are **no** (default) and **true**.

**webhelp.fragment.after.body**

This parameter can be used to display a given XHTML fragment after the body in all types of pages. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

**webhelp.fragment.after.body.main.page**

This parameter can be used to display a given XHTML fragment after the body in the main page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

**webhelp.fragment.after.body.search.page**

This parameter can be used to display a given XHTML fragment after the body in the search results page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

**webhelp.fragment.after.body.terms.page**

This parameter can be used to display a given XHTML fragment after the body in the index terms page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

**webhelp.fragment.after.body.topic.page**

This parameter can be used to display a given XHTML fragment after the body in the topic page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

**webhelp.fragment.after.feedback**

This parameter can be used to display a given XHTML fragment after the Oxygen Feedback commenting component in the topic page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

**webhelp.fragment.after.header**

This parameter can be used to display a given XHTML fragment after the header section in all types of pages. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

**webhelp.fragment.after.header.main.page**

This parameter can be used to display a given XHTML fragment after the header section in the main page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

**webhelp.fragment.after.header.search.page**
This parameter can be used to display a given XHTML fragment after the header section in the search results page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.after.header.terms.page**

This parameter can be used to display a given XHTML fragment after the header section in the index terms page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.after.header.topic.page**

This parameter can be used to display a given XHTML fragment after the header section in the topic page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.after.logo_and_title**

This parameter can be used to display a given XHTML fragment after the logo and title in all types of pages. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.after.main.content.area**

This parameter can be used to display a given XHTML fragment after the main content section in all types of pages. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.after.main.content.area.main.page**

This parameter can be used to display a given XHTML fragment after the main content section in the main page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.after.main.content.area.topic.page**

This parameter can be used to display a given XHTML fragment after the main content section in the topic page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.after.main.page.search (deprecated)**

This parameter is deprecated. Use [webhelp.fragment.after.search.input.main.page](#) instead.

**webhelp.fragment.after.publication.toc**

This parameter can be used to display a given XHTML fragment before the publication's table of contents component in the topic page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.after.search.input**

This parameter can be used to display a given XHTML fragment after the search field in all types of pages. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.
webhelp.fragment.after.search.input.main.page

This parameter can be used to display a given XHTML fragment after the search field in all the main page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.after.search.input.search.page

This parameter can be used to display a given XHTML fragment after the search field in all the search results page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.after.search.input.terms.page

This parameter can be used to display a given XHTML fragment after the search field in all the index terms page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.after.search.input.topic.page

This parameter can be used to display a given XHTML fragment after the search field in all the topic page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.after.toc_or_tiles

This parameter can be used to display a given XHTML fragment after the table of contents or tiles in the main page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.after.top_menu

This parameter can be used to display a given XHTML fragment after the top menu in all types of pages. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.after.topic.breadcrumb

This parameter can be used to display a given XHTML fragment after the breadcrumb component in the topic page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.after.topic.content

This parameter can be used to display a given XHTML fragment after the topic's content in the topic page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.after.topic.toc

This parameter can be used to display a given XHTML fragment after the topic's table of contents component in the topic page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.after.topic.toolbar
This parameter can be used to display a given XHTML fragment after the toolbar buttons above the topic content in the topic page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.before.body

This parameter can be used to display a given XHTML fragment before the page body in all types of pages. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.before.body.main.page

This parameter can be used to display a given XHTML fragment before the page body in the main page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.before.body.search.page

This parameter can be used to display a given XHTML fragment before the page body in the search results page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.before.body.terms.page

This parameter can be used to display a given XHTML fragment before the page body in the index terms page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.before.body.topic.page

This parameter can be used to display a given XHTML fragment before the page body in the topic page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.before.feedback

This parameter can be used to display a given XHTML fragment before the Oxygen Feedback commenting component in the topic page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.before.logo_and_title

This parameter can be used to display a given XHTML fragment before the logo and title. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.before.main.content.area

This parameter can be used to display a given XHTML fragment before the main content section in all types of pages. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.before.main.content.area.main.page

This parameter can be used to display a given XHTML fragment before the toolbar buttons above the topic content in the topic page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.
This parameter can be used to display a given XHTML fragment before the main content section in the main page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.before.main.content.area.search.page**

This parameter can be used to display a given XHTML fragment before the main content section in the search results page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.before.main.content.area.terms.page**

This parameter can be used to display a given XHTML fragment before the main content section in the index terms page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.before.main.content.area.topic.page**

This parameter can be used to display a given XHTML fragment before the main content section in the topic page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.before.main.page.search (deprecated)**

This parameter is deprecated. Use `webhelp.fragment.before.search.input.main.page` instead.

**webhelp.fragment.before.publication.toc**

This parameter can be used to display a given XHTML fragment before the publication's table of contents component in the topic page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.before.search.input**

This parameter can be used to display a given XHTML fragment before the search field in all types of pages. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.before.search.input.main.page**

This parameter can be used to display a given XHTML fragment before the search field in the main page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.before.search.input.search.page**

This parameter can be used to display a given XHTML fragment before the search field in the search results page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.before.search.input.terms.page**

This parameter can be used to display a given XHTML fragment before the search field in the index terms page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.
webhelp.fragment.before.search.input.topic.page

This parameter can be used to display a given XHTML fragment before the search field in the topic page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.before.toc_or_tiles

This parameter can be used to display a given XHTML fragment before the table of contents or tiles in the main page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.before.top_menu

This parameter can be used to display a given XHTML fragment before the top menu in all types of pages. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.before.topic.breadcrumb

This parameter can be used to display a given XHTML fragment before the breadcrumb component in the topic page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.before.topic.content

This parameter can be used to display a given XHTML fragment before the topic's content in the topic page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.before.topic.toc

This parameter can be used to display a given XHTML fragment before the topic's table of contents component in the topic page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.before.topic.toolbar

This parameter can be used to display a given XHTML fragment before the toolbar buttons above the topic content in the topic page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.custom.search.engine.results

This parameter can be used to replace the search results area with custom XHTML content. The value of the parameter is the path to an XHTML file that contains your custom content.

webhelp.fragment.custom.search.engine.script

This parameter can be used to replace WebHelp's built-in search engine with your own custom search engine. The value of the parameter is the path to an XHTML file that contains the scripts required for your custom search engine to run.

webhelp.fragment.footer
This parameter can be used to display a given XHTML fragment as the page footer in all types of pages. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

**Important:**

This parameter should only be used if you are using a valid, purchased license of Oxygen XML Editor Eclipse plugin (do not use it with a trial license).

**webhelp.fragment.head**

This parameter can be used to display a given XHTML fragment in the header section in all types of pages. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

**webhelp.fragment.head.main.page**

This parameter can be used to display a given XHTML fragment in the header section in the main page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

**webhelp.fragment.head.search.page**

This parameter can be used to display a given XHTML fragment in the header section in the search results page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

**webhelp.fragment.head.terms.page**

This parameter can be used to display a given XHTML fragment in the header section in the index terms page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

**webhelp.fragment.head.topic.page**

This parameter can be used to display a given XHTML fragment in the header section in the topic page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

**webhelp.fragment.welcome**

This parameter can be used to display a given XHTML fragment as a welcome message (or title). The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

**Output Component Parameters**

**webhelp.default.collection.type.sequence**

Specifies if the **sequence** value will be used by default when the `@collection-type` attribute is not specified. This option is helpful if you want to have *Next* and *Previous* navigational buttons generated for all HTML pages. Allowed values are **no** (default) and **yes**.
webhelp.enable.sticky.header

Controls whether or not the header section will remain sticky in the output. Possible values are yes (default) or no.

webhelp.enable.sticky.publication.toc

Controls whether or not the publication table of contents will remain sticky in the output. Possible values are yes (default) or no.

webhelp.enable.sticky.topic.toc

Controls whether or not the topic table of contents will remain sticky in the output. Possible values are yes (default) or no.

webhelp.figure.title.placement

Controls the placement of the title for figures (relative to the image). Possible values include top (default) and bottom.

webhelp.labels.generation.mode

Controls whether or not labels are generated in the output. These labels are useful because users can easily search for topics with the same label by simply clicking on the label presented in the output. Possible values are:

- **keywords-label** - Generates labels for each defined `<keyword>` element that has the `@outputclass` attribute value set to `label`.
- **keywords** - Generates labels for each defined `<keyword>` element. If the topic contains `<keyword>` elements with the `@outputclass` attribute value set to `label`, then only these elements will have labels generated for them in the output.
- **disable** - Disables the generation of labels in the Webhelp Responsive output.

webhelp.merge.nested.topics.related.links

Specifies if the related links from nested topics will be merged with the links in the parent topic. Thus the links will be moved from the topic content to the related links component and all of the links from the same group (for example, Related Tasks, Related References, Related Information) are merged into a single group. The default value is yes.

webhelp.publication.toc.hide.chunked.topics

Specifies if the table of contents will contain links for chunked topics. The default value is yes.

webhelp.publication.toc.links

Specifies which links will be included in the table of contents. The possible values are:

- **chapter** (default) - The TOC will include links for the current topic, its children, its siblings, and its direct ancestor (including the direct ancestor's siblings), and the parent chapter.
- **topic** - The TOC will only include links for the current topic and its direct children.
- **all** - The TOC will include all links.
webhelp.publication.toc.tooltip.position

By default, if a topic contains a `<shortdesc>` element, its content is displayed in a tooltip when the user hovers over its link in the table of contents. This parameter controls whether or not this tooltip is displayed and its position relative to the link. The possible values are:

- left
- right (default)
- top
- bottom
- hidden - The tooltip will not be displayed.

webhelp.rellinks.group.mode

Specifies the related links grouping mode. All links can be grouped into a single “Related Information” heading or links can be grouped by their target type (topic, task, or concept). Allowed values: `single-group` (default) or `group-by-type`.

webhelp.show.breadcrumb

Specifies if the breadcrumb component will be presented in the output. The default value is `yes`.

webhelp.show.changes.and.comments

When set to `yes`, user comments, replies to comments, and tracked changes are published in the WebHelp output. The default value is `no`.

webhelp.show.child.links

Specifies if child links will be generated in the output for all topics that have subtopics. The default value is `no`.

webhelp.show.full.size.image

Specifies if responsive images that are displayed with a smaller dimension than their original size can be clicked to see an enlarged version of the image. The default value is `yes`.

webhelp.show.indexterms.link

Specifies if an icon that links to the index terms page will be displayed in the output. The default value is `yes` (meaning the index terms icon is displayed). If set to `false`, the index terms icon is not displayed in the output and the index terms page is not generated.

webhelp.show.main.page.tiles

Specifies if the tiles component will be presented in the main page of the output. For a tree style layout, this parameter should be set to `no`.

webhelp.show.main.page.toc

Specifies if the table of contents will be presented in the main page of the output. The default value is `yes`.

webhelp.show.navigation.links

Specifies if navigation links will be presented in the output. The default value is `yes`. 
webhelp.show.print.link

Specifies if a print link or icon will be presented within each topic in the output. The default value is yes.

webhelp.show.publication.toc

Specifies if a table of contents will be presented on the left side of each topic in the output. The default value is yes.

webhelp.show.topic.toc

Specifies if a topic table of contents will be presented on the right side of each topic in the output. This table of contents contains links to each `section` within the current topic that contains an `@id` attribute and the section corresponding to the current scroll position is highlighted. The default value is yes.

webhelp.show.top.menu

Specifies if a menu will be presented at the topic of the main page in the output. The default value is yes.

webhelp.skip.main.page.generation

If set to true, the default main page is not generated in the output. The default value is false.

webhelp.table.title.placement

Controls the placement of the title for tables. Possible values include top (default) and bottom.

webhelp.top.menu.activated.on.click

When this parameter is activated (set to yes), clicking an item in the top menu will expand the submenu (if available). You can then click on a submenu item to open the item (topic). You can click outside the menu or press ESC to hide the menu. When set to no (default), hovering over a menu item displays the menu content.

webhelp.top.menu.depth

Specifies the maximum depth level of the topics that will be included in the top menu. The default value is 3. A value of 0 means that the menu has unlimited depth.

webhelp.topic.collapsible.elements.initial.state

Specifies the initial state of collapsible elements (tables with titles, nested topics with titles, sections with titles, index term groups). The possible values are collapsed or expanded (default value).

**Search-Related Parameters**

webhelp.enable.search.autocomplete

Specifies if the Autocomplete feature is enabled in the WebHelp search text field. The default value is yes.

webhelp.google.search.results
A file path that specifies the location of a well-formed XHTML file containing the Google Custom Search Engine element `gcse:searchresults-only`. You can use all supported attributes for this element. It is recommended to set the `@linkTarget` attribute to `frm` for frameless (`iframe`) version of WebHelp or to `contentWin` for the frameset version of WebHelp. The default value for this attribute is `_blank` and the search results will be loaded in a new window. If this parameter is not specified, the following code will be used: `<gcse:searchresults-only linkTarget="frm"></gcse:searchresults-only>`.

**webhelp.google.search.script**

A file path that specifies the location of a well-formed XHTML file containing the Custom Search Engine script from Google.

**webhelp.search.default.operator**

Makes it possible to change the default operator for the search engine. Possible values are `and`, `or` (default). If set to `and` while the search query is `WORD1 WORD2`, the search engine only returns results for topics that contain both `WORD1` and `WORD2`. If set to `or` and the search query is `WORD1 WORD2`, the search engine returns results for topics that contain either `WORD1` or `WORD2`.

**webhelp.search.enable.pagination**

Specifies whether or not search results will be displayed on multiple pages. Allowed values are `yes` or `no`.

**webhelp.search.index.elements.to.exclude**

 Specifies a list of HTML elements that will not be indexed by the search engine. The value of the `@class` attribute can be used to exclude specific HTML elements from indexing. For example, the `div.not-indexed` value will not index all `<div>` elements that have a `@class` attribute with the value of `not-indexed`. Use a comma separator to specify more than one element.

**webhelp.search.japanese.dictionary**

The file path of the dictionary that will be used by the *Kuromoji* morphological engine for indexing Japanese content in the WebHelp pages. The encoding for the dictionary must be UTF8.

**webhelp.search.page.numberOfItems**

Specifies the number of search results items displayed on each page. This parameter is only used when the `webhelp.search.enable.pagination` parameter is enabled.

**webhelp.search.ranking**

If this parameter is set to `false` then the 5-star rating mechanism is no longer included in the search results that are displayed on the Search tab (default setting is `true`).

**webhelp.search.stop.words.exclude**

Specifies a list of words that will be excluded from the default list of stop words that are filtered out before the search processing. Use comma separators to specify more than one word (for example: `if,for,is`).
webhelp.search.stop.words.include

Specifies a list of words that will be ignored by the search engine. Use a comma separator to specify more than one word.

webhelp.sitemap.base.url

Base URL for all the `<loc>` elements in the generated `sitemap.xml` file. If this parameter is specified, the `<loc>` element will contain the value of this parameter plus the relative path to the page. If this parameter is not specified, the `<loc>` element will only contain the relative path of the page (the relative file path from the `@href` attribute of a `<topicref>` element from the DITA map, appended to this base URL value).

webhelp.sitemap.change.frequency

The value of the `<changefreq>` element in the generated `sitemap.xml` file. The `<changefreq>` element is optional in `sitemap.xml`. If you leave this parameter set to its default empty value, then the `<changefreq>` element is not added in `sitemap.xml`. Allowed values: <empty string> (default), always, hourly, daily, weekly, monthly, yearly, never.

webhelp.sitemap.priority

The value of the `<priority>` element in the generated `sitemap.xml` file. It can be set to any fractional number between 0.0 (least important priority) and 1.0 (most important priority). For example, 0.3, 0.5, or 0.8. The `<priority>` element is optional in `sitemap.xml`. If you leave this parameter set to its default empty value, then the `<priority>` element is not added in `sitemap.xml`.

Publishing Speedup Parameters

parallel

A common parameter with other transformation types. When set to true (default value is false), the publishing pre-processing stages are run in parallel slightly improving the publishing time.

store-type

A common parameter with other transformation types. When set to memory, the processing stages use internal memory to store temporarily processed documents, thus decreasing the publishing time but slightly increasing the amount of internal memory used for the process. When publishing on Windows, setting this parameter can decrease the publishing times by about one-third.

Note:

The fix.external.refs.com.oxygenxml parameter is not supported when running the transformation from a command line. This parameter is normally used to specify whether or not the application tries to fix such references in a temporary files folder before the DITA Open Toolkit is invoked on the fixed references.
Parameters for Adding a Link to PDF Documentation in WebHelp Responsive Output

The following transformation parameters can be used to generate a PDF link component in the WebHelp Responsive output (for example, it could link to the PDF equivalent of the documentation):

- **webhelp.pdf.link.url**
  Specifies the target URL for the PDF link component.

- **webhelp.pdf.link.text**
  Specifies the text for the PDF link component.

- **webhelp.pdf.link.icon.path**
  Specifies the path or URL of the image icon to be used for the PDF link component. If not specified, a default icon is used.

- **webhelp.pdf.link.anchor.enabled**
  Specifies whether or not the current topic ID should be appended as the name destination at the end of the PDF link. Allowed values are: yes (default) and no.

- **webhelp.show.pdf.link**
  Specifies whether or not the PDF link component is shown in the WebHelp Responsive output. Allowed values are: yes (default) and no.

WebHelp Responsive XSLT-Import and XSLT-Parameter Extension Points

XSLT extension points can be used from either from an Oxygen Publishing Template or from a DITA-OT extension plug-in.

### Extension Points from an Oxygen Publishing Template

The publishing template allows you to specify an XSLT extension point. The extension point will only affect the transformations that use the particular template.

**Important:**

While the publishing templates only support referencing one extension point at a time, you can use `xslt:include` or `xslt:import` to aggregate multiple modules.

For a specific example of how to use an extension in a publishing template, see: How to Use XSLT Extension Points from a Publishing Template *(on page 1442).*

**Example:**
Extension Points from a DITA-OT Extension Plug-in

The DITA-OT plug-in installer adds an XSLT import statement in the default WebHelp XSLT so that the XSLT stylesheet referenced by the extension point becomes part of the normal build. You can use these extension points to override XSLT processing steps.

Example:

```xml
<plugin id="com.oxygenxml.webhelp.responsive.extension">
  <feature extension="com.oxygenxml.webhelp.xsl.dita2webhelp"
      file="xsl/fixup.xsl"/>
</plugin>
```

XSLT-Import Extension Points

The following extension points are supported:

- **com.oxygenxml.webhelp.xsl.dita2webhelp**
  Extension point to override the XSLT stylesheet (`dita2webhelp.xsl`) that produces an HTML file for each DITA topic. The location of this file is `DITA-OT-DIR\plugins\com.oxygenxml.webhelp.responsive\xsl\dita2webhelp\dita2webhelp.xsl`

- **com.oxygenxml.webhelp.xsl.createMainPage**
  Extension point to override the XSLT stylesheet (`createMainPage.xsl`) that produces the WebHelp Responsive main HTML page (`index.html`). The location of this file is `DITA-OT-DIR\plugins\com.oxygenxml.webhelp.responsive\xsl\mainFiles\createMainPage.xsl`

- **com.oxygenxml.webhelp.xsl.createNavLinks**
  Extension point to override the XSLT stylesheets that are used to generate navigation links in the WebHelp Responsive pages. These stylesheets can be found in the `navLinks` folder: `DITA-OT-DIR\plugins\com.oxygenxml.webhelp.responsive\xsl\navLinks`

- **com.oxygenxml.webhelp.xsl.createSearchPage**
  Extension point to override the XSLT stylesheet (`createSearchPage.xsl`) that produces the WebHelp Responsive search HTML page (`search.html`). The location of this file is
**com.oxygenxml.webhelp.xsl.createIndexTermsPage**

Extension point to override the XSLT stylesheet (createIndexTermsPage.xsl) that produces the WebHelp Responsive index terms HTML page (indexterms.html). The location of this file is: `DITA-OT-DIR\plugins\com.oxygenxml.webhelp.responsive\xsl\mainFiles\createIndexTermsPage.xsl`.

**com.oxygenxml.webhelp.xsl.createTocXML**

Extension point to override the XSLT stylesheet (tocDita.xsl) that produces the toc.xml file. This file contains information extracted from the DITA map (on page 2654) and it is mainly used to construct the WebHelp Table of Contents and navigational links. The path to this stylesheet is: `DITA-OT-DIR\plugins\com.oxygenxml.webhelp.responsive\xsl\navLinks\tocDita.xsl`.

**com.oxygenxml.webhelp.xsl.contextHelpMap**

Extension point to override the XSLT stylesheet (contextHelpMapDita.xsl) that generates the context sensitive help mapping. The path to this stylesheet is: `DITA-OT-DIR\plugins\com.oxygenxml.webhelp.responsive\xsl\contextHelp\contextHelpMapDita.xsl`.

### XSLT-Parameter Extension Points

If your customization stylesheet declares one or more XSLT parameters and you want to control their values from the transformation scenario, you can use one of the following XSLT parameter extension points:

- **com.oxygenxml.webhelp.xsl.dita2webhelp.param**
  
  Use this extension point to pass parameters to the stylesheet specified using the `com.oxygenxml.webhelp.xsl.dita2webhelp` extension point (on page 1485).

- **com.oxygenxml.webhelp.xsl.createMainPage.param**
  
  Use this extension point to pass parameters to the stylesheet specified using the `com.oxygenxml.webhelp.xsl.createMainPage` extension point (on page 1485).

- **com.oxygenxml.webhelp.xsl.createNavLinks.param**
  
  Use this extension point to pass parameters to the stylesheet specified using the `com.oxygenxml.webhelp.xsl.createNavLinks` extension point (on page 1485).

- **com.oxygenxml.webhelp.xsl.createSearchPage.param**
  
  Use this extension point to pass parameters to the stylesheet specified using the `com.oxygenxml.webhelp.xsl.createSearchPage` extension point (on page 1485).

- **com.oxygenxml.webhelp.xsl.createIndexTermsPage.param**
  
  Use this extension point to pass parameters to the stylesheet specified using the `com.oxygenxml.webhelp.xsl.createIndexTermsPage` extension point (on page 1486).
com.oxygenxml.webhelp.xsl.createTocXML.param

Use this extension point to pass parameters to the stylesheet specified using the com.oxygenxml.webhelp.xsl.createTocXML extension point (on page 1486).

com.oxygenxml.webhelp.xsl.contextHelpMap.param

Use this extension point to pass parameters to the stylesheet specified using the com.oxygenxml.webhelp.xsl.contextHelpMap extension point (on page 1486).

WebHelp Classic Output for DocBook (Deprecated)

The WebHelp Classic variant is designed for desktop systems when feedback from users is not necessary and it is available for DocBook. You can also integrate a feedback system that provides the ability for your users to add comments in the output. This section contains information about configuring a WebHelp Classic system and customizing the output.

This type of WebHelp system can be generated by using the DocBook WebHelp Classic (Deprecated) (on page 1196) transformation scenario.

WebHelp Classic Output Layout and Features

Layout of the WebHelp Classic System Interface

The layout of the WebHelp Classic system consists of the following components:

- **Left Pane or Frame**
  
  This section on the left side of the help system includes the following tabs:

  - **Content**
    
    A typical table of contents style presentation of your content. You can use the Expand all/Collapse all buttons to expand or collapse all the topics presented in the Table of Contents.

    **Note:**
    
    You can enhance the appearance of items in the Table of Contents. See the Customizing WebHelp Classic Output chapter (on page 1495) for more details.

  - **Index**
    
    Presents the index terms for your content. If your content does not contain any <indexterm> elements, this tab is not generated.
Search Results

This tab is generated when the Search field is used. It presents the search results in the form of links to topics where the search terms are found, along with a rating scheme for each result. For more details, see the Search Feature section (on page 1489).

Upper Pane or Frame

The upper section of the help system includes the following features:

Search Field

Use this feature to perform searches in your content. When you enter search terms in this field, the results are displayed in the Search Results tab in the left section of the help system, along with a rating scheme for each result. For more details, see the Search Feature section (on page 1489).

Frames Option

Click on this option to display the output rendered in HTML frames.

Print Option

Opens a dialog box with various printing options and a print preview.

Navigation Links

You can navigate through the content of your output using the navigation links or arrows in the upper-right part of the page. These arrows allow you to move to the Parent topic, Previous topic, or Next topic. Links to the parent topics of the currently open topic are also presented at the top of the page.

Tip:

To hide the Parent, Next, and Previous links, you can edit the transformation scenario and set the value of the args.hide.parent.link parameter to yes.

Main Pane or Frame

The content of the help pages are rendered and displayed in this main section.
WebHelp Classic Search Engine

Search Rules

Rules that are applied during a search include:

- You can use quotes to perform an exact search for multiple word phrases (for example, "grow flowers" will only return results if both words are found consecutively and exactly as they are typed in the search field). This type of search is known as a phrase search.
- **Boolean Search** is supported using the following operators: and, or, not. When there are two adjacent search terms without an operator, or is used as the default search operator (for example, grow flowers is the same as grow or flowers).
- The space character separates keywords (an expression such as grow flowers counts as two separate keywords.
- Words composed by merging two or more words with colon (:), minus (-), underline (_), or dot (\.) characters count as a single word.
- Your search terms should contain two or more characters (note that stop words will be ignored). This rule does not apply to CJK (Chinese, Japanese, Korean) languages.
When searching for multiple words in CJK (Chinese, Japanese, Korean) languages that often have them appear in strings without a space separator, you need to add a space to separate the words. Otherwise, WebHelp will not find results. For example, Chinese uses a specialized character for space separators, but the current WebHelp implementation cannot detect such specialized characters, so to search for 开始之前 (it translates as "before you begin" or "before start"), you have to enter 开始 之前 (notice the space between the second and third symbols) in the search field.

Note:
Phrase searches (two or more consecutive words in an exact order) do not work for CJK (Chinese, Japanese, Korean) languages.

5-Star Rating Mechanism and Sorting

The Search feature is also enhanced with a rating mechanism that computes scores for every result that matches the search criteria. These scores are then translated into a 5-star rating scheme and the stars are displayed to the right of each result. The search results are sorted depending on the following:

• Search entries that satisfy the phrase search criterion are presented first.
• The number of keywords found in a single page (the higher the number, the better).
• The context (for example, a word found in a title, scores better than a word found in unformatted text).

The search ranking order, sorted by relevance is as follows:

◦ The search term is included in a meta keyword.
◦ The search term is in the title of the page.
◦ The search term is in bold text in a paragraph.
◦ The search term is in normal text in a paragraph.

Excluded Terms

To improve performance, the Search feature excludes certain stop words. For example, the English version of the stop words includes: a, an, and, are, as, at, be, but, by, for, if, in, into, is, it, no, not, of, on, or, such, that, the, their, then, there, these, they, this, to, was, will, with.

WebHelp Classic Search Results Tab

When you enter search terms in the Search field at the top of the help system, the results are displayed in the Search Results tab in the left section. When you click on a result in the Search Results tab, that result is displayed in the main pane with the search terms highlighted. If you press Enter with the Search field empty, the highlights are removed.
Missing Terms

If you enter multiple search terms (other than stop words), for any result that the search engine found at least one term but not one or more of the other terms, the Missing terms will be listed below each result.

Tag Element Scoring Values

HTML tag elements are also assigned a scoring value and these values are evaluated for the search results. For information about editing these values, see How to Change Element Scoring in Search Results (on page 1509).

Browser Compatibility

This output format is compatible with the most recent versions of the following common browsers:
Important:
Due to some security restrictions in certain browsers (Google Chrome), WebHelp Classic pages loaded from the local system (through URLs of the file:///... format) may not work properly. It is recommended that you load WebHelp Classic pages in Google Chrome only from a web server (with a URL such as http://your.server.com/webhelp/index.html or http://localhost/web_pages/index.html).

Warning:
Due to some restrictions in web browsers regarding JavaScript code, the frameless version (index.html start page) of the WebHelp Classic system should only be loaded from a web server (with a URL such as http://your.server.com/webhelp/index.html or http://localhost/web_pages/index.html). When loading WebHelp Classic pages from the local file system, the frameset version (index_frames.html start page) of the WebHelp Classic system should be used instead (file:///...).

Syntax Highlights in 'programlisting' Elements
The DocBook <programlisting> element supports settings values in its @language attribute. For some of these predefined values, syntax highlights are automatically generated in the WebHelp output:

- language-json
- language-yaml
- language-xml
- language-bourne
- language-c
- language-cmd
- language-cpp
- language-csharp
- language-css
- language-dtd
- language-ini
- language-java
- language-javascript
- language-lua
- language-perl
- language-powershell
Generating WebHelp Classic Output for DocBook

The publishing process can be initiated from a transformation scenario within Oxygen XML Editor/Author or from a command-line tool outside Oxygen XML Editor/Author.

Running from Oxygen XML Editor/Author

To publish DocBook content to WebHelp Classic output from a transformation scenario inside Oxygen XML Editor/Author, use one of the following procedures, depending on whether or not you want a feedback section in your output.

WebHelp Classic Output

To publish a DocBook document as a WebHelp Classic system, follow these steps:

1. Click the Configure Transformation Scenario(s) action from the toolbar.
2. Select the DocBook WebHelp Classic (Deprecated) scenario from the DocBook 4 or DocBook 5 section.
3. Click Apply associated.

When the transformation is complete, the output is automatically opened in your default browser.

Automating the WebHelp Classic Output for DocBook

DocBook-based WebHelp output can be generated from an automated publishing process using a command-line tool outside of Oxygen XML Editor/Author. However, to do this, you must purchase an additional Oxygen XML WebHelp license.

Deploying the Oxygen Feedback Comments Component for DocBook

You can add a comments component in your WebHelp Classic output to provide a simple and efficient way for your community to interact and offer feedback. The comments component is contributed by Oxygen Feedback, a modern comment management system that can be integrated with your WebHelp Classic output to provide a comments area at the bottom of each WebHelp page where readers can add new comments or reply to existing ones.
Oxygen Feedback includes a modern, user-friendly administration interface where you can moderate comments, manage users, view statistics, and configure settings. It is very easy to integrate and there are no requirements for installing additional software.

An add-on is also available that contributes a Feedback Comments Manager view in Oxygen XML Editor/Author where the documentation team can see all the comments added in your WebHelp output. This means they can react to user feedback by making corrections and updating the source content without leaving the application.

Adding the Feedback System to WebHelp Classic Documentation

Prerequisite

To install and manage Oxygen Feedback, you must obtain a license for the product. This requires that you choose a subscription plan during the installation procedure. To see the subscription plans prior to installing the product, go to: https://www.oxygenxml.com/oxygen_feedback/buy_feedback.html.

Installation Procedure

1. Log in to your Feedback account from the administration login page (https://feedback.oxygenxml.com/login). You can click Log in with Google or Log in with Facebook to create an account using your Google or Facebook credentials, or click the Sign Up tab to create an account using your name and email address.
2. Click the Add site button to create a site configuration. If you have not already selected a subscription plan, you will be directed to a page where you can choose from several options.
3. In the Settings page, enter a Name and Description for the site configuration. There are some optional settings that can be adjusted according to your needs. For more details, see the Site Settings topic. Click Continue.
4. In the Initial version page, enter the Base URL for your website (you can add additional URLs by clicking the Add button). You can also specify an Initial version if you want it to be something other than 1.0. If you do not plan to have multiple versions, leave the version as 1.0. For more details, see the Initial Version topic. Click Continue.
5. In the Installation page, choose a site generation option:
   a. If you will generate the documentation using a transformation scenario in Oxygen XML Editor/Author, select the Oxygen XML Editor option and continue with these steps:
      i. Copy the generated HTML fragment and click Finish.
      ii. Create an XML file (for example, feedback-install.xml) with the generated installation fragment.
      iii. In Oxygen XML Editor/Author, open the Configure Transformation Scenario(s) dialog box.
      iv. Select and duplicate the DocBook WebHelp Classic (Deprecated) scenario (on page 1196).
      v. Go to the Parameters tab.
      vi. Set the webhelp.footer.file parameter to reference the path of the fragment file created earlier.
b. If you will generate the documentation using a command-line script, select the Oxygen XML WebHelp option and continue with these steps:
   i. Copy the generated HTML fragment and click Finish.
   ii. Create an XML file (for example, feedback-install.xml) with the generated installation fragment.
   iii. Use the webhelp.footer.file parameter in your command-line script to specify the path to the file you created. For example:

```
docbook.bat -Dwebhelp.footer.file=c:\path\to\feedback-install.xml
```

6. [Optional] If you want the Oxygen Feedback comments component to fill the entire page width, contribute a custom CSS file (use the html.stylesheet parameter to reference it) that contains the following style rule:

```css
div.footer {
  float: none;
}
```

For more details about Oxygen Feedback, how to configure settings, moderate comments, view statistics, and much more, see the Oxygen Feedback user guide.

**Customizing WebHelp Classic Output**

Oxygen XML WebHelp provides support for customizing the WebHelp Classic output to suit your specific needs. The WebHelp Classic type of output is designed for desktop systems and features a familiar tri-pane layout. You can use this system to publish DocBook documents. You can also integrate a feedback system to allow your users to add comments to your output.

To change the overall appearance of the WebHelp Classic output, you can use the visual WebHelp Skin Builder tool (on page 1495), which does not require knowledge of CSS language. If you are familiar with CSS and coding, you can style your WebHelp output through your own custom stylesheets. You can also customize your output by modifying option and parameters in the transformation scenario.

This section includes topics that explain various ways to customize your WebHelp system output, such as how to improve the appearance of the Table of Contents, add logo images in the title area, integrate with social media, add custom headers and footers, and much more.

**Changing the Layout and Styles**

This section contains some topics that explain how to customize the layout and style of your WebHelp Classic output using custom CSS, inserting custom HTML content, and more.

**WebHelp Skin Builder**

The WebHelp Skin Builder is a simple, easy-to-use tool, specially designed to assist users to visually customize the look and feel of the WebHelp output. It is implemented as an online tool hosted on the Oxygen XML website and allows you to experiment with various styles and colors over a documentation sample.
To be able to use the Skin Builder, you need:

- An Internet connection and unrestricted access to Oxygen XML website.
- A late version web browser.

To start the Skin Builder, use a web browser to go to https://www.oxygenxml.com/webhelp-skin-builder.

Skin Builder Layout

The left side panel of the Skin Builder is divided into 3 sections:

- **Actions** - Contains the following two buttons:
  - **Import** - Opens an Import CSS dialog box that allows you to load a CSS stylesheet and apply it over the documentation sample.
  - **Export** - Saves all properties as a CSS file.
- **Settings** - Includes a Highlight selection option that helps you identify the areas affected by a particular element customization.
  - When hovering an item in the customizable elements menu, the affected sample area is highlighted with a dotted blue border.
  - When an item in the customizable elements menu is selected, the affected sample area is highlighted with a solid red border.
- **Customize** - Provides a series of customizable elements organized under four main categories:
  - Header
  - TOC Area
  - Vertical Splitter
  - Content

For each customizable element, you can alter properties such as background color or font face. Any alteration made in the customizable elements menu is applied in real time over the sample area.

Creating a Customization Skin

1. You can start with one of the built-in skins or a CSS stylesheet applied over the sample using the Import button.
2. Use the elements in the Customize section to set properties that modify the look of the skin. By default, all customizable elements display a single property, but you can make more visible by clicking the Add button and choosing from the available properties.

   **Note:**
   If you want to revert a particular property to its initial value, click the Reset button.

3. When you are happy with the skin customizations you have made, click the Export button. All settings will be saved in a CSS file.
Apply a Customization Skin to a DocBook to WebHelp Classic Transformation Scenario

1. Start Oxygen XML Editor Eclipse plugin.
2. Load the DocBook file you want to produce as a WebHelp output.
3. In the Parameters tab, set the `webhelp.skin.css` parameter to point to the previously exported CSS.
4. To customize the logo, use the following parameters: `webhelp.logo.image` and `webhelp.logo.image.target.url`.
5. Run the transformation to obtain the WebHelp output.

Resources

For more information about using the WebHelp Skin Builder, watch our video demonstration:

https://www.youtube.com/embed/32PGX--PQx0

How to Use CSS Styling to Customize WebHelp Output

The most common way to customize the look and style of your WebHelp output is to use custom CSS styling. This method can be used to make small, simple styling changes or more advanced, precise changes. To implement the styling in your WebHelp output, you simply need to create the custom CSS file and reference it in your transformation scenario or script. This custom file will be the final CSS to be applied so its content will override the styles in the other pre-existing CSS files.

Using the CSS Inspector to Identify Content for Custom CSS File

You can use your browser's CSS inspector to identify the pertinent code in the current CSS files and you can even make changes directly in the CSS inspector to test the results so that you know exactly what content to use in your custom CSS file.

In most popular browsers (such as Chrome, Firefox, and Edge), you can access the CSS inspector by using F12 or by selecting Inspect Element (or simply Inspect) from the contextual menu.

Tip:

When using Safari on macOS, you must first enable the Develop menu by going to the Advanced settings and selecting Show Develop menu in menu bar. Then you can select Show Web Inspector from the Develop menu or click Command + Option + I.

Referencing the Custom CSS Using Oxygen XML Editor/Author

To use a custom CSS to style WebHelp output and use a transformation scenario from within Oxygen XML Editor/Author, follow this procedure:
1. Create your custom CSS file.
2. Edit the WebHelp transformation scenario and open the Parameters tab. Set the html.stylesheet parameter to the path of your custom CSS file.
3. Run the WebHelp transformation scenario to generate the output.

Referencing the Custom CSS Using a Script Outside of Oxygen XML Editor/Author

**Important:**
Running WebHelp transformations from a script outside of Oxygen XML Editor/Author requires an additional license and some additional setup:

- You must have a valid license for the Oxygen XML WebHelp Plugin (https://www.oxygenxml.com/buy_webhelp.html).
- The Oxygen XML WebHelp Plugin must be installed and integrated.

To use a custom CSS to style WebHelp output and use a script outside of Oxygen XML Editor/Author (on page 1493), follow this procedure:

1. Create your custom CSS file.
2. Reference your custom CSS file. Use the html.stylesheet parameter in your transformation script and set its value to the path of your custom CSS file.
3. Execute the transformation script.

How to Add Custom HTML Content in WebHelp Classic Output

You can add custom HTML content in the WebHelp Classic output by inserting it in a well-formed XML file that will be referenced in the transformation. This content may include references to additional JavaScript, CSS, and other types of resources, or such resources can be inserted inline within the HTML content that is inserted in the XML file.

Using Oxygen XML Editor/Author

To include custom HTML content in the WebHelp Classic output using a transformation scenario from within Oxygen XML Editor/Author, follow this procedure:

1. Insert the HTML content in a well-formed XML file considering the following notes:

   - **Well-Formedness** - If the content of the file is not XML Well-formed (on page 543), (or fragments are not well-formed), the transformation will fail.

     A common use case is if you want to include several <script> or <link> elements. In this case, the XML fragment has multiple root elements and to make it well-formed, you can wrap it in an <html> element. This element tag will be filtered out and only its children will be copied to the
output documents. Similarly, you can wrap your content in `<head>`, `<body>`, `<html/head>`, or `<html/body>` elements.

- **Referencing Resources in the XML File** - You can include references to local resources (such as JavaScript or CSS files) by using the built-in `${oxygen-webhelp-output-dir}` macro to specify their paths relative to the output directory:

```html
<html>
  <script type="text/javascript" src="${oxygen-webhelp-output-dir}/js/test.js"/>
  <link rel="stylesheet" type="text/css" href="${oxygen-webhelp-output-dir}/css/test.css"/>
</html>
```

To copy the referenced resources to the output directory, follow the procedure in: How to Copy Additional Resources to Output Directory (on page 1507).

- **Inline JavaScript or CSS Content**:

  **JavaScript**:

  ```html
  <script type="text/javascript">
    /* Include JavaScript code here. */
    
    function myFunction() {
      return true;
    }
  </script>
  ```

  **CSS**:

  ```html
  <style>
    /* Include CSS style rules here. */
    *
    color:red
  }
</style>
```

**Note:**

If you have special characters (for example, `&`, `<`) that break the well-formedness of the XML fragment, it is important to place the content inside an XML comment. **[Important]** XML comment tags (both the start and end tags) must be on lines by themselves. If they are on the same line as any of the script's content, it will likely result in a JavaScript error.
2. Edit the WebHelp Classic transformation scenario.
3. Go to the **Parameters** tab.
4. Edit the value of the `webhelp.head.script` parameter and set it to reference the URL of the XML file created in step 1. Your additional content will be included at the end of the `head` element of your output document.

   **Note:**
   If you want to include the content in the `body` element, use the `webhelp.body.script` parameter instead.

5. Click **OK** to save the changes and run the transformation scenario.

### Using a Script Outside of Oxygen XML Editor/Author

**Important:**
Running WebHelp transformations from a script outside of Oxygen XML Editor/Author requires an additional license and some additional setup:

- You must have a valid license for the Oxygen XML WebHelp Plugin ([https://www.oxygenxml.com/buy_webhelp.html](https://www.oxygenxml.com/buy_webhelp.html)).
- The Oxygen XML WebHelp Plugin must be installed and integrated.

To include custom HTML content in the WebHelp Classic output using a script outside of Oxygen XML Editor/Author ([on page 1493](#)), follow this procedure:

1. Insert the HTML content in a well-formed XML file considering the following notes:

   - **Well-Formedness** - If the content of the file is not XML Well-formed ([on page 543](#)), (or fragments are not well-formed), the transformation will fail.

     A common use case is if you want to include several `<script>` or `<link>` elements. In this case, the XML fragment has multiple root elements and to make it well-formed, you can wrap it in an
<html> element. This element tag will be filtered out and only its children will be copied to the output documents. Similarly, you can wrap your content in <head>, <body>, <html/>, or <html/body> elements.

- **Referencing Resources in the XML File** - You can include references to local resources (such as JavaScript or CSS files) by using the built-in `${oxygen-webhelp-output-dir}` macro to specify their paths relative to the output directory:

```html
<html>
  <script type="text/javascript" src="${oxygen-webhelp-output-dir}/js/test.js"/>
  <link rel="stylesheet" type="text/css" href="${oxygen-webhelp-output-dir}/css/test.css" />
</html>
```

To copy the referenced resources to the output directory, follow the procedure in: How to Copy Additional Resources to Output Directory (on page 1507).

- **Inline JavaScript or CSS Content**:

  **JavaScript**:

  ```html
  <script type="text/javascript">
    /* Include JavaScript code here. */

    function myFunction() {
      return true;
    }
  </script>
  ```

  **CSS**:

  ```html
  <style>
    /* Include CSS style rules here. */

    *{
      color:red
    }
  </style>
  ```

**Note:**

If you have special characters (for example, &lt;,) that break the well-formedness of the XML fragment, it is important to place the content inside an XML comment.

**[Important]** XML comment tags (both the start and end tags) must be on lines by themselves. If they are on the same line as any of the script's content, it will likely result in a JavaScript error.
2. Use the `webhelp.head.script` parameter in your transformation script and set its value to reference the URL of the XML file created in step 1. Your additional content will be included at the end of the `head` element of your output document.

**Note:**
If you want to include the content in the `body` element, use the `webhelp.body.script` parameter instead.

3. Execute the transformation script.

**Related Information:**
How to Copy Additional Resources to Output Directory *(on page 1507)*

### How to Change Number Styles for Ordered Lists

Ordered lists (`<ol>`) are usually numbered in XHTML output using numerals. If you want to change the numbering to alphabetical, follow these steps:

1. Define a custom `@outputclass` value and set it as an attribute of the ordered list, as in the following example:

   ```xml
   <ol outputclass="number-alpha">
     <li>a</li>
     <li>b</li>
     <li>c</li>
   </ol>
   ```

2. Add the following code snippet in a custom CSS file:

   ```css
   ol.number-alpha{
     list-style-type:lower-alpha;
   }
   ```
How to Change the Icons in a WebHelp Classic Table of Contents

You can change the icons that appear in a WebHelp Classic table of contents by assigning new image files in a custom CSS file. By default, these icons are defined with the following CSS codes (the first example is the icon that appears for a collapsed menu and the second for an expanded menu):

```css
.hasSubMenuClosed{
    background: url('../img/book_closed16.png') no-repeat; 
    padding-left: 16px;
    cursor: pointer;
}

.hasSubMenuOpened{
    background: url('../img/book_opened16.png') no-repeat;
    padding-left: 16px;
    cursor: pointer;
}
```

Using Oxygen XML Editor/Author

To assign other icons and use a transformation scenario from within Oxygen XML Editor/Author, follow this procedure:

1. Create a custom CSS file that assigns your desired icons to the `.hasSubMenuClosed` and `.hasSubMenuOpened` properties.

```css
.hasSubMenuClosed{
    background: url('TOC-my-closed-button.png') no-repeat;
}

.hasSubMenuOpened{
    background: url('TOC-my-opened-button.png') no-repeat;
}
```

2. It is recommended that you store the image files in the same directory as the default icons (`[OXYGEN_INSTALL_DIR]/frameworks/docbook/xsl/com.oxygenxml.webhelp.classic/oxygen-webhelp/resources/img`).

3. Edit the WebHelp transformation scenario and open the Parameters tab. Set the `html.stylesheet` parameter to the path of your custom CSS file.

4. Run the WebHelp transformation scenario to generate the output.
Using a Script Outside of Oxygen XML Editor/Author

**Important:**

Running WebHelp transformations from a script outside of Oxygen XML Editor/Author requires an additional license and some additional setup:

- You must have a valid license for the Oxygen XML WebHelp Plugin (https://www.oxygenxml.com/buy_webhelp.html).
- The Oxygen XML WebHelp Plugin must be installed and integrated.

To assign other icons and use a script outside of Oxygen XML Editor/Author (on page 1493), follow this procedure:

1. Create a custom CSS file that assigns your desired icons to the `.hasSubMenuClosed` and `.hasSubMenuOpened` properties.

   ```css
   .hasSubMenuClosed{
     background: url('TOC-my-closed-button.png') no-repeat;
   }
   ```

   ```css
   .hasSubMenuOpened{
     background: url('TOC-my-opened-button.png') no-repeat;
   }
   ```

2. It is recommended that you store the image files in the same directory as the default icons ([DocBook XSL directory]com.oxygenxml.webhelp.classic\oxygen-webhelp\resources\img).  
3. Reference your custom CSS file. Use the `html.stylesheet` parameter in your transformation script and set its value to the path of your custom CSS file.
4. Execute the transformation script.

**How to Customize the Appearance of Selected Items in the Table of Contents**

The appearance of selected items in the table of contents of WebHelp Classic output can be enhanced.

For example, to highlight the background of the selected item, follow these steps:

1. Locate the `toc.css` file in the following directory: [DocBook XSL directory]com.oxygenxml.webhelp.classic\oxygen-webhelp\resources\css.
2. Edit that CSS file, find the `menuItemSelected` class, and change the value of the `background` property.
3. Run the transformation.
Adding Graphics and Media Resources

This section contains topics that explain how to add media resources to the published WebHelp Class output or to the output directory.

How to Add a Favicon in WebHelp Systems

You can add a custom favicon to your WebHelp output by simply using a parameter in the transformation scenario to point to your favicon image. This is available for DocBook WebHelp output using the WebHelp Classic transformation.

Using Oxygen XML Editor/Author

To add a favicon to your WebHelp output using a transformation scenario from within Oxygen XML Editor/Author, follow this procedure:

1. Edit the WebHelp transformation scenario and open the Parameters tab.
2. Locate the webhelp.favicon parameter and enter the file path that points to the image that will be used as the favicon.
3. Run the transformation scenario.

Result: Browsers that provide favicon support will display the favicon (typically in the browser's address bar, in the list of bookmarks, and in the history).

Using a Script Outside of Oxygen XML Editor/Author

Important:

Running WebHelp transformations from a script outside of Oxygen XML Editor/Author requires an additional license and some additional setup:

- You must have a valid license for the Oxygen XML WebHelp Plugin (https://www.oxygenxml.com/buy_webhelp.html).
- The Oxygen XML WebHelp Plugin must be installed and integrated.

To add a favicon to your WebHelp output using a script outside of Oxygen XML Editor/Author, follow this procedure:
1. Specify the file path that points to the image that will be use as the *favicon* using the `webhelp.favicon` parameter.
2. Execute the transformation script.

**Result:** Browsers that provide *favicon* support will display the *favicon* (typically in the browser's address bar, in the list of bookmarks, and in the history).

### How to Add a Logo Image in the Title Area

You can customize **WebHelp Classic** output to include a logo in the title area. It will be displayed before the publication title. You can also specify a URL that can be used to send users to a specific website when they click the logo image.

This customization can be done using a transformation scenario from within **Oxygen XML Editor/Author** or using a command-line script outside of **Oxygen XML Editor/Author**.

**Using Oxygen XML Editor/Author**

To add a logo in the title area of your WebHelp output using a transformation scenario from within **Oxygen XML Editor/Author**, follow this procedure:

1. Edit a **WebHelp Classic** transformation scenario, then open the **Parameters** tab.
2. Specify the path to your logo in the `webhelp.logo.image` parameter.
3. If you also want to add a link to your website when you click the logo image, set the URL in the `webhelp.logo.image.target.url` parameter.
4. Run the transformation scenario.

**Using a Script Outside of Oxygen XML Editor/Author**

**Important:**

Running WebHelp transformations from a script outside of **Oxygen XML Editor/Author** requires an additional license and some additional setup:

- You must have a valid license for the **Oxygen XML WebHelp Plugin** ([https://www.oxygenxml.com/buy_webhelp.html](https://www.oxygenxml.com/buy_webhelp.html)).
- The **Oxygen XML WebHelp Plugin** must be installed and integrated.

To add a logo in the title area of your WebHelp output using a script outside of **Oxygen XML Editor/Author**, follow this procedure:
1. Specify the path to your logo using the \texttt{webhelp.logo.image} parameter.
2. If you also want to add a link to your website when you click the logo image, set the URL using the \texttt{webhelp.logo.image.target.url} parameter.
3. Execute the transformation script.

\textbf{How to Add Videos in DocBook WebHelp Classic Output}

You can insert references to videos in your DocBook topics and then publish them to \texttt{WebHelp Classic} output. The videos can be played directly in all HTML5-based outputs, including WebHelp systems.

To add videos in the \texttt{WebHelp Classic} output generated from DocBook documents, follow these steps:

1. Edit the DocBook document and reference the video using a \texttt{<mediaobject>} element, as in the following example:

   \begin{verbatim}
   <mediaobject>
     <videoobject>
       <videodata fileref="http://www.youtube.com/watch?v/VideoName"/>
     </videoobject>
   </mediaobject>
   \end{verbatim}

2. Apply a \texttt{WebHelp} transformation scenario to obtain the output.

\textbf{How to Copy Additional Resources to Output Directory}

You can copy additional resources (such as JavaScript, CSS or other resources) to the output directory of a WebHelp system by using the \texttt{webhelp.custom.resources} parameter.

\textbf{Using Oxygen XML Editor/Author}

To copy additional resources to the output directory using a transformation scenario from within \texttt{Oxygen XML Editor/Author}, follow this procedure:

1. Place all your resources in the same directory.
2. Edit the WebHelp transformation scenario, then open the \texttt{Parameters} tab.
3. Edit the value for the \texttt{webhelp.custom.resources} parameter and set it to the absolute path of the directory in step 1.
4. Click \texttt{OK} to save the changes to the transformation scenario.
5. Run the transformation scenario.

\textbf{Result}: All files from the new directory will be copied to the root of the WebHelp output directory.
Using a Script Outside of Oxygen XML Editor/Author

**Important:**
Running WebHelp transformations from a script outside of Oxygen XML Editor/Author requires an additional license and some additional setup:

- You must have a valid license for the Oxygen XML WebHelp Plugin (https://www.oxygenxml.com/buy_webhelp.html).
- The Oxygen XML WebHelp Plugin must be installed and integrated.

To copy additional resources to the output directory using a script outside of Oxygen XML Editor/Author (on page 1493), follow this procedure:

1. Place all your resources in the same directory.
2. Specify the absolute path to that directory using the `webhelp.custom.resources` parameter.
3. Execute the transformation script.

**Result:** All files from the new directory will be copied to the root of the WebHelp output directory.

How to Add MathML Equations in WebHelp Output

Currently, only Firefox can render MathML equations embedded in the HTML code. MathJax is a solution to properly view MathML equations embedded in HTML content in a variety of browsers.

If you have DocBook content that has embedded MathML equations and you want to properly view the equations in published HTML output types (such as WebHelp), you need to add a reference to the MathJax script in the `head` element of all HTML files that have the equation embedded.

For example:

```html
<script type="text/javascript"

src="https://cdnjs.cloudflare.com/ajax/libs/mathjax/2.7.1/MathJax.js?config=TeX-AMS-MML_HTMLorMM"

</script>
```

**Result:** The equation should now be properly rendered in the WebHelp output for other browsers.

Searching the Output

This section contains topics that explain how to customize some of the search features in WebHelp Classic output.
How to Change Element Scoring in Search Results

The WebHelp Search feature is enhanced with a rating mechanism that computes scores for every page that matches the search criteria. HTML tag elements are assigned a scoring value and these values are evaluated for the search results. The WebHelp directory includes a properties file that defines the scoring values for tag elements and this file can be edited to customize the values according to your needs.

To edit the scoring values of HTML tag element for enhancing WebHelp search results, follow these steps:

1. Edit the scoring properties file for DocBook WebHelp systems ([DocBook XSL directory]\com.oxygenxml.webhelp.classic\indexer\scoring.properties). The properties file includes instructions and examples to help you with your customization. The values that can be edited in the scoring.properties file:

   ```
   h1 = 10
   h2 = 9
   h3 = 8
   h4 = 7
   h5 = 6
   h6 = 5
   b = 5
   strong = 5
   em = 3
   i = 3
   u = 3
   div.toc=-10
   title=20
   div.ignore=ignored
   meta_keywords = 20
   meta_indexterms = 20
   meta_description = 25
   shortdesc=25
   ```

2. Save your changes to the file.

3. Re-run your WebHelp transformation.

How to Index Japanese Content in WebHelp Classic

To optimize the indexing of Japanese content in WebHelp pages, the Lucene Kuromoji Japanese analyzer can be used. This analyzer is included in the Oxygen XML Editor/Author installation kit.

Using Oxygen XML Editor/Author

To activate the Japanese indexing in your WebHelp output using a transformation scenario from within Oxygen XML Editor/Author, follow this procedure:
1. Set the language for your content to Japanese. Edit a DocBook to WebHelp transformation scenario and in the Parameters tab, set the value of the l10n.gentext.default.language parameter to ja.

2. Run the WebHelp transformation scenario to generate the output.

Using a Script Outside of Oxygen XML Editor/Author

⚠️ Important:
Running WebHelp transformations from a script outside of Oxygen XML Editor/Author requires an additional license and some additional setup:

- You must have a valid license for the Oxygen XML WebHelp Plugin (https://www.oxygenxml.com/buy_webhelp.html).
- The Oxygen XML WebHelp Plugin must be installed and integrated.

To activate the Japanese indexing in your WebHelp output using a script outside of Oxygen XML Editor/Author, follow this procedure:

1. Set the language for your content to Japanese. Use the l10n.gentext.default.language parameter in your transformation script and set its value to ja.

2. Execute the transformation script.

Related information
How to Localize the Interface of DocBook to WebHelp Classic Output (on page 1510)

Localization in WebHelp Classic Output

This section contains topics that explain the localization support for DocBook WebHelp Classic transformations.

How to Localize the Interface of DocBook to WebHelp Classic Output

Static labels that are used in the WebHelp output are kept in translation files in the [DocBook XSL directory]/com.oxygenxml.webhelp.classic/oxygen-webhelp/resources/localization folder. Translation files have the strings-lang1-lang2.xml name format, where lang1 and lang2 are ISO language codes. For example, the US English text is kept in the strings-en-us.xml file.

To localize the interface of the WebHelp output for DocBook transformations, follow these steps:

1. Look for the strings-[lang1]-[lang2].xml file in [DocBook XSL directory]/com.oxygenxml.webhelp.classic/oxygen-webhelp/resources/localization directory (for example, the Canadian French file would be: strings-fr-ca.xml). If it does not exist, create one starting from the strings-en-us.xml file.
2. Translate all the labels from the above language file. Labels are stored in XML elements that have the following format: `<str name="Label name">Caption</str>`.

3. Make sure that the new XML file that you created in the previous two steps is listed in the file [DocBook XSL directory]/com.oxygenxml.webhelp.classic/oxygen-webhelp/resources/localization/strings.xml. For example, a Canadian French file would be listed as: `<lang xml:lang="fr-ca" filename="strings-fr-ca.xml">`.

4. Edit any of the DocBook to WebHelp transformation scenarios (with or without feedback) and set the `l10n.gentext.default.language` parameter to the code of the language you want to localize (for example, `fr-ca` for Canadian French).

5. Run the transformation scenario to produce the WebHelp output.

Related Information:

How to Index Japanese Content in WebHelp Classic (on page 1509)

How to Activate Support for Right-to-Left (RTL) Languages

To activate support for RTL (right-to-left) languages in WebHelp output, set the `@xml:lang` attribute with the corresponding attribute value:

- `ar-eg` - Arabic
- `he-il` - Hebrew
- `ur-pk` - Urdu

Integrating Social Media and Google Tools in the WebHelp Classic Output

Oxygen XML Editor Eclipse plugin includes support for integrating some of the most popular social media sites in WebHelp output.

How to Add a Facebook Like Button in WebHelp Classic Output

It is possible to integrate Facebook™ into your WebHelp Classic output and the widget will appear in the footer sections of your WebHelp page.

Using Oxygen XML Editor/Author

To add a Facebook™ Like widget to your WebHelp output using a transformation scenario from within Oxygen XML Editor/Author, follow this procedure:

1. Go to the Facebook Developers website.
2. Fill-in the displayed form, then click the Get Code button.
3. Copy the two code snippets and paste them into a `<div>` element inside an XML file called `facebook-widget.xml`. Make sure you follow these rules:
   - The file must be well-formed.
   - The code for each `<script>` element must be included in an XML comment.
The start and end tags for the XML comment must be on a separate line.

The content of the XML file should look like this:

```xml
<div id="facebook">
  <div id="fb-root"/>
  <script>
    <!--
    (function(d, s, id) {
      var js, fjs = d.getElementsByTagName(s)[0];
      if (d.getElementById(id)) return;
      js = d.createElement(s); js.id = id;
      js.src = "//connect.facebook.net/en_US/sdk.js#xfbml=1&version=v2.0";
      fjs.parentNode.insertBefore(js, fjs);
    }(document, 'script', 'facebook-jssdk'));
    -->
  </script>
  <div class="fb-like" data-layout="standard" data-action="like"
       data-show-faces="true" data-share="true"/>
</div>
```

4. In Oxygen XML Editor/Author, click the Configure Transformation Scenario(s) action from the toolbar.

5. Select an existing WebHelp Classic transformation scenario (depending on your needs, it may be with or without feedback) and click the Duplicate button to open the Edit Scenario dialog box.

6. Switch to the Parameters tab and edit the `webhelp.footer.file` parameter to reference the `facebook-widget.xml` file that you created earlier.

7. Click Ok and run the transformation scenario.

Using a Script Outside of Oxygen XML Editor/Author

⚠️ Important:

Running WebHelp transformations from a script outside of Oxygen XML Editor/Author requires an additional license and some additional setup:

- You must have a valid license for the Oxygen XML WebHelp Plugin (https://www.oxygenxml.com/buy_webhelp.html).
- The Oxygen XML WebHelp Plugin must be installed and integrated.

To add a Facebook™ Like widget to your WebHelp output using a script outside of Oxygen XML Editor/Author (on page 1493), follow this procedure:
1. Go to the Facebook Developers website.
2. Fill-in the displayed form, then click the Get Code button.
3. Copy the two code snippets and paste them into a `<div>` element inside an XML file called `facebook-widget.xml`. Make sure you follow these rules:
   - The file must be well-formed.
   - The code for each `<script>` element must be included in an XML comment.
   - The start and end tags for the XML comment must be on a separate line.

   The content of the XML file should look like this:

   ```xml
   <div id="facebook">
     <div id="fb-root"/>
     <script>
       <![CDATA[
         (function(d, s, id) {
           var js, fjs = d.getElementsByTagName(s)[0];
           if (d.getElementById(id)) return;
           js = d.createElement(s); js.id = id;
           js.src = '//connect.facebook.net/en_US/sdk.js#xfbml=1&version=v2.0';
           fjs.parentNode.insertBefore(js, fjs);
         }(document, 'script', 'facebook-jssdk'));
       ]]>
     </script>
     <div class="fb-like" data-layout="standard" data-action="like"
         data-show-faces="true" data-share="true"/>
   </div>
   </div>
   ```

4. Use the `webhelp.footer.file` parameter in your transformation script and set its value to reference the `facebook-widget.xml` file that you created earlier.

5. Execute the transformation script.

**How to Add Tweet Button in WebHelp Classic Output**

It is possible to integrate X™ (formerly known as Twitter) into your WebHelp Classic output and the widget will appear in the footer section of your WebHelp page.

**Using Oxygen XML Editor/Author**

To add a X™ Tweet widget to your WebHelp Classic output using a transformation scenario from within Oxygen XML Editor/Author, follow this procedure:

1. Go to the Tweet button generator page.
2. Fill in the displayed form. The Preview and code area displays the code that you will need.
3. Copy the code snippet displayed in the **Preview and code** area and paste it into a `<div>` element inside an XML file called `tweet-button.xml`. Make sure you follow these rules:
   - The file must be well-formed.
   - The code for each `<script>` element must be included in an XML comment.
   - The start and end tags for the XML comment must be on a separate line.
   
   The content of the XML file should look like this:

   ```xml
   <div id="twitter">
     <a href="https://twitter.com/share" class="twitter-share-button">Tweet</a>
     <script>
       !function(d, s, id) {
         var js, fjs = d.getElementsByTagName(s)[0], p = /^http:/.test(d.location) ? 'http' : 'https';
       if (! d.getElementById(id)) {
           js = d.createElement(s);
           js.id = id;
           js.src = p + '//platform.twitter.com/widgets.js';
           fjs.parentNode.insertBefore(js, fjs);
         }
         (document,
         'script', 'twitter-wjs');
       }-->
     </script>
   </div>
   ```

4. In **Oxygen XML Editor/Author**, click the ➤ Configure Transformation Scenario(s) action from the toolbar.

5. Select an existing WebHelp transformation scenario (depending on your needs, it may be with or without feedback) and click the **Duplicate** button to open the **Edit Scenario** dialog box.

6. Switch to the **Parameters** tab and edit the `webhelp.footer.file` parameter to reference the `tweet-button.xml` file that you created earlier.

7. Click **Ok** and run the transformation scenario.

### Using a Script Outside of Oxygen XML Editor/Author

**Important:**

Running WebHelp transformations from a script outside of **Oxygen XML Editor/Author** requires an additional license and some additional setup:
To add a X™ Tweet widget to your WebHelp Classic output using a script outside of Oxygen XML Editor/Author (on page 1493), follow this procedure:

1. Go to the Tweet button generator page.
2. Fill in the displayed form. The Preview and code area displays the code that you will need.
3. Copy the code snippet displayed in the Preview and code area and paste it into a <div> element inside an XML file called tweet-button.xml. Make sure you follow these rules:
   - The file must be well-formed.
   - The code for each <script> element must be included in an XML comment.
   - The start and end tags for the XML comment must be on a separate line.

The content of the XML file should look like this:

```xml
<div id="twitter">
  <a href="https://twitter.com/share" class="twitter-share-button">Tweet</a>
  <script>
    <!--
    !function (d, s, id) {
      var js, fjs = d.getElementsByTagName(s)[0], p = /^http:/test(d.location) ? 'http': 'https';
      if (! d.getElementById(id)) {
        js = d.createElement(s); js.id = id;
        js.src = p + '://platform.twitter.com/widgets.js';
        fjs.parentNode.insertBefore(js, fjs);
      }
    }
    (document, 'script', 'twitter-wjs');
    -->
  </script>
</div>
```

4. Use the webhelp.footer.file parameter in your transformation script and set its value to reference the tweet-button.xml file that you created earlier.

5. Execute the transformation script.
How to Integrate Google Analytics in WebHelp Classic Output

You can use Google Analytics to track and report site data for your WebHelp Classic output.

Using Oxygen XML Editor/Author

To integrate Google Analytics into your WebHelp Classic output using a transformation scenario from within Oxygen XML Editor/Author, follow this procedure:

1. Create a new Google Analytics account (if you do not already have one) and log on.
2. Choose the Analytics solution that best fits the needs of your website.
3. Follow the on-screen instructions to obtain a Tracking Code that contains your Tracking ID. A Tracking Code looks like this:

```html
<script>
(function(i,s,o,g,r,a,m){i['GoogleAnalyticsObject']=r;i[r]=i[r]||function(){
(i[r].q=i[r].q||[]).push(arguments)},i[r].l=1*new Date();a=s.createElement(o),
m=s.getElementsByTagName(o)[0];a.async=1;a.src=g;m.parentNode.insertBefore(a,m)
}(window,document,'script','//www.google-analytics.com/analytics.js','ga'));

ga('create', 'UA-XXXXXXXX-X', 'auto');
ga('send', 'pageview');
</script>
```

4. Save the Tracking Code (obtained in the previous step) in a new XML file called googleAnalytics.xml. Note that the file should only contain the tracking code.
5. In Oxygen XML Editor/Author, click the Configure Transformation Scenario(s) action from the toolbar.
6. Select an existing WebHelp transformation scenario (depending on your needs, it may be with or without feedback) and click the Duplicate button to open the Edit Scenario dialog box.
7. Switch to the Parameters tab and edit the webhelp.footer.file parameter to reference the googleAnalytics.xml file that you created earlier.
8. Click Ok and run the transformation scenario.

Using a Script Outside of Oxygen XML Editor/Author

Important:

Running WebHelp transformations from a script outside of Oxygen XML Editor/Author requires an additional license and some additional setup:

- You must have a valid license for the Oxygen XML WebHelp Plugin (https://www.oxygenxml.com/buy_webhelp.html).
- The Oxygen XML WebHelp Plugin must be installed and integrated.
To integrate Google Analytics into your WebHelp Classic output using a script outside of Oxygen XML Editor/Author (on page 1493), follow this procedure:

1. Create a new Google Analytics account (if you do not already have one) and log on.
2. Choose the Analytics solution that best fits the needs of your website.
3. Follow the on-screen instructions to obtain a Tracking Code that contains your Tracking ID. A Tracking Code looks like this:

   ```
   <script>
   (function(i,s,o,r,a,m){i['GoogleAnalyticsObject']=r;i[r]=i[r]||function(){
   (i[r].q=i[r].q||[]).push(arguments)},i[r].l=1*new Date();a=s.createElement(o),
m=s.getElementsByTagName(o)[0];a.async=1;a.src=g;m.parentNode.insertBefore(a,m)
 })(window,document,'script','//www.google-analytics.com/analytics.js','ga');

   ga('create', 'UA-XXXXXXXX-X', 'auto');
   ga('send', 'pageview');
   </script>
   ```

4. Save the Tracking Code (obtained in the previous step) in a new XML file called googleAnalytics.xml. Note that the file should only contain the tracking code.
5. Use the webhelp.footer.file parameter in your transformation script and set its value to reference the googleAnalytics.xml file that you created earlier.
6. Execute the transformation script.

How to Integrate Google Search in WebHelp Classic Output

It is possible to integrate the Google Search Engine into your WebHelp Classic output and you can specify where you want the results to appear in your WebHelp page.

Using Oxygen XML Editor/Author

To integrate the Google Search Engine into your WebHelp output using a transformation scenario from within Oxygen XML Editor/Author, follow this procedure:

1. Go to the Google Custom Search Engine page using your Google account.
2. Select the Create a custom search engine button.
3. Follow the on-screen instructions to create a search engine for your site. At the end of this process you should obtain a code snippet that looks like this:

   ```
   <script>
   (function () {
   var cx = '00088821088977588983:8mn4x_mf-yg';
   var gcse = document.createElement('script');
   gcse.type = 'text/javascript';
   gcse.async = true;
   ```
4. Save the script into a well-formed HTML file called `googlecse.html`.

5. In **Oxygen XML Editor/Author**, click the **Configure Transformation Scenario(s)** action from the toolbar.

6. Select an existing WebHelp Responsive transformation scenario (depending on your needs, it may be with or without feedback) and click the **Duplicate** button to open the **Edit Scenario** dialog box.

7. Switch to the **Parameters** tab and edit the `webhelp.google.search.script` parameter to reference the `googlecse.html` file that you created earlier.

8. You can also use the `webhelp.google.search.results` parameter to choose where to display the search results.
   a. Create an HTML file with the following content: `<div class="gcse-searchresults-only" data-autoSearchOnLoad="true" data-queryParameterName="searchQuery"></div>` (you must use the HTML5 version for the GCSE). For more information about other supported attributes, see Google Custom Search: Supported Attributes.
   b. Set the value of the `webhelp.google.search.results` parameter to the file path of the file you just created. If this parameter is not specified, the following code is used: `<div class="gcse-searchresults-only" data-autoSearchOnLoad="true" data-queryParameterName="searchQuery"></div>`.

9. Click **Ok** and run the transformation scenario.

### Using a Script Outside of Oxygen XML Editor/Author

**Important:**

Running WebHelp transformations from a script outside of **Oxygen XML Editor/Author** requires an additional license and some additional setup:

- You must have a valid license for the **Oxygen XML WebHelp Plugin** ([https://www.oxygenxml.com/buy_webhelp.html](https://www.oxygenxml.com/buy_webhelp.html)).
- The **Oxygen XML WebHelp Plugin** must be installed and integrated.

To integrate the **Google Search Engine** into your WebHelp Classic output using a script outside of **Oxygen XML Editor/Author** (*on page 1493*), follow this procedure:

1. Go to the **Google Custom Search Engine page** using your Google account.
2. Select the **Create a custom search engine** button.
3. Follow the on-screen instructions to create a search engine for your site. At the end of this process you should obtain a code snippet that looks like this:

```html
<script>
(function() {
  var cx = '000888210889775888983:8mn4x_mf-yg';
  var gcse = document.createElement('script');
  gcse.type = 'text/javascript';
  gcse.async = true;
  var s = document.getElementsByTagName('script')[0];
  s.parentNode.insertBefore(gcse, s);
})();
</script>
```

4. Save the script into a well-formed HTML file called `googlecse.html`.

5. Use the `webhelp.google.search.script` parameter in your transformation script and set its value to reference the `googlecse.html` file that you created earlier.

6. You can also use the `webhelp.google.search.results` parameter to choose where to display the search results.
   a. Create an HTML file with the following content: `<div class="gcse-searchresults-only" data-autoSearchOnLoad="true" data-queryParameterName="searchQuery"></div>` (you must use the HTML5 version for the GCSE). For more information about other supported attributes, see Google Custom Search: Supported Attributes.
   b. Set the value of the `webhelp.google.search.results` parameter to the file path of the file you just created. If this parameter is not specified, the following code is used: `<div class="gcse-searchresults-only" data-autoSearchOnLoad="true" data-queryParameterName="searchQuery"></div>`.

7. Execute the transformation script.

### Miscellaneous Customization Topics

This section contains miscellaneous topics about how to customize the WebHelp Classic output.

### How to Disable Caching in WebHelp Classic Output

In cases where a set of WebHelp Classic pages need to be updated on a regular basis to deliver the latest version of the documentation, the WebHelp pages should always be requested from the server upon re-loading it in a Web browser on the client side, rather than re-using an outdated cached version in the browser.

To disable caching in WebHelp Classic output, follow this procedure:
1. Edit the following file: 
   \[OXYGEN_INSTALL_DIR\]\frameworks\docbook\xsl\com.oxygenxml.webhelp.classic\xsl\createMainFiles.xsl.
2. Locate the following template in the XSL file: `<xsl:template name="create-toc-common-file">` and add the following code snippet:

   ```xml
   <meta http-equiv="Pragma" content="no-cache" />
   <meta http-equiv="Expires" content="-1" />
   ``

   **Note:**
   The code should look like this:

   ```html
   <html>
   <head>
   <xsl:if test="$withFrames">
   <base target="contentwin"/>
   </xsl:if>
   <meta http-equiv="Pragma" content="no-cache" />
   <xsl:if test="$withFrames">
   <meta http-equiv="Expires" content="-1" />
   </xsl:if>
   <!-- Disable caching of WebHelp pages in web browser. -->
   </head>
   <!-- .... -->
   ``

3. Save your changes to the file.
4. Re-run your WebHelp transformation scenario.

**How to Publish WebHelp Classic Output on a SharePoint Site**

Since WebHelp output must be published locally, on the same machine where the WebHelp process is running, to publish your files directly to a SharePoint library you need to map a network drive to connect to SharePoint and change your file extensions to `.aspx`, as described in the steps below.

**Using Oxygen XML Editor/Author**

To publish WebHelp Classic output on a SharePoint site and use a transformation scenario from within Oxygen XML Editor/Author, follow this procedure:

1. Map a network drive to connect to your SharePoint library. For more information, see: https://support.microsoft.com/en-us/kb/2616712.
2. Edit the WebHelp transformation scenario and open the **Parameters** tab. Set the `html.ext` parameter to `.aspx`.
3. Run the WebHelp transformation scenario to generate the output.
Using a Script Outside of Oxygen XML Editor/Author

**Important:**
Running WebHelp transformations from a script outside of Oxygen XML Editor/Author requires an additional license and some additional setup:

- You must have a valid license for the Oxygen XML WebHelp Plugin (https://www.oxygenxml.com/buy_webhelp.html).
- The Oxygen XML WebHelp Plugin must be installed and integrated.

To publish WebHelp Classic output on a SharePoint site and use a script outside of Oxygen XML Editor/Author (on page 1493), follow this procedure:

1. Map a network drive to connect to your SharePoint library. For more information, see: https://support.microsoft.com/en-us/kb/2616712.
2. Use the html.ext parameter in your transformation script and set its value to .aspx.
3. Execute the transformation script.

DITA to PDF Output Customization

Oxygen XML Editor Eclipse plugin provides support for generating PDF output using transformation scenarios for certain types of documents (for example, DITA, DocBook, TEI, and JATS) and Oxygen XML Editor Eclipse plugin supports several different types of processors. There are numerous ways to customize the published output to fit your specific needs.

CSS-based DITA to PDF Customization

Oxygen XML Editor Eclipse plugin comes bundled with a DITA-OT CSS-based PDF Publishing Plugin for transforming DITA maps or single topics to PDF, while styling the resulting output using CSS. It is the base of two types of transformation scenarios:

**DITA Map Transformation Type (DITA Map PDF - based on HTML5 & CSS)**

This transformation type converts DITA maps to PDF using a CSS-based processing engine and HTML5 as an intermediate format. For this transformation, the pdf-css-html5 transtype is used. Because the structure of the HTML5 intermediate format resembles the one used in WebHelp output, it is possible to reuse parts of your CSS file you developed for a WebHelp customization.

**Single Topic Transformation Type (DITA PDF - based on HTML5 & CSS)**

This transformation type converts a single DITA topic to PDF using a CSS-based processing engine and HTML5 as an intermediate format. For this transformation, the pdf-css-html5-single-topic transtype is used. This transformation is derived from the DITA Map PDF - based on HTML5 & CSS transformation type but applies on a single topic.
Overview

This section contains topics that provide a basic overview of the DITA-OT CSS-based PDF Publishing Plugin, technical details, and some additional resources to help you with your customizations.

Tip:
For more information and some tips in regard to publishing DITA documents to PDF using CSS, watch our Webinars:

- Transforming DITA documents to PDF using CSS, Part 1 – Page Definitions, Cover Page and PDF Metadata.
- Transforming DITA documents to PDF using CSS, Part 3 – Advanced Fonts Usage.
- Transforming DITA documents to PDF using CSS, Part 4 – Advanced CSS Rules.
- Transforming XML and HTML documents to PDF using CSS, Part 1 – Basic CSS Layout.
- Transforming XML and HTML documents to PDF using CSS, Part 2 – Lists, Tables and Images.
- Transforming XML and HTML documents to PDF using CSS, Part 3 – Global Page Layout.
- Transforming XML and HTML documents to PDF using CSS, Part 4 – Advanced Functionalities.

Resources

Customizing the PDF output requires knowledge of CSS, Paged Media, and DITA. The following list provides some resources to help you:

- CSS Paged Media - This is a part of the CSS specification that shows how to organize your publication in pages, how to use headers/footers, page breaks, and other page-related issues. The specification is available here: https://www.w3.org/TR/CSS2/page.html. Also, there is a set of hands-on examples in the Oxygen PDF Chemistry user guide: https://www.oxygenxml.com/doc/ug-chemistry/.
- DITA - You will need a basic understanding of DITA elements, attributes, and structure. A good resource is The DITA Style Guide - Best Practices for Authors by Tony Self. It is available at: www.ditastyle.com and: https://www.oxygenxml.com/dita/styleguide/c_DITA_Authoring_Concepts.html. You can find all
the details for every DITA element on OASIS website: http://docs.oasis-open.org/dita/v1.2/os/spec/DITA1.2-spec.html.

- **HTML5** - You will need a good knowledge of HTML5. You can find resources here: https://developer.mozilla.org/en-US/docs/Web/Guide/HTML/HTML5

**Related Information:**
DITA-OT DAY 2017: Using CSS to Style PDF Output

**Supported Processors**

The **DITA-OT CSS-based PDF Publishing Plugin** supports the following CSS processors:

- **Oxygen PDF Chemistry** - This is recommended processor because the built-in CSS files were fine-tuned for this processor. For example, metadata extraction (on page 1608) only functions with this processor. If the plugin is started from an Oxygen XML Editor/Author distribution, a Chemistry installation is not needed.

**Technical Details**

It has the following transformation types:

- **pdf-css-html5** (**DITA Map PDF - based on HTML5 & CSS transformation**) - CSS styling applied over a merged HTML5 document (the merged DITA map converted to HTML5).
- **pdf-css-html5-single-topic** (**DITA PDF - based on HTML5 & CSS transformation**) - CSS styling applied over a merged HTML5 document (the merged DITA topic converted to HTML5).

This is how it works:

1. It expands all the topic references into a temporary clone of the map, resolving keys and reused content. For the single topic transformation the result is a file with the keys and content resolved.
2. It generates a structure for the table of contents and index. The result is a merged map with all the references resolved. When transforming a single topic, the TOC and Index are not added to the merged file, this includes only the contents of the topic.
3. It post-processes the merged map. It fixes some of the structure in the TOC and index, moves the *frontmatter* and *backmatter* to the correct places, transforms any change tracking and review processing instructions to elements that can be styled later, etc. During this phase, the `com.oxygenxml.pdf.css.xsl.merged2merged` ([on page 1738](#)) extension points are also called. The result is another merged map.

Note:
In the single topic transformation type (**DITA PDF - based on HTML5 & CSS**), these steps are simplified.
4. It converts the post-processed merged map or topic into a single HTML5 file. The generated HTML elements have the `@class` attribute from their original DITA elements. This means that you can either use selectors that were designed for DITA structure, or ones for the HTML structure. For more details, see Reusing the Styling for WebHelp and PDF Output (on page 1694). During this phase, the `com.oxygenxml.pdf.css.xsl.merged2html5` (on page 1738) extensions points are also called.

5. It uses a collection of CSS stylesheets against the merged HTML5 file and uses a PDF processor to generate the final PDF. References to the CSS files are collected from the publishing template (on page 1540).
Increasing Memory Allocation for Java

If you are working with a large project with extensive metadata or key references, you may need to increase the amount of memory that is allocated to the Java process that performs the publishing.

There can be two situations where an out of memory error can be triggered:

- From the DITA-OT basic processing (the preparation of the merged HTML document).
- From the Chemistry PDF CSS processor (the transformation of the merged HTML document to PDF).

When the Transformation is Started from Oxygen

To alter the memory allocation setting from the transformation scenario, follow these steps:

1. Open the **Configure Transformation Scenario(s)** dialog box.
2. Select your transformation scenario, then click **Edit**.
3. Go to the **Advanced** tab.
4. Uncheck the **Prefer using the "dita" command** option.
5. Locate the **JVM Arguments** and increase the default value. For instance, to set 2 gigabytes as the maximum amount of memory, you can use: `-Xmx2g`. If you do not specify the `-Xmx` value in this field, by default, the application will use a maximum of 512 megabytes when used with a 32-bit Java Virtual Machine and one gigabyte with a 64-bit Java Virtual Machine.

   **Note:**

   This memory setting is used by both the DITA-OT process and the Chemistry CSS processor.

When the Transformation is Started from the Command Line

- If the DITA-OT process fails with Out Of Memory Error: you can change the value of the `ANT_OPTS` environment variable from a command line for a specific session.

   **Example:** To increase the JVM memory allocation to 1024 MB for a specific session, issue the following command from a command prompt (depending on your operating system):

   - **Windows**
     ```
     set ANT_OPTS=%ANT_OPTS% -Xmx1024M
     ```
   - **Linux/macOS**
     ```
     export ANT_OPTS="$ANT_OPTS -Xmx1024M"
     ```

   **Tip:**

   To persistently change the memory allocation, change the value allocated to the `ANT_OPTS` environment variable on your system.
• If the Chemistry PDF CSS processor fails with an Out Of Memory Error: try adding the `baseJVMArgLine` parameter to the DITA-OT command line. For example:

```shell
-DbaseJVMArgLine=-Xmx2048m
```

### Transformation Parameters

This list includes the most common customization parameters that are available in the **DITA Map PDF - based on HTML5 & CSS** transformation scenario. Other standard DITA-OT parameters were omitted for clarity, but they are supported.

**Note:**

These parameters must be prefixed by "-D" when used from a command line.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>args.allow.external.coderefs</code></td>
<td>Enables the inclusion of code files that are located outside the DITA map folder hierarchy, referenced using the DITA <code>&lt;coderef&gt;</code> element. Allowed values are <strong>yes</strong> or <strong>no</strong> (default).</td>
</tr>
</tbody>
</table>
| `args.chapter.layout` | Specifies whether chapter-level TOCs are generated for bookmaps. When set to **MINITOC**, a small section with links is added at the beginning of each chapter. The default is **BASIC**. For details, see: Table of Contents on a Page (Mini TOC) (on page 1643).

Allowed values:

- **BASIC** - No chapter TOC is created.
- **MINITOC** - A chapter-level TOC is generated.
- **MINITOC-BOTTOM-LINKS** - A chapter-level TOC is generated, with the links under the chapter description. |
| `args.css` | You can use this to specify a list of CSS URLs to be used in addition to those specified in the `dita.css.list` parameter or publishing template. The files must have URL syntax and be separated using semicolons. |
| `args.css.param.*` | You can use this parameter pattern to set attributes on the root of the merged map. This means you can activate specific CSS rules from your custom CSS using custom attributes. For examples, see: Styling Through Custom Parameters (on page 1734). |
| `args.css.param.clone-referenced-footnotes` | You can use this parameter to control the footnotes behavior: |
- When set to yes, footnotes that are referenced multiple times throughout a publication are cloned and placed at the bottom of the page for each occurrence.
- When set to no (default value), only the first footnote reference is placed at the bottom of the page and subsequent references point back to the original footnote.

### args.css.param.numbering

You can use this parameter to change the numbering of the first-level topics (chapters) and nested topics. Allowed values:

- **shallow** - Only the topics from the first level are numbered (chapters). This is the default.
- **deep** - All the topics from the map are numbered (nested topics up to level 3).
- **deep-chapter-scope** - Similar to deep, but in addition, the page numbers, figures, and table numbers are reset at the start of each first-level topic (chapter). The table and figure titles (and the links to them) are prefixed with the chapter numbers. The generic cross reference links contain both the first-level topic (chapter) numbers and the page numbers to avoid ambiguity. This parameter value is only available for the **DITA Map PDF - based on HTML5 & CSS** transformation scenario.
- **deep-chapter-scope-no-page-reset** - Similar to **deep-chapter-scope**, but the page numbers do not reset at the start of each first-level topic (chapter). The generic cross reference links contain only the page number. This parameter value is only available for the **DITA Map PDF - based on HTML5 & CSS** transformation scenario.

For more details, see [Numbering Types](on page 1629).

### args.css.param.numbering-sections

Controls whether or not the sections are included in the table of contents. When set to **yes** (sections are included), they are numbered according the numbering scheme set by the **args.css.param.numbering** parameter.

### args.css.param.show-onpage-lbl

Controls whether or not the links will have an on page NN label after them. This parameter has different defaults, depending on the transformation type. For map transformations (**pdf-css-html5 trans type**), the default is **yes**. For topic transformations (**pdf-css-html5-single-topic trans type**), the default is **no**.
| **args.css.param.show-profiling-attributes** | Controls whether or not the profiling attributes are displayed in the output.  

Allowed values:  
- **yes**  
- **no** (default) |
| **args.css.param.title.layout** | Changes the structure of the title element. In the output, the title area consists of two parts: one is the number of the chapter (and optionally, the sections number), and one is the title text. This parameter allows a switch between normal text flow (in-line flow) and a table layout where the number is placed in one cell and the text in the other (to avoid wrapping text under the chapter number).  

- **normal**  
- **table** (avoid wrapping text under counter) |
| **args.draft** | Specifies whether or not the content of `<draft-comment>` and `<required-cleanup>` elements is included in the output.  

Allowed values:  
- **no** (default) - No draft information is shown in the output.  
- **yes** - The draft information is shown in the output. |
| **args.figurelink.style** | Specifies how cross references to figures are styled in output. Allowed values:  
- **NUMBER** - Only the number of the figures are shown in links.  
- **TITLE** - Only the title of the figures are shown in links.  
- **NUMTITLE** (default) - Both the title and number of the figures are shown in links. |
| **args.gen.task.lbl** | Specifies whether or not to generate headings for sections within task topics. Allowed values: **YES** or **NO** (default). When set to **YES**, headings such as "About this task", "Before you begin", "Procedure", or "What to do next", are shown in the task contents. |
| **args.hyph.dir** | Specifies the directory that contains custom hyphenation dictionaries. Fore more details see: Hyphenation (on page 1673). |
| **args.input** | Specifies the main DITA map file for your documentation project. |
| **args.keep.output.debug.files** | Specifies whether or not the debug files generated during the transformation should be kept in the output folder. Allowed values: **YES** (default) or **NO**. |
| **args.output.base** | Specifies the name of the output file without a file extension. By default, the name of the PDF file is derived from the name of the DITA map file. This parameter allows you to override it. |
| **args.rellinks.group.mode** | Specifies the related links grouping mode. All links can be grouped into a single "Related Information" group or links grouped by their target type (topic, task, or concept). Allowed values: **single-group** (default) or **group-by-type**. For more details see: [How to Group Related Links by Type (on page 1704)](https://www.oxygenxml.com). |
| **args.tablelink.style** | Specifies how cross references to tables are styled in output. Allowed values: 
  - **NUMBER** - Only the number of the tables are shown in links.
  - **TITLE** - Only the title of the tables are shown in links.
  - **NUMTITLE** (default) - Both the title and number of the tables are shown in links. |
| **clean.temp** | Specifies whether or not the DITA-OT deletes the files in the temporary directory after it finishes a build. Allowed values: **yes** (default) or **no**. |
| **chemistry.security.policy** | Specifies a Java policy file that applies to the Chemistry process. A template can be found here: [plugins/com.oxygenxml.pdf.css/lib/oxygen-pdf-chemistry/config/chemistry.policy](https://www.oxygenxml.com). |
| **chemistry.security.workspace** | Specifies a directory where the temporary files and font cache created by the Chemistry process need to be stored. This becomes required when the **chemistry.security.policy** parameter is set. |
| **chemistry.security.resources.dir** | Path to an additional folder that Chemistry will use to read its resources (CSS, images). The process already has read access to the input map folder, the publishing templates folder, and the OPE install folder. This optional parameter should only be used when the **chemistry.security.policy** parameter is set. |
| **chemistry.security.resources.host** | The host, specified as **name:port**, that Chemistry will use to get resources (e.g. CSS files, images, fonts). This optional parameter should only be used when the **chemistry.security.policy** parameter is set. |
| **css.processor.path.anten-na-house** | Path to the Antenna House executable file that needs to be run to generate the PDF (for example, `C:\path\to\AHFCmd.exe` on Windows). |
| **css.processor.path.chemistry** | Path to the **Oxygen PDF Chemistry** executable file that needs to be run to generate the PDF (for example, `C:\path\to\chemistry.bat` on Win-
If this parameter is not set, the plugin will use the system's PATH environment variable to locate and start **Oxygen PDF Chemistry**.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>css.processor.path.prince</code></td>
<td>Path to the Prince executable file that needs to be run to generate the PDF (for example, <code>C:\path\to\prince.exe</code> on Windows).</td>
</tr>
<tr>
<td><code>css.processor.type</code></td>
<td>Specifies the processor to use for the transformation. Allowed values: <code>chemistry</code> (default), <code>antenna-house</code>, or <code>prince</code>.</td>
</tr>
<tr>
<td><code>default.language</code></td>
<td>Specifies the default language for source documents. Examples: <code>fr</code>, <code>de</code>, <code>zh</code>, etc. Depending on the transformation type, the actual number of supported languages can vary, see: Localization (on page 1773).</td>
</tr>
<tr>
<td><code>drop.block.margins.at.page-boundary</code></td>
<td>Specifies that the top and bottom margins associated with a block element should be discarded when the block is at the top or bottom of the page. Allowed values: <code>YES</code> (default) or <code>NO</code>.</td>
</tr>
<tr>
<td><code>editlink.ditamap.edit.url</code></td>
<td>Use this parameter to add an Edit link next to the topic title in the WebHelp output. When a user clicks the link, the topic is opened in Oxygen XML Web Author or Content Fusion where they can make changes that can be saved to a file server. The value should be set as the edit URL of the main DITA map used for publishing your output. The easiest way to obtain the URL is to open the map in Web Author or Content Fusion and copy the URL from the browser's address bar.</td>
</tr>
<tr>
<td><code>editlink.additional.query.parameters</code></td>
<td>You can use this optional parameter to add additional parameters to be appended to each generated edit link. Each parameter must start with <code>&amp;</code> (for example: <code>&amp;tags-mode=no-tags</code>).</td>
</tr>
<tr>
<td><code>editlink.remote.ditamap.url (deprecated)</code></td>
<td>Use this parameter in conjunction with <code>editlink.web.author.url</code> to add an Edit link next to the topic title in the PDF output. When a user clicks the link, the topic is opened in Oxygen XML Web Author where they can make changes that can be saved to a file server. The value should be set as the custom URL of the main DITA map. For example, a GitHub custom URL might look like this: <code>https://getFileContent/oxyengxml/userguide/master/UserGuide.ditamap</code>.</td>
</tr>
<tr>
<td><code>editlink.web.author.url (deprecated)</code></td>
<td>This parameter needs to be used in conjunction with <code>editlink.remote.ditamap.url</code> to add an Edit link next to the topic title in the PDF output. When a user clicks the link, the topic is opened in Oxygen XML Web Author where they can make changes that can be saved to a file server. The value should be set as the URL of the Web Author installation. For example: <code>https://www.oxygenxml.com/oxygen-xml-web-author/</code>.</td>
</tr>
</tbody>
</table>
| `enable.latin.glyph.substitutions` | When set to yes (default), glyph substitution is enabled (if the particular font supports it). This applies to Latin-based scripts only (the substitutions are always enabled in other types of scripts). If you encounter problems rendering or copying accented glyphs (e.g. umlauts or other dia-
it might be helpful to set this parameter to **no** to disable the font glyph substitutions. Another example of a case when you might need to disable the substitutions is a situation where an accented character cannot be mapped to a compound glyph, resulting in the glyph not being rendered in the PDF output.

**Warnings:**

- Disabling substitutions also disables Latin ligatures.
- Disabling substitutions is not recommended unless absolutely necessary. It is better practice to use another font if you can find one that does not have the rendering issues.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>expand.xpath.in.svg.templates</code></td>
<td>Expands XPath expressions (whose format is <code>$\{expression\}$</code>) contained in SVG templates. Allowed values: <strong>yes</strong> (default) or <strong>no</strong>.</td>
</tr>
<tr>
<td><code>figure.title.placement</code></td>
<td>Controls the title placement of the figures, relative to the image. Possible values include <strong>top</strong> (default) and <strong>bottom</strong>.</td>
</tr>
<tr>
<td><code>filter.unused.glossentries</code></td>
<td>When set to <strong>no</strong> (default), all glossary entries are displayed in the glossary. If set to <strong>yes</strong>, only referenced entries are displayed.</td>
</tr>
<tr>
<td><code>fix.external.refs.com.oxygenxml</code></td>
<td>The DITA Open Toolkit usually has problems processing references that point to locations outside of the processed DITA map directory. This parameter is used to specify whether or not the application should try to fix such references in a temporary files folder before the DITA Open Toolkit is invoked on the fixed references. The fix has no impact on your edited DITA content. Allowed values: <strong>true</strong> or <strong>false</strong> (default).</td>
</tr>
<tr>
<td><code>hide.frontpage.toc.index.glossary</code></td>
<td>When set to <strong>yes</strong>, the generated structures (table of contents, index list, front page, etc.) are removed from the output. The default is <strong>no</strong>.</td>
</tr>
<tr>
<td><code>image.resolution</code></td>
<td>You can use this parameter to set the default resolution used by images. It works mainly on vector images since raster images have their resolution defined in their metadata. The default is <strong>96</strong> (dpi). For more information, see how to change images resolution (on page 1706).</td>
</tr>
<tr>
<td><code>pdf.accessibility</code></td>
<td>When set to <strong>yes</strong>, the PDF output is generated in compliance with the PDF/Universal Accessibility standard (also known as ISO 14289). The default is <strong>no</strong>.</td>
</tr>
<tr>
<td><code>pdf.archiving.mode</code></td>
<td>Specifies the archiving mode. The PDF output will be generated in compliance with the PDF/A standard.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>pdf.version</td>
<td>Use this parameter to specify the version of the produced PDF. It has no impact on the set of PDF features used by the engine, but may be used to signal a compatibility level to the PDF readers. The default is 1.5.</td>
</tr>
<tr>
<td>pdf.security.restrict.printhq</td>
<td>Restricts high quality printing. Used for protecting the PDF Document. The restriction is off by default. Accepted values: yes or no.</td>
</tr>
<tr>
<td>pdf.security.restrict.assembledoc</td>
<td>Restricts assembling document (e.g. adding pages). Used for protecting the PDF Document. The restriction is off by default. Accepted values: yes or no.</td>
</tr>
<tr>
<td>pdf.security.restrict.accesscontent</td>
<td>Restricts extracting text and graphics. Used for protecting the PDF Document. The restriction is off by default. Accepted values: yes or no.</td>
</tr>
<tr>
<td>pdf.security.restrict.fillinforms</td>
<td>Restricts filling in existing interactive forms. Used for protecting the PDF Document. The restriction is off by default. Accepted values: yes or no.</td>
</tr>
<tr>
<td>pdf.security.restrict.annotations</td>
<td>Restricts filling in existing interactive forms. Used for protecting the PDF Document. The restriction is off by default. Accepted values: yes or no.</td>
</tr>
<tr>
<td>pdf.security.restrict.print</td>
<td>Restricts printing. Used for protecting the PDF Document. The restriction is off by default. Accepted values: yes or no.</td>
</tr>
<tr>
<td>pdf.security.restrict.copy</td>
<td>Restricts copying content. Used for protecting the PDF Document. The restriction is off by default. Accepted values: yes or no.</td>
</tr>
<tr>
<td>pdf.security.restrict.edit</td>
<td>Restricts copying content. Used for protecting the PDF Document. The restriction is off by default. Accepted values: yes or no.</td>
</tr>
<tr>
<td>pdf.security.user.password</td>
<td>User password. The document can be opened using this password. When the owner password parameter is not specified, the user password gives full rights to the people using it. When the owner password parameter is specified, the people can open the document using the user password but restrictions will apply. Missing by default.</td>
</tr>
<tr>
<td>pdf.security.owner.password</td>
<td>Owner password. There are no restrictions for people using this password.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
</tr>
<tr>
<td>-----------</td>
<td>-------------</td>
</tr>
<tr>
<td>pdf.security.encrypt.metadata</td>
<td>Encrypts the metadata. By default active when other security parameters are set. Accepted values: yes or no.</td>
</tr>
<tr>
<td>show.changes.and.comments</td>
<td>When set to yes, the user comments, colored highlights and tracked changes are shown in the output.</td>
</tr>
<tr>
<td>show.changes.and.comments.as.changebars</td>
<td>When set to yes (default) and the show.changes.and.comments parameter is also set to yes, the user comments and tracked changes are shown as change bars in the PDF output. This parameter can be used in conjunction with the show.changes.and.comments.as.pdf.sticky.notes parameter to choose whether the change bars are displayed in footnotes or sticky notes. You can override this from your customization CSS (on page 1550).</td>
</tr>
<tr>
<td>show.changes.and.comments.as.pdf.sticky.notes</td>
<td>When set to yes (default) and the show.changes.and.comments parameter is also set to yes, the user comments and tracked changes are shown in the PDF output as sticky note annotations. When set to no, the comments and tracked changes are left in the document model and are styled by the default CSS rules as footnotes. You can override this from your customization CSS (on page 1550).</td>
</tr>
<tr>
<td>show.changed.text.in.pdf.sticky.notes.content</td>
<td>When set to yes (default) and both the show.changes.and.comments and show.changes.and.comments.as.pdf.sticky.notes parameters are also set to yes, the inserted and deleted text is shown in the sticky note annotations. When set to no, only the inserted and deleted labels are shown in the annotations (this is useful for search scope).</td>
</tr>
<tr>
<td>show.image.map.area.numbers</td>
<td>When set to yes, a counter for each area from the image map is displayed over the image, near the defined shape. The default is no.</td>
</tr>
<tr>
<td>show.image.map.area.shapes</td>
<td>When set to yes, each of the image map area shapes is displayed with a translucent fill over the image. You can use this to debug your image maps. The default is no.</td>
</tr>
<tr>
<td>show.media.as.link</td>
<td>When set to yes, media objects will not appear and an external link is generated for each one instead.</td>
</tr>
<tr>
<td>sort.and.group.glossentries</td>
<td>When set to no (default), elements in the glossary are sorted based upon the document order. If set to yes, elements in the glossary are sorted alphabetically and grouped by their first letter.</td>
</tr>
<tr>
<td>store-type</td>
<td>Setting this parameter to memory will increase the processing speed and thus, could help decrease the publishing time.</td>
</tr>
<tr>
<td>table.title.placement</td>
<td>Controls the placement of the title for tables. Possible values include top (default) and bottom.</td>
</tr>
</tbody>
</table>
### table.title.repeat
Specifies whether or not a table caption should repeat on other pages when the table spans onto multiple pages. The caption is not repeated for tables nested in lists or other tables. Allowed values are **yes** (default) or **no**.

### use.css.for.embedded.svg
When set to **yes** (default), the CSS files specified in the publishing template or by the `args.css` parameter are also applied on embedded SVG elements. Allowed values are **yes** and **no**.

### use.navtitles.in.all.links
Specifies whether a `<navtitle>` defined in a topic or a topic reference should be used as the display name for all links or only in the table of contents. Allowed values are **yes** and **no** (default).

### parallel
Specifies whether or not certain pre-processing tasks should be run in parallel. Setting this parameter to **true** may add a small increase to the publishing speed. Allowed values are: **true** and **false** (default).

The following parameters can be used to specify a publishing template:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pdf.publishing.template</td>
<td>Specifies the path to the folder containing the custom PDF template.</td>
</tr>
<tr>
<td>pdf.publishing.template.descriptor</td>
<td>Specifies the name of the descriptor file to be loaded from the PDF template folder or package. If not specified, the first encountered descriptor file is loaded.</td>
</tr>
</tbody>
</table>

The following parameter is available on all DITA transformations when using the **Oxygen Publishing Engine**:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>args.disable.security.checks</td>
<td>Specifies whether or not to load external entities that are not solved through catalogs. For security reasons, the default is <strong>no</strong>.</td>
</tr>
</tbody>
</table>

Allowed values:
- **yes**
- **no** (default)

The following parameters are only available for the **DITA PDF - based on HTML5 & CSS** single DITA topic transformation scenario (pdf-css-html5-single-topic trans type):

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>args.root.map</td>
<td>Specifies the path of the root map file used to expand the key references in the published topic.</td>
</tr>
<tr>
<td>args.enable.root.map.key.processing</td>
<td>Indicates whether or not the keys should be processed using the root map parameter.</td>
</tr>
</tbody>
</table>

Allowed values:
Console Logging

To activate the logging of the last processing stage, involving the usage of the Chemistry processor to generate the PDF from the merged HTML, use the `--verbose` (or `-v`) DITA-OT parameter from the command line.

Note: When the transformation is started from an Oxygen application, this parameter is automatically set.

License Key

When running the Oxygen PDF Chemistry engine or the Oxygen Publishing Engine from inside a started Oxygen XML Editor/Author installation, an extra license key is not required. The sections below pertain to running the publishing from the command line.

Chemistry License

If you have an Oxygen PDF Chemistry license key, you will be able to generate PDF output that is not stamped with the Chemistry logo image from the command line.

To install your Chemistry license key:

- If you are using the version of Chemistry that comes bundled in Oxygen XML Editor/Author, save the license key text in a file with the name `licensekey.txt` and place it in the `DITA-OT-DIR/plugins/com.oxygenxml.pdf.css/lib/oxygen-pdf-chemistry` folder.
- If you are using another Chemistry installation, make sure you place the `licensekey.txt` file in that folder.

Oxygen Publishing Engine License

If you have purchased a license for the Oxygen Publishing Engine, you will be able to produce both PDF and WebHelp output without any restrictions from the command line.

To install your Oxygen Publishing Engine license key, save the license key text in a file with the name `licensekey.txt` and place it in the `DITA-OT-DIR` folder.

Generating PDF Output

The publishing process can be initiated from a transformation scenario within Oxygen XML Editor/Author, from a command line outside Oxygen XML Editor/Author, or from an integration server.
Generating PDF from a Command Line

To publish the PDF output from a command line outside of Oxygen XML Editor/Author, you can use the dita startup script that comes bundled with the DITA Open Toolkit distribution.

The command line supports all the parameters specific to the PDF transformation (on page 1527). Here is an example of how to write the commands:

- **Windows:**
  ```bash
dita.bat -f pdf-css-html5 -i C:\path\to\map.ditamap -o C:\path\to\output\folder -v
  ```

- **Linux/macOS:**
  ```bash
dita -f pdf-css-html5 -i /path/to/map.ditamap -o /path/to/output/folder -v
  ```

**Note:**
You can use the long form of the command-line options (e.g. `--format` or `--input`). For more information about the build parameters, see DITA-OT: Building Output Using the dita Command.

Generating PDF from an Integration Server

PDF output can be automatically generated from a Continuous Integration/Continuous Delivery system, such as Jenkins.

To integrate PDF output with the Jenkins CI tool, follow these steps:

1. Create a Maven project to incorporate Oxygen Publishing Engine.
2. Go to the root of your Maven project and edit the `pom.xml` file to include the following fragment:

   ```xml
   <project xmlns="http://maven.apache.org/POM/4.0.0"
            xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
            xsi:schemaLocation="http://maven.apache.org/POM/4.0.0
                               http://maven.apache.org/xsd/maven-4.0.0.xsd">
      <modelVersion>4.0.0</modelVersion>

      <groupId>com.oxygenxml</groupId>
      <artifactId>oxygen-oxygen-pdf-css-generator</artifactId>
      <version>1.0</version>

      <properties>
        <!-- The path to Oxygen Publishing Engine -->
        <dita-ot-dir>/path/to/oxygen-publishing-engine</dita-ot-dir>
        <!-- The path to the DITA map that you want to process. -->
        <input-file>/path/to/map.ditamap</input-file>
        <!-- The path of the output directory. -->
      </properties>
   </project>
   ```
<output-dir>/path/to/output/folder</output-dir>

<!-- The path to the PDF publishing template folder (containing the .opt file). -->
<publishing-template>/path/to/template/folder</publishing-template>

<build>
<plugins>
<plugin>
<groupId>org.codehaus.mojo</groupId>
<artifactId>exec-maven-plugin</artifactId>
<version>1.6.0</version>
<executions>
<execution>
<id>generate-pdf-css</id>
<phase>generate-sources</phase>
<goals>
<goal>exec</goal>
</goals>
<configuration>
<executable>${dita-ot-dir}/bin/dita</executable>
<arguments>
<argument>--format=pdf-css-html5</argument>
<argument>--input=${input-file}</argument>
<argument>--output=${output-dir}</argument>
<argument>-Dpdf.publishing.template=${publishing-template}</argument>
<argument>--v</argument>
</arguments>
</configuration>
</execution>
</executions>
</plugin>
</plugins>
</build>

3. Go to the Jenkins top page and create a new Jenkins job. Configure this job to suit your particular requirements, such as the build frequency and location of the Maven project.

Webinar: Introducing the Oxygen Publishing Engine for DITA
Publishing Templates

An Oxygen Publishing Template defines all aspects of the layout and styles for output obtained from the following transformation scenarios:

- WebHelp Responsive
- DITA Map PDF - based on HTML5 & CSS

It is a self-contained customization package stored as a ZIP archive or folder that can easily be shared with others. It provides the primary method for customizing the output.

Tip:
You can start creating publishing templates by using the Oxygen Styles Basket. [https://styles.oxygenxml.com](https://styles.oxygenxml.com)

Some possible customization methods include:

- Add additional template resources to customize the output (such as logos, Favicons, or CSS files).
- Extend the default processing by specifying one or more XSLT extension points.
- Specify one or more transformation parameters to customize the output.
- Customize various aspects of the output through simple CSS styling.
- For WebHelp Responsive output, change the layout of the main page or topic pages by customizing which components will be displayed and where they will be positioned in the page.

The following graphics are possible sample structures for Oxygen Publishing Template packages:

**Figure 452. Oxygen Publishing Template Package (WebHelp Responsive)**
For information about creating and customizing publishing templates, and how to adjust the WebHelp and PDF output through CSS styling and other customization methods, watch our Webinar: Creating Custom Publishing Templates for WebHelp and PDF Output. The Webinar slides and sample project are also available from that webpage.

Related Information:
- How to Create a Publishing Template (on page 1380)
- How to Edit a Packed Publishing Template (on page 1382)
- How to Add a Publishing Template to the Publishing Templates Gallery (on page 1383)
- How to Share a Publishing Template (on page 1550)

**Publishing Template Package Contents for PDF Customizations**

An Oxygen Publishing Template for PDF output must contain a template descriptor file and at least one CSS file, and may contain other resources (such as graphics, XSLT files, etc.). All the template resources can be stored in either a ZIP archive or in a folder. It is recommended to use a ZIP archive because it is easier to share with others.

**Template Descriptor File**

Each publishing template includes a descriptor file that defines the meta-data associated with template. It is an XML file with certain elements that defines all the resources included in a template (such as CSS files, images, and transformation parameters).

The template descriptor file must have the .opt file extension and must be located in the templates' root folder.

A PDF template descriptor might look like this:

```xml
<publishing-template>
  <name>Flowers</name>

  <pdf>
    <tags>
      <tag>purple</tag>
      <tag>light</tag>
    </tags>
  </pdf>
</publishing-template>
```
Tip:
It is recommended to edit the template descriptor in Oxygen XML Editor/Author because it provides content completion and validation support.

Template Name and Description

Each template descriptor file requires a <name> element. This information is displayed as the name of the template in the transformation scenario dialog box.

Optionally, you can include a <description> and it displayed when the user hovers over the template in the transformation scenario dialog box.

Template Author

Optionally, you can include author information in the descriptor file and it displayed when the user hovers over the template in the transformation scenario dialog box. This information might be useful if users run into an issue or have questions about a certain template.

If you include the <author> element, a <name> is required and optionally you can include <email>, <organization>, and <organizationUrl>.

Oxygen XML Editor Eclipse Plugin 26.0 | 11 - Publishing | 1541
PDF Element

The `<pdf>` element contains various details about the template and its resources that define the PDF output. It is a required element if you intend on using a DITA Map to PDF transformation scenario. The elements that are allowed in this `<pdf>` section specify the template tags (on page 1542), template preview image (on page 1542), resources (on page 1543) (such as CSS files), transformation parameters (on page 1543), or XSLT extensions (on page 1544).

```xml
<pdf>
  <tags>
    ...
  </tags>
  <preview-image file="MyPreview.png"/>
  <resources>
    ...
  </resources>
  <parameters>
    ...
  </parameters>
</pdf>
```

Template Tags

The `<tags>` section provides meta information about the template (such as color theme). Each `tag` is displayed at the top of the Templates tab window in the transformation scenario dialog box and they help the user filter and find particular templates.

```xml
<publishing-template>
  ...
  <pdf>
    <tags>
      <tag>purple</tag>
      <tag>light</tag>
    </tags>
  </pdf>
</publishing-template>
```

Template Preview Image

The `<preview-image>` element is used to specify an image that will be displayed in the transformation scenario dialog box. It provides a visual representation of the template to help the user select the right template. The image dimensions should be 200 x 115 pixels and the supported image formats are: JPEG, PNG, or GIF.
You can also include an `<online-preview-url>` element to specify the URL of a published sample of your template. This will display an Online preview icon in the bottom-right corner of the image in the transformation scenario dialog box and if the user clicks that icon, it will open the specified URL in their default browser.

```xml
<publishing-template>
  ...
  <pdf>
    ...
    <preview-image file="ashes/ashes-tree.png"/>
    <online-preview-url=https://www.example.com/samples/tiles/ashes</online-preview-url>
  </pdf>
</publishing-template>
```

**Template Resources**

The `<resources>` section of the descriptor file specifies a set of resources (CSS files) that are used to customize various components in the generated output. These resources will be copied to the output folder during the transformation process. At least one CSS file must be included (using the `<css>` element).

```xml
<publishing-template>
  ...
  <pdf>
    ...
    <resources>
      <css file="css/custom_styles.css"/>
      <css file="css/custom_fonts.css"/>
    </resources>
  </pdf>
</publishing-template>
```

**Note:**
All relative paths specified in the descriptor file are relative to the template root folder.

**Transformation Parameters**

You can also set one or more transformation parameters in the descriptor file.

```xml
<publishing-template>
  ...
  <pdf>
    ...
    <parameters>
      <parameter name="show.changes.and.comments" value="yes"/>
    </parameters>
  </pdf>
</publishing-template>
```

The following information can be specified in the `<parameters>` element:
Parameter name

The name of the parameter. It may be one of the transformation parameters listed in the Parameters tab of the DITA Map PDF - based on HTML5 & CSS transformation scenario or a DITA-OT PDF-based output parameter.

Note:
It is not recommended to specify an input/output parameter in the descriptor file (such as the input Map, DITAVAL file, or temporary directory).

Attention:
JVM arguments like -Xmx cannot be specified as a transformation parameter.

Parameter Value

The value of the parameter. It should be a relative path to the template root folder for file paths parameters.

Parameter Type

The type of the parameter: string or filepath. The string value is default.

After creating a publishing template (on page 1546) and adding it to the templates gallery (on page 1549), when you select the template in the transformation scenario dialog box, the Parameters tab will automatically be updated to include the parameters defined in the descriptor file. These parameters are displayed in italics.

XSLT Extension Points

The publishing templates support one or more XSLT extension points. They can be specified using the <xslt> element in the descriptor file using the following structure:

```xml
<publishing-template>
  ...
  <pdf>
    ...
    <xslt>
      <extension
        id="com.oxygenxml.pdf.css.xsl.merged2html5"
        file="xslt/merged2html5Extension.xsl"/>
      <extension
        id="com.oxygenxml.pdf.css.xsl.merged2merged"
        file="xslt/merged2mergedExtension.xsl"/>
    </xslt>
  </pdf>
  ...
</publishing-template>
```

For more information about the available extension points, see: XSLT Extensions for PDF Transformations (on page 1738).
Combining PDF and WebHelp Responsive Customizations in a Template Package

An Oxygen Publishing Template package can contain both a PDF and WebHelp Responsive customization in the same template package and you can use that same template in both types of transformations. The template descriptor file can define the customization for both types by including both a `webhelp` and `pdf` element and some of the resources can be reused. Resources referenced in elements in the `webhelp` element will only be used for WebHelp transformations, and resources referenced in the elements in the `pdf` element will only be used in PDF transformations.

```xml
<publishing-template>
  <name>Flowers</name>
  <description>Flowers themed light-colored template</description>

  <webhelp>
    <tags>
      <tag>purple</tag>
      <tag>light</tag>
    </tags>
    <preview-image file="flowers-preview.png"/>
    <resources>
      <css file="flowers-wh.css"/>
      <css file="flowers-page-styling.css"/>
    </resources>
    <parameters>
      <parameter name="webhelp.show.main.page.tiles" value="no"/>
      <parameter name="webhelp.show.main.page.toc" value="yes"/>
    </parameters>
  </webhelp>

  <pdf>
    <tags>
      <tag>purple</tag>
      <tag>light</tag>
    </tags>
    <preview-image file="flowers-preview.png"/>
    <resources>
      <css file="flowers-pdf.css"/>
      <css file="flowers-page-styling.css"/>
    </resources>
    <parameters>
      <parameter name="show.changes.and.comments" value="yes"/>
    </parameters>
  </pdf>
</publishing-template>
```
How to Create a Publishing Template

To create a customization, you can start from scratch or from an existing template, and then adapt it according to your needs.

Creating a Publishing Template Starting from Scratch

To create a new *Oxygen Publishing Template* (on page 2656), follow these steps:

1. Create a folder that will contain all the template files.

2. In *Oxygen XML Editor/Author*, open the new document wizard (use File > New or the New toolbar button), then choose the Publishing Template Descriptor template.

![Figure 454. Choosing the Publishing Template Descriptor Document Template](image)

3. Save the .opt file into your customization directory.

4. Open the .opt file in the editor and customize it to suit your needs.
Creating a Publishing Template Starting from an Existing Template

If you are using a DITA Map WebHelp Responsive or DITA Map PDF - based on HTML5 & CSS transformation, the easiest way to create a new Oxygen Publishing Template (on page 2656) is to select an existing template in the transformation scenario dialog box and use the Save template as button to save that template into a new template package that can be used as a starting point.

To create a new Oxygen Publishing Template, follow these steps:

1. Open the transformation scenario dialog box and select the publishing template you want to export and use as a starting point.

2. **Optional:** You can set one or more transformation parameters from the Parameters tab and the edited parameters will be exported along with the selected template. You will see which parameters will be exported in the dialog box that is displayed after the next step.

3. Click the Save template as button.

   **Step Result:** This opens a template package configuration dialog box that contains some options and displays the parameters that will be exported to your template package.

4. Specify a name for the new template.

5. **Optional:** Specify a template description.

6. **Optional:** The same publishing template package can contain both a WebHelp Responsive and PDF customization and you can use the same template in both types of transformations (DITA Map WebHelp Responsive or DITA Map to PDF - based on HTML5 & CSS). You can use the Include WebHelp customization and Include PDF customization options to specify whether your custom template will include both types of customizations.

7. **Optional:** For WebHelp Responsive customizations, you can select the Include HTML Page Layout Files option if you want to copy the default HTML Page Layout Files (on page 1359) in your template package. They are helpful if you want to change the structure of the generated HTML pages.

8. In the Save as field, specify the name and path of the ZIP file where the template will be saved.

   **Step Result:** A new ZIP archive will be created on disk in the specified location with the specified name.

9. Open the .opt file in the editor and customize it to suit your needs.

For more information about creating and customizing publishing templates, watch our video demonstration:

https://www.youtube.com/embed/zNmXfKWXw08

Creating a Publishing Template Using the Oxygen Styles Basket

Another way to create an Oxygen Publishing Template (on page 2656) is to use the Oxygen Styles Basket. This tool is a handy free-to-use web-based visual tool that helps you create your own Publishing Template Package to customize your DITA Map WebHelp Responsive transformation scenarios.
It is based on galleries that you can visit to pick styling aspects to create a custom look and feel. Various different types of styles can be selected (such as fonts, tables, lists, spacing, code) and all changes can be seen in the **Preview** pane. You can also click the **See Results** button to generate a preview of either WebHelp or PDF output.

It is possible to **Download** the current template or **Upload** a previously generated template for further customization.

![Oxygen Styles Basket Interface](image)

**Figure 455. Oxygen Styles Basket Interface**

**Resources**

For more information about the **Oxygen Styles Basket**, see the following resources:

- **Video**: Introducing the New Oxygen Styles Basket
- **Webinar**: Using Oxygen Styles Basket to Create CSS Customization from Scratch

**Related information**

- Publishing Template Package Contents for PDF Customizations *(on page 1540)*
- Publishing Template Package Contents for WebHelp Responsive Customizations *(on page 1343)*

**How to Edit a Packed Publishing Template**

To edit an existing **Oxygen Publishing Template** *(on page 2656)* package, follow these steps:

1. Unzip the ZIP archive associated with the **Oxygen Publishing Template** in a separate folder.
2. Link the folder associated with the template in the **Project Explorer** view.
3. Using the **Project Explorer** view, you can modify the resources (CSS, JS, fonts) within the *Oxygen Publishing Template* folder to fit your needs.

4. Open the publishing template descriptor file (.opt extension) in the editor and modify it to suit your needs.

5. **Optional:** Once you finish your customization, you can archive the folder as a ZIP file.

**Related Information:**
- Publishing Template Package Contents for PDF Customizations *(on page 1540)*
- Publishing Template Package Contents for WebHelp Responsive Customizations *(on page 1343)*

### How to Use a Publishing Template in a PDF Transformation

**From Oxygen XML Editor/Author**

A publishing template can be used for PDF output from the *DITA Map PDF - based on HTML5 & CSS* transformation scenario (or from the *DITA PDF - based on HTML5 & CSS* transformation scenario).

The **Templates** tab in the transformation scenario dialog box displays all the templates that are available in your template gallery. To use a particular template in the transformation scenario, simply select it from this tab and then continue configuring the transformation using the other tabs to suit your needs.

To add the publishing template to your templates gallery, follow these steps:

1. Open the transformation scenario dialog box by editing a *DITA Map PDF - based on HTML5 & CSS* transformation (or a *DITA PDF - based on HTML5 & CSS* transformation scenario).

2. In the **Templates** tab, click the **Configure Publishing Templates Gallery** link to.

   **Step Result:** This will open the preferences page.

3. Click the **Add** button and specify the location of your template directory.

   **Step Result:** Your template directory is now added to the **Additional Publishing Templates Galleries** list.

4. Click **OK** to return to the transformation scenario dialog box.

**Result:** All the templates contained in your template directory will be displayed in the preview pane along with all the built-in templates.

**From a Command Line**

You can use the `pdf.publishing.template` parameter to point to the *.opt (publishing template) file:

```
 dita.bat
   --input=map\test.ditamap*
   
   "-Dpdf.publishing.template=full_path_to_template_dir/my_template.opt"
```
Or use the two parameters to indicate the folder containing the publishing templates and the name of the publishing template file relative to that folder:

```
dita.bat
--input=map\test.ditamap
"-Dpdf.publishing.template=full_path_to_template_dir"
"-Dpdf.publishing.template.descriptor=my_template.opt"
--format=pdf-css-html5
...```

Tip:
You can also start the `dita` process by passing it a DITA OT Project File. Inside the project file you can specify as parameters for the `webhelp-responsive` transformation type the WebHelp-related parameters.

**Related Information:**
Transformation Parameters *(on page 1527)*

**How to Share a Publishing Template**

To share a publishing template with others, following these steps:

1. Copy your template in a new folder in your project.
2. Go to Options > Preferences > DITA > Publishing and add that new folder to the list.
3. Switch the option as the bottom of that preferences page to Project Options.
4. Share your project file (.xpr).

**Customizing PDF Output Using CSS**

The publishing process is driven by a customization CSS.

**Warning:**
You should not edit the CSS stylesheet from `DITA-OT-DIR/plugins/com.oxygenxml.pdf.css/css/print`. Instead, create your own customization.

To change the styling of the output for the DITA Map PDF - based on HTML5 & CSS or the DITA PDF - based on HTML5 & CSS transformation scenarios you can either create your own custom CSS rules or create a publishing template using the Oxygen Styles Basket.
Create Custom CSS Rules from Scratch

1. Create a CSS file that will contain all of your customizations. It is recommended to create this file in your project directory so you can edit it easily.

Tip:
If you use the default Chemistry processor in Oxygen XML Editor/Author, you can use LESS instead of CSS. In this case, the customization files should have the .less extension.

2. Add your custom CSS rules. As a good starting point, you can check the various topics in this section for assistance with specific types of customizations.

3. Link the CSS file. For this, you have two options:
   - Create a publishing template, create the customization CSS file inside the template folder, and link it to the publishing template descriptor. For assistance, see Publishing Templates (on page 1340).
   - Choose an existing publishing template, then edit the scenario and set the full path to the custom CSS file as the value of the args.css parameter. The rules from custom CSS will override the rules from the template CSS files.

4. Run the transformation scenario.

Creating a Publishing Template Using the Oxygen Styles Basket

Another way to create an Oxygen Publishing Template (on page 2656) is to use the Oxygen Styles Basket. This tool is a handy free-to-use web-based visual tool that helps you create your own Publishing Template Package to customize your DITA Map PDF - based on HTML5 & CSS transformation scenarios.

It is based on galleries that you can visit to pick styling aspects to create a custom look and feel. Various different types of styles can be selected (such as fonts, tables, lists, spacing, code) and all changes can be seen in the Preview pane. You can also click the See Results button to generate a preview of either PDF or WebHelp output.

It is possible to Download the current template or Upload a previously generated template for further customization.
Tip:

Debugging the CSS

If you notice that some of the CSS properties were not applied as expected, some of the tips offered in this topic might help you with the debugging process.

**CAUTION:**
Do not modify the built-in rules directly in the CSS files from the Oxygen XML Editor/Author installation. Instead, copy the rules to your own customization CSS.
Inspecting the Merged Map File

During the transformation stages, two merged map files are created. These files could be used to help debug unexpected results.

1. The first thing you should try is to check the file structure of the HTML merged map file. This file can be found in the out/pdf-css directory and it has the .merged.html file extension (you will also find a .merged.xml file that aggregates the entire DITA map structure). You can open the HTML files in Oxygen XML Editor/Author to examine the structure. Optionally, you can use the pretty print feature (Format and Indent) to make the structure easier to read.

2. If the structure is as expected, you can start checking that the CSS selectors are written correctly against the document structure.

3. If the CSS selectors are correctly written, you can start inspecting how the styles are applied (you can try any of the methods listed below).

Inspecting the Applied Styles Using a Browser

The following procedure explains how to inspect the applied CSS styles using Chrome, but any modern browser can be used and the procedure for each of them is similar:

1. Open the file ending in .merged.html.
2. Open the Chrome Developer Tools by using More Tools > Developer Tools (or press CTRL+SHIFT+i).
3. Activate the Rendering pane by using More Tools > Rendering then select print from the Emulate CSS media section. This will activate the CSS selectors enclosed in @media print {..}:

![Chrome Developer Tools](image)
4. Right-click on the element you want to inspect and select the **Inspect** action, you will see the element (in the **Elements** pane) and the list of styles that are applied on it (in the **Styles** pane):

![Current inspected element](image)

---

**Tip:**
Clicking any of the stylesheet links from the **Styles** pane opens the original CSS files in the **Sources** pane. Editing the rules in that pane results in a live preview of how the change will affect the output (these modifications will be lost on reload).

---

**Inspecting the Applied Styles Using Oxygen XML Editor/Author**

To inspect the applied CSS styles using Oxygen:
1. In Oxygen XML Editor/Author, open the file ending in .merged.html.
2. From the Styles toolbar, choose the + Print Ready entry. This will activate certain CSS selectors enclosed in `@media print {...}`.

Note: This allows you to debug the styling of elements, the table of contents, and the index, but not the styles of the page margin boxes (headers, footers) or page breaks.

3. Right-click on the element you want to inspect and select the Inspect Styles action. The dedicated CSS Inspector view will be opened and it will show the applied CSS rules.

Tip: With this file open in Author mode, it might be helpful to switch the Tags Display Mode to Full Tags with Attributes. You might be able to identify the selector you need to style without using the CSS Inspector view.

Other Debugging Techniques

Here are some other debugging techniques you may find useful:

- Add background and border properties to the specific CSS rule. If they do not appear in the output, then there is a problem with the rule selector.
- Add the !important keyword to a property that is not applied, or make the selector more specific (by adding more parent selectors).
- Add the following fragment in your customization CSS to show how the elements are mapped to PDF:

```css
* {
    border: 1pt solid blue !important;
}

*:before(1000) {
    content: oxy_name() !important;
    color: orange;
}

*:before(900) {
    content: "*[ class='" attr(class) "']" !important;
    color: orange;
}
```

This will show the element name, its class attribute, and will paint a blue border around each of the elements in the output. It will not show the page margin boxes or some content elements that are hidden.
How to Speed up CSS Development and Debugging

You may have already run the DITA Map PDF - based on HTML5 & CSS transformation scenario before using this procedure.

You can speed up your CSS development considerably by not invoking the entire pipeline of transforming your DITA maps to PDF. Instead, you can directly transform the merged map (on page 1553) (.merged.html) into PDF using Oxygen PDF Chemistry.

1. Open the .merged.html located in the output directory in the editor.
2. Configure a new XML to PDF transformation with CSS scenario. There is no need to set the CSS URL in the resulting dialog box. The stylesheets are already declared in the file head. This scenario uses the Chemistry CSS processor.
3. Optional: Enable the console output of the CSS processor from: Options > Preferences > XML > PDF Output > CSS-based Processors.

Now you can make incremental changes to the CSS stylesheet and quickly see the results by transforming the merged file directly.

Fastpath:
If your changes only involve element styling (with no specific paged media CSS rules and properties), you can simply open the merged file in a browser (such as Chrome or Firefox) and refresh at each CSS change, as shown in: Debugging the CSS (on page 1552).

How to Use XPath Expressions in CSS

How to Write XPath Expressions

To use XPath expressions in CSS, you need to use the oxy xpath() function. These XPath expressions are used to extract the content from the HTML merged DITA map document.

The following example shows how to display the product name meta-information before the front page title:

```
*{class~*='front-page/front-page-title'}:before {
  text-align: left;
  content: oxy_xpath('/*[contains(@class, 'topic/prodname')]/text()[1]');
  display:block;
}
```

Important:
Do not use the DITA element names directly. You must use the DITA @class attribute instead, as these attributes are propagated to the HTML elements while the element names can be lost. By using the class selectors, you also cover DITA specializations.
Tip:
Use the "[1]" XPath predicate to select the first value from the document. Do not forget the parenthesis between the node to be selected.

For example: oxy_xpath("//*[contains(@class, 'topic/prodname')]/text()[1]").

Note that the meta-information might be copied multiple times in the output, inherited by the <topicref> elements, so you might get more values than expected.

Other Notes:

- You can call the oxy_xpath() function in string-set property.
- You can use content extracted using the oxy_xpath() function in both pseudo-elements and @page at-rules.
- Do not use strings as values for pseudo-elements content because they are not supported in them.

How to Debug XPath Expressions

Suppose that you need to display the publication author in the bottom-left part of the cover page.

The ditamap content is the following:

```xml
<map>
  <title>The Art of Bike Repair</title>
  <topicmeta>
    <author>John Doe</author>
  </topicmeta>
  ...
</map>
```

To debug an XPath expression:

1. Read the XPath Expressions Guidelines (on page 1556).
2. Launch the transformation of the DITA map using your customization CSS.
3. Open the [MAP_NAME].merged.html file (from the output folder) in Oxygen XML Editor/Author. You will find this inside the HTML:

```html
<div class="- front-page/front-page front-page">
  <div class="- map/topicmeta topicmeta">
    <div class="- topic/author author">John Doe</div>
  </div>
  <div class="- front-page/front-page-title front-page-title">
    <div class="- topic/title title">The Art of Bike Repair</div>
  </div>
</div>
```
4. Activate the XPath Builder view (Window > Show View > XPath/XQuery Builder).

5. Paste your XPath expression (for example: `//*[[contains(@class, "front-page/front-page")]]/*[contains(@class, "map/topicmeta")]/*[contains(@class, "topic/author")]/text()`) and click the Execute XPath button. Check if it returns the expected results.

6. Copy the expression in your customization CSS and define the rules that will use it. For example:

```css
:host {
    string-set: author oxy_xpath('//*[contains(@class, "front-page/front-page")]/*[contains(@class, "map/topicmeta")]/*[contains(@class, "topic/author")]/text()');
}
@page front-page {
    @bottom-left {
        content: "Created by " string(author);
    }
}
```

**Note:**
The "\" character used in the expression allows the multi-line display without breaking the query.

7. Run the transformation again to obtain the desired output.

**Note:**
The XPath builder has a function that allows it to display the document path of the current element from the editor (Settings drop-down menu > Update on cursor move). Alternatively, you can right-click the element in the merged document and select the Copy XPath action, then paste it in the XPath builder.

**Related Information:**
XPath Builder Documentation
XPath Examples (w3schools.com)

**Default Page Definitions**

All page definitions are found in: [PLUGIN_DIR]css/print/p-pages-and-headers.css.

**Note:**
This is listed solely for illustration purposes, as the plugin might use something different.
There are page definitions for the default page, chapter page, table of contents page, front matter page, back matter page, index page, large tables page, and blank page.

**Default Page**

The default page imposes a header that contains the publication title, chapter, and section title. They alternate on the left or right side of the page:

```xml
@page :left {
    @top-left {
        content: string(maptitle) string(parttitle) string(chaptertitle) string(sectiontitle) " | " counter(page);}
}

@page :right{
    @top-right {
        content: string(maptitle) string(parttitle) string(chaptertitle) string(sectiontitle) " | " counter(page);}
}
```

*Tip:*

To override the default rules defined for named pages (such as chapter or table of contents), you need to use more specific page rules that contain the page name:

```xml
@page :left, table-of-contents:left, chapter:left {
    @top-left {
        content: "...";
    }
}

@page :right, table-of-contents:right, chapter:right{
    @top-right {
        content: "...";
    }
}
```

**Chapter Page**

This is inherited from the default page. The chapter page is associated with the topics marked as chapters, usually direct children of the map. It clears the header from the first page of each chapter. If you need to add other information to the chapter headers, make sure you override these rules in your CSS:
Table of Contents Page

The table of content page. It clears the headers and uses a lower roman page number in the header.

```xml
@page table-of-contents {
  @top-left    { content: none; }
  @top-center  { content: none; }
  @top-right   { content: none; }
  @bottom-left { content: none; }
  @bottom-center { content: none; }
  @bottom-right { content: none; }
}

@page table-of-contents: left {
  @top-left {
    content: string(toc-header) " | " counter(page, lower-roman);
  }
}

@page table-of-contents: right {
  @top-right {
    content: string(toc-header) " | " counter(page, lower-roman);
  }
}

/* Do not put a header on the first page of the TOC */
@page table-of-contents: first: left {
  @top-left {
    content: none;
  }
}
```
Front Matter and Back Matter Page

The bookmap front matter and back matter page. It clears the headers.

Index Page

The page that contains the index terms (appears only if there are such items in your topics). It uses a lower alpha page number in the footer:
When transformed, the page layout is spread on two columns.

**Large Tables Page**

The big tables are placed on a rotated page, with orientation landscape:

```xml
@page landscape-page:right {
  size: landscape;

  @top-left {
    content: none
  }

  @top-center {
    content: none
  }

  @top-right {
    content: none
  }

  @right-bottom {
    content: string(maptitle) string(parttitle) string(chaptertitle) string(sectiontitle) " | " |
    counter(page);
    transform: rotate(90deg);
    vertical-align: middle;
    text-align: right;
  }
}

@page landscape-page:left {
  size: landscape;
```
Blank Page

The following example clears the header for the blank pages that may be created by a `page-break-before`, `page-break-after`, or by using double side pagination (on page 1650):

```
@page :blank{
    @top-left {
        content: none;
    }
    @top-right {
        content: none;
    }
}
```

Page Size

This is where you can find information on how the page sizes are defined.

Page Size - Built-in CSS rules

The `[PLUGIN_DIR]/css/print/p-page-size.css` file contains the default page rules. It uses the US-LETTER size (8.5 X 11 inches). The content of this file is:

```
@page {
    padding-top: 0.2em;
    padding-bottom: 0.2em;
}
```
**How to Change the Page Size**

Suppose you want to publish using the standard A4 page size, with a margin of 2cm.

In your customization CSS *(on page 1550)*, use:

```css
@page {
    size: A4;
    margin: 2cm;
}
```

If you need different margins depending on the page side:

```css
@page {
    size: A4;
    margin: 2cm;
}
@page :left{
    margin-right:4cm;
}
@page :right{
    margin-left:4cm;
}
```

This would only increase the gutter margins or the inside margins needed for binding of the final book. The other margins would remain 2cm.

**How to Change the Page Orientation**

Suppose you want to publish on a landscape page orientation. The default is portrait, so you need to change it by using the size property. This will contain both the physical measurements and the orientation. In your customization CSS *(on page 1550)*, use:

```css
@page {
    size: us-letter landscape;
}
```
How to Change the Page Settings for a Specific Element

Suppose your publication mainly uses a portrait page orientation, but there are some topics that have wide images. To avoid having the images bleed outside of the page, you could use a wider page setting (landscape).

1. Mark the topic with an `@outputclass` attribute and give it a distinct value (for example, `wide`), you can set the attribute on the root element of the topic or on the `<topicref>` element from the map.

   **Note:**
   The `@outputclass` values from the `<topicref>` automatically propagate to the root of the topic from the merged map (on page 1553).

2. In your customization CSS (on page 1550), match the output class and associate it with a named page. In the following example, the page has a landscape orientation and small margins. This technique works for any element (e.g. a table or list) not just for a topic.

   ```css
   @page wide-page {
       size: letter landscape;
       margin: 0.5in;
   }
   *
   *[outputclass = 'wide'] { page: wide-page !important; }
   ```

   **Note:**
   The `!important` rule is necessary to override the default page settings.

Page Headers and Footers

The page headers and footers use the string sets defined for publication, chapter, and section titles. These string-sets are defined in the numbering CSS (on page 1625):

- **parttitle**
  Set to the title of the current part (only for DITA bookmaps that use parts).

- **chaptertitle**
  Set to the title of the current chapter (Shallow and Deep numbering).

- **sectiontitle**
  Set to the title of each section (Deep numbering only).

To see where the default page rules are defined, see: Default Page Definitions (on page 1558).
Although you may define string sets in your customization CSS, you need to take into account the fact that the string-set CSS property is not additive, and matching the same elements will end up breaking the current definitions. A very common use-case is to match the title element that is also used in the default CSS. The best approach, in this case, is to take a look at the rules from the numbering CSS (on page 1625), copy the ones dealing with string sets to your customization, then alter the property definition by adding your definition to the existing ones (and not removing the existing ones).

**Related Information:**
- Numbering (on page 1625)

### Page Headers and Footers - Built-in CSS

The headers and footers are part of the page definitions. To see how the default page layouts are defined, see: Default Page Definitions (on page 1558).

### How to Change the Size of Headers and Footers

This is directly related to the page margins and size.

The headers and footers are placed in the so-called page margin boxes, a series of rectangular areas residing in the page margins.

To affect the margins of all page definitions, you may use the following rule:

```css
@page {
  margin-top: 3cm !important;
  margin-bottom: 3cm !important;
  margin-left: 2cm !important;
  margin-right: 2cm !important;
}
```

If you want to affect only a specific page, like the first page from chapters for instance, you must use more specific page selectors. See the Default Page Definitions (on page 1558) for details.

Note that the page margin boxes fill the entire page margin. This means the `margin-top`, for example, dictates the height of the `@top-left-corner`, `@top-left`, `@top-center`, `@top-right`, `@top-right-corner` margin boxes. These cannot have margins on themselves, so to change the position of the content inside them, you must use `padding` properties:

```css
@page {
  @top-left {
    content: "...
    padding: 1cm;
  }
  ..
}
```
How to Change the Font of the Headers and Footers

To change the font for all the headers and footers, in your customization CSS (on page 1550), add a CSS rule similar to this:

```css
@page {
    font-size: 12pt;
    font-family: "Arial";
}
```

Important:
These settings apply to all page margin boxes, but not to the text inside the page.

If you want to change the settings only for a specific page type (for example, the table of contents), use the name of the page:

```css
@page table-of-contents {
    font-size: 12pt;
    font-family: "Arial";
}
```

Related Information:
How to Change the Header of the Table of Contents (on page 1641)

How to Display Chapter's Headers on First Page

By default, the header is not displayed on the first page of each chapter:

```css
/* No headers on the chapter first page. */
@page chapter:first:LEFT{
    @top-left {
        content: none;
    }
}
@page chapter:first:RIGHT{
    @top-right {
        content: none;
    }
}
```

If you want to display them on the first page, you just need to override the above default rules with the following default content:

```css
@page chapter:first:LEFT{
    @top-left {
```
Oxygen XML Editor Eclipse Plugin 26.0 | 11 - Publishing | 1568

Tip:
It is also possible to import the [PLUGIN_DIR]/css/print/p-optional-pages-and-headers.css stylesheet into your custom CSS.

How to Position Text in the Headers and Footers

By default, the name of the publication and chapter titles are placed in the top-left or top-right page margin boxes:

```xml
@page :left {
@top-left {
    content: string(maptitle) string(parttitle) string(chaptertitle) string(sectiontitle) " | "
    counter(page);
}
}

@page :right {
@top-right {
    content: string(maptitle) string(parttitle) string(chaptertitle) string(sectiontitle) " | "
    counter(page);
}
}
```

If you want to change this, you should use the content CSS properties of other page margin boxes, and inhibit the ones in the above content. For example, to set the chapter title in the page top left corner, you can use:

```xml
@page :left {
@top-left {
    content: string(maptitle) string(parttitle) string(chaptertitle) string(sectiontitle) " | "
    counter(page);
}
@top-left-corner {
    content: string(maptitle) string(parttitle) string(chaptertitle) string(sectiontitle) " | "
    counter(page);
}
```
**Note:**

The corner page margin boxes are fixed and limited as the available space. Above, the `text-align` and `white-space` properties are used to make the text bleed out of these boxes towards the center of the page. If you plan to add an image or artwork background, you should consider using the technique described in: *How to Decorate the Header by Using a Background Image on the Entire Page (on page 1573)*.

### How to Change the Header Separators

There are some strings defined for parts, chapters, and sections. Each of these strings start with the " | " character as a separator. For example, in the header of a page, you may find a sequence of strings:

```
My Publication | Introduction | Getting Started
```

- "My Publication" is the value of the `maptitle` string.
- "Introduction" is the value of the `chaptertitle` string.
- "Getting Started" is the value of the `sectiontitle` string.

There might be cases where you want to change this separator. You will need to recompose the header content using the above string sets. Suppose you want to use " - " as a separator. In your customization CSS (on page 1550), add the following CSS rule:

```css
*[class = "topic/topic"][is-part] > *[class = "topic/title"] {
    string-set: parttitle " - " counter(part, upper-roman) " - " content(),
}
```
partitle-no-prefix " " counter(part, upper-roman) " - " content(),
chaptertitle ",
chaptertitle-no-prefix "; /* Avoid propagating a past chapter title on a new part */
}
*[class =~ "topic/topic"]{is-chapter}:not([is-part]) > *[class =~ "topic/title"] {
    string-set: chaptertitle " - " counter(chapter) " - " content(),
    chaptertitle-no-prefix " " counter(chapter) " - " content();
}

If you enabled the deep numbering for chapters and subsections (on page 1629), then use:

*[class =~ "map/map"]{numbering ^= 'deep'} *[class =~ "topic/topic"]{is-part} > *[class =~ "topic/title"] {
    string-set: parttitle " - " counter(part, upper-roman) " - " content(),
    parttitle-no-prefix " " counter(part, upper-roman) " - " content(),
    chaptertitle ",
    chaptertitle-no-prefix "; /* Avoid propagating a past chapter title on a new part */
}
*[class =~ "map/map"]{numbering ^= 'deep'} *[class =~ "topic/topic"]{is-chapter}:not([is-part]) > *[class =~ "topic/title"] {
    string-set: chaptertitle " - " counters(chapter-and-sections, ".") " - " content(),
    chaptertitle-no-prefix " " counters(chapter-and-sections, ".") " - " content(),
    sectiontitle "; /* Avoid propagating a past section title on a new chapter */
}
*[class =~ "map/map"]{numbering ^= 'deep'} *[class =~ "topic/topic"]{is-chapter}:not([is-part]) > *[class =~ "topic/topic"] > *[class =~ "topic/title"] {
    string-set: sectiontitle " - " counters(chapter-and-sections, ".") " - " content();
}

How to Simplify the Header (Keep Only the Chapter Title)

The headers display information such as map title, part title, chapter title, and section title, ending in the page number.

content: string(maptitle) string(parttitle) string(chaptertitle) string(sectiontitle) " | " counter(page);

This might be too much if you have long titles. The solution is to override the default header content.

In your customization CSS (on page 1550), add the following CSS rule:

`@page :left {
    @top-left {
        content: string(chaptertitle) " | " counter(page);
    }
}`
Important:
Some of the CSS default page rules are more important. If you see that the content does not change:

- Try to also specify the name of the page, to increase the specificity of the rules:

```css
@page :left, table-of-contents:left, chapter:left {
  ...
}
@page :right, table-of-contents:right, chapter:right {
  ...
}
```

- Add an `!important` classifier just before the semi-colon.

```css
@top-right {
  content: string(chaptertitle) " | " counter(page) !important;
}
```

How to Style a Part of the Text from the Header

If you need to style a fragment of text (for example, a company slogan) with certain colors or font styles, you have several options:

- Use an SVG image as the background for a page margin box or for the entire page. See: How to Add a Background Image to the Header (on page 1572).

- Use the `oxy_label` constructor. This is a function that creates a text label with a set of styles.

```css
@page {
  @top-right {
    content: oxy_label(text, "My Company", styles, "color:red; font-size: larger;")
      ,
      oxy_label(text, "Product", styles, "color:blue; text-decoration:underline"));
  }
}
```

You can combine the `oxy_label` with `oxy_xpath`, to extract and style a piece of text from the document:

```css
content: oxy_label(text, oxy_xpath("/some/xpath"), styles, "color:blue; ");
```
Note:
These functions work only with the Chemistry CSS processor.

Note:
You cannot use `string()` inside an `oxy_label()`. As a workaround, to apply styling on the dynamic text retrieved by a `string()` function you can define some overall styles for the entire page margin box and then use the `oxy_label` to style differently the static text.

```css
@page {
  @top-right {
    color: red;
    content: oxy_label(text, "My Company", styles, "color: black")
      string(chaptertitle); /* This inherits the styling from @top-right*/
  }
}
```

- Use two adjacent page margin boxes, and style them differently:

```css
@page {
  @top-center {
    content: "First part";
    color: red;
    text-align: right;
  }
  @top-left {
    content: "- Second part";
    color: blue;
    text-align: left;
  }
}
```

How to Add a Background Image to the Header

A common use-case is to add a background image to one of the page corners.

```css
@page :left {
  @bottom-left-corner {
    content: " ";
    background-image: url('https://www.oxygenxml.com/resellers/resources/OxygenXMLEditor_icon.svg');
    background-repeat: no-repeat;
    background-position: 50% 50%;
  }
}
```
Important:
Always specify a `content` property. If not, the page margin box will not be generated.

Another use-case is to use the `@top-left` or `@top-right` page margin boxes. These boxes have an automatic layout and they can be very small if they have no content. If there is no text to be placed over the image, use a series of non-breaking spaces (`\A0`) to increase the box width as in the following example (alternatively, you can use the technique described in How to Decorate the Header by Using a Background Image on the Entire Page (on page 1573)):

```html
@page :left {
  @top-left{
    content: '\A0\A0\A0\A0\A0\A0\A0\A0\A0\A0\A0\A0';
    background-image: url('https://www.oxygenxml.com/resellers/resources/OxygenXMLEditor_icon.svg');
    background-repeat:no-repeat;
    background-position:50% 50%;
  }
}
```

Note:
You can use raster image formats (such as PNG or JPEG), but it is best to use vector images (such as SVG or PDF). They scale very well and produce better results when printed. In addition, the text from these images is searchable and can be selected (if the glyphs have not been converted to shapes) in the PDF viewer.

Images and Figures (on page 1705)
How to Add a Background Image for the Cover (on page 1592)
How to Add a Link in Headers and Footers (on page 1579)

How to Decorate the Header by Using a Background Image on the Entire Page

If you want to precisely position artwork and the page margin boxes are not sufficient, it is possible to use a background image for the entire page.

This technique consists of creating an image (SVG is the best since it is a vector image) as wide as the page that would contain the logo and placing other decorations at the desired locations. This offers the best results and the position of the artwork does not depend on the page margin contents.

Example:
For a list of all the possible page names, see: Default Page Definitions (on page 1558).

Related Information:
How to Add a Background Image for the Cover (on page 1592)

How to Change Header Text for Each Topic

It is possible to dynamically change the header depending on the content in a topic. The following example assumes that the data to be presented in the header is located in the metadata section of each topic. One way is to specify it in the DITA map by using the `<topicmeta>` element for the `<topicref>` topic reference:

```
...  
<topicref href="topics/installing.dita">
    <topicmeta>
        <data name="header-data" value="ID778-3211"/>
    </topicmeta>
...  
```

In the above example, there is set of key value pairs with the name `header-data`. This information is automatically copied into the content in the merged map file (on page 1553), like this:

```
<topic ... >
    <title class="- topic/title ">Installing</title>
    <shortdesc class="- topic/shortdesc ">You install components to make them available for your solution.</shortdesc>
    <prolog class="- topic/prolog ">
        ...
    ...
    <data class="- topic/data " name="header-data" value="ID778-3211"/>
    ...
```

This information can be extracted from the CSS:

```
/* Define the string set variable that contains the text extracted from the data element */
*[class =~ "topic/topic"] *[class =~ "topic/data"]\[name=header-data\] { 
    string-set: hdrstr attr(value);
}

/* Using the value='none' stops applying the image. */
*[class =~ "topic/topic"] *[class =~ "topic/data"]\[name=header-data\][value=none] { 
```
string-set: hdrstr "";
}

/* Use the string set variable in one of the page margin boxes. */
@page chapter {
  @top-left-corner {
    content: string(hdrstr);
  }
}

Notes:
The string set is applied to all pages that follow the data element, until another data element changes it:

...  
<topicref href="topics/installing.dita">
  <topicmeta>
    <data name="header-data" value="ID778-3211"/>
  </topicmeta>
</topicref>
<topicref href="..."> <!-- Uses the same value -->
<topicref href="..."> <!-- Uses the same value -->
<topicref href="..."> <!-- Uses the same value -->
<topicref href="topics/change.dita">
  <topicmeta>
    <data name="header-data" value="ID990-3200"/>
  </topicmeta>
</topicref>
<topicref href="..."> <!-- The string set is changed now -->
<topicref href="..."> <!-- The string set is changed now -->
<topicref href="..."> <!-- The string set is changed now -->
To clear the text, use the none value:

...  
<topicref href="..."> <!-- The string set is void now -->

How to Change Header Images for Each Chapter

It is possible to dynamically change an image in the header depending on the chapter. For this, you need to define an image reference in the metadata section of each chapter. One way is to specify it in the DITA map by using the <topicmeta> element for the <chapter> topic reference:
In the above example, there is a set of key value pairs with the name `header-image`. The `img/installing.png` is an image reference relative to the DITA map URI. This information is automatically copied into the content in the merged map file (on page 1553), like this:

```
<topic is-chapter="true" ...>
    <title class="- topic/title ">Installing</title>
    <shortdesc class="- topic/shortdesc ">You install components to make them available for your solution.</shortdesc>
    <prolog class="- topic/prolog ">
        ...
    </prolog>
    <data class="- topic/data " name="header-image" value="img/installing.png"/>
    ...
</topic>
```

This information can be picked up from CSS:

```
/* Define the string set variable that contains an URL */
*[class = "topic/topic"] *[class = "topic/data"][name="header-image"] {
    string-set: imgst oxy_url(oxy_xpath('/@xtrf'), attr(value));
}

/* Using the value='none' stops applying the image. */
*[class = "topic/topic"] *[class = "topic/data"][name="header-image"][value="none"] {
    string-set: imgst "";
}

/* Use the string set variable in one of the page margin boxes. */
@page chapter {
    @top-left-corner {
        content: string(imgst);
        font-size: 0; /* remove the font ascent and descent */
    }
}
```

**Details:** The `@value` attribute is used to build a URL relative to the URI of the DITA map. To determine the base URI of the DITA map, the `@xtrf` attribute was used from the root element of the merged map document, extracted using the `oxy_xpath` function.
Notes:

• The image is always aligned vertically to the middle of available space from the page margin box.
• Make sure you use an image of the correct size. For example, if you want to place the image in the top-left corner of the page, assuming the top and left page margins are 1 in, then make sure the image is a square having a size of 1 in.
• The image is applied to all pages that follow the data element, until another data element changes it:

```
...<chapter href="topics/installing.dita">
  <topicmeta>
    <data name="header-image" value="img/installing.png"/>
  </topicmeta>
</chapter>
... <!-- Uses the same installing.png image -->
<chapter href="...">
  <!-- Uses the same installing.png image -->
<chapter href="...">
  <!-- Uses the same installing.png image -->
<chapter href="topics/change.dita">
  <topicmeta>
    <data name="header-image" value="img/change.png"/>
  </topicmeta>
</chapter> <!-- Uses the same change.png image -->
<chapter href="...">
  <!-- Uses the same change.png image -->
<chapter href="...">
  <!-- Uses the same change.png image -->
<chapter href="...">
  <!-- Uses the same change.png image -->

To clear the image, use the `none` value:

```
... <!-- Uses the same installing.png image -->
... <!-- Uses the same change.png image -->
```

How to Add a Multi-line Copyright Notice to the Footer

Suppose you want to add a footer with the following two lines of text at the end of each page that is shown on the right side:

© 2017 - My Company Ltd
All rights reserved
For this, you need to specify a rule that matches all the right pages and adds that content in the `bottom-center`. In your customization CSS (on page 1550), add the following CSS rule:

```css
@page :right {
  @bottom-center {
    content: "© 2017 - My Company Ltd \A All rights reserved";
    font-size: 0.5em;
    color: silver;
  }
}
```

**Note:**

Other page rules (such as the `table-of-contents`) override the contents of the `@bottom-center` because they are more specific. If you need to also print the copyright in the TOC pages, then use this as the selector:

```css
@page :right, table-of-contents: right {
...
}
```

**Note:**

To use new lines (`\n` characters) in your headers or footers, use the `\A` notation, as in the example above.

### How to Add a Group of Topics to the Footer

To create a footer that contains the content of several topic files, but only on the last page, there are two possible approaches:

**Method 1: Using the position:fixed CSS Property**

1. Group all the footer topics under a single parent topic, under the last topic from your DITA map. For example, you can have the following map structure:

   ```xml
   ...
   End topic
   Footer container topic
   
   Footer content topic 1
   Footer content topic 2
   ```

2. Add an `@outputclass=footer` on the `<topic>` root element of the footer container topic, or on its `<topicref>` in the map.

3. Use the CSS `position: fixed` property to position this topic to the bottom of the page.
* [outputclass =~ "footer"] {  
  position: fixed;  
  bottom: 0.5in;  
  left: 0.5in;  
  width: 5in;  
  height: 200pt;  
}

Note:  
Make sure the width and height are enough for the content of the footer to fit. Be careful because the content might bleed out of the page. Use bottom and left values to position the block in the page.

Method 2: Using the float:footnote CSS Property

The second approach would be to declare the footer block as a footnote. Assuming the same DITA Map structure as above, you can use the following CSS fragment:

* [outputclass =~ "footer"] {  
  float: footnote;  
}

* [outputclass =~ "footer"]:footnote-call{  
  color: transparent;  
  font-size: 0;  
}

* [outputclass =~ "footer"]:footnote-marker{  
  color: transparent;  
  font-size: 0;  
}

Note:  
Use transparent colors and/or zero size font to avoid the display of the footnote counters.

How to Add a Link in Headers and Footers

Method 1: Using an SVG Link Attribute

It is possible to add a link inside the document header (or footer) by using the `<a>` element inside an SVG document. For example, suppose you have the following SVG document named `custom.svg:`
This creates an SVG link with *PDF Chemistry* displayed as its text (the content of the `<text>` element).

**Note:**

If you just want to add a link without text, you can define a rectangle that contains the link instead of text.

To display the link, you just need to set your SVG file as the content of one of the page margin boxes:

```css
@page {
    @top-left {
        content: url("custom.svg");
    }
}
```

**Method 2: Using the CSS `-oxy-link` Property**

It is also possible to add a link inside the document header (or footer) by using the `-oxy-link` property on the @page margin box declaration. The entire page margin box will behave as a link and will be clickable.

```css
@page {
    @top-left {
        content: "Link";
        -oxy-link: "https://www.oxygenxml.com/";
        color:blue;
    }
}
```

**How to Change the Header Styling Depending on Page Side**

To modify the styling of the default page headers, add the following CSS rule in your customization CSS *(on page 1550)*:

```css
@page .left {
    @top-left {
        color:navy;
        font-style:italic;
    }
    @top-right {
```
If you intend to modify just the headers of the table of contents, use the `table-of-contents` page rule selector:

```xml
<page table-of-contents:left {
    @top-left {
        color:navy;
        font-style:italic;
    }
    @top-right {
        color:red;
    }
}
```

**How to Use XPath Computed Data or Images in the Header or Footer**

A very simple approach is to use the `oxy_xpath` directly in the `content` property:

```xml
<page front-page {
    @top-center {
        content: "Created: " oxy_xpath('//*[contains(@class, " topic/created "])[[1]];"
    }
}
```

**Example 1: Compute the Number of Words**

The following example computes the number of words from the publication. It counts all the words, including the ones from the TOC, but does not take the static labels into account:

```xml
<page front-page {
    @bottom-center {
        content: "Number of words: "
        oxy_xpath("string-length(normalize-space(/)) - \n        string-length(translate(normalize-space(/),',','') +1");
    }
}
```

**Note:**

The XPath expression from the page rules is evaluated in the context of the document root element, so you will need to use absolute expressions starting with `/` or `//`. This is different from the case when the `oxy_xpath` is used in CSS rules that match an element. In this case, the XPath expressions are evaluated in the context of the matched element and you can use relative paths.
Tip:
XPath 2.0 is supported (not schema aware).

Example 2: Retrieve Image from a Document and Insert it in the Header

Another example is to use an image from the document in the publication header:

```xml
<bookmeta>
  <metadata>
    ...
    <data name="cover">
      <image href="product-cover.png" outputclass="cover-image"/>
    </data>
    ...
  </metadata>
</bookmeta>
```

```css
@page {
  @top-center {
    content: url("oxy_xpath('//*[contains(@outputclass, "cover-image")]/@href')");
  }
}
```

If the URL returned by `oxy_xpath` is not absolute, it is considered to be relative to the CSS file. To obtain an absolute URL from one relative to the XML document, you can use in the XPath expression functions like `resolve-uri` and `document-uri`:

```css
@page {
  @top-center {
    content: url(oxy_xpath("resolve-uri('//*[contains(@outputclass, 'cover-image')]/@href'),
    document-uri(/*/*))");
  }
}
```

Example 3: Insert the Current Date in the Footer

Another example is to use the `oxy_xpath` function to compute the current date and insert it in the publication footer:

```css
@page {
  @bottom-left {
    content: oxy_xpath('current-date()');
  }
}
```
Example 4: Picking up Metadata from the Original Map

Another example is to use the `oxy_xpath` function to extract the title, or any other element text value from the original processed DITA map file. For this, you can use the `@xtrf` attribute that is set on the root element of the merged map. This attribute contains the URL of the input map.

```xml
:string-set: maptitle oxy_xpath( 'document(@xtrf)/*[contains(@class, " map/map ")]/*[contains(@class, " topic/title ")]/text()');
```

http://zvon.org/xxl/XPathTutorial/General/examples.html
Oxygen User Guide: `oxy_xpath()` Function

How to Add a Line Under the Header

There are two ways to add a horizontal line under the header.

Method 1: Add a Border in the Page Margin Boxes

To add a horizontal line that would stretch across the width of the page, add a bottom border to each of the 5 margin boxes in the top side of the page (top-left-corner, top-left, top-center, top-right, top-right-corner).

If you consider that the space between the header and the bottom border is too large, you could also change the alignment by adding a `vertical-align: bottom;` declaration in the page margin boxes.

For example, if you need to set some text as a header in the top-left margin box and insert a horizontal line under it, the customization CSS would look something like this:

```css
@page chapter, chapter:first:
    left: right, front-page{
        padding-top: 1em;
        @top-left {
            content: "Custom header";
            color: gray;
            border-bottom: 1px solid black;
            vertical-align: bottom;
        }
        @top-center{
            content:" ";
            border-bottom: 1px solid black;
            vertical-align: bottom;
        }
    }
```
Note:
The padding-top: 1em; is used to avoid the border at the bottom of the header that joins with the page content.

Method 2: Use a Background Image

An alternative method is to add a horizontal line/border under an existing header (or in any other part of the page) using an SVG image, as described in How to Add a Background Image to the Header (on page 1572).

How to Change the Headings Using a Parameter

Suppose you need to change the headings of your publication by specifying a static text in a parameter.

First, establish a name for your parameter (it must start with the args.css.param. prefix). For example, you could name it args.css.param.heading.text. It will have the text value that you will pass when starting the transformation. This parameter does not have to be registered anywhere as it will be automatically recognized and passed as an XML attribute on the root of the merged file, as specified in Styling Through Custom Parameters (on page 1734).

Next, alter your customization CSS to make use of the parameter value. In the example below, the text is placed in the central part of the header:

```css
@page front-page, table-of-contents, chapter {
    @top-center{
        content: " ";
        border-bottom: 1px solid black;
        vertical-align: bottom;
    }
}
```
```
content: oxy_xpath("*/@heading.text");
```

```}
```

Note:
You can use any XPath 2.0 here. It will be executed in the context of the merged map document, so you can collect data from it. You can use if/then/else expressions if your parameter is a switch.

The text does not affect the first pages from the page sequences because the built-in CSS page rules (on page 1558) clear the content from the headers. If you need the text content on all pages, you might consider adding an !important keyword after the content property value, or increase the specificity of the page selectors, like this:

```page  front-page,
   table-of-contents,
   table-of-contents:first: left,
   table-of-contents:first: right,
   chapter:first: left,
   chapter:first: right{
   @top-center{
    ...
   }
```

Another use case is to alter the string-sets that are used in the headers (not the headers directly), as it is explained here: How to Use XPath Computed Data or Images in the Header or Footer (on page 1581). You can use this technique to alter the chapter titles as in the following example:

```
* [class ~= "map/map"] [numbering~='deep']
   * [class ~= "topic/topic"] [is-chapter]:not([is-part]) >
      * [class ~= "topic/title"] {
          string-set:
            chapter:      * | " counters(chapter-and-sections, "." ) * - "
            oxy_xpath("*/@heading.text")  content(),
            section:    ""
```

Note:
This is a rule copied from p-numbering-deep.css and it may change if future versions.

How to Change the Headings depending on the Language

It is possible to customize the text displayed in the headings depending on the language of the publication.
In this case, you can simply use the `@lang` attribute in your customization CSS. In the following example, the page counter displayed in the bottom part of the page is preceded by the word "Page", according to the selected language:

```css
@page chapter {
  @bottom-center {
    content: oxy_xpath("if (@lang='es') then 'Página' 
    else if (@lang='it') then 'Pagina' 
    else 'Page'") " " counter(page);
  }
}
```

**Note:**
Backslashes (`\`) are used to split the XPath into multiple lines to make it easier to read.

### How to Display the Chapter and the Page Number in the Footer

It is possible to display the chapter number along with the page number in the footer of each page. For example, a CC-PP (using a 2-digits numbering) display can be done using the following CSS rules:

```css
*[class =~ "map/map"] *[class =~ "topic/topic"] [is-part] {
  string-set: chapternumber "";
}
*[class =~ "map/map"] *[class =~ "topic/topic"] [is-chapter]:not([is-part]) {
  string-set: chapternumber counter(chapter, decimal-leading-zero);
}
*[class =~ "map/map"] *[class =~ "bookmap/frontmatter"]
*[class =~ "map/map"] *[class =~ "bookmap/backmatter"]
*[class =~ "map/map"] *[class =~ "topic/topic"] [is-part] ~ *[class =~ "topic/topic"]:not([is-part]) {
  string-set: chapternumber "";
}
...
@page chapter {
  @bottom-center {
    content: string(chapternumber) "-" counter(page, decimal-leading-zero);
  }
}
```

### Page Breaks

The page breaks can be controlled in multiple ways:
1. By creating an @page and assigning it to an element will create a page break between this element and the sibling elements that have a different page.

3. In your DITA topic, set the @outputclass attribute on the topic root (or any element) to contain one of the page-break-before, page-break-after, or page-break-avoid values. If you want to control the page breaking from the DITA map, use the @outputclass attribute on the <topicref>, with any of the values mentioned above.

Related Information:
Double Side Pagination (on page 1650)
Oxygen PDF Chemistry: Controlling Page Breaks

Page Breaks - Built-in CSS

Page break properties are used in: [PLUGIN_DIR]css/print/p-page-breaks.css.

How to Avoid Page Breaks in Lists and Tables

To avoid splitting elements over two pages, you can use the page-break-inside CSS property. For example, if you want to impose this on tables and lists, then add the following rules to your customization CSS (on page 1550):

```
* [class ~*="topic/table"] {  
  page-break-inside:avoid;
}
* [class ~*="topic/ol"] {  
  page-break-inside:avoid;
}
* [class ~*="topic/ul"] {  
  page-break-inside:avoid;
}
```

**Note:**
Since the task steps are inherited from topic/ol, they will also not be split over two separate pages. However, if you want to allow this, add the following CSS rule:

```
* [class ~*="task/steps"] {  
  page-break-inside:auto;
}
```

**Note:**
Another way to do this is to mark the element with an @outputclass set to page-break-avoid.
How to Force a Page Break Before or After a Topic or Another Element

If you want to force a page break before all the second-level topics (for example, sections in chapters that are usually kept flowing one after another without page breaks), add the following in your customization CSS (on page 1550):

```css
*{class =~ "map/map"} > *[class =~ "topic/topic"] > *[class =~ "topic/topic"] {
  page-break-before:always;
}
```

If you need to break at third or fourth level topics, add more `. > *[class =~ "topic/topic"]` selectors to the expression.

If you want to force a page break for a specific topic, mark the topic (or any other element you need to control page breaking for) with an `@outputclass` attribute set to one of these values:

- **page-break-before**: Use this for a page break before the marked element.
- **page-break-after**: Use this for a page break after the marked element.
- **page-break-avoid**: Use this to avoid page breaks inside the marked element.

For example, to force a page break before a certain topic, use:

```xml
<topic outputclass="page-break-before" ... >
```

**Note:**

You can set the output class on the `<topicref>` element from the DITA map instead of the `<topic>` element. In this way you can reuse the topic in another context where the page breaking is not necessary.

You can also control page breaking for lists, paragraphs, or any other block type elements. The following example avoids page breaks inside an ordered list:

```xml
<ol outputclass="page-break-avoid" ... >
```

How to Add a Blank Page After a Topic

If you want to add a new blank page after a topic, add the following rules to your customization CSS (on page 1550).

Style the separating blank page:

```css
@page topic-separating-page{
  @top-left {
    content: "";
  }
}
```
Associate this page to the :after pseudo-element of the topic:

```css
*[class~="topic/topic"] [outputclass~="add-separator-page"]:after {
  content: " ";
  display: block;
  page: topic-separating-page;
}
```

In the XML content, on the `<topic>` element, set the @outputclass to the add-separator-page value.

```xml
<topic outputclass="add-separator-page"> ... </topic>
```

The :after pseudo-element will be created next to the topic content and will be placed on the topic-separating-page.

Use the page margin box selectors to override the default content from the headers/footers.

**Note:**
You can set the output class on the `<topicref>` element from the DITA map instead of the `<topic>` element. This allows you to reuse the topic in another context where the page breaking is not necessary.

### How to Enforce a Number of Lines from Paragraphs that Continue in Next Page

In typography, an orphan is the first line of a paragraph that appears alone at the bottom of a page (the paragraph continues on a subsequent page), while a widow is the last line of a paragraph that appears alone at the top of a page. The default is 2 for each of them. You can control this number by adding the following to your customization CSS (on page 1550):

```css
:root {
  widows:4;
  orphans:4;
}
```
Note:
As a difference from the W3C standard, the `widows` and `orphans` CSS properties are applied to lists as well (the default is 2). This means that a list that spans consecutive pages will have either zero or at least 2 lines on each of the pages.

How to Avoid Page Breaks Between Top-Level Topics (Chapters)

If you plan to publish a simple map with just one level of topics (such as a list of topics), then the automated page breaks between these topics might not be desired.

In this case, you can use the following CSS snippet to disable the page breaks between chapters:

```css
*[class *= "topic/topic"]{is-chapter} {
    -oxy-page-group:auto;
}
```

Oxygen PDF Chemistry User Guide: Chapter Page Placement and Styling

Cover (Title) Page

Customizing the cover page is one of the most requested customization requests.

Cover Page - XML Fragment

The merged map file (on page 1553) contains the `<oxy:front-page>` element, as a child of the root element. This contains the metadata and an `<oxy:front-page-title>` element with the title structure.

```xml
<bookmap xmlns:ditaarch="http://dita.oasis-open.org/architecture/2005/" ...>
        <bookmeta xmlns:dita-ot="http://dita-ot.sourceforge.net/ns/201007/dita-ot"
            ...
        </bookmeta>
        <oxy:front-page-title>
            <booktitle xmlns:dita-ot="http://dita-ot.sourceforge.net/ns/201007/dita-ot"
                class="- topic/title bookmap/booktitle ">
                <booklibrary class="- topic/ph bookmap/booklibrary ">Retro Tools</booklibrary>
                <mainbooktitle class="- topic/ph bookmap/mainbooktitle ">Tasks</mainbooktitle>
                <booktitlealt class="- topic/ph bookmap/booktitlealt ">Product tasks</booktitlealt>
            </booktitle>
        </oxy:front-page-title>
    </ oxy:front-page>
</bookmap>
```
For the DITA Map PDF - based on HTML5 & CSS transformation type, the merged map is further processed resulting in a collection of HTML5 `<div>` elements. These elements preserve the original DITA `@class` attribute values and add a new value derived from the DITA element name.

```xml
<div class="- map/map bookmark/bookmap" ... >
  <div class=" front-page/front-page front-page">
    ... 
  </div>
  <div class=" front-page/front-page-title front-page-title">
    <div class="- topic/title bookmark/booktitle booktitle">
      <div class="- topic/ph bookmark/booklibrary booklibrary">
        Retro Tools
      </div>
      <div class="- topic/ph bookmark/mainbooktitle mainbooktitle">
        Tasks
      </div>
      <div class="- topic/ph bookmark/booktitlealt booktitlealt">
        Product tasks
      </div>
    </div>
  </div>
</div>
```

**Cover Page - Built-in CSS rules**

The element with the class `frontpage/frontpage` is associated with a page named `front-page` with no headers or footers. The front page title is styled with a bigger font. The built-in CSS rules are in `[PLUGIN_DIR]/css/print/p-front-page.css`.

```css
@media print {
  *[class="front-page/front-page"] {
    page: front-page;
  }

  /* Prevents the front-page title margin collapsing */
  *[class="front-page/front-page"]::before(1000) {
    display: block;
    content: "\A";
    font-size: 0;
  }

  *[class="front-page/front-page-title"] {
    display: block;
    text-align: center;
    margin-top: 3in;
    font-size: 2em;
    font-family: arial, helvetica, sans-serif;
    font-weight: bold;
  }
}
```
Note:
This is listed solely for illustration purposes, as the plugin might use something different.

How to Add a Background Image for the Cover

The simplest way is to create an SVG image as large as the entire physical page and set it as the background for the `front-page`. This makes it easy to accomplish a good positioning of the graphical elements or artwork. In the foreground, you can place text fragments using a series of `:after` pseudo-elements bound to the front page title.

To set the size to an SVG image, you should specify the `@width` and `@height` attributes on the `<svg>` root element using specified unit values (in, cm, etc.) This should be enough only if all the coordinates from your drawing have unit identifiers.

If you are using unit-less coordinates in your drawing like the following:

```xml
<svg xmlns="http://www.w3.org/2000/svg" width="8.5in" height="11in" viewBox="0 0 600 850">
  <polyone points="17.78 826.21 577.51 ....">
    ...<br>
  </polyone>
</svg>
```

Next, make sure you also specify the `@viewBox` attribute on the `<svg>` root element that defines the abstract rectangle that contains the drawing:

```xml
<svg xmlns="http://www.w3.org/2000/svg" width="8.5in" height="11in" viewBox="0 0 110 110">
</svg>
```

The following SVG document has the `@width`, `@height`, and `@viewBox` attributes. The width and height have physical units (in inches), while the view box and rectangle coordinates are unit-less.

```xml
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE svg PUBLIC "-//W3C//DTD SVG 1.1//EN"
  "http://www.w3.org/Graphics/SVG/1.1/DTD/svg11.dtd">
<svg xmlns="http://www.w3.org/2000/svg" width="8.5in" height="11in" viewBox="0 0 110 110">
</svg>
```
<desc>A gradient as big as a page.</desc>
<defs>
<linearGradient id="lc"
    x1="0%" y1="0%"
    x2="0%" y2="100%"
    spreadMethod="pad">
    <stop offset="0%" stop-color="#00DD00" stop-opacity="1"/>
    <stop offset="100%" stop-color="#00AA00" stop-opacity="1"/>
</linearGradient>
</defs>
<rect x="5" y="5" width="100" height="100" rx="10" ry="10"
    style="fill:url(#lc);
            stroke: #005000;
            stroke-width: 3;"/>
<text x="33%" y="50%" color="#FFFFAA">Sample</text>
</svg>

This example shows a gradient. It is the size of a US-LETTER page and can be used in a publication using this page size.

**Note:**
You can use raster image formats (such as PNG or JPEG), but it is best to use vector images (such as SVG or PDF). They scale very well and produce better results when printed. In addition, the text from these images is searchable and can be selected (if the glyphs have not been converted to shapes) in the PDF viewer.

In your customization CSS *(on page 1550)*, add the following:

```css
@media front-page {
    background-image: url("us-letter.svg");
    background-position: center;
    background-repeat: no-repeat;
    background-size: 100% 100%;
}
```

For smaller artworks, you can use `background-position` with percentage values to position and center the artwork (for example, a company logo):

```css
@media front-page {
    background-image: url("company-logo.svg");
    background-position: 50% 5%; /* The first is the alignment on the X axis, the second on the Y axis. */
    background-repeat: no-repeat;
}
```
Note:
The text from the SVG or PDF background images is searchable in the PDF reader.

How to Display the Background Cover Image Before the Title

It is possible to split the font-page display into two pages so that the background image appears on one page and the title on another. The solution is to define a new page for the main title:

```css
@page front-page {
  @top-left { content: none; }
  @top-right { content: none; }
  @bottom-center { content: none; }

  background-image: url("us-letter.svg");
  background-position: center;
  background-repeat: no-repeat;
  background-size: 100% 100%;
}

@page main-title-page {
  @top-left { content: none; }
  @top-right { content: none; }
  @bottom-center { content: none; }
}

*{class ~= "front-page/front-page-title"}:before {
  display: block;
  content: "\2002";
  margin-bottom: 3in;
}

*{class ~= "front-page/front-page-title"} {
  page: main-title-page;
}
```

How to Use Different Background Cover Images Based on Bookmap or Map Information

It is common to use the same CSS file for customizing multiple publications, and you may need to set a different cover for each of them. The solution is to use an XPath expression to extract some information from the document, and based on that, select the SVG images.

```css
@page front-page {
  background-image: url(oxy_xpath("\n})
```
The backslash (\) is used to continue the expression string on the subsequent lines (there should be no spaces after it). For more use cases solved using XPath, see: Metadata (on page 1608).

Oxygen PDF Chemistry: Graphics

### How to Change Styling of the Cover Page Title

Match the front page title element in your customization CSS (on page 1550) based on its class attribute:

```css
*\[class \~\= "front-page/front-page-title"\] {
    margin-top: 1in;
    font-size: 3em;
}
```

**Important:**

Make sure the sum of the top and bottom margins and paddings for this element do not exceed the physical dimension of the page. If this happens, an extra blank page may appear before the cover page. Usually, it is enough to specify only the top margin.

### How to Add Text to the Cover Page

If you need to add arbitrary text to the cover page, you can use the front page title element as an anchor and add as many blocks of text as you need after it, and style them differently.

In your customization CSS (on page 1550), add the following:

```css
*\[class \~\= "front-page/front-page-title"\]:after(1) {
    display: block;
    content: "DRAFT VERSION";
    font-size: large;
    color: red;
    text-align: center;
}
```

```css
*\[class \~\= "front-page/front-page-title"\]:after(2) {
```
To use content from the document, you can use the `oxy_xpath` function in the `content` property. For a more complex example, including the generation of a new page for the synthetic `:after` elements, see: How to Show Metadata in the Cover Page (on page 1613).

**Related Information:**
How to Show Metadata in the Cover Page (on page 1613)

**How to Place Cover on the Right or Left Side**

In your customization CSS (on page 1550), add the following CSS rules:

```css
*[class = "front-page/front-page"]{
  page-break-before: left;
}
```

**Note:**
This will create an empty page at the beginning of the publication, moving the cover content on the needed side.

For more information, see: Oxygen PDF Chemistry: Controlling Page Breaks.

**Related Information:**
Double Side Pagination (on page 1650)
How to Add a Second Cover Page and Back Cover Page

It is possible to add a second cover page after the front-page by defining another page-selector:

```xml
@page second-cover {
    @top-left {content: none;}
    @top-right {content: none;}
    @bottom-center {content: none;}

    background-image: url("second-cover.svg");
    background-position: center;
    background-repeat: no-repeat;
    background-size: 100% 100%;
}

*[class =~ 'front-page/front-page']:after{
    page: second-cover;
    page-break-after: always;
    display: block;
    content: "\2002";
}
```

If you want to add a back cover page, you should use an :after pseudo element on the map itself:

```xml
*[class =~ "map/map"]:after {
    page: back-cover;
    content: "\2002";
}
```

and bind it to another @page declaration:

```xml
@page back-cover {
    @top-left {content: none;}
    @top-right {content: none;}
    @bottom-center {content: none;}

    background-image: url("back-cover.svg");
    background-position: center;
    background-repeat: no-repeat;
    background-size: 100% 100%;
}

*[class =~ "map/map"]:after {
    page: back-cover;
    content: "\2002";
}
```
Note:
For any `background-image`, it is recommended to use SVG instead of PNG (or JPG) because it scales it to the page size.

Tip:
To add multiple cover pages, use multiple-leveled pseudo selectors, such as `:after(1), :after(2)`. Remember that the larger the value, the more distant the pseudo element is to the target element.

How to Dynamically Add a Second Cover Page

It is possible to dynamically set the path to the SVG image that will be displayed on the secondary cover page.

First, you need to declare a `<data>` element in the `bookmap`'s metadata that contains the URL to your cover image:

```xml
<bookmap>
  <booktitle>...
  </booktitle>
  <bookmeta>
    <metadata>
      <data name="second-cover-url" value="covers/second-cover.svg"/>
    </metadata>
    ...
  </bookmeta>
  ...
</bookmap>
```

Note:
This can also be done on a normal DITA map by using the `<topicmeta>` after the map's `<title>`.

Next, you need to modify the page declaration inside your CSS stylesheet and replace the `background-image` property value with the result of the `oxy_xpath()` function:

```css
@page second-cover {
  ...
  background-image: url(oxy_xpath("//*[contains(@class, 'bookmap/bookmeta')]/*[contains(@class, 'topic/data')][@name='second-cover-url']/@value"));
  ...
}
```
Tip:
You can reuse the same stylesheet on multiple maps. You just need to change the data value for each of them.

How to Add a Specific Number of Empty Pages After the Cover Page

In your customization CSS (on page 1550), add the following CSS rules:

```css
@page my-blank-page {
    /* Hide the page numbers */
    @top-left { content: none; }
    @top-right { content: none; }
}

*[class ~='front-page/front-page']::after(1) {
    page:my-blank-page;
    display:block;
    content: '\2002';
    color:transparent;
    page-break-after:always;
}

*[class ~='front-page/front-page']::after(2) {
    page:my-blank-page;
    display:block;
    content: '\2002';
    page-break-after:always;
}

*[class ~='front-page/front-page']::after(3) {
    page:my-blank-page;
    display:block;
    content: '\2002';
    page-break-after:always;
}
```

Note:
The `\2002` character is a space that is not shown on the pages, but gives a value for the content property.

Related Information:
How to Force an Odd or Even Number of Pages in a Chapter (on page 1652)
How to Add a Copyright Page after the Map Cover (Not for Bookmaps)

Regular DITA maps do not have the concept of a copyright notice. This is available only in the DITA bookmap structure.

If you are constrained to using a regular map and you need to add a copyright page between the front cover and the TOC, use the following technique:

In your customization CSS (on page 1550), declare a new page layout:

```css
@page copyright-notice-page {
 @top-left {
     content:none; /* Clear the headers for the copyright page */
 }
 @top-right {
     content:none;
 }
}
```

The element with the class front-page/front-page element contains the title of the publication and generates the cover page. A synthetic :after element is created that follows this element and it is placed on a different page.

```css
*[class="front-page/front-page"]:after{  
    display:block;
    page: copyright-notice-page; /* Moves the synthetic element on a new page. */
    margin-top:90%; /* use margins to position the text in the page */
    margin-left: 5em;
    margin-right: 5em;
    content: "Copyright 2018-2019 MyCorp Inc. \A All rights reserved";
    text-align:center; /* More styling */
    color:blue;
 }
```

If you need to add more content as blocks, use the :after(2), :after(3) pseudo-elements:

```css
*[class="front-page/front-page"]:after(2){  
    display:block;
    page: copyright-notice-page; /* Continue on the same page as the first ':after'. */
    content: "Some more styled text";
    color:red;
 }
```
If you want to extract information from the document, use the `oxy_xpath()` function. For example, if the copyright info is stored in the map like this:

```xml
<map ...>
   <topicmeta>
      <copyright>
         <copyryear year="2018"/>
         <copyrholder>MyCorp Inc.</copyrholder>
      </copyright>
   </topicmeta>
   ...
</map>
```

then use this:

```css
*([class =~ "front-page/front-page"]):after(3) {
    display: block;
    page: copyright-notice-page;
    content: "Year: \n    oxy_xpath('/*[contains(@class, " front-page/front-page ")]/*/contains(@class, " map/topicmeta ")]/*/contains(@class, " topic/copyright ")]/*/contains(@class, " topic/copyryear ")]/*/@year'"
    "\A Holder: "
    oxy_xpath('/*[contains(@class, " front-page/front-page ")]/*/contains(@class, " map/topicmeta ")]/*/contains(@class, " topic/copyright ")]/*/contains(@class, " topic/copyrholder ")]/*/text()');
    color: green;
}
```

How to Debug XPath Expressions *(on page 1557)*

How to Remove the Cover Page and TOC

If you need to hide or remove the cover page, the table of contents or other structures, match the elements with a "front-page/front-page" and "toc/toc" classes in your customization CSS *(on page 1550)*:

```css
*[class =~ 'map/map'] > *[class =~ 'toc/toc'] {
    display:none !important;
}
*[class =~ 'map/map'] > *[class =~ 'front-page/front-page'] {
    display:none !important;
}
*[class=~'topic/topic'][is-chapter] {
```
How to Add a Cover in Single-Topic Publishing

It is possible to add a cover page before the topic when publishing a single-topic PDF (without a DITA map) using the DITA PDF - based on HTML5 & CSS transformation scenario.

For example, to add a background image before the published topic, you need to create a new `@page` rule and add it in a block before the actual content of the document:

```xml
@page topic-cover {
  @top-left {content: none;}
  @top-right {content: none;}
  background-image: url("img/cover.svg");
  background-position: center;
  background-repeat: no-repeat;
  background-size: 100% 100%;
}
:root::before {
  page: topic-cover;
  display: block;
  content: "\2002";
  page-break-after: always;
}
```

How to Use SVG Templates for Creating Dynamic Cover Pages

It is possible to use XPath expressions inside SVG templates to insert dynamic text when creating PDF output using the DITA Map PDF - based on HTML5 & CSS scenario.

Using SVG Template as a Cover Page

A common use-case is when you want to create a custom cover page and this cover should display metadata information (i.e. the author, dates, and copyright information):

1. In the source `<bookmap>`, the various metadata elements are inserted inside the `<bookmeta>` element:

   ```xml
   <bookmap id="taskbook">
   <booktitle>
     <booklibrary>Retro Tools</booklibrary>
     <mainbooktitle>Product tasks</mainbooktitle>
     <booktitlealt>Tasks and what they can do</booktitlealt>
   </booktitle>
   </bookmap>
   ```
2. The corresponding `merged.html` file will have the following content:

```html
...<div class="- front-page/front-page front-page">
    <div class="- map/topicmeta bookmap/bookmeta topicmeta bookmeta">
        <div class="- topic/author author">Howe Tuduit</div>
        <div class="- topic/critdates critdates">
            <div date="2015-01-01" class="- topic/created created"></div>
            <div modified="2016-04-03" class="- topic/revised revised"></div>
            <div modified="2016-03-05" class="- topic/revised revised"></div>
        </div>
        <div class="- topic/data bookmap/bookrights data bookrights">
            <div class="- topic/data bookmap/copyrfirst data copyrfirst">
                <div class="- topic/ph bookmap/year ph year">2004</div>
            </div>
            <div class="- topic/data bookmap/copyrlast data copyrlast">
                <div class="- topic/ph bookmap/year ph year">2007</div>
            </div>
            <div class="- topic/data bookmap/bookowner data bookowner">
                <div class="- topic/data bookmap/organization data organization">Retro Tools, Inc.</div>
            </div>
        </div>
    </div>
...```
3. The cover image (for example, named `cover.template.svg`) should display `<bookmeta>` node information (author, creation date, and copyright information) and the `<mainbooktitle>` will be displayed rotated.

```xml
<svg version="1.1" id="Layer_1" xmlns="http://www.w3.org/2000/svg"
     xmlns:xlink="http://www.w3.org/1999/xlink" x="0px" y="0px"
     viewBox="0 0 610 790" style="enable-background:new 0 0 610 790;" xml:space="preserve">
  <style type="text/css">
    .st0{fill:url(#SVGID_1_);}
    .st1{opacity:0.31;fill:#FFFFFF;enable-background:new  ;}
    .st2{fill:#FFFFFF;}
    .st3{fill:#F04C3E;}
    .st4{fill:none;stroke:#FFFFFF;stroke-width:0.3685;stroke-miterlimit:2.6131;}
    .st5{font-family:'Arial';}
    .st6{font-size:24.3422px;}
    .st7{font-size:10px;}
    .st8{font-size:63.3422px;font-weight:bold;}
    .st9{fill:#F04C3E;stroke:#000000;stroke-miterlimit:10;}
  </style>
  <linearGradient id="SVGID_1_" x1="305.6" y1="799.9393" x2="305.6" y2="8.9393"
                  gradientUnits="userSpaceOnUse">
    <stop offset="1.848748e-02" style="stop-color:#2F639F"/>
    <stop offset="1" style="stop-color:#1C3E72"/>
  </linearGradient>
  <rect x="0.1" y="0.1" class="st0" width="611" height="791"/>
  <path class="st1" d="M143.4,700.5l381.3-381.3c35.2-35.2,35.2-92.3,
               0-127.5L332.1-0.9H0.1v685.6l115.8,15.8C51.1,735.7,108.2,735.7,143.4,700.5z"/>
  <path class="st2" d="M1.5,617.6c29.2,22.6,71.4,20.5,98.2-6.31351.2-315.2c29.1,29.1,
               76.3,0-105.4L224.8,0.5H1.5V617.6z"/>
</svg>
```
Notes:
◦ XPath expressions are not expanded if the SVG template is open in Author mode.
◦ XPath expressions can be tested (without ${}) using the XPath/XQuery Builder view.
◦ XPath Conditional Expressions, For Expressions, and Let Expressions are supported.

Important:
◦ If you received the SVG image from someone else (e.g. a graphics designer), make sure that the text from the image was not converted to glyph shapes and that it is rendered using the <text> element.
◦ The SVG <text> element does not wrap the text if it overflows the image. If you have longer text that needs to be rendered, you might consider using multiple <text> elements and more evolved XPath expressions (for example, using the substring() function) to place the text on multiple lines.

Tip:
You can ask a designer to fill the image with some placeholders that you can later find and replace with your XPath expressions. In the above SVG, the designer could place the text
4. The CSS stylesheet should declare the template file as a background-image for the cover (on page 1592). Also the following example hides the `<mainbooktitle>` and its bookmark (it is displayed in the template):

```
@page front-page {
  background-image: url("cover.template.svg");
  background-repeat: no-repeat;
  background-size: 100% 100%;
}

*[class ~="bookmap/booktitle"] {
  display: none;
}

*[class ~="front-page/front-page-title"] > *[class ~="bookmap/booktitle"] {
  bookmark-level: 0;
}
```
5. After the transformation, the final document cover will look like this:

![Product tasks](image)

- SVG Templates
Metadata

DITA has a solid vocabulary for specifying metadata. There are `<prolog>` elements in the topics, and `<topicmeta>`, `<bookmeta>` elements in the bookmaps. They can be used to define authors, dates, audiences, organizations, etc. See: https://www.oxygenxml.com/dita/1.3/specs/archSpec/base/metadata-in-maps-and-topics.html

It is up to you to decide where this information should be presented, in the PDF content or in the PDF document properties.

Metadata - XML Fragment

In the merged map file (on page 1553), the metadata section is placed inside the `<oxy:front-page>` element. This is different from the original placement in the map or bookmap (after the title), but allows for the usage of information from it in the title page.

Bookmaps

This is an example of a section taken from a merged bookmap. It only contains some of the possible metadata elements. The `bookmeta` metadata section is inherited from `topicmeta`:

```xml
         xmlns:opentopic-index="http://www.idiominc.com/opentopic/index" cascade="merge"
         ditaarch:DITAArchVersion="1.3">
    <bookmeta xmlns:dita-ot="http://dita-ot.sourceforge.net/ns/201007/dita-ot"
              class="- map/topicmeta bookmap/bookmeta ">
      <author class="- topic/author ">Howe Tuduit</author>
      <bookid class="- topic/data bookmap/bookid ">
        <isbn class="- topic/data bookmap/isbn ">071271271X</isbn>
        <booknumber class="- topic/data bookmap/booknumber ">SG99-9999-00</booknumber>
        <maintainer class="- topic/data bookmap/maintainer ">
          <organization class="- topic/data bookmap/organization ">ACME Tools</organization>
          <person class="- topic/data bookmap/person ">
          </person>
        </maintainer>
      </bookid>
      <bookrights class="- topic/data bookmap/bookrights ">
        ...
      </bookrights>
      <bookowner class="- topic/data bookmap/bookowner ">
        <organization class="- topic/data bookmap/organization ">ACME Tools, Inc.</organization>
      </bookowner>
    </bookmeta>
  </oxy:front-page>
</bookmap>
```
For the DITA Map PDF - based on HTML5 & CSS transformation type, the merged map is further processed resulting in a collection of HTML5 <div> elements. These elements preserve the original DITA @class attribute values and add a new value derived from the DITA element name.

Maps

The maps have a more simple structure, they use the <topicmeta> element for metadata sections. This is also a simplified example, as there may be many more elements in the metadata section:
For the **DITA Map PDF** - based on **HTML5 & CSS** transformation type, the merged map is further processed resulting in a collection of HTML5 `<div>` elements. These elements preserve the original DITA `@class` attribute values and add a new value derived from the DITA element name.
Metadata - Built-in CSS rules

The [PLUGIN_DIR]/css/print/p-meta.css file contains the rules that extract metadata.

How to Create a Searchable PDF

To make a PDF searchable, you need to add some `<keyword>` or `<indexterm>` elements inside bookmaps, maps, or topics. Most of the search engines will parse the resulting document and extract those keywords and create a search base.

**Note:**
Both `<keyword>` and `<indexterm>` elements can be combined inside the `<keywords>` element. They will be equally processed by the search engine.

In the generated PDF, keywords are displayed in the Document Properties.

**Bookmaps**

If you want your keywords to appear inside a bookmap, you need to define them inside the `<bookmeta>` element:

```xml
<bookmap>
    ...
    <bookmeta>
        <keywords>
            <keyword>web server</keyword>
            <keyword>hard disk</keyword>
        </keywords>
    </bookmeta>
</bookmap>
```

**Maps**

If you want your keywords to appear inside a map, you need to define them inside the `<topicmeta>` element:

```xml
<map>
    ...
    <topicmeta>
        <keywords>
            <keyword>flowers</keyword>
            <indexterm>culture and preparation</indexterm>
            <keyword>seasons</keyword>
        </keywords>
    </topicmeta>
</map>
```

**Topics**

If you want your keywords to appear inside one or more topics, you need to define them inside the `<prolog>` element:
<topic>
  ...
  <prolog>
    <metadata>
      <keywords>
        <indexterm>iris</indexterm>
      </keywords>
    </metadata>
    ...
  </prolog>
</topic>

Warning:
Keywords must be at map level or at topic level, you cannot combine them.

How to Add the Publication Audience to the Custom PDF Metadata

The audience element indicates the users the publication is addressing. This can be placed inside a `<topicmeta>` element in a `<map>` as in the following example:

```
<map>
  ...
  <topicmeta>
    ...
    <audience type="programmer" job="programming" experiencelevel="expert"/>
  </topicmeta>
</map>
```

To collect the `@type` attribute, add the following in your customization CSS (on page 1550):

```
*[class ^= "map/map"] > *[class ^= "map/topicmeta"] > *[class ^= "topic/audience"] {
  -oxy-pdf-meta-custom: "Audience" attr(type);
}
```

Notice:
It is best to use the class selector (such as `*[class ^= "map/topicmeta"]`) instead of `topicmeta` to cover cases where the elements are specialized (for instance, in a bookmap the `bookmeta` is a `topicmeta`, so your selector will also function for bookmaps, not only simple maps.

Note:
The selector begins with `map >` to choose the `<topicmeta>` that is a direct child of the map, not other `<topicmeta>` elements from other `<topicref>` elements.

Tip:
You can define multiple key value pairs by separating them with commas:
The metadata is displayed in the **Custom** tab of the **Document Properties** dialog box from Acrobat Reader:

---

The following CSS extensions are used in the subsequent examples:

- **oxy_xpath** - Executes an XPath expression and returns string content. Use this whenever you need to extract data from an element other than the one matched by the CSS rule selector.
- **:after(N)** - Creates more than one *after* pseudo-element. The argument value represents how far the generated content is from the real content. For example, in the second code snippet in the next section (on page 1614), the content of the **:after** is closer to the title (upper) than the content of the **:after(2)**.
Note:
The `attr()` CSS function can also be used but it is limited to extracting attribute values from the matched element.

Processing Metadata for Bookmaps

Suppose you need to present the **Author** and the **ISBN** (when it exists) just under the publication title and suppose your bookmap contains:

```xml
<bookmap id="taskbook">
  <booktitle>
    <booklibrary>Retro Tools</booklibrary>
    <mainbooktitle>Product tasks</mainbooktitle>
    <booktitlealt>Tasks and what they can do</booktitlealt>
  </booktitle>
  <bookmeta>
    <author>Howe Tuduit</author>
    <critdates>
      <created date="1/1/2015"/>
      <revised modified="3/4/2016"/>
      <revised modified="3/5/2016"/>
    </critdates>
    <bookid>
      <isbn>071271271X</isbn>
    </bookid>
  </bookmeta>
  ... 
</bookmap>
```

The entire `<booktitle>` element content is displayed on the first page of the PDF, so if you need to add the information after it, in your customization CSS (on page 1550), add the following CSS rules:

```css
*[class ~="bookmap/booktitle"]:after {
  display: block;
  content: "by " oxy_xpath("//*[contains(@class, " bookmap/bookmeta ")]/*[contains(@class, " topic/author ")]/text()");
  margin-top: 4em;
  text-align: center;
  color: gray;
}
*[class ~="bookmap/booktitle"]:after(2) {
  display: block;
  content: oxy_xpath("if(/*[contains(@class, " bookmap/isbn ")]) then concat("ISBN ", //*[contains(@class, " bookmap/isbn ")]/text()) else "")");
  text-align: center;
}
```
Processing Metadata for DITA Maps

Suppose you need to present the Revision Date just under the publication title and suppose your DITA map contains:

```xml
<map>
  <title>Growing Flowers</title>
  <topicmeta>
    <critdates>
      <revised modified="2021-04-26"/>
    </critdates>
  </topicmeta>
  ...
</map>
```

The entire `<title>` element content is displayed on the first page of the PDF. If you need to add the information after it, add the following CSS rules in your customization CSS (on page 1550):

```css
/*[class =~ "front-page/front-page-title"] > *[class =~ "topic/title"]:after {
  display: block;
  content: "last revision " oxy_xpath("(//*[contains(@class, " map/topicmeta "])][1] */[contains(@class, " topic/revised "])@modified");
  margin-top: 4em;
  text-align: center;
  color: gray;
}
```

**Note:**
The [1] predicate is used to avoid duplicated results as the `topicmeta` is included in all children topics.

Generating Synthetic Pages for Metadata

Suppose you need to show this information on a page that follows the title page, instead of on the title page. In this case, you need to prepare a named page and place the content in it. Add the following rules in your customization CSS (on page 1550):

```css
@page page-for-meta {
  background-color: yellow; /* Just to see it better*/
  @top-left-corner {
    content: ""; /* Remove the default header */
  }
  @top-right-corner {
    content: ""; /* Remove the default header */
  }
```
How to Show Metadata in the Header or Footer

The header and footer are composed of page margin boxes that can be populated with static text by using **string-sets**.

If you need to add some of the map metadata to the header of the front page (for example, the creation date), add the following CSS rules in your customization CSS (on page 1550):

```css
*{class =~ "bookmap/booktitle"}:after {
  page: page-for-meta;
}
*{class =~ "bookmap/booktitle"}:after(2) {
  page: page-for-meta;
}

@page front-page {
  @top-center {
    content: "Created: " string(mapcreated);
  }
}
```

**Note:**
The *front-page* is the name of a page that used to present the element with the class "front-page/ front-page". The above page rule is combined with the default styles.

How to Show Metadata Information (Revision History) in the Topic Prologue

This topic explains how to present metadata information that is normally hidden in the published output. For the example that follows, this will be the revision history list:

```xml
<task id="task_3ml_qm3_rf">
  <title>Removing the battery</title>
  <shortdesc/>
  <prolog>
    <change-historylist>
```
By default, the `<prolog>` element is hidden (display:none) and has several properties that make it collapse, even if the display property is changed.

- It has a transparent color.
- The font has size zero.
- The width and height values are zero.

Start by resetting the prolog properties, but only for prologs that contains a history list. The others will be kept hidden.

```
*{class~="topic/prolog"]:has(*{class~="relmgmt-d/change-historylist"}){

display:block;
color:inherit;
font-size:1rem;
width:auto;
height:auto;
}
```

Next, the following will keep the children of the prolog hidden (other than the change history):

```
*{class~="topic/prolog"]:has(*{class~="relmgmt-d/change-historylist"}) >
*:not(*{class~="relmgmt-d/change-historylist"}) {

display:none;
}
```

The `<change-item>`, `<change-revisionid>`, and `<change-completed>` (like the descendents of the `<change-historylist>`) are specializations of the `<topic/data>` element and are also hidden in the output, so you need to make them visible. In the following selector, you can add more classes, depending on what elements you want to be visible.

```
*{class~="relmgmt-d/change-item"},
*{class~="relmgmt-d/change-revisionid"},
*{class~="relmgmt-d/change-completed"} {

display:block;
}
```
Now some styling for the entire list:

```
*{class~="relmgmt-d/change-historylist"} {
  font-size:1rem;
  border:3pt solid silver;
  padding:0.5em;
}
*{class~="relmgmt-d/change-historylist"]:before {
  content: "Revision History:";
  font-weight:bold;
}
```

And the child elements:

```
/* Example of styling some of the descendends of the history list. */
*{class="relmgmt-d/change-item"} {
  margin:1em;
}
*{class="relmgmt-d/change-revisionid"]:before {
  content: "Revision ID: " !important;
  font-weight:bold;
}
*{class="relmgmt-d/change-completed"]:before {
  content: "Completed: " !important;
  font-weight:bold;
}
```

In the output, the history list is now visible:

```
Removing the battery
```

```
Revision ID: abd3
Completed: Build no 1.
Revision ID: bc72
Completed: Build no 2.
```

**How to Remove or Change the PDF Keywords**

The keywords defined in the prolog sections of topics are automatically collected and set as PDF keywords. These are shown by the readers in the PDF document properties window.

If you need to remove them, you can use the following CSS snippet in your customization CSS (on page 1550):

```
/* Example of styling some of the descendends of the history list. */
*{class="relmgmt-d/change-item"} {
  margin:1em;
}
*{class="relmgmt-d/change-revisionid"]:before {
  content: "Revision ID: " !important;
  font-weight:bold;
}
*{class="relmgmt-d/change-completed"]:before {
  content: "Completed: " !important;
  font-weight:bold;
}
```
To change them, if you have a hard-coded list, you just enumerate each of them in the property content, separating them with comma:

`:root {
-oxy-pdf-meta-keywords: "alpha, beta, gamma";
}`

If you need to extract them by other criteria from the merged map, you can use the `oxy_xpath()` function instead of the hard-coded list.

### How to Remove the PDF Publication Title Property

The title defined in the PDF reader is automatically collected from the map's main title.

If you want to display the map name instead of the title, you can use one of the following rules in your customization CSS *(on page 1550)*:

```css
/*
* Titles (maps).
*/
*[class =~ "front-page/front-page-title"] *[class =~ "topic/title"]:not([class =~ 'bookmap/booktitle']) {
    -oxy-pdf-meta-title: unset;
}

/*
* Titles (bookmaps).
*/
*[class =~ "front-page/front-page"] *[class =~ "bookmap/booktitle"] > *[class =~ "bookmap/mainbooktitle"] {
    -oxy-pdf-meta-title: unset;
}
```

### How to Change the PDF Publication Title Property

The `<title>` element of a bookmap is quite complex and contains elements for the book library and an alternate title:

```xml
<booktitle>
    <booklibrary>Retro Tools</booklibrary>
    <mainbooktitle>Main Book Title</mainbooktitle>
    <booktitlealt>Book Title Alternative</booktitlealt>
</booktitle>
```
For the publication title, the built-in CSS uses only the content of the `<mainbooktitle>`. If you want to collect all of the text from the `<booktitle>`, you can add the following rule to your customization CSS (on page 1550):

```css
:root {
  -oxy-pdf-meta-title: oxy_xpath('//*[contains(@class, "bookmap/booktitlealt")]')[1]/text();
  -oxy-pdf-meta-description: "";
}
```

An XPath expression is used to collect all the `<booktitlealt>` elements from the merged map, select the first one, then use its text.

The built-in CSS uses the `<booktitlealt>` as the PDF description. In the example above, this property is cleared since it was moved as a title.

## How to Use Data Elements from the Map to Create Custom PDF Metadata

To use a key value in the CSS, the key must be referenced from the content (either a topic or map). If you do not have it referenced, you may force a reference by using the `<topicmeta>` or `<bookmeta>` section of your map and a `<data>` element. This has no effect on the published content, but allows the CSS rules to use its content.

```xml
<bookmeta>
  ....
  <data keyref="my_key"/>
  ....
</bookmeta>
```

This is expanded in the merged HTML file to:

```html
<div class="- map/topicmeta bookmap/bookmeta topicmeta bookmeta">
  ...
  <div keyref="my_key" class="- topic/data data">
    <div class="- topic/keyword keyword">KEY VALUE</div>
  </div>
  ...
</div>
```

Suppose that you need the expanded key value in the footer of the publication. You can define a string-set on this `<data>` element:

```css
*[class =~ "topic/data"]|keyref="my_key"] {  
  string-set: key-string content(text);
}
@page {  
  @bottom-left {
    content: "My key is: " string(key-string) !important;
  }
```
Or you can use the value from a :before pseudo-element, like the one for the title:

```css
*:～="topic/title":before {
  content: oxy_xpath("//*[contains(@class, 'topic/data')][@keyref = 'my_key']//text()");
}
```

Another use-case is to use the key as a source for a custom PDF document property:

```css
*:～="topic/data"[keyref="my_key"] {
  -oxy-pdf-meta-custom: attr(keyref) content(text);
}
```

### How to Control the PDF Viewer

The PDF document may contain settings for the PDF Viewer. This helps to make the viewing experience common for all of the readers. For example, you can specify the zoom level that the document is presented, or whether the outline view should be displayed.

There are several CSS properties you can use. These properties should be set on the root element. If they are set on multiple elements, the first one will be taken into account.

**Examples**

- To hide the PDF Viewer toolbar and menu bar:
  ```css
  :root {
    -oxy-pdf-viewer-hide-menubar: true;
    -oxy-pdf-viewer-hide-toolbar: true;
  }
  ```

- To make the document be displayed with a different zoom level:
  ```css
  :root {
    -oxy-pdf-viewer-zoom: 50%;
  }
  ```

- To make the PDF Viewer just as large as the displayed document (e.g. if there is a zoom level that makes the document smaller, then the window of the viewer will be just as big as the page):
  ```css
  :root {
    -oxy-pdf-viewer-fit-window: true;
  }
  ```

- If you need the pages to be displayed as a single continuous column (to be able to scroll in a single view port), use:
The supported include: single-page, two-columns-left, and more.

- To make the document outline view visible, use:

```xml
:root {
  -oxy-pdf-viewer-page-mode: use-outlines;
}
```

The supported values include: use-thumbs, use-none. For more details, see the list of Chemistry extension CSS properties.

**Front Matter and Back Matter**

The *front matter* is a series of topics that are usually placed after the cover page and before the TOC or the content.

The *back matter* is a series of topics that are usually placed after the content of the book.

**Front Matter and Back Matter - XML Fragment**

In the merged map file *(on page 1553)*, the *frontmatter* topic references are wrapped in a `<frontmatter>` element that has the class `bookmap/frontmatter`. Then, the referenced content is marked with the attribute `@is-frontmatter="true"`:

```xml
<bookmap xmlns:ditaarch="http://dita.oasis-open.org/architecture/2005/" ...>
  <oxy:front-page class="- front-page/front-page ">
    ...
  </oxy:front-page>
  <opentopic:map xmlns:ot-placeholder="http://suite-sol.com/namespaces/ot-placeholder" class="- toc/toc ">
    ...
    <frontmatter xmlns:dita-ot="http://dita-ot.sourceforge.net/ns/201007/dita-ot" class="- map/topicref bookmap/frontmatter ">
      ...
    </frontmatter>
  </opentopic:map>
  <concept class="- topic/topic concept/concept " is-frontmatter="true"
    topicrefclass="- map/topicref bookmap/bookabstract ">
    ...
  </concept>
</bookmap>
```
For the **DITA Map PDF - based on HTML5 & CSS** transformation type, the merged map is further processed resulting in a collection of HTML5 `<div>` elements. These elements preserve the original DITA `@class` attribute values and add a new value derived from the DITA element name.

```
<div xmlns:ditaarch="http://dita.oasis-open.org/architecture/2005/" ...
     <div class=" front-page/front-page front-page">
         ...
     </div>
</div>
<div class="- toc/toc toc">
     <div class="- map/topicref bookmark/bookfrontmatter topicref frontmatter">
         <div href="#unique_2" type="topic" class="- map/topicref topicref">
             ...
         </div>
     </div>
</div>
<article class="- topic/topic concept/concept topic concept nested0"
     is-frontmatter="true"
     topicrefclass="- map/topicref bookmap/bookabstract " ...
```

**Note:**

The process also applies for the backmatter topic references inside a `<backmatter>` element with the `bookmap/backmatter` class and referenced content with the `@is-backmatter="true"` attribute both in the merged map and merged HTML files.

**Front Matter and Back Matter - Built-in CSS**

The built-in CSS rules are in `[PLUGIN_DIR]/css/print/p-bookmap-frontmatter-backmatter.css`. By default, it associates the top-level topics that do not represent chapters to a `matter-page` style of page layout. Each child topic starts on a new page.

**Related Information:**

Page Headers and Footers *(on page 1565)*

**How to Remove Page Breaks Between Front Matter Child Topics**

If you do not like the fact that all the topics that enter a bookmark frontmatter start on a new page, you can disable this by using the following rules in your customization CSS *(on page 1550)*:

```
*{class := "map/map"] > *[class := "topic/topic"]{is-frontmatter}[
    page-break-before: auto;
}
```
How to Style the Front Matter and Back Matter Topics

Style all the Topics with the Same Aspect

All the topics referenced from the `<frontmatter>` and `<backmatter>` bookmap elements are formatted using the `matter-page` as defined in Default Page Definitions *(on page 1558)*. In the merged file, the `<backmatter>` and `<frontmatter>` elements are omitted, and their child topic content is matched using a CSS rule like the one below:

```css
*{class ~="map/map"] > *{class ~="topic/topic"]{is-backmatter],
*{class ~="map/map"] > *{class ~="topic/topic"]{is-frontmatter]{
  page: matter-page;
  ...
}
```

Style the Topics Depending on Their Role

There might be cases when you need to distinguish between certain types of topics that have different roles in your publication:

- Preface
- Notice
- Abstract
- Copyright

These are referenced from the DITA map by specialized `<topicref>` elements, with different class attribute values.

The class attribute values are then passed by the transformation process onto the corresponding topic elements from the merged map content. For example, a topic that was referenced by a `<preface>` map element now has a "bookmap/preface" value in its `@topicrefclass` attribute:

```xml
<topic
  class="- topic/topic ">
  id="unique_1"
  topicrefclass="- map/topicref bookmap/preface ".>
  ...
</topic>
```

This can be used to match and apply various styling choices, or even a particular page layout:

```xml
@page preface-page {
  background-color:silver;
  @top-center{
    content: "Custom Preface Header";
  }
}
```
Numbering

The topics in this section contain some technical details in case you need to fine-tune the way the numbering works.

Numbering - Built-in CSS

The built-in CSS rules are in:

- [PLUGIN_DIR]/css/print/p-numbering-shallow.css
- [PLUGIN_DIR]/css/print/p-numbering-deep.css
- [PLUGIN_DIR]/css/print/p-numbering-deep-chapter-scope.css
- [PLUGIN_DIR]/css/print/p-numbering-deep-chapter-scope-no-page-reset.css

The first CSS (shallow) contains rules that add a "Chapter NN" before the first-level topics from the publication, the second one (deep) contains rules that add a deep structure of counters on all topics referenced from the map (at any level), the third one (chapter-scope) creates a chapter scope-oriented numbering (meaning that the numbering for pages, tables, figures, and links to them are reset for each chapter), and the last one is similar to the third except that page numbers do not reset. For more details, see Numbering Types (on page 1629).

Numbering - Input XML Fragments

The numbering affects multiple logical parts of your publication, the table of contents, headers/footers, chapter titles, figures and tables titles:

The Table of Contents

The table of contents is a tree of <topicref> elements.

```xml
<map xmlns:ditarch="http://dita.oasis-open.org/architecture/2005/" ...

    class=" front-page/front-page ">

    ...

</oxy:front-page>

<opentopic:map xmlns:opentopic="http://www.idiominc.com/opentopic" class=" toc/toc">

    <title class="- topic/title ">Publication Title</title>

    <topicref is-chapter="true" class="- map/topicref "> ... </topicref>

    <topicmeta class="- map/topicmeta "> ... </topicmeta>

    <navtitle href="#unique_1" class="- topic/navtitle ">Overview</navtitle>

    ...
```
Note:
The <opentopic:map> element contains the effective table of contents structure.

Note:
The TOC items are the elements with the class: - map/topicref.

Note:
The ones identified as chapters have the @is-chapter attribute set.

For the DITA Map PDF - based on HTML5 & CSS transformation type, the merged map is further processed resulting in a collection of HTML5 <div> elements. These elements preserve the original DITA @class attribute values and add a new value derived from the DITA element name.
The Header and Footers

These are based on string sets generated for the titles. The complete set of strings is defined in: [INSTALLATION_DIR]/css/print/p-pages-and-headers.css.

The CSS rules that build the string sets are matching the map title from the front page and the titles from the content.

For the DITA Map PDF - based on HTML5 & CSS transformations:

The main content is organized as follows:
For the **DITA Map PDF - based on HTML5 & CSS** transformations:

```xml
<opentopic:map>
  ...
  <opentopic:toc>
    ...
  </opentopic:toc>
  ...
</opentopic:map>
```

**Note:**

The topic content comes after the `<opentopic:map>` element.

**Note:**

The child topics are the elements that have the class `- topic/topic` included in the parents.

**Note:**

The ones identified as chapters have the `@is-chapter` attribute set.

**The Titles of Chapters**

The titles from the content are children of the topics:
Numbering Types

The type of numbering that appears in your publication is controlled by the `args.css.param.numbering` parameter.

This parameter activates various sets of CSS rules from the built-in CSS. By default, only the first-level topics (the chapters) are numbered (shallow numbering). The following values are accepted:

<table>
<thead>
<tr>
<th>Value</th>
<th>Chapters</th>
<th>Sections/ Nested Topics</th>
<th>Figures &amp; Tables</th>
<th>Pages</th>
</tr>
</thead>
<tbody>
<tr>
<td>shallow</td>
<td>numbered</td>
<td>no</td>
<td>counted from the start of the publication</td>
<td>from the start of the publication</td>
</tr>
<tr>
<td>deep</td>
<td>numbered</td>
<td>numbered</td>
<td>counted from the start of the publication</td>
<td>from the start of the publication</td>
</tr>
<tr>
<td>deep-chapter-scope</td>
<td>numbered</td>
<td>numbered</td>
<td>numbering is restarted at the beginning of each chapter, adds the chapter number in their titles (and in the links to them), and in the list of tables and list of figures sections</td>
<td>restarted at the beginning of each chapter</td>
</tr>
<tr>
<td>deep-chapter-scope-no-page-reset</td>
<td>numbered</td>
<td>numbered</td>
<td>numbering is restarted at the beginning of each chapter, adds the chapter number in their titles (and in the links to them), and in the list of tables and list of figures sections</td>
<td>from the start of the publication</td>
</tr>
</tbody>
</table>

Note:
The title elements have the class `- topic/title`. The actual element name can be different.
Table 41. Types of Numbering (continued)

<table>
<thead>
<tr>
<th>Value</th>
<th>Chapters</th>
<th>Sections/Nested Topics</th>
<th>Figures &amp; Tables</th>
<th>Pages</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
<td>of tables and list of figures sections</td>
<td></td>
</tr>
</tbody>
</table>

![Note:
When using any of the deep numbering types, no distinction is made between sections and nested topics. For example, if a topic contains two sections, followed by another nested topic, the sections will be numbered with 1 and 2, and the nested topic with 3.

![Notice:
The deep-chapter-scope and deep-chapter-scope-no-page-reset values are only available for the DITA Map PDF - based on HTML5 & CSS transformation scenario.

Examples

Shallow

Each chapter (or first-level topic) is numbered, but sections/nested topics are not numbered. Figures, tables, and pages are numbered sequentially from the start of the publication and they do not reset.

Chapter 1. First Chapter
  Page 1
  Topic
    Section
    Table 1
    Table 2
  Topic
    Section
  Page 2
  Table 3
Chapter 2. Second Chapter
  Page 3
  Topic
    Table 4
    Table 5
  Topic
  Page 4

It will result in the following content inside the PDF:
Chapter 1. Introduction......................................................................1
Chapter 2. Care and Preparation..............................................................2
  Pruning.........................................................................................2
  Garden Preparation.........................................................................3
Chapter 3. Flowers by Season.................................................................4
  Spring Flowers........................................................................4
  Iris.........................................................................................4
  Snowdrop.................................................................................6
...

List of Figures
  Figure 1: Iris

List of Tables
  Table 1: Flowers

Deep

All chapters (or first-level topics) and sections/nested topics are numbered (these are also
prefixed with the chapter number). Figures, tables, and pages are numbered sequentially from
the start of the publication and they do not reset.

1. First Chapter
  Page 1
    Topic 1.1
      Table 1
    Topic 1.2
      Table 2
  Page 2
    Table 3
  2. Second Chapter
    Page 3
      Topic 2.1
      Table 4
      Table 5
      Topic 2.2
    Page 4

It will result in the following content inside the PDF:

1. Introduction......................................................................................1
2. Care and Preparation.........................................................................2
  2.1. Pruning..................................................................................2
  2.2. Garden Preparation...................................................................3
3. Flowers by Season...........................................................................4
Deep Chapter Scope

Each chapter (or first-level topic) is independent (so it can be read separately, as a separate part of your publication). The sections/nested topics, pages, figures, and table counters (and links to them) restart at each chapter. The general cross reference links also display the chapter number before the page number to clearly specify the target.

It will result in the following content inside the PDF:

1. Introduction.................................................................1
2. Care and Preparation.....................................................1
   2.1. Pruning...............................................................1
   2.2. Garden Preparation...............................................2
3. Flowers by Season.......................................................1
   3.1. Spring Flowers....................................................1

List of Figures

Figure 1: Iris

List of Tables

Table 1: Flowers
Deep Chapter Scope No Page Reset

Each chapter (or first-level topic) is independent (so it can be read separately, as a separate part of your publication). The sections/nested topics, figures, and table counters (and links to them) restart at each chapter, but the page numbers do not reset. The generic cross reference links contain only the page number.

1. First Chapter
   Page 1
   Topic 1.1
   Table 1-1
   Link to page 4
   Topic 1.2
   Page 2
   Table 1-2

2. Second Chapter
   Page 3
   Topic 2.1
   Table 2-1
   Table 2-2
   Table 2-3
   Topic 2.2
   Table 2-4
   Page 4
   Link to page 1

It will result in the following content inside the PDF:

1. Introduction.................................................................1
2. Care and Preparation....................................................2
   2.1. Pruning.................................................................2
   2.2. Garden Preparation................................................3
3. Flowers by Season.......................................................4
   3.1. Spring Flowers.....................................................4
   3.1.1. Iris.................................................................4
3.1.2. Snowdrop.................................................................6
...

Table 2-1: Flowers

Tip:
When using deep numbering, if you want to exclude sections from being numbered, see How to Include Topic Sections in TOC (on page 1636).

How to Reset Page Numbering at First Chapter/Part

By default, pages are numbered from the start of the publication, but in some cases, you may need to restart the page numbering at the first chapter of your publication.

Warning:
The following sections do not apply for `args.css.param.numbering="deep-chapter-scope"` because it already define a specific numbering scheme that resets the page number at each chapter.

Reset Page Numbering in Shallow Context

To reset the page counter at the first part/chapter when the `args.css.param.numbering="shallow"` parameter value is set, use the following rules in your customization CSS (on page 1550):

```css
*[class =~ "map/map"] > :not([class =~ "topic/topic"] [is-chapter]) + *[class =~ "topic/topic"] [is-chapter] {
  counter-reset: page 1;
}
*[class =~ "map/map"] > :not([class =~ "topic/topic"] [is-part]) + *[class =~ "topic/topic"] [is-part] {
  counter-reset: page 1 chapter;
}
```

Reset Page Numbering in Deep Context

To reset the page counter at the first part/chapter when the `args.css.param.numbering="deep"` parameter value is set, use the following rules in your customization CSS (on page 1550):

```css
*[class =~ "map/map"] [numbering =~ 'deep'] > :not([class =~ "topic/topic"] [is-chapter]) + *[class =~ "topic/topic"] [is-chapter] {
  counter-reset: page 1 section1;
```
Reset Page Numbering in Deep Chapter Scope No Page Reset Context

To reset the page counter at the first part/chapter when the `args.css.param.numbering="deep-chapter-scope-no-page-reset"` parameter value is set, use the following rules in your customization CSS (on page 1550):

```css
/*[class ~="map/map"] [numbering ^='deep'] > :not([class ~="topic/topic"] [is-part]) + *[class ~="topic/topic"] [is-part] {
    counter-reset: page 1 chapter chapter-and-sections;
}
```

How to Use Part, Chapter, and Subtopics Numbers in Links

This topic is applicable if you have enabled deep numbering (on page 1629). Suppose you have a link in the third chapter that points to a paragraph in the second subtopic of the first chapter and you need this structural information (1.2) presented to the user, just after the link text. To do this, you can use the `target-counters` CSS function to extract the entire context of the counters from the target. The `chapter-and-sections` built-in counter is already updated with both the chapter number and the nested topics:

```css
/*[class ~="topic/xref"] :after {
    content: target-counters(attr(href), chapter-and-sections, ".") !important;
}
```

This counter does not include the part number, so be careful when linking between parts (consider adding the target part number explicitly):

```css
/*[class ~="topic/xref"] :after {
    content: "[" target-counter(attr(href), part, upper-roman) "/" target-counters(attr(href),
    chapter-and-sections, ".") "]" !important;
    color:blue;
}
```

Related Information:

Numbering Types (on page 1629)
How to Include Topic Sections in TOC

To include topic sections in the table of contents, set the `args.css.param.numbering-sections` transformation parameter (on page 1527) to yes. In this case, they are numbered according to the numbering scheme set by the `args.css.param.numbering` parameter (on page 1629).

If you want to prevent topic sections from being numbered in your output, set the value of the `args.css.param.numbering-sections` parameter to no.

Table of Contents

The table of contents is a hierarchy of topic titles with links to the topic content.

For plain maps, the TOC is automatically generated. For DITA bookmaps, you will need to add a `<toc>` element in the `<booklists>` element (inside the `<frontmatter>`):

```xml
<bookmap>
  ...
  <frontmatter>
    ...
    <booklists>
      <toc/>
      <figurelist/>
      <tablelist/>
    </booklists>
  </frontmatter>
  ...
  ...
</bookmap>
```

Related Information:
Table of Contents on a Page (Mini TOC) (on page 1643)
List of Tables/Figures (on page 1648)
Index (on page 1657)

Table of Contents - XML Fragment

In the merged map file (on page 1553), the `<opentopic:map>` contains a hierarchy of `<topicref>` elements, or other elements (such as `<chapter>` or `<part>`) that are specializations of `<topicref>`.

Each of the `<topicref>` elements include a `metadata` section that includes the topic title.
For the DITA Map PDF - based on HTML5 & CSS transformation type, the merged map is further processed resulting in a collection of HTML5 `<div>` elements. These elements preserve the original DITA `@class` attribute values and add a new value derived from the DITA element name.
Note:
The `<oxy:toc-title>` element is used as a placeholder for the name of the TOC. For instance, you can use the string "Contents", specified on a pseudo-element, in the CSS.

Table of Contents - Built-in CSS

The built-in CSS rules are in: `[PLUGIN_DIR]/css/print/p-toc.css`.

Related Information:
Page Headers and Footers (on page 1565)

How to Increase TOC Depth

By default, only the first three levels of topics are displayed in the Table of Contents of the PDF output.

The CSS rule (see Table of Contents - Built-in CSS (on page 1638)) that hides topics on higher levels is:

```css
/* Hide sections below level 3. */
*[class =~ "map/topicref"] [is-chapter] >
*[class =~ "map/topicref"]:not([is-chapter]) >
*[class =~ "map/topicref"] >
*[class =~ "map/topicref"] {
/* */
```
If you want to increase the TOC depth so that topic references on level 3 or higher are visible, you can overwrite this rule in your customization CSS like this:

```css
*{[class =~ "map/topicref"]}{
  display: block;
}
```

If the `args.css.param.numbering` parameter is set to a value other than `shallow`, you also need to add the following rules in your customization CSS:

```css
*{[class =~ "map/map"]}{
  counter-increment: toc-chapter-and-sections;
}
```

```css
*{[class =~ "map/topicref"]}{
  counter-reset: toc-chapter-and-sections;
}
```

```css
*{[class =~ "map/topicref"]}{
  content: counters(toc-chapter-and-sections, ".") ". ";
}
```
How to Style the Table of Contents Entries

Note:
Each of the items from the table of contents is an element that has the `map/topicref` class.

The following example uses the italic font for the label and changes the color and style of the connecting line between the title and the page number.

In your customization CSS (on page 1550), add the following two selectors:

```css
/* The toc item label - the topic title */
*[class ~='map/topicref'] *[class ~='topic/navtitle'] {  
  font-style:italic;
  color: navy;
}

/* The dotted line between the topic name and the page number. */
*[class ~='map/topicref'] *[class ~='topic/navtitle']:after {
  content: leader('-') target-counter(attr(href), page);
  color: navy;
}
```

And if you need to alter the indent of the nested table of content items, use the following selector:

```css
*[class ~='map/topicref'] *[class ~='map/topicref'] {  
  margin-left: 1em;
}
```

The numbers can be styled like this:

```css
*[class ~='map/topicref'] > *[class ~='map/topicmeta']:before,
*[class ~='map/topicref']
  > *[class ~='map/topicmeta'] > *[class ~='topic/navtitle']:before{
    color:blue;
}
```

The following is an example of customizing the font size for the items representing chapters. The chapters are level one topics and are marked in the merged DITA document TOC with the attribute `@is-chapter`.

```css
*[class ~='map/topicref'][is-chapter = 'true'] > *[class ~='map/topicmeta'] > *[class ~='topic/navtitle']{
  font-size:2em;
}
```
How to Change the Header of the Table of Contents

In the built-in CSS, there is a page named `table-of-contents`. The default is to have the word 'Contents' in its header (this is localized, using the `toc-header` string defined in the `p-18n.css`) alternating in the left or right side of the header:

```css
@page table-of-contents:left {
  @top-left {
    content: string(toc-header) " | " counter(page, lower-roman);
    font-size: 8pt;
  }
}
@page table-of-contents:right {
  @top-right {
    content: string(toc-header) " | " counter(page, lower-roman);
    font-size: 8pt;
  }
}
```

If you need to change this string, or change the color, you should use the following `@page` selectors as a starting point in your customization CSS (on page 1550):

```css
@page table-of-contents:left {
  @top-left {
    content: "My publication table of contents | " counter(page, lower-roman);
    color:red;
  }
}
@page table-of-contents:right {
  @top-right {
    content: "My publication table of contents | " counter(page, lower-roman);
    color:red;
  }
}
```

⚠️ Important:

The first page from the table of contents does not have any content displayed in the header. The default CSS contains rules that disable the content. If you need to also display the numerals on the first page, use the following:

```css
@page table-of-contents:first:left {
  @top-left {
    content: string(toc-header) " | " counter(page, lower-roman);
  }
}
```
How to Make the Table of Contents Start on an Odd Page

In your customization CSS (on page 1550), add the following snippet for the table-of-contents page:

```css
@page table-of-contents {
  -oxy-initial-page-number: auto-odd;
}
```

How to Display a Topic Before the Table of Contents

To display a topic before the table-of-contents page, follow these steps:

1. Make sure the topic is referenced on the first level in the DITA map.
2. Set the `@outputclass` to `before-toc` on the `<topicref>`.

```
<topicref href="pathToMyTopic" outputclass="before-toc">
```

Result: When the PDF is processed, the topic will automatically appear before the table of contents.

How to Display Short Descriptions in the TOC

To display the short descriptions from the topics in the table of contents, you need to make the `<shortdesc>` element visible.

The following example only makes the short descriptions associated with the chapters visible. The chapters are level one topics and are marked in the merged DITA document TOC with the attribute `@is-chapter`.

In your customization CSS (on page 1550), add the following CSS selector:

```css
*[class ~="map/topicref"]{is-chapter = "true"} > *[class ~="map/topicmeta"] > *[class ~="map/shortdesc"] { 
```
How to Remove Entries from the TOC

To remove entries from the table of contents, set the `@toc="no"` attribute on the `topicrefs` from the map that need to be removed. This is sometimes desirable for the topics listed in the frontmatter or backmatter when using a bookmap.

How to Hide the TOC

To hide the TOC, you have multiple options:

- [Recommended] Use a DITA `<bookmap>` instead of a `<map>`, and omit the `<toc>` element from the `<booklists>`. An example bookmap can be found in the DITA 1.3 Spec.
- Use the transformation parameter: `hide.frontpage.toc.index.glossary` (on page 1532).
- Use a `display:none` property to hide the element that contains the TOC structure, and also remove it from the PDF bookmarks tree:

  ```css
  *[class ~="map/map"] > *[class ~="toc/toc"] { display:none; }
  *[class ~="map/map"] > *[class ~="toc/toc"] > *[class ~="toc/title"] { bookmark-label: none; -ah-bookmark-label: none; }
  ```

Related Information:
Transformation Parameters (on page 1527)

Table of Contents on a Page (Mini TOC)

To add a mini table of contents for each chapter, you need to:

- Use DITA bookmaps instead of regular maps.
- Set the `args.chapter.layout` transformation parameter to either of the following values: MINITOC or MINITOC-BOTTOM-LINKS.
Note: If the chapter does not have child topics, it will not have a mini TOC in the PDF output.

Layout for MINITOC

This table of contents is positioned between the chapter title and the chapter child topics. It consists of a list of links pointing to the child topics, positioned in the left side of the page, and a description in the right side. This content is collected from the topic file referenced by the chapter `<topicref>` in the map.

### Chapter 1. Introduction

**Topics:**

- About this framework.
- Description

<table>
<thead>
<tr>
<th>About this framework.</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>The framework is DITA.</td>
<td>The framework is composed by a large set of modules.</td>
</tr>
</tbody>
</table>

Layout for MINITOC-BOTTOM-LINKS

This table of contents is positioned between the chapter title and the chapter child topics. It consists of a chapter description and list of links pointing to the child topics, under the description. This description is collected from the topic file referenced by the chapter `<topicref>` in the map.
Chapter 1. Introduction

DITA Open Toolkit, or DITA-OT for short, is a set of Java-based, open-source tools that provide
processing for content authored in the Darwin Information Typing Architecture.

The DITA Open Toolkit documentation provides information about installing, running, configuring
and extending the toolkit.

Topics:

- About this framework.
- Description

About this framework.

The framework is DITA.

Description

The framework is composed by a large set of modules.

The above chapter example has the following DITA map fragment:

```xml
<chapter href="topics/chapter-introduction.dita">
  <topicref href="topics/introduction-about.dita" />
  <topicref href="topics/introduction-description.dita" />
</chapter>
```

The `chapter-introduction.dita` file provides the description content that is in the right side of the page.
The children `<topicref>` elements generate the mini TOC links.

Table of Contents for Chapters (Mini TOC) - XML Fragment

In the merged XML file, the mini TOC is built from a related links section and some `<div>` elements that wrap
the entire mini TOC and the description area.

- `chapter/minitoc`
  Wraps the entire structure, including the content of the chapter `<topicref>`.

- `chapter/minitoc-links`
  Wraps the `<related-links>` element. Note that the label of the related links list is internationalized.
chapter/minitoc-desc

Contains the entire content of the topic file referenced by the chapter `<topicref>` element in the map.

```
<div class="- topic/div chapter/minitoc ">
  <div class="- topic/div chapter/minitoc-links ">
    <related-links class="- topic/related-links ">
      <linklist class="- topic/linklist ">
        <desc class="- topic/desc ">
          <ph class="- topic/ph chapter/minitoc-label ">Topics: </ph>
        </desc>
        <link class="- topic/link " href="#unique_2" type="topic" role="child">
          <linktext class="- topic/linktext ">About this framework.</linktext>
        </link>
        <link class="- topic/link " href="#unique_3" type="topic" role="child">
          <linktext class="- topic/linktext ">Description</linktext>
        </link>
      </linklist>
    </related-links>
  </div>
  <div class="- topic/div chapter/minitoc-desc ">
    <shortdesc class="- topic/shortdesc ">DITA Open Toolkit, or DITA-OT for short, is a set of Java-based, open-source tools that provide processing for content authored in the Darwin Information Typing Architecture</shortdesc>
    <body class="- topic/body ">
      <p class="- topic/p ">The DITA Open Toolkit documentation provides information about installing, running, configuring and extending the toolkit.</p>
    </body>
  </div>
</div>
```

When using the `pdf-css-html5` transformation, this structure is converted to a set of HTML elements, preserving the class values:

```
<div class="- topic/div chapter/minitoc div minitoc">
  <div class="- topic/div chapter/minitoc-links div minitoc-links"/>
  <nav role="navigation" class="- topic/related-links related-links">
    Topics: </nav>
</div>
```
DITA Open Toolkit, or DITA-OT for short, is a set of Java-based, open-source tools that provide processing for content authored in the Darwin Information Typing Architecture.

The DITA Open Toolkit documentation provides information about installing, running, configuring and extending the toolkit.

Table of Contents for Chapters (Mini TOC) - Built-in CSS

The built-in CSS rules are in: [PLUGIN_DIR]/css/print/p-chapters-minitoc-desc.css.

How to Style the Table of Contents for Chapters (Mini TOC)

Suppose that you do not want the links and the chapter description to be side by side, but instead place the links above the description. Also, you may choose to remove the label above the links and put all the links in a colored rectangle with decimal numbers before them.

In your customization CSS (on page 1550), add the following selectors:
/* Change from inline to blocks to stack them one over the other. */

*[class="chapter/minitoc-desc"],
*[class="chapter/minitoc-links"] {
    display: block;
    width: 100%;
}

/* No need for the 'Topics:' label. */

*[class="chapter/minitoc-links"] *[class="topic/desc"] {
    display: none;
}

/* Add background for the links list. */

*[class="chapter/minitoc-links"] {
    background-color: silver;
    padding: 0.5em;
}

/* Remove the border and the padding from the description. We do not need that separator. */

*[class="chapter/minitoc-desc"] {
    border-left: none;
    padding-left: 0;
}

/* Add a number before each of the links. */

*[class="chapter/minitoc-links"] *[class="topic/link"] {
    display: list-item;
    list-style-type: decimal;
    margin-left: 1em;
}

How to Speed up CSS Development and Debugging (on page 1556)

List of Tables/Figures

To activate these:

1. The map must be a DITA bookmap.
2. There must be a `<figurelist>` or `<tablelist>` in the `frontmatter` or `backmatter`. In the following example, both of the lists are added just after the table of contents (the `<toc>` element is the placeholder where the table of contents will be created):
How to Set a Header for a List of Tables/Figures

Suppose you want to set the headline "Figure List" on the second and subsequent pages associated to a list of figures and something similar for a list of tables.

Start by associating pages to the list of figures and tables from the merged file:

```xml
<tablelist />
<figurelist />
</booklists>
</frontmatter>
```

**Note:**

The "placeholder/tablelist" is the class name of the output generated from the `<tablelist>` bookmap element.

Then define the pages:

```xml
@page figurelist {
    @top-left { content: none; }
    @top-center { content: "Figure List"; }
    @top-right { content: none; }
}

@page figurelist:first {
    @top-left { content: none; }
    @top-center { content: none; }
    @top-right { content: none; }
}

@page tablelist {
```
How to Remove the Numbers Before a List of Tables or Figures

Suppose you need to remove the "Figure NN" prefix before each entry of a list of figures.

An entry in the generated list of figures from the merged map looks like this:

```html
<entry class="- listentry/entry " href="#unique_6Connect_42Fig_rjy_spn_xgb">
  <prefix class="- listentry/prefix ">Figure</prefix>
  <number class="- listentry/number ">4</number>
  <title class="- topic/title ">This is another figure</title>
</entry>
```

For the HTML merged map, the element names are all `<div>` elements but they have the same class.

So, to hide the label and the number, use:

```css
*{class~="listentry/prefix"},
*{class~="listentry/number"} {
  display:none;
}
```

This works for both a list of tables and list of figures since the structure of each entry is the same.

To make it more specific (for example, to apply it only for the list of figures), you can add the selector:

```css
*{class="placeholder/figurelist"} *{class="listentry/prefix"},
*{class="placeholder/figurelist"} *{class="listentry/number"} {
  display:none;
}
```

Double Side Pagination

By default, the processor generates pages that are mirror images (the right page has the header on the right side, the left pages have the header on the left side). The chapters follow one another with no constraint on the page side.
Note:
For a plain DITA map, the chapters are the `<topicref>` elements that are placed on the first level. For bookmaps, the chapters are the topics referenced by a `<chapter>` element.

This section contains information about how to position the start of the chapters on an odd folio number. Some of the CSS rules given here as examples are already listed in: `INSTALLATION_DIRECTORY/css/print/p-optional-double-side-pagination.css`. You may choose to import this file from your customization CSS (on page 1550).

### How to Start Chapters on Odd Pages

A common use case is to arrange the chapters of the publication to start on an odd page number.

In your customization CSS (on page 1550), add the following:

```css
@page chapter {
    -oxy-initial-page-number: auto-odd;
}

@page table-of-contents {
    -oxy-initial-page-number: auto-odd;
}
```

Supported values for `-oxy-initial-page-number` include: `auto`, `auto-even`, `auto-odd`, or a number.

### How to Style the Empty (Blank) Pages

By making the chapters start on an odd page, the CSS processor might add blank pages to the previous page sequence as padding.

To style those blank pages add the following code in your customization CSS (on page 1550):

```css
@page chapter:blank, table-of-contents:blank {
    @top-left    { content: none; }
    @top-center  { content: none; }
    @top-right   { content: none; }
    @bottom-left { content: none; }
    @bottom-center { content: none; }
    @bottom-right { content: none; }
}
```

Note:
This just removes the headers and footers, but you can use a background image or a header with "Intentionally left blank" text.
How to Force an Odd or Even Number of Pages in a Chapter

Another use case is to specify a number of pages for a section. Suppose that you have a table of contents that follows the cover page and you need to have an even number of pages. Hence, the next chapter would start on an even page.

In your customization CSS (on page 1550), use the \texttt{-oxy-force-page-count} property with an even value:

\begin{verbatim}
@page table-of-contents {
  -oxy-force-page-count: even;
}
\end{verbatim}

Supported values for \texttt{-oxy-force-page-count} include: \texttt{even}, \texttt{odd}, \texttt{end-on-even}, \texttt{end-on-odd}, \texttt{auto}, \texttt{no-force}.

How to Style the First page of a Chapter

You can use the \texttt{:first} page rule selector to control how the first page of a chapter looks. Suppose that you have defined the following layout for your default page and you want to put the publication title (the \texttt{maptile} string) on the header of the first page (instead of the chapter name that is displayed on this page):

In your customization CSS (on page 1550), add the following:

\begin{verbatim}
@page chapter:first {
  @top-right-corner { content: string(maptitle); }
  @top-left { content: none; }
}
\end{verbatim}

Multiple Column Pages

This section contains information about how to handle pages that have multiple columns.

How to Use a Two Column Layout

Change Layout for Predefined Pages

First, you need to identify which of the pages need to be changed. Pages are already defined for the cover page, table of contents, chapter content, and others. The complete list is here: Default Page Definitions (on page 1558).

Next, add the \texttt{column-count} and \texttt{column-gap} properties to that page. For example:

\begin{verbatim}
@page chapter{
  column-count:2;
  column-gap:1in;
}
\end{verbatim}
If you need some of the elements to expand on all the columns, use the `column-span:all` CSS property. The next snippet makes the chapter titles span both columns:

```
*[class =~ "topic/topic"]\[is-chapter\] > *[class =~ "topic/title"] {  
column-span:all;
}
```

**Limitation:**
You cannot use multiple column configurations on the same page. Oxygen XML Editor Eclipse plugin only takes the `column-count` and `column-gap` properties into account if they are set on `@page` rules, not on elements from the content.

**Change Layout for a Specific Topic**

If you need to have a different column layout for just one topic, you can use the following technique:

1. Define an `outputclass` on the topic root element.

```
<topic outputclass="two_columns" ...>
```

2. Define a CSS rule that changes the `page` property for the matching element.

```
*[class =~ "two_columns"],  
*[outputclass =~ "two_columns"]{  
  page: two_column_page !important;
}
```

**Tip:**
In the selector, use the `class` attribute for the HTML transformation, or `outputclass` for the direct transformation, or leave them both if you are not sure.

**Note:**
The topics from the first level use the `chapter` page. You must use `!important` because the built-in rules are more specific and you need to override the `page` property.

3. Define a page layout.

```
@page two_column_page {  
  column-count: 2;
}
```

Note that the topic will be separated from other sibling topics with different page layouts by page breaks.

**Change Column Breaks for Headings**

If you need to start each topic on a new column, you can use the following technique:
Suppose you have the following map:

```xml
<map>
  <title>Map</title>
  <topicref href="first.dita"/>
  <topicref href="second.dita"/>
</topicref>
  <topichead navtitle="Topichead">
    <topicref href="second.dita"/>
  </topichead>
</map>
```

You can use the following rules to get the chapter on the new column display:

```css
@page {
  column-count: 2;
}
*[class ~="topic/topic"] *{class ~="topic/title"] {  
  -oxy-column-break-before: always;
}
*{class ~="topic/title"] + *{class ~="topic/topic"] > *{class ~="topic/title"] {  
  -oxy-column-break-before: auto;
}
```

Each topic will be displayed on a new column except for topics that only have a title and no content.

**Related Information:**
- Page Formatting in Oxygen PDF Chemistry
- Multiple Page Formatting in Oxygen PDF Chemistry

**Bookmarks**

The PDF Bookmarks are used to generate a hierarchical structure similar to a table of contents in a specialized view of your PDF Reader.

By default, the titles defined in the topics are used as bookmark labels.

**PDF Bookmarks - Built-in CSS**

The PDF bookmarks are generated by matching the titles from the topics in the content. The built-in CSS rules are in: `[PLUGIN_DIR]/css/print/p-bookmarks.css`.

**How to Change the Bookmark Labels using the Navigation Title**

To change the bookmark labels, you can specify a navigation title in a DITA map or topic.
This will be used as the bookmark label instead of the topic title in the table of contents and the bookmark views. There are two possibilities to do specify it:

1. Place a `<navtitle>` element in the topic reference in the DITA map:

   ```xml
   ...<topicref href="topics/my_topic.dita" locktitle="yes">
   <topicmeta>
     <navtitle>Introduction</navtitle>
   </topicmeta>
   </topicref>...
   ```

   **Note:**
   As a best practice, a `@locktitle` attribute with the value 'yes' is needed to activate the navigation title. The plugin applies the navigation title even if the attribute is missing.

2. Place a `<navtitle>` element in the topic, as a title alternative.

   ```xml
   <title id="other_topic" xml:lang="en-us">
   <title>Normal Title</title>
   <titlealts>
     <navtitle>Navigation Title</navtitle>
   </titlealts>
   <body>
   ...
   ```

### How to Control Bookmarks Depth and Sections Display in PDF.

By default, the PDF bookmarks are generated for up to 7 levels. If you need to limit them (for example, to 2 levels), you can use the following CSS rules in your customization CSS *(on page 1550):*

```css
*[class="topic/topic"] *{bookmark-label:none;}
```
These rules clear the labels generated by the titles starting with the depth of 3 (the topic nesting level is given by the selectors \texttt{*[class="topic/topic"]}).

By default, the PDF bookmarks also include the sections. If you need to remove them, you can use the following CSS rule in your customization CSS (on page 1550):

\begin{verbatim}
*{class = "topic/topic"} *{class = "topic/section"} > *{class = "topic/title"},
*{class = "topic/topic"} *{class = "topic/topic"} *{class = "topic/section"} > *{class = "topic/title"},
*{class = "topic/topic"} *{class = "topic/section"} > *{class = "topic/title"},
*{class = "topic/topic"} *{class = "topic/topic"} *{class = "topic/topic"} > *{class = "topic/title"},
*{class = "topic/topic"} *{class = "topic/topic"} *{class = "topic/topic"} *{class = "topic/section"} > *{class = "topic/title"},
*{class = "topic/topic"} *{class = "topic/topic"} *{class = "topic/topic"} *{class = "topic/topic"} *{class = "topic/section"} > *{class = "topic/title"},
*{class = "topic/topic"} *{class = "topic/topic"} *{class = "topic/topic"} *{class = "topic/topic"} *{class = "topic/topic"} *{class = "topic/section"} > *{class = "topic/title"},

bookmark-label: none;
\end{verbatim}

**How to Specify the Open/Closed PDF Bookmark State**

If you want to specify the initial state for the bookmarks (opened/expanded or closed/collapsed), you can use the \texttt{bookmark-state} property in your customization CSS (on page 1550).

For example, to specify that all bookmarks for the first three levels are opened (expanded) in the initial state, use:

\begin{verbatim}
*{class="topic/topic"} > *{class="topic/title"},
*{class="topic/topic"} *{class="topic/topic"} > *{class="topic/title"},
*{class="topic/topic"} *{class="topic/topic"} *{class="topic/topic"} > *{class="topic/title"} {
    bookmark-state:open;
}
\end{verbatim}

**How to Remove the Numbering From the PDF Bookmarks**

By default, the PDF bookmark labels are generated while taking the text set before the chapters titles into account. Since this usually contains the part, chapter, or section numbers, the PDF Bookmarks will make use of them.

The solution is to remove the \texttt{content(before)} from the \texttt{bookmark-label}, leaving just the \texttt{content(text)}.

In your customization CSS (on page 1550), add the following CSS rules:
Important:
This is a simple example that does not use the possible navigation titles, just the content of the `<title>` element. Copy and modify the built-in CSS for the full CSS rule that matches the `<title>` and `<titlealts>` elements:

```css
*{class~="topic/topic"}:has(*{class~="topic/titlealts"}) > *{class~="topic/title"} {...}
```

Related Information:
Numbering (on page 1625)

Index

The content of an `<indexterm>` element is used to produce an index entry in the generated index. You can nest `<indexterm>` elements to create multi-level indexes. The content is not output as part of the topic content, only as part of the index tree.

To add an index to your publication, you just need to add `<indexterm>` elements inside the `<prolog>` section (inside a `<metadata>` element):

```
<title>The topic title.</title>
<prolog>
 <metadata>
  <keywords>
   <indexterm>Installing <indexterm>Water Pump</indexterm></indexterm>
  </keywords>
 </metadata>
</prolog>
<body>
.....
```

or in the content itself:

```
...  
<p>Open the lid then turn the body pump to the right. <indexterm>Installing <indexterm>Water Pump</indexterm></indexterm>
</p>
...```
If you are using a bookmap, you need to specify where the index list should be presented (for instance in the backmatter of the book. Technically, it is possible to also add it to the frontmatter, but this is unusual). This is done using an `<indexlist>` element in the `<booklists>` element (inside the `<backmatter>`):

```xml
<bookmap>
  ...
  <chapter href="tasks/troubleshooting.dita">
    ...
  </chapter>
  <backmatter>
    <booklists>
      <indexlist/>
    </booklists>
  </backmatter>
</bookmap>
```

For plain maps, the index list is automatically added at the end of the publication, with no need to modify the map.

**Index - XML Fragment**

In the merged map file (on page 1553), the structure that holds the index tree is the `opentopic-index:index.groups` element.

```xml
<map class="- map/map ">
  <oxy:front-page>
    ...
  </oxy:front-page>
  <opentopic:map xmlns:opentopic="http://www.idiominc.com/opentopic">
    ...
  </opentopic:map>
  <topic class="- topic/topic ">
    <title class="- topic/title ">Request Support</title>
    ...
  </topic>
  <opentopic-index:index.groups id="d16e5548">
    ...
  </opentopic-index:index.groups>
</map>
```

Each of the groups contain:

- A label, the starting letter ("T" in the following example).
- A tree of `opentopic-index:index.entry` elements.
Each of the entries contain:

- The formatted value \(<\text{opentopic-index:formatted-value}>\).
- A link to the publication content \(<\text{opentopic-index:refID}\)/\(<\text{oxy:index-link}\>).
- Possibly other child entries.

For the **DITA Map PDF - based on HTML5 & CSS** transformation type, the merged map is further processed resulting in a collection of HTML5 \(<\text{div}\>\) elements. These elements preserve the original DITA \(<\text{class}\>\) attribute values and add a new value derived from the DITA element name.

\(<\text{div class=\"- map/map map\"}>\)

\(<\text{div class=\"front-page/front-page\">}\)

...
The index group content becomes:

```xml
<div class="index/group group">
  <div class="index/label label">T</div>
  <div class="index/entry entry">
    <div class="index/formatted-value formatted-value">table of contents</div>
    <div class="index/refid refid">
      <div class="index/link link" href="#d16e3988">[d16e3988]</div>
    </div>
  </div>
  <div class="index/entry entry">
    <div class="index/formatted-value formatted-value">change header</div>
    <div class="index/refid refid">
      <div class="index/link link" href="#d16e4176">[d16e4176]</div>
    </div>
  </div>
  <div class="index/entry entry">
    <div class="index/formatted-value formatted-value">style</div>
    <div class="index/refid refid">
      <div class="index/link link" href="#d16e4120">[d16e4120]</div>
    </div>
  </div>
</div>
```

Index - Built-in CSS

All index styling is found in: [PLUGIN_DIR]/css/print/p-index.css.
How to Style the Index Page Title and the Grouping Letters

In your customization CSS (on page 1550), add the following CSS rules:

```css
*[class ~="index/groups"] *[class ~="index/group"] *[class ~="index/label"] {
  font-size:1.5em;
  color:navy;
}

*[class ~="index/groups"]:before {
  content: "- Index - ";
  color:navy;
  font-size: 4em;
}
```

The result is:

```
- Index -
```

F
  footer 37
H
  header 37
T
  table of contents 32
  change header 35
  style 34

How to Style the Index Terms Labels

In your customization CSS (on page 1550), add the following CSS rule:

```css
*{class="index/groups"} *{class="index/formatted-value"} {
  font-style:oblique;
  color:gray;
}
```

The result is:
How to Add Filling Dots Between the Index Labels and the Page Numbers

Suppose you want the leader CSS content to generate a row of dots. It is necessary that the parent entry has the text justified.

In your customization CSS (on page 1550), add the following CSS rule:

```css
*.[class~="index/formatted-value"],
*.[class~="index/refid"] {
    display:inline;
}

/* Hide the sequences of links that actually do not contain links. */
*.[class~="index/group"] *.[class ~="index/entry"] > *.[class~="index/refid"]{
    display:none;
}
*.[class~="index/group"] *.[class ~="index/entry"] >
*.[class~="index/refid”]:has(*.[class~="index/link"]){
    display:inline;
}

*.[class~="index/group"] *.[class="index/entry"] {
    text-align:justify;
}
*.[class~="index/group"] *.[class ~="index/entry"] > *.[class~="index/refid"]:before{
    content:leader(' .');
}
```

The output now contains the dots:
How to Change the Index Page Number Format and Reset its Value

The page number is reset at the beginning of the index page by the built-in CSS rule:

```css
* [class ~="index/groups"] {
    counter-reset: page 1;
}
```

If you want to start the page counter from a different initial number, just change the value of this counter. For example, to continue the normal page counting, use:

```css
* [class ~="index/groups"] {
    counter-reset: none;
}
```

If you need to style the page number differently (for example, using decimals), add the following CSS rule in your customization CSS (on page 1550):

```css
@page index {
    @bottom-center { content: counter(page, decimal) }
}
```

How to Impose a Table-like Index Layout

In case you need to place the index labels and links on the same line but with some extra alignment constraints, you can use inline blocks to give the index a table-like appearance:
You need to place the elements that have the following class on the same line:

index/formatted-value

This is the text of the index term.

index/refid

This element contains a list of links.

A fixed width is used for the formatted value and the links container (almost half of the available width). To achieve the index hierarchical layout, set progressive padding to the formatted value text.

In your customization CSS (on page 1550), add the following CSS rule:

```css
*[^index/formatted-value],
*[^index/refid]{
  display:inline-block;
}

*[^index/formatted-value]{
  width:45%;
}
*[^index/refid] {
  width:45%;
}
```
/* Hide the sequences of links that actually do not contain links. */
*{class~="index/groups"}*{class~="index/entry"}>*{class~="index/refid"}{
  display:none;
}
*{class~="index/groups"}*{class~="index/entry"}>
*{class~="index/refid"}:has(*{class~="index/link"}){
  display:inline-block;
}

/* Move the nesting of indexterms from margin to padding */
*{class~="index/groups"}*{class~="index/entry"} {
  margin-left:0;
}
*{class~="index/groups"}
*{class~="index/entry"}
*{class~="index/formatted-value"}{
  padding-left:0.2em;
}
*{class~="index/groups"}
*{class~="index/entry"}
*{class~="index/entry"}
*{class~="index/formatted-value"}{
  padding-left:0.4em;
}
*{class~="index/groups"}
*{class~="index/entry"}
*{class~="index/entry"}
*{class~="index/entry"}
*{class~="index/formatted-value"}{
  padding-left:0.6em;
}

/* Some styling */
*{class~="index/formatted-value"},
*{class~="index/refid"}{
  padding:0.2em;
  background-color:#EEEEEE;
}

To avoid bleeding of the index term label, you may need to mark it as being hyphenated:
To activate hyphenation, see: How to Enable Hyphenation for Entire Map (on page 1675).

Appendices

The `<appendices>` element that is available in the DITA bookmap has a special behavior (based on its sibling nodes):

1. If the bookmap contains `<part>` elements, the `<appendices>` will behave as a part.
2. If the bookmap contains `<chapter>` (and no `<part>`) elements, the `<appendices>` will behave as a chapter.

**Note:**
The behavior includes page-break, numbering, and title rendering.

For example, if I define a bookmap with a `<part>` element, I will obtain:

```xml
<part>
    <chapter/>
    <topicref/>
    <chapter/>
</part>
<appendices>  <!-- Appendices behaves like a Part -->
    <appendix>  <!-- Appendix behaves like a Chapter -->
        <appendix>  <!-- Appendix behaves like a TopicRef -->
    </appendix>
</appendices>
```

For another example, if I define a bookmap with a `<chapter>` element only, I will obtain:

```xml
<chapter/>
    <topicref/>
<chapter/>
<appendices>  <!-- Appendices behaves like a Chapter -->
    <appendix>  <!-- Appendix behaves like a TopicRef -->
    <appendix>  <!-- Appendix behaves like a TopicRef -->
</appendices>
```

**Warning:**
If the `<appendices>` element is not defined and the `<appendix>` is used directly instead, then it will behave like a *Part* or *Chapter* using the same pattern as for `<appendices>`.
How To Control Page Break Within Appendices

If you define a bookmap with `<appendices>` and some `<appendix>` elements, you may want the parent `<appendices>` to be on a separate page than its children. This is done automatically if the bookmap contains `<part>` elements. Otherwise, you may need to use the following in your CSS:

```css
*[topicrefclass ~="bookmap/appendix"]:first-of-type {
    page-break-before: always;
}
```

Footnotes

Footnotes are pieces of information that have several purposes, including citations, additional information (copyright, background), outside sources, and more. They are divided as follows:

- **The footnote call** - The number that remains in the content, usually superscripted.
- **The footnote marker** - The number displayed at the bottom of the page (the value matches the footnote call).
- **The footnote text** - The value of the `<fn>` element, also displayed at the bottom of the page.

Footnotes - Built-in CSS

Footnote properties are defined in `[PLUGIN_DIR]/css/print/p-foot-notes.css`.

How to Change Style of the Footnote Markers and Footnote Calls

To bold the footnotes numbers, use some colors, and change the footnote marker, add the following rules to your customization CSS (on page 1550):

```css
*[class ~= "topic/fn"]:footnote-call {
    font-weight: bold;
    color:red;
}

*[class ~= "topic/fn"]:footnote-marker {
    content: counter(footnote) " / ";
    font-weight: bold;
    color:red;
}
```

To indent the footnote content displayed at the end of the page, add the following rules to your customization CSS (on page 1550):

```css
*[class ~= "topic/entry"] > *[class ~= "topic/fn"] {
    padding-left: 1in;
}
```
**How to Add a Separator Above the Footnotes**

The `@footnote` part of a `@page` declaration controls the style of the separator between the page content and the footnotes. For the content, you should set a `leader`. The leader uses a letter or a line style to fill the entire width of the page.

```
@page {
    margin: 0.5in;
    ...
    @footnote {
        content: leader(solid);
        color: silver;
    }
}
```

To create a dotted line, you can use the dot character: `leader('.', ')`). Other commonly used characters are: `"-" (dash) and "_" (underscore).

**How to Reset the Footnotes Counter**

It is possible to reset the footnote counter. For example, if you want to reset the counter at the beginning of each chapter, add one of the following rules to your customization CSS (on page 1550):

```
@page chapter {
    counter-reset: footnote 1;
}
```

```
*[class =~ "bookmap/chapter"],
*[class =~ "topic/topic"]{is-chapter} {
    counter-reset: footnote 1;
}
```

In a deep numbering context, you need to use the following rule instead:

```
*[class =~ "map/map"]{numbering =~ 'deep'} *[class =~ "topic/topic"]{is-chapter}:not{{is-part}} {
    counter-reset: section1 0 footnote 1;
}
```

or can mark any element with an `@outputclass` value, match that value, and reset the counter at any point in your counter:
How to Display Footnotes Below Tables

In your PDF output, you may want to group all the footnotes contained in a table just below it instead of having them displayed at the bottom of the page.

To add this functionality, use an Oxygen Publishing Template and follow these steps:

1. If you have not already created a Publishing Template, you need to create one. For details, see How to Create a Publishing Template (on page 1546).
2. Link the folder associated with the publishing template to your current project in the Project Explorer view.
3. Using the Project Explorer view, create an xslt folder inside the project root folder.
4. In the newly created folder, create an XSL file (for example, named merged2mergedExtension.xsl) with the following content:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
    xmlns:xs="http://www.w3.org/2001/XMLSchema"
    xmlns:opentopic-func="http://www.idiominc.com/opentopic/exsl/function"
    exclude-result-prefixes="xs opentopic-func"
    version="2.0">

    <!-- Match only top level tables (i.e tables that are not nested in other tables), that contains some footnotes. -->
    <xsl:template match="*[contains(@class, 'topic/table')]
        [not(ancestor::*[contains(@class, 'topic/table')])]
        [/*[contains(@class, 'topic/fn')]]">
        <xsl:with-param name="top-level-table" select="." tunnel="yes"/>
    </xsl:next-match>

    <!-- Create a list with all the footnotes from the current table. -->
    <ol class="topic/ol" outputclass="table-fn-container">
        <xsl:for-each select="//*[contains(@class, 'topic/fn')]">
            <!-- Try to preserve the footnote ID, if available, so that the xrefs will have a target. -->
        </xsl:for-each>
    </ol>

</xsl:stylesheet>
```
The footnotes that have an ID must be ignored, they are accessible only through existing xrefs (already present in the merged.xml file).

The above template already made a copy of these footnotes in the OL element so it is not a problem if markup is not generated for them in the cell.

The xrefs to footnotes with IDs inside table-cells. We need to recalculate their indexes if their referenced footnote is also in the table.

<!-- There is a reference in the table, recalculate index. -->

<xsl:when test="$fn">
  <!-- There is a reference in the table, recalculate index. -->
  <xsl:variable name="fn-number" select="index-of($top-level-table//*[contains(@class, 'topic/fn')], $fn)"/>
  <xsl:value-of select="$fn-number"/>
</xsl:when>
</xsl:choose>
5. Open the template descriptor file (on page 1540) associated with your publishing template (the .opt file) and set the XSLT stylesheet created in the previous step with the com.oxygenxml.pdf.css.xsl.merged2merged XSLT extension point:
6. Create a css folder in the publishing template directory. In this directory, save a custom CSS file with rules that style the glossary structure. For example:

```html
/* Customize footnote calls, inside the table. */
*[outputclass ~='table-fn-call'] {
  line-height: none;
}

/* Customize the list containing all the table footnotes. */
*[outputclass ~='table-fn-container'] {
  border-top: 1pt solid black;
  counter-reset: table-footnote;
}

/* Customize footnotes display, below the table. */
*[outputclass ~='table-fn'] {
  font-size: smaller;
  counter-increment: table-footnote;
}
*[outputclass ~='table-fn']:marker {
  font-size: smaller;
  content: "(" counter(table-footnote) ")";
}

/* Customize xrefs pointing to footnotes with IDs. */
*[class ~='topic/table'] *[class ~='topic/xref'][type = 'fn'] {
  color: unset;
  text-decoration: none;
}
*[class ~='topic/table'] *[class ~='topic/xref'][type = 'fn']:after {
  content: none;
}
*[class ~='topic/table'] *[class ~='topic/xref'][type = 'fn'] *[class ~='hi-d/sup']:before {
  content: ";"
}
*[class ~='topic/table'] *[class ~='topic/xref'][type = 'fn'] *[class ~='hi-d/sup']:after {
  content: ")";
}
```

7. Open the template descriptor file (on page 1540) associated with your publishing template (the .opt file) and reference your custom CSS file in the resources element:
8. Edit the **DITA Map PDF - based on HTML5 & CSS** transformation scenario.

9. In the **Templates** tab, click the **Choose Custom Publishing Template** link and select your template.

10. Click **OK** to save the changes and run the transformation scenario.

## Hyphenation

Hyphenation specifies how words should be hyphenated when text wraps across multiple lines.

The transformation plugin uses the capabilities of the **PDF Chemistry** processor to perform hyphenation.

### Hyphenation Dictionaries

The Oxygen XML Editor Eclipse plugin provides built-in hyphenation patterns for the following languages:

<table>
<thead>
<tr>
<th>Code</th>
<th>Language</th>
</tr>
</thead>
<tbody>
<tr>
<td>da</td>
<td>Danish</td>
</tr>
<tr>
<td>de</td>
<td>German</td>
</tr>
<tr>
<td>de_CH</td>
<td>German (Switzerland)</td>
</tr>
<tr>
<td>en</td>
<td>English</td>
</tr>
<tr>
<td>en-GB</td>
<td>English (Great Britain)</td>
</tr>
<tr>
<td>es</td>
<td>Spanish</td>
</tr>
<tr>
<td>fr</td>
<td>French</td>
</tr>
<tr>
<td>it</td>
<td>Italian</td>
</tr>
<tr>
<td>nb</td>
<td>Norwegian Bokmål</td>
</tr>
<tr>
<td>nl</td>
<td>Dutch</td>
</tr>
<tr>
<td>ro</td>
<td>Romanian</td>
</tr>
<tr>
<td>ru</td>
<td>Russian</td>
</tr>
<tr>
<td>sv</td>
<td>Swedish</td>
</tr>
<tr>
<td>th</td>
<td>Thai</td>
</tr>
</tbody>
</table>
The built-in hyphenation pattern license terms are listed in the XML files in the 
[CHEMISTRY_INSTALL_DIR]/config/hyph folder. Most of them comply with the LaTex distribution policy.

### Installing New Hyphenation Dictionaries

Oxygen XML Editor Eclipse plugin uses the TeX hyphenation dictionaries converted to XML by the OFFO project: https://sourceforge.net/projects/offo/.

The .xml files allow you to access the licensing terms and you can use them as a starting point to create customized dictionaries (see How to Alter a Hyphenation Dictionary (on page 1674)).

The .hyp files are the compiled dictionaries that the Oxygen XML Editor Eclipse plugin actually uses.

One simple way to add more dictionaries:

1. Download and extract the offo-hyphenation-compiled.zip file. This file is a bundle of many dictionary files.
2. Copy the fop-hyph.jar file to the [OXYGEN_INSTALL_DIR]/lib directory.
3. If you just need a single dictionary, place the .hyp or .xml file in the [OXYGEN_INSTALL_DIR]/config/hyph directory (create that directory if it is missing).

### How to Alter a Hyphenation Dictionary

You can copy the dictionaries you need to change in another directory, then use the -hyph-dir parameter to refer them inside your transformation.

Each file is named with the language code and has the following structure:

```
<hyphenation-info>
  <hyphen-min before="2" after="3"/>
</hyphenation-info>

<exceptions>
  o-mni-bus
  ...
</exceptions>

<patterns>
  préémi3nent.
  proémi3nent.
</patterns>
```
To change the behavior of the hyphenation, you can modify either the patterns or the exceptions sections:

**exceptions**

Contains the list of words that are not processed using the patterns, each on a single line. Each of the words should indicate the hyphenation points using the hyphen ("-".) character. If a word does not contain this character, it will not be hyphenated.

For example, o-mni-bus will match the omnibus word and will indicate two possible hyphenation points.

**Note:**

Compound words (i.e. e-mail) cannot be controlled by exception words.

**patterns**

Contains the list of patterns, each on a single line. A pattern is a word fragment, not a word. The numbers from the patterns indicate how desirable a hyphen is at that position.

For example, tran3s2act indicates that the possible hyphenation points are "tran-s-act" and the preferable point is the first one, having the higher score of "3".

### How to Enable Hyphenation for Entire Map

To enable hyphenation for your entire map:

1. Make sure you set an `@xml:lang` attribute on the root of your map, or set the `default.language` parameter in the transformation.

2. In your customization CSS (on page 1550), add:

   ```css
   :root {
     hyphens: auto;
   }
   ```

3. To except certain elements from being hyphenated, use `hyphens:none`. The following example excludes the `<keyword>` elements from being hyphenated:

   ```css
   *[class =~ "topic/keyword"] {
     hyphens: none;
   }
   ```
How to Enable/Disable Hyphenation for an Element

1. Make sure you set an @xml:lang attribute on the root of your map, or set the default.language parameter in the transformation.

2. You have two options to control hyphenation inside an XML element:

**CSS Approach**

Use the `hyphens` property.

For example, if you want to enable hyphenation in codeblocks:

```css
* [class~="pr-d/codeblock"] {
    hyphens: auto;
}
```

If you want to disable hyphenation inside tables:

```css
* [class~="topic/table"] {
    hyphens: none;
}
```

**Attribute Approach**

Use the `@outputclass="hyphens"` or `@outputclass="no-hyphens"` attributes/values.

For example, if you want to enable hyphenation in codeblocks:

```xml
<codeblock outputclass="hyphens">
    ...
</codeblock>
```

If you want to disable hyphenation inside tables:

```xml
<table outputclass="no-hyphens">
    ...
</table>
```

**Note:**

The default built-in CSS enables hyphenation for tables:

```css
* [class ~="topic/table"] {
    hyphens: auto;
}
```

How to Force or Avoid Line Breaks at Hyphens

It is possible to force or avoid line breaks inside words with hyphens (U+2010). This can be useful, for example, inside tables that have product references if you want the display to remain on a single line (or to split it on multiple lines). To achieve this, you can use the `oxy-break-line-at-hyphens` property:

The accepted values are:

- **auto**
  
  Words are hyphenated automatically according to an algorithm that is driven by a hyphenation dictionary. This can lead to line breaks at hyphens.

- **avoid**
  
  Words are still hyphenated automatically except no line break will occur on hyphens.

- **always**
  
  Words are still hyphenated automatically except line breaks will be forced on hyphens.

**Example:**

Suppose you have a products table like this:

```xml
<table>
  <row>
    <cell>Product-1233-55-88</cell>
    <cell>120</cell>
  </row>
  <row>
    <cell>Product-1244-66-99</cell>
    <cell>112</cell>
  </row>
  <row>
    <cell>Product-1233-55-88</cell>
    <cell>120</cell>
  </row>
</table>
```

and the following rule in a CSS stylesheet:
In the output, the list of product references will be displayed in a single line. On the contrary, setting the property value to always, will force a break after each hyphen.

**Accessibility**

By default, the PDF documents produced using this plugin are partially accessible in the sense that most of the paragraphs, tables, lists, headers, and footers are tagged automatically so a PDF reader can use this information to present the content.

**Related Information:**
Oxygen PDF Chemistry: Accessibility

**Accessibility - Built-in CSS**

Accessibility properties are defined in `{PLUGIN_DIR}css/print/p-accessibility.css`.

**How to Create Fully Accessible Documents**

To make your documents fully accessible (PDF/UA1 compliant), do the following:

1. The accessibility standard requires that all the fonts be embedded in the PDF. To force font embedding, you have to specify fonts for all elements and for all page margin boxes in your customization CSS (on page 1550). For instance, you can use:

   ```
   body { font-family: Arial }
   @page {
     @top-left {font-family: Arial }
     @top-right {font-family: Arial }
     @top-center {font-family: Arial }
     @top-left-corner {font-family: Arial }
     @top-right-corner {font-family: Arial }
     @bottom-left {font-family: Arial }
     @bottom-right {font-family: Arial }
     @bottom-center {font-family: Arial }
     @bottom-left-corner {font-family: Arial }
     @bottom-right-corner {font-family: Arial }
   }
   ```

2. Create a new transformation scenario (based on the DITA Map PDF - based on HTML5 & CSS or the DITA PDF - based on HTML5 & CSS built-in scenario).
3. In the Parameters tab, change the value of the pdf.accessibility parameter to yes.
4. Run the transformation.

Archiving

Your PDF files may need to be archived for security or legal reasons. In this case, the generated file must be compliant to the PDF/A ISO standard.

Related Information:
Oxygen PDF Chemistry: Archiving

How to Allow Document Archiving

To make your documents archive-able (PDF/A compliant), do the following:

1. The archiving standard requires that all the fonts be embedded in the PDF. To force font embedding, you have to specify fonts for all elements and for all page margin boxes in your customization CSS (on page 1550). For instance, you can use:

```css
body { font-family: Arial }

@page {
    @top-left {font-family: Arial }
    @top-right {font-family: Arial }
    @top-center {font-family: Arial }
    @top-left-corner {font-family: Arial }
    @top-right-corner {font-family: Arial }
    @bottom-left {font-family: Arial }
    @bottom-right {font-family: Arial }
    @bottom-center {font-family: Arial }
    @bottom-left-corner {font-family: Arial }
    @bottom-right-corner {font-family: Arial }
}
```

2. Create a new transformation scenario, based on the DITA Map PDF - based on HTML5 & CSS built-in scenario.
3. In the Parameters tab, select a value for the pdf.archiving.mode parameter from the list.
4. Run the transformation.

Fonts

Fonts are an important part of the publication. Your font selection should take into consideration both design and the targeted ranges of characters.
Notes:

- Before using a font, make sure you have the permissions to use it and make sure you comply with all the license terms.
- When installing a font on Windows, make sure you select the **Install for all users** option.

To use them in the customization CSS *(on page 1550)*:

- You can place the font files in the same folder as your CSS and use a @font-face definition to reference them.
- You can use web fonts (for example, Google Fonts), and import the CSS snippet into your CSS.
- You can use system fonts.

All these techniques are explained in: *Oxygen PDF Chemistry User Manual: Fonts*.

**How to Avoid Characters Being Rendered as #**

When the processor renders text with a font that does not include certain characters, those characters are replaced with the # symbol. This can easily be seen from Oxygen’s Results view. For example:

```
[CH] Glyph "?" (0x7ae0) not available in font "Roboto-Regular".
```

To prevent this, make sure you use the proper font.

As an example, suppose the right arrow character is used in a definition list like this:

```xml
<dlentry>
    <dt>&#8594;</dt>
    <dd><ph>This is the right arrow.</ph></dd>
</dlentry>
```

If the font does not include this character, the output will look something like this:

```
This is the right arrow.
```

To fix this you can either:

1. Install Arial Unicode MS font on your system. This is one of the PDF processor fallback fonts. Starting with version 24 there are additional fonts used as fallback as `SimSun`, `Malgun Gothic` and more, so if one of these are found on the system they will be used directly.
2. Specify the fallback font in your customization.

For the second case, if you use *Times New Roman* for the entire publication, you could add *Symbol* as the fallback font. In your customization CSS *(on page 1550)*, add:
To change the font for the entire publication, not just an element, you can use:

```
:root {font-family: "Times New Roman", Symbol !important; }
```

@page {
    @top-left {font-family: "Times New Roman", Symbol !important; }
    @top-right {font-family: "Times New Roman", Symbol !important; }
    @top-center {font-family: "Times New Roman", Symbol !important; }
    @top-left-corner {font-family: "Times New Roman", Symbol !important; }
    @top-right-corner {font-family: "Times New Roman", Symbol !important; }
    @bottom-left {font-family: "Times New Roman", Symbol !important; }
    @bottom-right {font-family: "Times New Roman", Symbol !important; }
    @bottom-center {font-family: "Times New Roman", Symbol !important; }
    @bottom-left-corner {font-family: "Times New Roman", Symbol !important; }
    @bottom-right-corner {font-family: "Times New Roman", Symbol !important; }
}
```

**Tip:**

On Windows, one simple way to determine the font needed to display the text is to copy the text fragment that has rendering problems from the DITA source document and paste it into Microsoft WordPad or Word. It will automatically select a font capable of rendering the text. Simply click on the text to see the name of the font from the "Font" ribbon toolbar. Then you can use it as a fallback font in the CSS. Make sure there are no licensing restrictions on that particular font.

**Note:**

It is also possible to use a generic family name as fallback, like serif, sans-serif or monospace, like this you will call upon the processor default fallback fonts system.

**Warning:**

Even if the message is a warning, sometimes it can lead to a failed transformation. This usually occurs for really special characters (different from letters or common characters).

### How to Set Fonts in Titles and Content

Suppose that in your customization CSS *(on page 1550)*, you have defined your font (for example, Roboto) using a Google web font:

```
https://fonts.googleapis.com/css2?family=Roboto:ital,wght@0,400;0,700;1,400;1,700&display=swap
```
You can force a font on all elements, then style the ones that need to be different. The advantage of this method is that you do not need to trace all elements that have a font family defined in the built-in CSS files, you just reset them all.

In your customization CSS (on page 1550), add an `!important` rule that associates a font to all the elements from the document:

```css
* {
  font-family: "Roboto", sans-serif !important;
}
```

**Note:**
If you want to use the `:root` selector instead of the `*` sector, without the `!important` qualifier, the elements that have a predefined font specified in the built-in CSS will keep that font. If your content uses non-Latin glyphs, it is possible that the built-in fonts do not render them.

Next, if you want to use another font for the document headings, your customization CSS (on page 1550) should contain the following rule:

```css
*[class~="front-page/front-page-title"],
*[class~="topic/title"] {
  font-family: "Roboto", sans-serif !important;
  font-weight: bold;
}
```

Then, identify the selectors for the elements that need to be styled with a different font than the one associated above. For information on how to do this, see: Debugging the CSS (on page 1552).

For example, if you want the titles or the pre-formatted text to have a different font from the rest, matched by the above `*` selector, you need to use more specific CSS selectors:

```css
*[class="pr-d/codeph"],
*[class="topic/pre"] {
  font-family: monospace !important;
}
```

**Important:**
These settings do not apply to page margin boxes, only to the text inside the page. If you also want to change the font used in headers and footers, see: How to Change the Font of the Headers and Footers (on page 1567).

**Related information**
How to Change the Font of the Headers and Footers (on page 1567)
How to Use Fonts for Asian Languages

For Asian languages, you must use a font or a sequence of fonts that cover the needed character ranges. If the characters are not found, the # symbol is used.

When you specify a sequence of fonts, if the glyphs are not found in the first font, the next font is selected, and so on until one is found that includes all the glyphs. A common font sequence for Asian languages is as follows:

```plaintext
font-family: Calibri, SimSun, "Malgun Gothic", "Microsoft JhengHei";
```

To apply this font sequence, see: How to Set Fonts in Titles and Content (on page 1681).

Some of the Asian fonts do not have italic, bold, or bold-italic variants. In this case, you may use the regular font file with multiple font face definitions to simulate (synthesize) the missing variants. You need to use the -oxy-simulate-style:yes CSS property in the font face definition as explained in: Using Simulated/Synthetic Styles in Oxygen Chemistry.

How to Use Asian Fonts in Linux

For Asian languages on Linux distributions, PDF Chemistry automatically uses DejaVu and Noto CJK as fallback fonts for Serif, Sans-Serif, and Monospace content.

**Warning:**

On some distributions, the Noto CJK fonts are not available. In this case, you need to install them using the system package manager:

- fonts-noto-cjk on Debian family distributions (e.g. Ubuntu).
- google-noto-cjk-fonts on Red Hat family distributions (e.g. CentOS).

How to Add a New Asian Font

If you want to add a specific font for Asian languages, you need to declare it inside your customization CSS (on page 1550). The following example uses the Noto Sans Tamil font-family:

```plaintext
/* Font Declaration */
@font-face {
    font-family: "Noto Sans Tamil";
    font-style: normal;
    font-weight: 400;
    src: url(../fonts/ttf/notosans tamil/NotoSansTamil-Regular.ttf);
}

@font-face {
    font-family: "Noto Sans Tamil";
}```
How to Set Fonts for Displaying Music

Music is rendered as normal text in most fonts, but some of them will render them as musical glyphs. For example, the *MusGlyphs* font converts the text to music and adjusts it to the surrounding text.

This font is divided in two sub-fonts that act for each of the following categories:

- **MusGlyphs** - Converts all characters that match a musical pattern into music glyphs. It should be used inside the elements that contain only music.
- **MusGlyphs-Text** - Converts only the text prefixed with the ‹ symbol into music glyphs. The remaining text is displayed normally.

To use this font, you simply need to declare each sub-font then use them in appropriate elements:

```css
@font-face {
  font-family: MusGlyphs;
  font-style: normal;
  font-weight: 400;
  src: url(../fonts/otf/musglyphs/MusGlyphs.otf);
}

@font-face {
  font-family: MusGlyphs-Text;
  font-style: normal;
  font-weight: 400;
  src: url(../fonts/otf/musglyphs/MusGlyphs-Text.otf);
}

@font-face {
  font-family: MusGlyphs-Text;
  font-style: normal;
  font-weight: bold;
  src: url(../fonts/otf/musglyphs/MusGlyphs-Text-Bold.otf);
}
/*
* All the elements are displayed with the MusGlyphs-Text.
* If a text is prefixed with @, music will be displayed.

```html
body {
    font-family: MusGlyphs-Text, serif;
}

/* Elements with @outputclass="music" contain only music. */
*[outputclass !="music"] {
    font-family: MusGlyphs, serif;
}
```

Comments, Highlights, and Tracked Changes

The comments and tracked changes can be made visible in the PDF output by setting the `show.changes.and.comments` transformation parameter to yes.

Figure 457. Chemistry Annotations in Acrobat Reader

By default, they are shown as PDF text annotations (sticky notes). These are graphical markers in the document content and are also listed in the Comments section when opening the output file in Acrobat Reader.

**Note:**

Comments with the Mark as Done flag selected appear with a check mark in the Comments section and with a Completed label (CHECK John Doe Completed).

To avoid rendering the elements as PDF annotations and show them as footnotes instead, you can use the `show.changes.and.comments.as.pdf.sticky.notes` transformation parameter set to no.

The comments and changes are included in the merged map file (on page 1553) either as XML elements (`<oxy-insert>, <oxy-delete>, <oxy-comment>, <oxy-attributes>`) in the case of the XML merged map, or as HTML elements with similar classes (`oxy-insert`, `oxy-delete`, `oxy-comment`, `oxy-attributes`) in the case of the HTML merged map. Sub-elements contain meta-information about each change.
Tip:
These elements are automatically recognized and transformed in PDF annotations when using Chemistry as PDF processor.

Note:
The inserted text, deleted text, and deleted markup are included in the sticky notes, you can change this behavior by using the `show.changed.text.in.pdf.sticky.notes.content` parameter (on page 1534).

Related Information:
- Transformation Parameters (on page 1527)
- Debugging the CSS (on page 1552)

Comments and Tracked Changes - Built-in CSS

The built-in CSS that controls the way tracked changes and comments are displayed is found in: 
`[PLUGIN_DIR]/css/print/p-side-notes.css`.

Comments and Tracked Changes - HTML Fragment

This section contains information about how each type of tracked change is structured in the merged map HTML file (on page 1553).

Insertions

For an insertion type of tracked change, the structure that defines the insertion details is inside a `range` (oxy-range-start to oxy-range-end), the inserted text is highlighted by a `<span>` element with the class `oxy-insert-hl`, and the details are stored in a `<span>` element with the `oxy-insert` class.

```html
<span class="oxy-range-start" id="sc_1" hr_id="1"/>

<span class="oxy-insert" href="#sc_1" hr_id="1">
  <span class="oxy-author">dan</span>
  <span class="oxy-content">insert</span>
  <span class="oxy-date">2018/03/15</span>
  <span class="oxy-hour">09:38:29</span>
  <span class="oxy-tz">+02:00</span>
</span>

<span class="oxy-insert-hl">This is an insert!!</span>

</span>

<span class="oxy-range-end" hr_id="1"/>
```
Comments

Similar to insertions, comments are defined in a range (oxy-range-start to oxy-range-end), the comment details in an element with the class oxy-comment, and the highlighted content is wrapped in the oxy-comment-hl element.

```
<span class="oxy-range-start" id="sc_1" hr_id="1"/>

<span class="oxy-comment" href="#sc_1" hr_id="1">
  <span class="oxy-author">dan</span>
  <span class="oxy-comment-text">This is a comment.</span>
  <span class="oxy-date">2018/03/15</span>
  <span class="oxy-hour">09:56:59</span>
  <span class="oxy-tz">+02:00</span>
</span>

<span class="oxy-comment-hl">The commented text.</span>

<span class="oxy-range-end" hr_id="1"/>
```

Note:

Comments that are marked as done have a flag="done" attribute:

```
<span class="oxy-comment" href="#sc_6" hr_id="6" flag="done">
```

Attribute changes

The attribute changes are more complex. The range is empty, and is directly above the affected element (the one that has modified attributes). The element with the class oxy-attributes contains details about multiple attribute changes, each stored in an element with the class oxy-attribute-change.

```
<element>

  <span class="oxy-range-start" id="sc_3" hr_id="3"/>
  <span class="oxy-range-end" hr_id="3"/>

  <span class="oxy-attributes" href="#sc_3" hr_id="3">
    <span class="oxy-attribute-change" type="inserted" name="platform">
      <span class="oxy-author">dan</span>
      <span class="oxy-current-value">windows</span>
      <span class="oxy-date">2018/03/15</span>
      <span class="oxy-hour">10:05:04</span>
      <span class="oxy-tz">+02:00</span>
    </span>
  </span>

</element>
```
**Deletions**

For a deletion, there are some elements that define the start and end of the deletion, and the highlighted text is wrapped in an element with the class `oxy-delete-hl`.

```xml
<span class="oxy-range-start" id="sc_2" hr_id="2"></span>
<span class="oxy-delete-hl">This is a deleted text. </span></span>
<span class="oxy-range-end" hr_id="2"></span>
```

There is a structure that offers details about the deletion change, using the element with the class `oxy-delete`. This is linked to the above deletion range by the same ID value:

```xml
<span class="oxy-delete" href="#sc_2" hr_id="2">
    <span class="oxy-author">dan</span>
    <span class="oxy-content"><image href="../img/ex.gif"></image></span>
    <span class="oxy-date">2018/03/14</span>
    <span class="oxy-hour">11:38:06</span>
    <span class="oxy-tz">+02:00</span>
</span>
```

**Colored Highlights**

To show some text as highlighted with a background color:

```xml
<span class="oxy-color-hl" color="rgba(140,255,140,50)">Some colored text.</span>
```

**How to Style Tracked Changes or Comments**

Here are some examples showing how to customize tracked changes and highlighted text:

- If you want to change the highlighted text color from the document content, use the `@class="oxy-comment-hl"` attribute (or `@class="oxy-delete-hl"` and `@class="oxy-insert-hl"`):
  ```css
  .oxy-comment-hl {
    color:magenta;
  }
  ```

- If you want to change the range labels indicating the start or the end of a change (by default, formatted like this: “[n]...[/n]” where n is the change number), you can use the following selectors:
• If you want to only show the changes and comments highlights

```
.oxy-range-start,
.oxy-range-end {
    display: none;
}
.oxy-insert,
.oxy-delete {
    display: none;
}
```

**Note:**
No comments will be displayed in the PDF Viewer Comments view after this modification.

### How to Style Tracked Changes Shown as Footnotes

**Important:**
This topic is relevant if you have set the `show.changes.and.comments.as.pdf.sticky.notes` transformation parameter to `no`, and therefore the changes are shown as footnotes instead of PDF annotations.

Here are some examples showing how to customize footnotes:

• If you want to change the background color and the border of the comment footnote, add the following snippet in your customization CSS (on page 1550):

```
.oxy-comment {
    background-color: inherit;
    border: 2pt solid yellow;
}
```

Similarly, you can style the other footnotes for `@class="oxy-attributes"`, `@class="oxy-delete"`, and `@class="oxy-insert"`.

• If you want to hide some footnotes (for example, the footnotes associated with the insertions, deletions, or attribute changes when your document contains a lot of tracked changes), add something
like this in your customization CSS (on page 1550) (the following example results in the deletions and
insertions being hidden, but the comments remain visible):

```css
.oxy-attributes, 
.oxy-delete, 
.oxy-insert {
    float: none;
    display: none;
}
```

### How to Show Only Change Bars on Tracked Changes

It is possible to only display the change bars for tracked changes (inserted or deleted content) in the PDF
document while hiding the other styling for the tracked changes. This is helpful if you want to see the
document in a final version while still seeing change bars where content was inserted or deleted.

To achieve this, follow these steps:

1. Set the `show.changes.and.comments` parameter to `yes` and the
   `show.changes.and.comments.as.pdf.sticky.notes` parameter to `no`.

   **Step Result:** The first parameter causes tracked changes to be visible in your document and styled (e.g.
   insertions are blue and underlined, while deletions are red with a strike-through). Changing the second
   parameter to `no` causes the tracked changes to be displayed as a footnote instead of a PDF annotation.

2. Hide the footnotes by adding the following in your customization CSS (on page 1550):

   ```css
   .oxy-attributes,  
   .oxy-comment,  
   .oxy-delete,  
   .oxy-insert {  
       float: initial;  
       display: none;  
   }
   ```

3. Remove the change range markers (the { and } symbols):

   ```css
   .oxy-range-start:before,  
   .oxy-range-end:before {
       content: none;
   }
   ```

4. Remove the styling for the insertions and deletions:

   ```css
   .oxy-insert-hl{  
       color: unset;
       text-decoration: none;
   }  
   .oxy-delete-hl {
   ```
Draft Watermarks

A watermark is an image displayed as the background of a printed document and it is faded enough to keep the publication text readable. Draft watermarks are used to indicate that a document is under construction or has not yet been approved.

How to Add a Draft Watermark on All Pages

To add a draft watermark to all of your publication pages, you can use the following page selector in your customization CSS (on page 1550):

```css
@page {
    background-image: url("draft.svg");
    background-position: center;
    background-repeat: no-repeat;
    background-size: 100% 100%;
}
```

If you have already set a background image for other pages (for example, the front-page or table-of-contents), the above selector won't change them, as they are more specific.

The best practice is to use a different draft.css CSS file that imports the customization CSS where the rest of the style changes reside. If you need to publish the content as a draft, use the draft.css in your transformation scenario, otherwise directly reference the customization CSS (on page 1550).

Related Information:
Images and Figures (on page 1705)
How to Add a Draft Watermark in the Foreground

If you want the watermark to be displayed above the text (in the foreground), instead of using the standard `background-image` property, you can use the `-oxy-foreground-image` property:

```css
@page {
  -oxy-foreground-image: url("draft.svg");
}
```

You can set a more specific selector if you just need to display the foreground in a subset group of pages (for example, chapters). In this case, the above selector will not change it since it is more specific.

**Note:**
The usage of SVG images is preferred because other image types suffer from pixelation and because foreground images are stretched to the full page size.

How to Add a Draft Watermark Depending on Metadata

Suppose you want to apply a Draft watermark until your DITA bookmap is approved and the map is approved when an `<approved>` element has been added to the metadata section (for example, in the `bookmeta/bookchangehistory` element).

```xml
<bookmeta>
  <author>John</author>
  <critdates>
    <created date="1/1/2015"/>
    <revised modified="3/4/2016"/>
    <revised modified="3/5/2016"/>
  </critdates>
  <bookchangehistory>
    <approved/>
  </bookchangehistory>
  ...
</bookmeta>
```

Use `oxy_xpath` every time you need to probe the value from an element other than the one matched by the CSS selector, and test the expression on the merged HTML file using the Oxygen XPath Builder view.

You can either use a page selector that imposes the draft watermark on the entire page surface (recommended):

```css
@page {
  background-image: url(oxy_xpath("if(/*[contains(@class, 'bookmap/approved')]}) then '' else 'draft-watermark.png'"));
  background-position: center;
}
```
background-repeat: no-repeat;
}

or use an element selector that restricts the watermark image only to the page area covered by that element:

```
:root, body{
    ... /* same as properties above */
}
```

**Note:**
You can use another element selector to target a specific part of your publication (for example, marking only the tables as drafts).

## Flagging Content

In DITA, you can mark certain content to flag it or draw attention to it. This is done by defining a flag in a DITAVAL file.

You can attach the DITAVAL file to the DITA map using the `<ditavalref>` element in the map, or by specifying it in the `args.filter` transformation parameter.

In the following example, all the elements that have the attribute `@product` set to `YourProd` is flagged to have a purple background:

```
<val>
    ...
    <prop action="flag" att="product" val="YourProd" backcolor="purple"/>
    ...
</val>
```

**Related Information:**
- Change Bars
- DITAVAL Elements

## How to Flag Content Using Change Bars

As an example, to add a `change bar` (revision mark) for particular content, you can use the following in the DITAVAL file:

```
<val>
    <revprop action="flag"/>
</val>
```
This would result in any content that is marked with `@rev="new"` having a blue change bar.

### How to Flag Content Using Images

You can mark the elements that match a specific profiling condition using images (one for the start, one for the end). The image references are relative to the DITAVAL file.

```xml
<val>
  <prop action="flag"
    att="product" val="MyProd"
    backcolor="blue"
    color="yellow" >

  <startflag imageref="startflag.jpg">
    <alt-text>This is the start of my product info</alt-text>
  </startflag>

  <endflag imageref="endflag.jpg">
    <alt-text>This is the end of my product info</alt-text>
  </endflag>

</prop>
</val>
```

### Styling the Content

If you need to change the styles of the elements from the topic contents, you should create a customization CSS (on page 1550) and then add CSS rules. To create the CSS rules, you can use the development tools described in Debugging the CSS (on page 1552).

### Reusing the Styling for WebHelp and PDF Output

If you are using the `pdf-css-html5` transformation type, then the generated HTML5 document that is later converted to PDF is very similar to the generated HTML5 pages from the WebHelp Responsive output.

This is an output example from the WebHelp transformation:

```html
<h1 class="title topicTitle1" id="ariaid-title2">Care and Preparation</h1>
<div class="body">
  <p class="shortdesc">When caring ...</p>
  <p class="p">When caring for your flower garden you want ...</p>
</div>
```

And the same example from the PDF transformation (note the additional emphasized class values):
It makes sense to reuse the same CSS rules you developed for one transformation type to the other. The main rule is to use the short class names instead of the long ones. For example, to style the short descriptions with italic font, use:

```
.shortdesc {
  font-style: italic;
}
```

The rule of thumb is that if you have a CSS rule that successfully styles an element in WebHelp, it should apply without any modification in the PDF output.

**Titles**

Titles in PDF can be classified into two categories:

- Table of contents titles, identified by the `map/topicref` and `topic/navtitle` class attributes.
- Content titles, that can be styled by matching the `topic/title` class attribute.

**How to Control Titles Layout**

By default, titles are rendered on a single line (with both the chapter/section number and title text). If the title is too long, the text wraps to the next line without any indentation.

```
4.5.5 This is a long title
text that wraps.
```

If you want each line of the title to start at the same location (and indented), you need to set the value of the `args.css.param.title.layout` transformation parameter to `table`. This means that the chapter/section number is placed in one cell and title text is placed in another cell (resulting and indented text):

```
4.5.5 This is a long title
text that wraps.
```

**How to Change Chapters Title Prefix**

**Changing Prefixes in Shallow Numbering**

In shallow numbering (default), to replace the "Chapter N." prefix, use the following rules in your customization CSS (on page 1550):

```
*{class =~ "map/topicref"}[is-chapter]:not([is-part]) > *{class =~ "map/topicmeta"} > *{class =~ "topic/navtitle"}:before{
  content: "Module " counter(toc-chapter, decimal-leading-zero) " - ";
```
Changing Prefixes in Deep Numbering

In deep numbering, to replace the "N." prefix, use the following rules in your customization CSS (on page 1550):

```css
*.[class = "topic/topic"]>[is-chapter]:not([is-part]) > *[class = "topic/title"]:before {
  content: "Module " counter(chapter, decimal-leading-zero) \\A";
}
```

How to Remove Parts and Chapter Title Prefixes

Removing Prefixes in Shallow Numbering

In shallow numbering (default), to hide the "Part N" and "Chapter NN" prefixes, use the following rules in your customization CSS (on page 1550):

```css
*.[class = "map/topicref"] > *.[class = "map/topicmeta"] > *.[class = "topic/navtitle"]:before {
  display: none !important;
}
*.[class = "topic/topic"] > *.[class = "topic/title"]:before {
  display: none !important;
}
```

You can also choose to remove only the 'Part N' prefix:

```css
*.[class = "map/topicref"]>[is-part] > *.[class = "map/topicmeta"] > *.[class = "topic/navtitle"]:before {
  display: none !important;
}
*.[class = "topic/topic"]>[is-part] > *.[class = "topic/title"]:before {
  display: none !important;
}
```

Or to remove only the "Chapter NN" prefix:

```css
*.[class = "map/topicref"]>[is-chapter]:not([is-part]) > *.[class = "map/topicmeta"] > *.[class = "topic/navtitle"]:before {
  display: none !important;
}
```
Removing Prefixes in Deep Numbering

In deep numbering, to hide the "Part N" and "Chapter NN" prefixes, use the following rules in your customization CSS (on page 1550):

```css
*{class ~="map/map"}[numbering ^= 'deep'] *{class ~="map/topicref"} *{class ~="map/topicmeta"}:before {
display: none !important;
}
*{class ~="topic/topic"}:before {
display: none !important;
}
```

How to Display Chapters Title on a Separate Page

You may want to display the chapters title on a separate page (for example, with a background). To do this, a new page should be defined in your customization CSS (on page 1550):

```css
@page chapter-title-page {
    background-image: url("resources/title-bg.png");
    background-repeat: no-repeat;
    background-size: 100% 100%;
    background-position: center;
}
```

After that, you need to replace the default "chapter" page definition with the one created before:

```css
*{class ~="topic/topic"}[is-chapter] {
    page: chapter-title-page;
}
```

Then, you need to set it back on the content following the title:

```css
*{class ~="topic/topic"}[is-chapter] > *{class ~="topic/title"} ~ *:not([class ~="topic/title"]) {
    page: chapter;
}
```

Finally, you can customize the title color, size, and more:

```css
*{class ~="topic/topic"}[is-chapter]:not([is-part]) > *{class ~="topic/title"} {
    color: white;
    font-size: 32pt;
}
```
Equations

This processor supports MathML equations.

How to Change the Font of MathML Equations

Suppose that you need to change the font of MathML equations from the documentation, and also add some padding. The MathML fragments are wrapped in elements that have the class `equation-d/equation-block` or `equation-d/equation-inline`, so you can match them with:

```css
*{class =~"equation-d/equation-block"},
*{class =~"equation-d/equation-inline"} {
  font-family: "courier new";
  font-size: 1.5em;
  padding: 1em;
}
```

Note:

An equation can be rendered using multiple classes of fonts (e.g. the `serif, sans serif, monospace, fractur, and doublestruck` classes. Depending on each of the equation symbols, a class is selected for it. The font specified in the CSS rule (as in the preceding example), applies only to the `serif` class. However, if a symbol codepoint is not covered by the currently selected class fonts, it falls back to the font specified in the CSS.

Attention:

Some of the fonts may not be supported. In that case, a default serif font is used.

Lists

This is the default layout for lists (values are in px):

Markers are displayed in the padding area, so they are not included in the principal block box.
The lists are treated differently than ordinary block elements in the sense that their margins are not collapsed with the margins of the neighboring blocks or lists. This is also visible for nested lists. To summarize:

- Setting the `padding-left` or `margin-left` properties on lists will move the whole list.
- Setting the `margin-left` property on list items will move the whole list.
- Setting the `padding-left` property on list items will only move the list item content (not the marker).

**Note:**

If the `padding-left` property is set on lists and the `margin-left` property is set on list items, the result will move the whole list with a combination of both padding and margin values.

### How to Align Lists with Page Margins

It is possible to reposition the lists to align them with the rest of the text from the body.

The default CSS rules for the lists are as follows:

```css
ol {
    display:block;
    margin-top: 1.33em;
    margin-bottom: 1.33em;
    list-style-type:decimal;
    padding-left: 40px;
}
ul {
    display:block;
    margin-top: 1.33em;
    margin-bottom: 1.33em;
    list-style-type:disc;
    padding-left: 40px;
}
```

To align the lists, the following rules are sufficient in the customization CSS *(on page 1550)*:

```css
*{class~="topic/ol"},
*{class~="topic/ul"} {
    padding-left: 0;
    list-style-position: inside;
}
```

**Note:**

By default, the `list-style-position` property is set to *outside*.
How to Style the List Markers

For the media print, the default CSS rules for the list items use the \texttt{:marker} pseudo-class.

```css
@media print {
  *[class="topic/li"]::marker {
    text-align: center;
    font-weight: bold;
  }
  *[class="topic/li"] {
    margin-left: 0.25in;
  }
}
```

To eliminate the bold font weight for the items form ordered lists then add the following rules to your customization CSS (on page 1550):

```css
*[class="topic/ol"] > *[class="topic/li"]::marker {
  font-weight: normal;
}
```

For the unordered lists:

```css
*[class="topic/ul"] > *[class="topic/li"]::marker {
  font-weight: normal;
}
```

How to Continue List Numbering

It is possible to continue the numbering of an ordered list even when the content is split on multiple `<ol>` elements.

You just need to define an \texttt{@outputclass} attribute on the lists where numbering should continue:

```xml
<ol @outputclass="continue">
  <li>First Item</li>
  <li>Second Item</li>
</ol>
<p>A paragraph</p>
<ol @outputclass="continue">
  <li>Third Item</li>
</ol>
```

Then set the following content inside your CSS customization:

```css
*[class = "*topic/ol"] {
  counter-reset: list-counter;
}
```
How to Change the Numbering System of Ordered Lists

It is possible to change all lists to have a different numbering system and there are several methods that can be used to achieve this.

Use the `list-style-type` CSS Property.

The Chemistry engine supports the following types: decimal, decimal-leading-zero, lower-roman, upper-roman, lower-latin, upper-latin, lower-alpha, upper-alpha.

```css
* [class = "topic/ol"] { list-style-type: lower-roman; }
```

Change the Content of the `:marker` CSS Pseudo-Element.

The following example emulates the Cyrillic numbering for the list items for an ordered list that has the `@outputclass` attribute set to `cyrillic`:

```css
* [class = "topic/ol"][outputclass = "cyrillic"] > * [class = "topic/li"]:marker {
  width: 3em;
}

* [class = "topic/ol"][outputclass = "cyrillic"] > * [class = "topic/li"]:nth-of-type(1):marker{ content: "а" }
* [class = "topic/ol"][outputclass = "cyrillic"] > * [class = "topic/li"]:nth-of-type(2):marker{ content: "б" }
* [class = "topic/ol"][outputclass = "cyrillic"] > * [class = "topic/li"]:nth-of-type(3):marker{ content: "в" }
```

⚠️ Important:

This example will work only for lists up to 28 items. You will have to extend it for longer lists!

Oxygen PDF Chemistry User Guide: Lists

Links

Links allow the users to navigate through the documentation.

How to Change 'on page NNN' Link Label

For printed material, it is usually desirable for the links to display a label after the text content (such as "on page 54"). This makes it easier the user to identify the target page. However, if the produced PDF is not printed and is intended only for electronic use, this label may create clutter and make the document harder to read. To eliminate this label, add the following in your customization CSS (on page 1550):

```
*[class =~ "topic/xref"]\[href\]:after,
*[class =~ "topic/link"]\[href\]:after {
  content: none !important;
}
```

Note:

A variant is to remove the "on page" label only and keep the page number:

```
*[class =~ "topic/xref"]\[href\]:after,
*[class =~ "topic/link"]\[href\]:after {
  content: " (" target-counter(attr(href), page) ")" !important;
}
```

Another use-case is to remove the labels only from links shown in tables cells, and leave the others as they are. For this, you could use a more specific selector:

```
*[class =~ "topic/entry"] *\[class =~ "topic/xref"]\[href\]:after{
  content: none !important;
}
```
How to Change Link Styles

Suppose you want the links to be bold and with an underline. In your customization CSS (on page 1550), add this snippet:

```css
* [class ~='topic/xref'][href]:after, 
* [class ~='topic/link'][href]:after { 
  font-weight: bold; 
  text-decoration: underline; 
}
```

How to Hide Descriptions in Related Links Sections

The link descriptions that come from DITA relationship tables or related link elements within topics, are structured in the merged map (on page 1553) like this:

```xml
<related-links class='-- topic/related-links '>
  <linkpool class='-- topic/linkpool '>
    <link class='-- topic/link '>
      ... role='friend' scope='local' type='topic'>Salvia</linktext>
    <desc class='-- topic/desc '>The salvia plant</desc>
  </link>
</linkpool>
...
</related-links>
```

If you need to hide these descriptions, add the following code in your customization CSS (on page 1550):

```css
*[class ~= "topic/link"] > *[class ~= "topic/desc"] { 
  display: none; 
}
```

How to Group Related Links by Type

By default, all links from DITA relationship tables or related link elements within topics are grouped under one "Related information" heading:

```
Related information
  Target Topic
  Target Concept
  Target Task
```

It is possible to group the links by target type (topic type) by setting the `args.rellinks.group.mode=group-by-type` parameter. The output will look like this:
Images and Figures

Images are an important part of a publication.

Note:
You can use raster image formats (such as PNG or JPEG), but it is best to use vector images (such as SVG or PDF). They scale very well and produce better results when printed. In addition, the text from these images is searchable and can be selected (if the glyphs have not been converted to shapes) in the PDF viewer.

Images - Built-in CSS

Image properties are defined in [PLUGIN_DIR]/css/print/p-figures-images.css.

```
*[class =~ ^\*\{topic/image\}*] {
prince-image-resolution: 96dpi;
-ah-image-resolution: 96dpi;
image-resolution: 96dpi;
max-width: 100%;
}
```

How to Fix Image Bleeding - Control Image Size

Sometimes the images may be too big for the page. The built-in CSS rules specify a maximum size for images, limiting to the width of the parent block. But if the parent block is itself too wide and bleeds out of page, you might consider specifying a length.

In your customization CSS (on page 1550), add the following snippet:

```
*[class =~ ^\*\{topic/image\}*] {
  ...
  /* The US-letter page size minus page margins. See p-page-size.css for the current page size. */
  max-width: 6.5in;
}
```
Pay attention to images that have an image map (on page 1711) associated. The built-in rules set the max-width: auto for them to avoid scaling. Otherwise, it would cause a misalignment between the image and its clickable areas. These images are best to have a @width and @height attribute.

How to Change Image Resolution

How to Change the Resolution for Raster Images

This technique changes the size of all raster images from your documentation. It will not work for vector images, such as PDF or SVG.

The default resolution is 96 dpi (same as in web browsers). You can change it by adding the following in your customization CSS (on page 1550):

```
*[class =~ "topic/image"] {
    prince-image-resolution: 300dpi;
    -ah-image-resolution: 300dpi;
    image-resolution: 300dpi;
}
```

Important:
The above selector does not apply to images from the <imagemap> element. You can use the following selector for that purpose:

```
*[class =~ "ut-d/imagemap"] > *[class =~ "topic/image"] {
    ...
}
```

Make sure you verify the area shapes to match the new image boundaries. The pixels specified in the image map area coordinates are always 1/96 in. For more details, see: How to Use Image Maps (on page 1711).

How to Change the Resolution for Vector Images

This technique will change the size of all vector images (such as PDF or SVG) and will not affect raster images.

Vector images are rendered with a default resolution of 96 dpi. You can change this default value by setting the image.resolution transformation parameter (on page 1527) to another value (from 72, 120, 300 and 600).

How to Place Big Images on Rotated Pages

Wide images may bleed out of the page. One solution for this is to use landscape pages for these wide images.

In your customization CSS (on page 1550), add:
Setting the `@outputclass` = 'land' attribute on the `<image>` element forces the image to be displayed on a new landscape page.

If you want to rotate the entire topic that contains the image, use:

* `*[class~="topic/topic"]*:has(*[class~="topic/body"] > *[class~="topic/image"][@outputclass="land"]),`  
* `*[class~="topic/topic"]*:has(*[class~="topic/body"] > * > *[class~="topic/image"][@outputclass="land"]),`  
* `*[class~="topic/topic"]*:has(*[class~="topic/body"] > * > * > *[class~="topic/image"][@outputclass="land"]) {`  
  page: landscape-page;
* }

How to Place a Text and Image Side by Side

If you need to align text and an image side-by-side, you can use the following technique:

1. Organize your text and image inside a `<div>` element like this:

   ```xml
   ...  
   <div outputclass="side-by-side">
      <p> This will be in the left side, the next figure in the right. </p>
   </div>
   ...  
   ```

   **Note:** You can use the `@outputclass` attribute to mark the `<div>` elements that have this special layout.

2. In your customization CSS (on page 1550), add:

   ```css
   *[outputclass ~="side-by-side"] > *[class ~="topic/p"] {  
      display:inline-block;  
      width: 45%;  
   }
   
   *[outputclass ~="side-by-side"] > *[class ~="topic/fig"] {  
      display:inline-block;  
      width: 45%;  
   }
   ```
The image should fill the entire width of the parent `<fig>` element:

```css
*[^outputclass ~="side-by-side"] > *[^class ~="topic/fig"] > *[^class ~="topic/image"] { width:100%; }
```

By default, the bottom of the image is on the same line as the text baseline. If you want the text and the image to be aligned at the top, add these lines:

```css
*[^outputclass ~="side-by-side"] > *[^class ~="topic/p"] { vertical-align:top; }

*[^outputclass ~="side-by-side"] > *[^class ~="topic/fig"] { vertical-align:top; }
```

**Note:**

If your figure does not have a title, you can also set `font-size:0pt` to remove the font ascent and descent around the image rectangle.

```css
*[^outputclass ~="side-by-side"] > *[^class ~="topic/fig"] { vertical-align:top; font-size:0pt; }
```

### How to Control the Image Size in Complex Static Content

It is common to have text and images mixed together in a `:before` or `:after` pseudo-element. For example, for notes you may have both artwork and text:

```css
[^class ~="topic/note"]:before { content: url('note.png') "Some text";
}
```

If you want to change the size of the image, you have two options:

- **Use the `image-resolution` CSS property:**

  ```css
 [^class ~="topic/note"] { image-resolution:300dpi; }
  ```

- **Separate the image from the text and apply the width and height CSS properties only on the image, using the width and height properties. You could use multiple `:before` pseudo-elements for that,**
considering that the farthest content presented before the actual content of an element is matched by the :before with the highest number in the brackets:

```css
*{class =~ "topic/note"}:before(2) { 
  content: url('note.png') ;
  width:0.5in;
}

*{class =~ "topic/note"}:before(1) { 
  content: "Some text";
}
```

### How to Center Images

DITA defines a `@placement` attribute for the `<image>` elements. The implicit value is `inline`. Suppose that you need to center the images that have the placement set to `break` (for example, they are not on the same line with other content and the images from the `<fig>` element).

In your customization CSS *(on page 1550)*, add:

```css
*[class =~ "topic/fig"] { 
  text-align: center;
}

/* Other images, with break placement. */
*[class =~ "topic/image"]{placement='break'}{
  display:block;
  text-align: center;
}

/*
Scaled images are getting a computed width attribute, so we can use the auto margins.
Auto margins function only if the block they apply to has a width.
*/
*[class =~ "topic/image"]{placement='break'}[width] { 
  margin-left:auto;
  margin-right:auto;
  border: 2pt solid red;
}
```
How to Change/Reset the Figure Numbering

Note:
This topic is applicable for the DITA Map PDF - based on HTML5 & CSS DITA PDF - based on HTML5 & CSS transformation types.

There are cases when you need to change the aspect of the figure counter that is shown before the figure titles. By default, the figure titles are formatted like this:

Figure NN. Lore Ipsum Title

NN is the number of the figure that starts being counted from the beginning of the publication.

One use-case is to have the NN counter be incremented only within one chapter (for example, the first chapter contains "Figure 1" and "Figure 2", and the second chapter starts over with "Figure 1" instead of incrementing to "Figure 3").

You should reset the figure counter on each topic marked as chapter, then hide the label from the figure `<figcaption>` (this is an HTML element generated by the XSL transformation), and create another label using a `:before` selector on the `<figcaption>`.

```html
* [class =~ "topic/topic"] [is-chapter] {
  counter-reset: figcount;
}

.fig--title-label{
  display:none;
}

*[class =~ "topic/fig"] > .figcap:before{
  /* Add more styling or change the content if needed */
  content: "Figure " counter(figcount) ". ";
  counter-increment: figcount;
}
```

How to Fix Missing Images

If your images are not accessible, you may receive an error message in the transformation console like this:

Image not found. URI:file:/path/to/my/image

This is usually because they are in a folder that is not in the folder subtree of the transformed map or topic.

To solve this, you can set the following transformation parameter: `fix.external.refs.com.oxygenxml=true`. 
How to Use Image Maps

To use the DITA `<imagemap>` element in a PDF transformation, follow this procedure:

1. Start by determining the width and height of your image in **CSS pixels** and specify it on the `<image>` element using the `@width` and `@height` attributes.

   **Notes:**
   - A **CSS pixel** is 1/96 in, so if the image is created at a 96dpi resolution, one dot from the image is one pixel in the CSS space. If your image is displayed at another resolution (on page 1706), then it is adjusted accordingly (for example, 192dpi results in two dots from the image being equal to one pixel in the CSS space).
   - You can use other CSS units, including percentages. The percentages are solved relative to the image size and represent a way of creating responsive image maps.

   **Warning:**
   If you publish the content for both PDF and HTML web output, make sure you only use **pixels**, as some browsers only support these units.

   **Example:**

   Suppose you have a large image that is 6400x4800 dots, but you want to make it fit in a box of 640x480 CSS pixels. In the following snippet, this is done by specifying the width and height attributes. The areas must use coordinates relative to these values.

   ```xml
   <imagemap>
     <image href="../images/Gear_pump_exploded.png" id="gear_pump_exploded" width="640" height="480">
       <alt>Gear Pump</alt>
     </image>
   </imagemap>
   
   2. In the map element, add areas (each with a shape and a set of coordinates):

   ```xml
   <image ...
   ...
   <area>
     <shape>circle</shape>
     <coords>172, 265, 14</coords>
     <xref href="parts/bushings.dita#bushings_topic/bushings" format="dita">Bushings</xref>
   </area>
   ```
The type of areas are the ones defined in the HTML standard: circle, poly, rect, default. For more details, see: https://html.spec.whatwg.org/multipage/image-maps.html#the-area-element.

**Warning:**

Areas coordinates are relative the image box and are not affected by the image resizing (change in image width/height or scaling), accordingly to the HTML specs:

“For historical reasons, the coordinates must be interpreted relative to the displayed image after any stretching caused by the CSS 'width' and 'height' properties (or, for non-CSS browsers, the image element's width and height attributes - CSS browsers map those attributes to the aforementioned CSS properties).”

**Tip:**

Adding the `<scale>` attribute on the `<imagemap>` element will scale both the image and areas.

3. Verify how the shapes look in the output. You can make the shapes visible by one of the following methods:

- Using the `show.image.map.area.numbers` and `show.image.map.area.shapes` transformation parameters.
- Adding a CSS snippet to your customization. The shapes have the `image-map-shape` class, the bullet around the image map number (`image-map-number`), and the text inside the bullet (`image-map-number-text`). To make them translucent yellow:

```css
.image-map-shape{
    fill: yellow;
    fill-opacity: 0.5;
    stroke-opacity: 0.5;
}
.image-map-number-text {
    visibility: visible;
}
```
Tip:
An SVG with links can be used as an alternative to the DITA `<imagemap>` element. Make sure that each link is a relative URI to an ID inside the publication content.

How to Hide the Image Map Links List

Below every image map, a list of links that point to the image map targets is displayed. This list can be hidden from the final output by using the following CSS selector:

```
.image-map--areas {
   display: none;
}
```

How to Use SVG Syntax Diagrams

The DITA `<syntaxdiagram>` element is supported by the PDF transformation. To use SVG syntax diagrams, follow this procedure:

1. Download the latest version of the `svg-syntaxdiagrams` plugin, unzip it, and copy all the folders into your `DITA-OT-DIR\plugins` folder (they all start with "com.").
2. Open a command prompt inside `DITA-OT-DIR\bin` and run the dita install command.
3. You can now add your custom `<syntaxdiagram>` element in your topic, as in the following example:

```
<syntaxdiagram id="syntaxdiagram_ok4_clk_xnb">
   <title>CopyFile</title>
   <groupseq>
      <kwd>COPYF</kwd>
   </groupseq>
   <groupcomp>
      <var>input-filename</var> <kwd>*INFILE</kwd>
   </groupcomp>
   <groupseq>
      <var>output-filename</var> <kwd>*OUTFILE</kwd>
   </groupseq>
   <groupchoice>
      <var>input-filename</var> <kwd>*INFILE</kwd>
   </groupchoice>
   <groupchoice>
      <var>output-filename</var> <kwd>*OUTFILE</kwd>
   </groupchoice>
</syntaxdiagram>
```

4. Run the DITA Map PDF - based on HTML5 & CSS (or DITA PDF - based on HTML5 & CSS) transformation.

Warning:
If you are not publishing the content for the first time, you may need to delete the `out/` and `temp/` folders to see the syntax diagram correctly in the `.merged.html` file.
**Result:** The PDF is generated and the syntax diagram is displayed as a referenced SVG file like this:

![Syntax Diagram Example](image)

### Videos

Videos can be referenced in a DITA topic by using the `<object>` element:

```xml
<object data="path/to/video.mp4" outputclass="video"/>
```

**Related information**

Oxygen PDF Chemistry User Guide: Videos

### How to Reference a Video Using a Key

Videos can also be referenced in DITA topics by using a key. The key must be defined in the DITA map like this:

```xml
<keydef keys="video" href="path/to/video.mp4" format="mp4"/>
```

The key is referenced in the topic with the `datakeyref` attribute within the `<object>` element:

```xml
<object datakeyref="video" outputclass="video" width="480" height="270"/>
```

### How to Change Video Size

It is possible to set the size for your videos directly from a custom CSS stylesheet *(on page 1550)*:

```css
.video {
  width: 480px;
  height: 270px;
}
```

**Related information**

Oxygen PDF Chemistry User Guide: Change the Video Size

### How to Change the Videos Cover

By default, a placeholder is displayed in place of the video. When clicked, this placeholder launches the video. A popup is presented in Acrobat Reader to enable the Multimedia content (the document must be trusted for the video to launch).

It is possible to change this placeholder with a custom one by using the `oxy-video-cover` property:

```css
.video {
  -oxy-video-cover: url("files/cover.png");
}
```
How to Center Videos

It is possible to center the videos by centering their containers like this:

```css
.video-container {
  text-align: center;
}
```

Tables

Tables are widely used in technical documentation. This section contains information about the CSS rules that are used to style them and how to fix some problems.

Tables - Built-in CSS

There is a combination of CSS files that address tables:

- `[PLUGIN_DIR]/css/core/-table-html-cals.css`
- `[PLUGIN_DIR]/css/print/p-tables.css`

How to Avoid a Table Exceeding the Page Width

The DITA specification indicates that tables should have a fixed layout. This can be done in two different ways:

1. Using proportional or relative measures - It includes percent values and shares values (i.e. "3*" or "12*").
2. Using fixed measures - It includes all the values followed by units (i.e. `in`, `pt`, `px`, and others).

Important:

- Although the specification allows you to combine these values, it is highly recommend that you only use one method at a time. Combining both methods could lead to a table exceeding the page width and will make the content unreadable.
- If all of the column width values are not declared in the table, the shares values (e.g. "2.5") will not be used.

How to Handle Wide Tables - Page Rotation

Some of the tables can have a large number of columns. In this case, the table may bleed out of the page. One solution is to use landscape pages for these tables.

Setting the attribute `orient = 'land'` attribute on the table element will force the table to be on a new landscape page.

Another solution is to use automatic detection of wide tables (5 or more columns):
Note:
The landscape-page page layout is defined in the [PLUGIN_DIR]/css/print/p-pages-and-headers.css file.

If you want to rotate the entire topic that contains the big table, use:

```css
* [class~="topic/table"] [data-cols='5'],
* [class~="topic/table"] [data-cols='6'],
* [class~="topic/table"] [data-cols='7'],
* [class~="topic/table"] [data-cols='8'],
* [class~="topic/table"] [data-cols='9'],
* [class~="topic/table"] [data-cols='10'] {
  page: landscape-page;
  max-width: 100%;
  max-height: 100%;
  width: 100%;
  page-break-before: avoid;
}
```

```css
* [class~="topic/topic"] :has(* [class~="topic/body"] > * [class~="topic/table"] [data-cols='5']),
* [class~="topic/topic"] :has(* [class~="topic/body"] > * [class~="topic/table"] [data-cols='6']),
* [class~="topic/topic"] :has(* [class~="topic/body"] > * [class~="topic/table"] [data-cols='7']),
* [class~="topic/topic"] :has(* [class~="topic/body"] > * [class~="topic/table"] [data-cols='8']),
* [class~="topic/topic"] :has(* [class~="topic/body"] > * [class~="topic/table"] [data-cols='9']),
* [class~="topic/topic"] :has(* [class~="topic/body"] > * [class~="topic/table"] [data-cols='10']){
  max-width: 100%;
  table-layout:auto;
}
* [class~="topic/topic"] :has(* [class~="topic/body"] > * > * [class~="topic/table"] [data-cols='5']),
* [class~="topic/topic"] :has(* [class~="topic/body"] > * > * [class~="topic/table"] [data-cols='6']),
* [class~="topic/topic"] :has(* [class~="topic/body"] > * > * [class~="topic/table"] [data-cols='7']),
* [class~="topic/topic"] :has(* [class~="topic/body"] > * > * [class~="topic/table"] [data-cols='8']),
* [class~="topic/topic"] :has(* [class~="topic/body"] > * > * [class~="topic/table"] [data-cols='9']),
* [class~="topic/topic"] :has(* [class~="topic/body"] > * > * [class~="topic/table"] [data-cols='10']),
* [class~="topic/topic"] :has(* [class~="topic/body"] > * > * > * [class~="topic/table"] [data-cols='5']){
```
How to Fix Text Bleeding From Table Cells

Slim tables or tables that have many columns make the text from the cells be confined to a small horizontal space. Sometimes this causes long words to bleed outside the cell boundaries.

By default, the built-in CSS automatically activates the hyphenation for the text inside tables as long as your topics have the language specified.

In case the text is still bleeding outside the boundaries, you can also use the `overflow-wrap` property to force the word to break:

```css
*[class~="topic/table"] { 
  overflow-wrap: break-word;
}
```

Related Information:

- Hyphenation (on page 1673)
- How to Enable/Disable Hyphenation for an Element (on page 1676)

How to Fix Small Images in Table

Tables contained in the output of DITA Map PDF - based on HTML5 & CSS (and DITA PDF - based on HTML5 & CSS) transformations have an automatic layout by default. This means that DITA-OT defines a preferred size on them, optimizing their width/height inside the content to make them as small as possible.

If, for example, you have a two-column table without defined column widths and one column contains images while the other column contains text, the table in the generated PDF will have its first column shrunk with smaller images and an enlarged second column (to occupy the least amount of space in the output).
To avoid this, you must *unset* the default image `max-width` so that the original size of the image will be used instead:

```html
*[{class =~ "topic/image"] { 
  max-width: unset;
}
```

### How to Center Tables

You can center the tables by using margins `auto`, while the table caption (title) can be centered using the `text-align` property:

```html
*[{class =~ "topic/table"] { 
  margin-left:auto;
  margin-right:auto;
  width: 50%;
  border: 1pt solid blue;
}
*[{class =~ "topic/table"] *[{class =~ "topic/title"]{ 
  text-align:center;
}
```

### How to Remove the Table NN Label

For the DITA Map PDF - based on HTML5 & CSS transformation scenario, the label for a table's title is wrapped in a span element with the class: `table--title-label`.

```html
<table ...
   ...
<caption class="- topic/title title tablecap">
  <span class="table--title-label">Table
     <span class="table--title-label-number">1. </span></span>
  <span class="table--title">The title of the table</span>
</caption>
   ...
```

To hide it, set its display to none:

```html
.table--title-label {
  display:none;
}
```

For the direct transformation, use:

```html
*[{class =~ "topic/table"] > *[{class =~ "topic/title"]:before {
  content: none;
}
```
How to Customize Rows, Columns and Cells

Common Use-Cases

Here are some common table use-cases and the CSS selectors for customizing table rows, columns, and cells. These example uses the background-color CSS property but any CSS property can be used (border, margin, padding, etc.).

• Select all non-header cells:

```css
* [class =~ "topic/tbody"] * [class =~ "topic/entry"] { 
    background-color: lightgray;
}
```

• Select some table rows (using :nth-of-type() pseudo-class):

```css
/* Select all even rows. */
* [class =~ "topic/tbody"] *[class =~ "topic/row"]:nth-of-type(even) { 
    background-color: lightgray;
}

/* Select the fourth row. */
* [class =~ "topic/tbody"] *[class =~ "topic/row"]:nth-of-type(4) { 
    background-color: yellow;
}
```

• Select specific table columns (using :nth-of-type() pseudo-class):

```css
/* Select all odd columns. */
* [class =~ "topic/tbody"] *[class =~ "topic/entry"]:nth-of-type(odd) { 
    background-color: lightgray;
}

/* Select the second column. */
* [class =~ "topic/tbody"] *[class =~ "topic/entry"]:nth-of-type(2) { 
    background-color: yellow;
}
```

Applying Properties to Specific Elements

If you need to apply some properties to specific elements, you can use the DITA @outputclass attribute:

```xml
<table frame="none">
    <title>Flowers</title>
    <tgroup cols="3">
        <colspec colname="c1" colnum="1" colwidth="171pt"/>
        <colspec colname="c2" colnum="2" colwidth="99pt"/>
        <colspec colname="c3" colnum="3" colwidth="150pt"/>
    </tgroup>
    <thead>
    </thead>
    <row>
```
In this case, the selector will be based on this `outputclass`:

```css
*[class ~="topic/table"] *[outputclass ~="colored"] {
  background-color: yellow;
}
```

How to Add Stripes to a Table

To create a striped look for your tables, you can use the following CSS rules:

```css
/* Header background and foreground */
*[class ~="topic/table"][outputclass ~="stripes"] > *[class ~="topic/thead"] > *[class ~="topic/row"] {
  background-color: blue;
  color:white;
}

/* A default background for the entire table body */
*[class ~="topic/table"][outputclass ~="stripes"] > *[class ~="topic/tbody"] {
  background-color: #eeeeee;
}```
The above rules assume that tables that are to be painted with stripes are marked with an `@outputclass` attribute:

```xml
<table outputclass="stripes">...
</table>
```

If you want to make all tables look the same, you can ignore this attribute and remove the `*[outputclass ~="stripes"]` simple selector from the above rules.

**CAUTION:**
Applying stripes and thin cell borders can cause rendering issues in the PDF renderer on screen display devices. For more information, see Disappearing Thin Lines or Cell Borders (on page 1778).

**How to Display Borders on a Split Cell**

By default, if a cell extends onto a second page, its bottom and top borders are discarded. To display these borders, you need to add the following property in your CSS customization:

```css
*[class ~= "topic/entry"] {  
  -oxy-borders-conditionality: retain;
}
```

**How to Rotate Content from a Table Cell**

In DITA CALS tables, you can rotate the content of a cell by setting the `@rotate` attribute to 1.

In the following example, the Sport, All terrain, and Family header cells are rotated.

```xml
<table frame="all" rowsep="1" colsep="1" id="table_dlp_fib_crb">
  <title>Car Features</title>
  <group cols="4">
    <colspec colname="c1" colnum="1" colwidth="14*"/>
    <colspec colname="c2" colnum="2" colwidth="1*" align="center"/>
    <colspec colname="c3" colnum="3" colwidth="1*" align="center"/>
  </group>
</table>
```
The built-in CSS matches the cells with this attribute and applies the following properties:
To change the vertical alignment of the content (for example, to move it to the middle of the cell), use the following in your CSS customization:

```
*{class="topic/entry"}[rotate='1'] {
    vertical-align:middle;
}
```

The resulting output will be:

<table>
<thead>
<tr>
<th>Car Name</th>
<th>Features</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Sport</td>
</tr>
<tr>
<td>Tesla Model S</td>
<td>X</td>
</tr>
<tr>
<td>Nissan Leaf</td>
<td></td>
</tr>
<tr>
<td>Dacia Duster</td>
<td>X</td>
</tr>
</tbody>
</table>

To make the text wrap (for instance, the "All terrain" could be split on two lines), you need to inhibit the whitespace preservation from the built-in CSS. In this case, all spaces will create a line break in the rotated layout. Thus, you can add this in your customization:

```
*{class="topic/entry"}[rotate='1'] {
    vertical-align:middle;
    white-space:normal;
}
```

The resulting output will be:
How to Add Horizontal Lines to a Choice Table

To add horizontal lines that separate the options within a `<choicetable>`, you can use borders set on each of the rows. The following CSS styles the top header and the first column with some background colors. In a choice table, the first column represents the choice labels.

```css
* [class~="task/choptionhd"],
* [class~="task/choptionhd"],
* [class~="task/chdeschd"],
* [class~="task/choption"] {
    background-color: #EEEEEE;
    text-align: left;
}

* [class~="task/choicetable"] {
    border: 2pt solid #EEEEEE;
}

* [class~="task/choicetable"] * [class~="task/chrow"],
* [class~="task/choicetable"] * [class~="task/chhead"]{
    border-bottom: 2pt solid #EEEEEE;
}

* [class~="task/choicetable"] * [class~="topic/stentry"] {
```

Note:

The padding and borders set on the table cells are not rotated (only the content of the cell is rotated). You can use `padding-left` (for instance) to move the labels to the horizontal axis.

```css
* [class~="topic/entry"] [rotate='1'] {
    padding-left: 2em;
}
```
Note:
Using the frame attribute on the choice table will make these selectors apply partially. Please make sure you are designing your customization CSS taking into account all possible values for the frame attribute.

Programming Elements

Programming Elements are used to render lines of programming code. These elements have preserved line endings and use a monospace font in the output.

How to Enable Syntax Highlight in Code Blocks

Note:
This topic refers only to the DITA Map PDF - based on HTML5 & CSS transformation type.

You can use syntax highlighting to make it easier to read your code snippets by displaying each type of code in different colors and fonts. In the DITA topics, set the `@outputclass` attribute on the `<codeblock>` elements to one of these values:

- language-json
- language-yaml
- language-xml
- language-bourne
- language-c
- language-cmd
- language-cpp
- language-csharp
- language-css
- language-dtd
- language-ini
- language-java
- language-javascript
- language-lua
- language-perl
- language-powershell
- language-php
- language-python
- language-ruby
For example, for a java snippet:

```xml
<codeblock outputclass="language-java">
  for (int i=0; i <100; i++) {
    // do something
  }
</codeblock>
```

The resulting HTML fragment in the merged HTML5 document is:

```xml
<pre class="+ topic/pre pr-d/codeblock pre codeblock language-java"
  xml:space="preserve">
  <strong class="hl-keyword" style="color:#7f0055">for</strong>
  <strong class="hl-keyword" style="color:#7f0055">int</strong>
  <span class="hl-number">i</span>=<span class="hl-number">0</span>; i <span class="hl-number">100</span>; i++) {
    <em class="hl-comment" style="color:#006400">// do something</em>
  }
</pre>

And in the output, it is rendered as:

```xml
for (int i=0; i <100; i++) {
    // do something
}
```

### Changing the Colors for the Syntax Highlighting

As you can see in the above example, the HTML elements `<span>` and `<strong>` are used to color the content. Since they have a `@style` attribute set, the overriding properties need to be marked with `!important`.

Suppose you want to color the keywords in red and the comments in blue. To do so, add the following to your customization CSS (on page 1550):

```css
.hl-keyword {
  color: red !important;
}
.hl-comment {
  color: blue !important;
}
```
How to Add Line Numbering in Code Blocks

Note:
This topic refers only to the DITA Map PDF - based on HTML5 & CSS transformation type.

You can add line numbering to make your code snippets easier to read. In the DITA topics, set the `@outputclass` attribute on the `<codeblock>` elements to the `show-line-numbers` value.

Note:
It is possible to use the `@outputclass="show-line-numbers"` together with any of the `language @outputclass` value (e.g. `@outputclass="language-java show-line-numbers"`).

For example, for a java snippet:

```xml
<codeblock outputclass="show-line-numbers">
public void convert(String systemId, InputStream is) {
    return new FileInputStream();
}
</codeblock>
```

The resulting HTML fragment in the merged HTML5 document is:

```html
<pre class="+ topic/pre pr-d/codeblock pre codeblock show-line-numbers"
outputclass="show-line-numbers" xml:space="preserve">
<span class="+ topic/pre-new-line pre-new-line">
</span>
<span class="+ topic/pre-new-line pre-new-line">
</span>
public void convert(String systemId, InputStream is) {
    return new FileInputStream();
    }
</pre>
```

And in the output, it is rendered as:

```java
1
2    public void convert(String systemId, InputStream is) {
3       return new FileInputStream();
4    }
5
```

How to Display Whitespaces in Code Blocks

Note:
This topic refers only to the DITA Map PDF - based on HTML5 & CSS transformation type.
You can display whitespace characters in code blocks to visualize indentation in the PDF. In the DITA topics, set the `@outputclass` attribute on the `<codeblock>` elements to the `show-whitespace` value.

**Note:** It is possible to use the `@outputclass="show-whitespace"` together with any of the `language` or `show-line-numbers` `@outputclass` values (e.g. `@outputclass="language-java show-line-numbers show-whitespace"`).

For example, for a java snippet:

```xml
<codeblock outputclass="show-whitespace">
public void convert(String systemId, InputStream is) {
    return new FileInputStream();
}
</codeblock>
```

The resulting HTML fragment in the merged HTML5 document is:

```html
<pre class="+ topic/pr-d/codeblock pr-d/codeblock show-whitespaces" outputclass="show-whitespaces" xml:space="preserve">
public void convert(String systemId, InputStream is) {
    return new FileInputStream();
}
</pre>
```

And in the output, it is rendered as:

```
public void convert(String systemId, InputStream is) {
    return new FileInputStream();
}
```

**How to Disable Line Wrapping in Code Blocks**

By default, code blocks have the content wrapped to avoid the bleeding of long lines out of the page. To avoid wrapping, add the following in your customization CSS (on page 1550):

```css
*[class="pr-d/codeblock"] {
    white-space: pre;
}
```

For the DITA Map PDF - based on HTML5 & CSS transformation type, the best solution to distinguish between lines is to leave them wrapped, but color each line with a different background (zebra coloring). An example is provided here: [XSLT Extensions for PDF Transformations (on page 1738)](https://example.com/xslt-extensions).
## How to Enable Line Wrap in Code Phrases

By default, line wrapping does not apply on inline elements, which could cause some lines of code to bleed out of the page. To allow line wrapping, the property should be set on the parent block with the following rule in your customization CSS *(on page 1550)*:

```css
*:has(*[class ~='pr-d/codeph']) { 
  overflow-wrap: break-word;
}
```

### Notes:

- It is possible to use `hyphens: auto` instead of `overflow-wrap: break-word`.
- It is possible to use the same rule for software domain elements (e.g. `<filepath>` or `<cmdname>`).

## How to Deal with Unwanted Returns in Code Blocks

There are cases where the source file contains long lines of code that need to continue onto the next line in the rendered PDF (to wrap visually).

When the user copies the block from the PDF reader, they get two separated lines. This means that the command fails when users copy it from the PDF to the command-line terminal (because it comes in as two commands).

For example, the command:

```bash
$gist = ls -l * | count -n | some more
```

May be rendered in the PDF on two lines:

```bash
$gist = ls -l * | count -n
| some more
```

And this is invalid when used in the terminal.

There is no CSS workaround for this, but to manually format the command line, add a line continuation character like this:

```bash
$gist = ls -l * | count -n \ 
| some more
```

### Note:

For Linux/macOSX, the continuation character is the backslash `. For Windows, this is the shift character `^`.

The command-line processor will now recognize that the first line is continuing on to the next one.
Notes

Notes contain an additional piece of information that calls attention to particular content. They may have various types (note, tip, fastpath, restriction, important, remember, attention, caution, danger, other).

For information on how to add and manage mixed content before the note icons and labels, see How to Control the Image Size in Complex Static Content (on page 1708).

How to Change Note Icons

The recommended icon format is SVG. The default size of the note icons is 24x24 px. To change the default icons for notes that do not have a @type attribute, add the following rule to your customization CSS (on page 1550):

```css
div.note {
    background-image: url("../img/note.svg");
}
```

For a note with a @type attribute set to warning, caution, or trouble, add the following corresponding CSS rule:

```css
div.warning {
    background-image: url("../img/warning.svg");
}
div.caution {
    background-image: url("../img/caution.svg");
}
div.trouble {
    background-image: url("../img/troubleshooting.svg");
}
```

For a note with @type attribute set to other and @othertype attribute set to Safety, add the following CSS rule:

```css
div.note[type="other"][othertype=Safety] {
    background-image: url("../img/life-preserver.svg");
}
```

How to Change Note Colors

To change the color of the default icons for notes that do not have a @type attribute, add the following rule to your customization CSS (on page 1550):

```css
*[[class~="topic/note"]][not([class~="hazard-d/hazardstatement"]) {
    background-color: #50bbff;
}
```

For a note with a @type attribute set to restriction, add the following CSS rule:
For a note with @type attribute set to other and @othertype attribute set to Safety, add the following CSS rule:

```
*[class~="topic/note"][type = "other"]\[othertype = Safety\] {
  background-color: #ffaa00;
}
```

### Hazard

**Hazards** (embodied by the `<hazardstatement>` element) contain warning information. They are based on ANSI Z535 and ISO 3864 standards and may have various values set for the type (note, tip, fastpath, restriction, important, remember, attention, caution, notice, danger, warning, other).

#### How to Customize Other Type Hazards

It is possible to create custom hazard types by using the @type and @othertype attributes. For example, to add a high voltage hazard in a microwave manual:

```xml
<hazardstatement id="hazardstatement_vzy_zdc_syb" type="other" othertype="HIGH_VOLTAGE">
  <messagepanel id="messagepanel_wzy_zdc_syb">
    <typeofhazard>Electrical Shock</typeofhazard>
    <howtoavoid>Do not disassemble or repair the microwave yourself.</howtoavoid>
  </messagepanel>
  <hazardsymbol id="hazardsymbol_z4t_gjc_syb" href="electricity_icon.svg"/>
</hazardstatement>
```

**Tip:**

SVG images are preferred for the `<hazardsymbol>` and you should set both @height="1em" and @width="1em" to obtain a rendering that is similar to default hazards.

To customize the hazard, add the following rules to your customization CSS (on page 1550):

```css
/* Change the header color. */
*\[othertype ~~ "HIGH_VOLTAGE"] .hazardstatement--other {
  content: "HIGH VOLTAGE"; /* Change the hazard text */
  background-color: #d84b20;
  color: unset;
}

/* Show logo in the header. */
*\[othertype ~~ "HIGH_VOLTAGE"] .hazardstatement--other::before {
  padding: .5rem;
}
```
The result in the PDF output would look like this:

![HIGH VOLTAGE]

Electrical Shock
Do not disassemble or repair the microwave yourself.

Tasks

Tasks provide step-by-step instructions that enable a user to perform an operation.

How to Add Requirements Labels

It is possible to add tasks headings by setting the `args.gen.task.lbl` parameter in the transformation. However, Machinery Tasks have some extra required elements. It is possible to add labels for these requirements by adding the following rules to your customization CSS (on page 1550):

```
/* Show logo in the left cell. */
*[othertype ~= "HIGH_VOLTAGE"] th {
    table-column-span: 2 !important;
}
*[othertype ~= "HIGH_VOLTAGE"] .hazardstatement--logo-col {
    display: table-column !important;
}
*[othertype ~= "HIGH_VOLTAGE"] td:first-of-type {
    display: table-cell !important;
}
*[othertype ~= "HIGH_VOLTAGE"] .hazardsymbol {
    height: 4em; /* Change the symbol dimension */
}
```
Abbreviated Forms

When using the `<abbreviated-form>` element in your content, it is possible to style the subsequent occurrences differently than the first occurrence. To achieve this, add something similar to the following rule in your customization CSS (on page 1550):

```xml
<abbreviated-form>element</abbreviated-form>
```

```css
a:has(abbreviated-form) {
  color: oxy_xpath("let $cdf:= dfn return if (preceding::dfn[@keyref = $cdf/@keyref]) then 'black' else 'red'");}
```
This example would render the first occurrence with a red color and an underline, while the subsequent occurrences would be rendered with a black color and no underline.

**Trademarks**

Trademarks are used to specify legally registered words and they are often used in technical documentation. To specify a trademark, your DITA content could use a structure similar to this:

```xml
<tm tmtype="tm">My Product Name</tm>
```

Depending on the value of the `@tmtype` attribute, a different symbol is appended to the text: (®, ™, or℠).

The structure of the merged HTML document the CSS will apply to is:

```html
<span class="- topic/tm tm" tmtype="tm">My Product Name</span>
```

**How to Style the Trademark Element Text**

To change the style of the entire trademark text, you can match the `topic/tm` class like this:

```css
* [class ~="topic/tm"] {  
  font-weight: bold;
}
```

**How to Style the Trademark Symbol**

To change the aspect of the trademark symbol, you can use the `topic/tmmark` class. Usually, common fonts already render these symbols smaller and with superscript by default. The following example does it from the CSS:

```css
* [class ~="topic/tmmark"] {  
  vertical-align: super;
  font-size: smaller;
}
```

**Styling Through Custom Parameters**

You can activate parts of your CSS by using custom transformation parameters that start with the `args.css.param` prefix.

These parameters are recognized by the publishing pipeline and are forwarded as synthetic attributes on the root element of the merged map. The last part of the parameter name will become the attribute name, while
the value of the parameter will become the attribute value. The namespace of these synthetic attributes is:

When using the DITA Map PDF - based on HTML5 & CSS or the DITA PDF - based on HTML5 & CSS transformations, the generated attribute will be in no namespace.

Notes:

- Make sure the name of your custom parameter does not conflict with an attribute name that may already exist on the root element.
- Use only Latin alphanumeric characters for parameter names.
- You can set multiple styling parameters at the same time.

How to Limit the Depth of the TOC Using a Parameter

In the following example, a custom parameter is used to switch from a full depth table of contents to a flat one that shows only the titles of the first-level topics (such as chapters, notices, or the preface).

The custom parameter is:

```
args.css.param.only-chapters-in-toc="yes"
```

The CSS that hides the topicrefs at level 2 or more:

```
:root[only-chapters-in-toc='yes'] *[class ~="toc/toc"]
  > *[class ~="map/topicref"] *[class ~="map/topicref"] {
    display:none;
  }
```

The `:root[a|only-chapters-in-toc='yes']` selector makes the rule activate only when the attribute is set.

How to Change the Page Size Using a Parameter

In the following example, a custom parameter is used to modify the page size. The parameter is defined in the transformation scenario as:

```
args.css.param.page-size="A4"
```

Then in the CSS, the attribute value is extracted and used as follows:

```
@page {
  size: oxy_xpath('/*/@[local-name()="page-size"][1]');
}
```

How to Change the Cover Page Using a Parameter

In the following example, a custom parameter is used to set the path of the cover page. The parameter points to an image by using its URL and is defined in the transformation scenario as:
Then in the CSS, the attribute value is extracted and used as follows:

```css
@page front-page {
    background-image: url(oxy_xpath('/*/@*[local-name()="cover-page"][1]'));
}
```

**Controlling the Publication Content**

Using a plain DITA map, the transformation will produce a publication with a front page, a table of contents, chapters with content, and an index at the end. This is appropriate for most cases, but there are use cases where some adjustments are necessary. For example, if you want to do one of the following:

- Remove the TOC or index.
- Add a glossary.
- Change the position of the TOC or the index relative to the sibling topics.
- Add a *preface*, *frontmatter*, or *backmatter* with copyright notices, abstracts, list of tables, list of figures, etc.

All of these can be achieved using a DITA `<bookmap>` element.

A bookmap has a more elaborate structure than a regular map. You should start by defining the title structure, with a main title and alternative title:

```xml
<!DOCTYPE bookmap PUBLIC "-//OASIS//DTD DITA BookMap//EN" "bookmap.dtd">
<bookmap id="taskbook">
    <booktitle>
        <mainbooktitle>Publication Title</mainbooktitle>
        <booktitlealt>A very short description of the publication</booktitlealt>
    </booktitle>
</bookmap>
```

Then you may define a *frontmatter*. For this, you can link the topics that need to appear before the main content. You can also define the location where the table of contents will be placed. In the example below, it appears between the `abstract.dita` and `foreword.dita` topics:

```xml
<frontmatter>
    <topicref href="topics/abstract.dita"/>
    <booklists>
        <toc/>
    </booklists>
    <topicref href="topics/foreword.dita"/>
</frontmatter>
```
Next, the topics are grouped into chapters:

```xml
...<chapter href="topics/installation.dita"/>
...```

At the end, you could define the structure of the backmatter. Just like for the frontmatter, you can include some topics and some generated content (such as the index). In the example below, the glossary is defined to come after the index, followed by a list of figures and list of tables. At the very end, there is a topic with some thank you notes.

```xml
<backmatter>
  <topicref href="topics/conclusion.dita"/>
  <booklists>
    <indexlist/>
    <glossarylist>
      <topicref href="topics/xp.dita" keys="xp" print="yes"/>
      <topicref href="topics/anti_lock_braking_system.dita" keys="abs" print="yes"/>
    </glossarylist>
    <figurelist/>
    <tablelist/>
  </booklists>
  <topicref href="topics/thanks.dita"/>
</backmatter>
```

As you can see, the bookmap offers much better control over the final content of the publication. It also offers more options in controlling the metadata that will go into the PDF (see the Metadata (on page 1608) topic).

### How to Omit the Front Page, TOC, Glossary, Index for a Plain DITA Map

For a plain DITA map, there are no elements that allow you to control if and where to place the generated content such as the title page, table of contents, list of tables, glossary, or index. For the most common use-case, when you want to hide them all and just keep the content, you can use the transformation parameter `hide.frontpage.toc.index.glossary`. See: Transformation Parameters (on page 1527).

**Related Information:**
- How to Remove Entries from the TOC (on page 1643)
- How to Hide the TOC (on page 1643)
How to Make Chapters Look Like Individual Publications

Note:
This topic is only applicable for the DITA Map PDF - based on HTML5 & CSS transformation scenario.

Sometimes you want to make each chapter independent (i.e. it can be read separately, as a separate part of your publication). For this, you need the page counter, figure, and table counters to restart at each chapter. You can control this by using the `args.css.param.numbering` (on page 1625) command-line parameter.

In addition to numbering, you can force the creation of a chapter TOC (on page 1643).

XSLT Extensions for PDF Transformations

Since PDF output is primarily obtained by running XSLT transformations over the DITA input files, one customization method would be to override the default XSLT templates that are used by the PDF transformation.

The `pdf-css-html5` transformation type uses two stages to transform the merged DITA map (the one that aggregates all the topics) to HTML5:

1. **Stage 1**: Makes some changes on the merged map (on page 1553) and the result is a modified merged map. This stage can be altered by implementing the `com.oxygenxml.pdf.css.xsl.merged2merged` XSLT extension point. This extension overrides the stylesheets found in the following folder: `DITA-OT-DIR\plugins\com.oxygenxml.pdf.css\xsl\merged2merged`.

   Note:
   Use this when you need to filter DITA content.

2. **Stage 2**: Transforms the merged map (on page 1553) to HTML5 and the result is a single HTML document. This stage can be altered by implementing the `com.oxygenxml.pdf.css.xsl.merged2html5` XSLT extension point. This extension overrides the stylesheets found in the following folder: `DITA-OT-DIR\plugins\com.oxygenxml.pdf.css\xsl\merged2html5`.

   Note:
   Use this when you need to change the HTML structures generated for a specific DITA element.

These extension points can be used either from a Publishing Template or a DITA-OT extension plugin.

How to Use XSLT Extension Points for PDF Output from a Publishing Template

This section contains some common examples of customizations using both XSLT and CSS stylesheets. These stylesheets must be used as CSS resources and XSLT extension points inside an Oxygen Publishing Template.
How to Style Codeblocks with a Zebra Effect

A possible requirement for your `<codeblock>` elements could be to alternate the background color on each line. Some advantages of this technique is that you can clearly see when text from the `<codeblock>` is wrapped.

Note:
Adding this styling will remove syntax highlights on codeblocks.

This effect can be done by altering the HTML5 output, creating a `div` for each line from the code block, then styling them.

To add this functionality using an Oxygen Publishing Template, follow these steps:

1. If you have not already created a Publishing Template, you need to create one. For details, see How to Create a Publishing Template (on page 1546).
2. Link the folder associated with the publishing template to your current project in the Project Explorer view.
3. Using the Project Explorer view, create an `xslt` folder inside the project root folder.
4. In this folder, create an XSL file (for example, named `merged2html5Extension.xsl`) with the following content:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
    xmlns:xs="http://www.w3.org/2001/XMLSchema"
    exclude-result-prefixes="xs"
    version="2.0">

    <xsl:template match="*[contains(@class, 'pr-d/codeblock ')]">
        <xsl:variable name="nm"><xsl:next-match/></xsl:variable>
        <xsl:apply-templates select="$nm" mode="zebra"/>
    </xsl:template>

    <xsl:template match="node() | @*" mode="zebra">
        <xsl:copy>
            <xsl:apply-templates select="node() | @*" mode="#current"/>
        </xsl:copy>
    </xsl:template>
</xsl:stylesheet>
```
5. Open the template descriptor file (on page 1540) associated with your publishing template (the .opt file) and set the XSLT stylesheet created in the previous step with the com.oxygenxml.pdf.css.xsl.merged2html5 XSLT extension point:

<publishing-template>
  ...
  <pdf>
    ...
    <xslt>
      <extension
        id="com.oxygenxml.pdf.css.xsl.merged2html5"
        file="xslt/merged2html5Extension.xsl"/>
    </xslt>
  </pdf>
</publishing-template>

6. Create a css folder in the publishing template directory. In this directory, save a custom CSS file with rules that style the <codeblock> structure. For example:

```css
.zebra {
  padding: 0;
}

.zebra > *:nth-of-type(odd) {
  background-color: lightgray;
}
```

7. Open the template descriptor file (on page 1540) associated with your publishing template (the .opt file) and reference your custom CSS file in the resources element:
8. Edit the DITA Map PDF - based on HTML5 & CSS transformation scenario.
9. In the Templates tab, click the Choose Custom Publishing Template link and select your template.
10. Click OK to save the changes and run the transformation scenario.

How to Remove the Related Links Section

Suppose that you want the related links sections to be removed from the PDF output.

To add this functionality using an Oxygen Publishing Template, follow these steps:

1. If you have not already created a Publishing Template, you need to create one. For details, see How to Create a Publishing Template (on page 1546).
2. Link the folder associated with the publishing template to your current project in the Project Explorer view.
3. Using the Project Explorer view, create an xslt folder inside the project root folder.
4. In this folder, create an XSL file (for example, named merged2mergedExtension.xsl) with the following content:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
    xmlns:xs="http://www.w3.org/2001/XMLSchema"
    exclude-result-prefixes="xs"
    version="2.0">

    <xsl:template match="*[contains(@class, ' topic/related-links ')]">
        <!-- Remove. -->
    </xsl:template>
</xsl:stylesheet>
```

5. Open the template descriptor file (on page 1540) associated with your publishing template (the .opt file) and set the XSLT stylesheet created in the previous step with the com.oxygenxml.pdf.css.xsl.merged2merged XSLT extension point:
6. Edit the DITA Map PDF - based on HTML5 & CSS transformation scenario.
7. In the Templates tab, click the Choose Custom Publishing Template link and select your template.
8. Click OK to save the changes and run the transformation scenario.

**How to Wrap Words in Markup**

Suppose you want compound words that contain hyphens (or any other criteria) to be wrapped with inline elements (such as the HTML `<code>` element).

To add this functionality using an Oxygen Publishing Template, follow these steps:

1. If you have not already created a Publishing Template, you need to create one. For details, see How to Create a Publishing Template (on page 1546).
2. Link the folder associated with the publishing template to your current project in the Project Explorer view.
3. Using the Project Explorer view, create an `xslt` folder inside the project root folder.
4. In this folder, create an XSL file (for example, named `merged2htmlExtension.xsl`) with the following content:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
                 xmlns:xs="http://www.w3.org/2001/XMLSchema"
                 exclude-result-prefixes="xs"
                 version="2.0">

  <xsl:template match="text()">
    <xsl:variable name="txt">
      <xsl:next-match/>
    </xsl:variable>
    <xsl:analyze-string regex="(\w|\-)+" select="$txt">

      <!-- A word -->
      <xsl:choose>
        <xsl:when test="contains(., '-')">
          <!-- A compound word -->
          <code class="compound-word">
            <xsl:value-of select="."/>
          </code>
        </xsl:when>
      </xsl:choose>

    </xsl:matching-substring>
  </xsl:template>
</xsl:stylesheet>
```
5. Open the template descriptor file (on page 1540) associated with your publishing template (the .opt file) and set the XSLT stylesheet created in the previous step with the com.oxygenxml.pdf.css.xsl.merged2merged XSLT extension point:

6. Edit the DITA Map PDF - based on HTML5 & CSS transformation scenario.
7. In the Templates tab, click the Choose Custom Publishing Template link and select your template.
8. Click OK to save the changes and run the transformation scenario.

How to Convert Definition Lists into Tables

Suppose you want your definition lists (<dl>) to be displayed as tables in your PDF output.

To add this functionality using an Oxygen Publishing Template, follow these steps:

1. If you have not already created a Publishing Template, you need to create one. For details, see How to Create a Publishing Template (on page 1546).
2. Link the folder associated with the publishing template to your current project in the Project Explorer view.
3. Using the Project Explorer view, create an xslt folder inside the project root folder.
4. In this folder, create an XSL file (for example, named `merged2html5Extension.xsl`) with the following content:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
    xmlns:xs="http://www.w3.org/2001/XMLSchema"
    exclude-result-prefixes="xs"
    version="2.0">
    <xsl:template match="*[contains(@class, ' topic/dl ')]">
        <xsl:call-template name="setaname"/>
        <xsl:apply-templates select="*[contains(@class, ' ditaot-d/ditaval-startprop ')]" mode="out-of-line"/>
        <!-- Wrap in a table -->
        <table>
            <xsl:call-template name="commonattributes"/>
            <xsl:call-template name="setid"/>
            <xsl:apply-templates/>
        </table>
    </xsl:template>
    <xsl:template match="*[contains(@class, ' topic/dlentry ')]">
        <!-- Wrap in a table row -->
        <tr>
            <xsl:call-template name="commonattributes"/>
            <xsl:call-template name="setidaname"/>
            <xsl:apply-templates/>
        </tr>
    </xsl:template>
    <xsl:template match="*[contains(@class, ' topic/dd ')] | *[contains(@class, ' topic/dt ')]">
        <!-- Wrap in a cell -->
        <td>
            <xsl:call-template name="commonattributes"/>
            <xsl:call-template name="setidaname"/>
            <xsl:apply-templates select="."/>
        </td>
    </xsl:template>
</xsl:stylesheet>
```
5. Open the template descriptor file (on page 1540) associated with your publishing template (the .opt file) and set the XSLT stylesheet created in the previous step with the com.oxygenxml.pdf.css.xsl.merged2html5 XSLT extension point:

6. Edit the DITA Map PDF - based on HTML5 & CSS transformation scenario.

7. In the Templates tab, click the Choose Custom Publishing Template link and select your template.

8. Click OK to save the changes and run the transformation scenario.

How to Display Footnotes Below Tables

In your PDF output, you may want to group all the footnotes contained in a table just below it instead of having them displayed at the bottom of the page.

To add this functionality, use an Oxygen Publishing Template and follow these steps:

1. If you have not already created a Publishing Template, you need to create one. For details, see How to Create a Publishing Template (on page 1546).
2. Link the folder associated with the publishing template to your current project in the Project Explorer view.
3. Using the Project Explorer view, create an xslt folder inside the project root folder.
4. In the newly created folder, create an XSL file (for example, named merged2mergedExtension.xsl) with the following content:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
    xmlns:xs="http://www.w3.org/2001/XMLSchema">
    <!-- Snippet of code from above -->
</xsl:stylesheet>
```
<?xml version="2.0"?>
<!--
Match only top level tables (i.e tables that are not nested in other tables),
that contains some footnotes.
-->
<xsl:template match="*[contains(@class, 'topic/table')]
 [not(ancestor::*[contains(@class, 'topic/table')])]
 [[/*[contains(@class, 'topic/fn')]]]">
 <xsl:next-match>
 <xsl:with-param name="top-level-table" select="." tunnel="yes"/>
 </xsl:next-match>
</xsl:template>

<!-- Create a list with all the footnotes from the current table. -->
<ol class="- topic/ol " outputclass="table-fn-container">
 <xsl:for-each select="*//*[contains(@class, 'topic/fn')]">

 <!-- Try to preserve the footnote ID, if available, so that the xrefs will have a
 target. -->
 
 <li class="- topic/li " id="{if(@id) then @id else generate-id(.)}"
 outputclass="table-fn">
 <xsl:apply-templates select="node()"/>
 </li>
 </xsl:for-each>
</ol>
</xsl:template>

<!--
The footnotes that have an ID must be ignored, they are accessible only
through existing xrefs (already present in the merged.xml file).

The above template already made a copy of these footnotes in the OL element
so it is not a problem if markup is not generated for them in the cell.
-->
<xsl:template
 match="*[contains(@class, 'topic/entry')]/*[contains(@class, 'topic/fn')][@id]"/>

<!--
The xrefs to footnotes with IDs inside table-cells. We need to recalculate
their indexes if their referenced footnote is also in the table.
-->
<xsl:template match="*[contains(@class, 'topic/xref')][@type='fn']
   [ancestor::*[contains(@class, 'topic/entry')]]">
  <xsl:param name="top-level-table" tunnel="yes"/>
  <xsl:variable name="destination" select="opentopic-func:getDestinationId(@href)"/>
  <xsl:variable name="fn" select="
    $top-level-table//*[contains(@class, 'topic/fn')][@id = $destination]"/>
  <xsl:choose>
    <xsl:when test="$fn">
      <!-- There is a reference in the table, recalculate index. -->
      <xsl:variable name="fn-number" select="
        index-of($top-level-table//*[contains(@class, 'topic/fn')], $fn)"/>
      <xsl:copy>
        <xsl:apply-templates select="@*"/>
        <xsl:apply-templates select="node() except (text(), *[contains(@class, 'hi-d/sup')])"/>
        <sup><xsl:apply-templates select="child::*[contains(@class, 'hi-d/sup')]/@*"/>
          <xsl:value-of select="$fn-number"/>
        </sup>
      </xsl:copy>
    </xsl:when>
    <xsl:otherwise>
      <!-- There is no reference in the table, keep original index. -->
      <xsl:next-match/>
    </xsl:otherwise>
  </xsl:choose>
</xsl:template>

<!-- The footnotes without ID inside table-cells. They are copied in the OL element, but have no xrefs pointing to them (because they have no ID), so xrefs are generated. -->
<xsl:template match="*[contains(@class, 'topic/entry')]/*[contains(@class, 'topic/fn')][not(@id)]">
  <xsl:param name="top-level-table" tunnel="yes"/>
  <xsl:variable name="fn-number" select="
    index-of($top-level-table//*[contains(@class, 'topic/fn')], .)"/>
  <xref type="fn" class="- topic/xref "
    href="#{generate-id(.)}" outputclass="table-fn-call">
    <!-- Generate an extra <sup>, identical to what DITA-OT generates for other xrefs. -->
  </xref>
</xsl:template>
5. Open the template descriptor file (on page 1540) associated with your publishing template (the .opt file) and set the XSLT stylesheet created in the previous step with the `com.oxygenxml.pdf.css.xsl.merged2merged` XSLT extension point:

```xml
<publishing-template>
  ...
  <pdf>
  ...  
  </pdf>
</publishing-template>
```

6. Create a css folder in the publishing template directory. In this directory, save a custom CSS file with rules that style the glossary structure. For example:

```css
/* Customize footnote calls, inside the table. */
*[outputclass ~='table-fn-call'] {
  line-height: none;
}

/* Customize the list containing all the table footnotes. */
*[outputclass ~='table-fn-container'] {
  border-top: 1pt solid black;
  counter-reset: table-footnote;
}

/* Customize footnotes display, below the table. */
*[outputclass ~='table-fn'] {
  font-size: smaller;
  counter-increment: table-footnote;
}
*[outputclass ~='table-fn']::marker {
  font-size: smaller;
  content: "(" counter(table-footnote) ")";
}
```
7. Open the **template descriptor file (on page 1540)** associated with your publishing template (the .opt file) and reference your custom CSS file in the `<resources>` element:

```xml
<publishing-template>
  ...
  <pdf>
    ...
    <resources>
      <css file="css/custom.css"/>
    </resources>
  </pdf>
</publishing-template>
```

8. Edit the **DITA Map PDF - based on HTML5 & CSS** transformation scenario.

9. In the **Templates** tab, click the **Choose Custom Publishing Template** link and select your template.

10. Click **OK** to save the changes and run the transformation scenario.

### How to Wrap Scientific Numbers in Tables Cells

In your PDF output, you may need to wrap scientific numbers on two lines when they are included in table cells.

To add this functionality, use an **Oxygen Publishing Template** and follow these steps:

1. If you have not already created a Publishing Template, you need to create one. For details, see **How to Create a Publishing Template (on page 1546)**.
2. Link the folder associated with the publishing template to your current project in the **Project Explorer** view.
3. Using the **Project Explorer** view, create an `xslt` folder inside the project root folder.
4. In the newly created folder, create an XSL file (for example, named `merged2html5Extension.xsl`) with the following content:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
    xmlns:xs="http://www.w3.org/2001/XMLSchema"
    exclude-result-prefixes="xs"
    version="2.0">
    <!-- Matches text from table cells. -->
    <xsl:template match="*[contains(@class, ' topic/entry ') ]/text()">
        <xsl:analyze-string select="." regex="[0-9]\.[0-9]{{2}}e-[0-9]{{2}}">
            <!-- The cell contains a scientific number like 1.23e-08. -->
            <xsl:matching-substring>
                <xsl:variable name="text" select="concat(substring-before(., 'e'), 'e', substring-after(., 'e'))"/>
                <xsl:value-of select="$text"/>
            </xsl:matching-substring>
            <xsl:non-matching-substring>
                <xsl:value-of select="."/>
            </xsl:non-matching-substring>
        </xsl:analyze-string>
    </xsl:template>
</xsl:stylesheet>
```

5. Open the [template descriptor file](#) (on page 1540) associated with your publishing template (the `.opt` file) and set the XSLT stylesheet created in the previous step with the `com.oxygenxml.pdf.css.xsl.merged2html5` XSLT extension point:

```xml
<publishing-template>
    ...
    <pdf>
    ...
    <xslt>
        <extension
            id="com.oxygenxml.pdf.css.xsl.merged2html5"
            file="xslt/merged2html5Extension.xsl"/>
    </xslt>
</publishing-template>
```

6. Edit the [DITA Map PDF - based on HTML5 & CSS](#) transformation scenario.

7. In the Templates tab, click the Choose Custom Publishing Template link and select your template.

8. Click OK to save the changes and run the transformation scenario.
How to Use a Bullet for Tasks that Contain a Single Step

If a DITA Task document only contains one list item (a single `<step>` element), you probably want it to be rendered the same as an unordered list (displayed with a bullet instead of a number), as in the following example:

```
...
<steps>
  <step>
    <cmd>My single step</cmd>
  </step>
</steps>
...
```

Normally, the output will be rendered as:

```
1. The step
```

instead of:

```
  The step
```

To change the default rendering so that a single step will be rendered with a bullet instead of a number, use an Oxygen Publishing Template and follow these steps:

1. If you have not already created a Publishing Template, you need to create one. For details, see How to Create a Publishing Template (on page 1546).
2. Link the folder associated with the publishing template to your current project in the Project Explorer view.
3. Using the Project Explorer view, create an `xslt` folder inside the project root folder.
4. In the newly created folder, create an XSL file (for example, named `merged2html5Extension.xsl`) with the following content:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
  xmlns:xs="http://www.w3.org/2001/XMLSchema"
  exclude-result-prefixes="xs"
  version="2.0">

  <xsl:template match="*[contains(@class, ' task/step ')][count(../*[contains(@class, ' task/step ')]) = 1]">
    <xsl:copy>
      <xsl:copy-of select="@*"/>
      <xsl:attribute name="outputclass" select="concat(@outputclass, ' single ')"/>
      <xsl:apply-templates/>
    </xsl:copy>
  </xsl:template>
</xsl:stylesheet>
```
5. Open the template descriptor file (on page 1540) associated with your publishing template (the .opt file) and set the XSLT stylesheet created in the previous step with the com.oxygenxml.pdf.css.xsl.merged2html5 XSLT extension point:

```xml
<publishing-template>
  ...
  <pdf>
    ...
    <xslt>
      <extension
          id="com.oxygenxml.pdf.css.xsl.merged2html5"
          file="xslt/merged2html5Extension.xsl"/>
    </xslt>
  </pdf>
</publishing-template>
```

6. Create a css folder in the publishing template directory. In this directory, save a custom CSS file with rules that style the glossary structure. For example:

```css
*{outputclass ~="single"}

  list-style-type:circle !important;
  margin-left:2em;
}
```

7. Open the template descriptor file (on page 1540) associated with your publishing template (the .opt file) and reference your custom CSS file in the resources element:

```xml
<publishing-template>
  ...
  <pdf>
    ...
    <resources>
      ...
      <css file="css/custom.css"/>
    </resources>
  </pdf>
</publishing-template>
```

8. Edit the DITA Map PDF - based on HTML5 & CSS transformation scenario.

9. In the Templates tab, click the Choose Custom Publishing Template link and select your template.

10. Click OK to save the changes and run the transformation scenario.

**How to Change the Critical Dates Format**

By default, the dates are entered in a YYYY-MM-DD format (where YYYY is the year, MM is the number of the month, and DD is the number of the day. You can change the format (for example, to something like January 1, 2020) using an XSLT extension.

To add this functionality, use an Oxygen Publishing Template and follow these steps:
1. If you have not already created a Publishing Template, you need to create one. For details, see How to Create a Publishing Template (on page 1546).

2. Link the folder associated with the publishing template to your current project in the Project Explorer view.

3. Using the Project Explorer view, create an xslt folder inside the project root folder.

4. In the newly created folder, create an XSL file (for example, named merged2mergedExtension.xsl) with the following content:

   ```xml
   <?xml version="1.0" encoding="UTF-8"?>
   <xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
                   xmlns:xs="http://www.w3.org/2001/XMLSchema"
                   exclude-result-prefixes="xs"
                   version="2.0">

     <xsl:template match="*[contains(@class, 'topic/created')]/@date | *[contains(@class, 'topic/revised')]/@modified">
       <xsl:attribute name="{name()}">
         <xsl:value-of select="format-date(., '[MNn] [D01], [Y0001]')"/>
       </xsl:attribute>
     </xsl:template>

   </xsl:stylesheet>
   ```

5. Open the template descriptor file (on page 1540) associated with your publishing template (the .opt file) and set the XSLT stylesheet created in the previous step with the com.oxygenxml.pdf.css.xsl.merged2merged XSLT extension point:

   ```xml
   <publishing-template>
     ...
     <pdf>
       ...
       <xslt>
         <extension
           id="com.oxygenxml.pdf.css.xsl.merged2merged"
           file="xslt/merged2mergedExtension.xsl"/>
       </xslt>
     </pdf>
     ...
   </publishing-template>
   ```

6. Edit the DITA Map PDF - based on HTML5 & CSS transformation scenario.

7. In the Templates tab, click the Choose Custom Publishing Template link and select your template.

8. Click OK to save the changes and run the transformation scenario.

Formatting Dates and Times in XSLT
How to Remove Links from Terms

Your topics might contain multiple references to the same `<term>`. These terms can further be explained in the glossary. In this case, you may want to only keep the first occurrence of this term to be a link to the glossary and display the other terms as text.

To add this functionality, use an Oxygen Publishing Template and follow these steps:

1. If you have not already created a Publishing Template, you need to create one. For details, see How to Create a Publishing Template (on page 1546).
2. Link the folder associated with the publishing template to your current project in the Project Explorer view.
3. Using the Project Explorer view, create an `xslt` folder inside the project root folder.
4. In the newly created folder, create an XSL file (for example, named `merged2html5Extension.xsl`) with the following content:

```xml
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
    xmlns:xs="http://www.w3.org/2001/XMLSchema"
    exclude-result-prefixes="xs"
    version="2.0">

    <xsl:template match="*[contains(@class, ' topic/term ')]" name="topic.term">
        <!-- Save the current @href value -->
        <xsl:variable name="current-href" select="@href"/>
        <!-- Get the closest parent topic -->
        <xsl:variable name="closest-parent" select="ancestor::*[contains(@class, ' topic/topic ')][1]"/>
        <!-- Get the first <term> having the same href -->
        <xsl:variable name="first-term-with-same-href" select="($closest-parent//
            *[contains(@class, ' topic/term ')][@href=$current-href])[1]"/>
        <!-- Call the HTML5 default template -->
        <xsl:variable name="result" select="<xsl:next-match/>"></xsl:variable>
        <!-- Call the copy template that will remove the links -->
        <xsl:apply-templates select="$result" mode="remove-extra-links">
            <xsl:with-param name="is-first-term-with-same-href"
                select="generate-id(.) = generate-id($first-term-with-same-href)"
                tunnel="yes"/>
        </xsl:apply-templates>
    </xsl:template>

    <xsl:template match="node() | @*" mode="remove-extra-links">
    </xsl:template>
</xsl:stylesheet>
```
5. Open the template descriptor file (on page 1540) associated with your publishing template (the .opt file) and set the XSLT stylesheet created in the previous step with the com.oxygenxml.pdf.css.xsl.merged2html5 XSLT extension point:

6. Edit the DITA Map PDF - based on HTML5 & CSS transformation scenario.
7. In the Templates tab, click the Choose Custom Publishing Template link and select your template.
8. Click OK to save the changes and run the transformation scenario.

How to Display Glossary as a Table

Suppose you want to display the content of your Glossary as a table, to condense the information for one entry on a single line.
Remember:
Make sure all the glossary is contained within a single `<glossgroup>` element.

To add this functionality, use an Oxygen Publishing Template and follow these steps:

1. If you have not already created a Publishing Template, you need to create one. For details, see How to Create a Publishing Template (on page 1546).
2. Link the folder associated with the publishing template to your current project in the Project Explorer view.
3. Using the Project Explorer view, create an `<xsl>` folder inside the project root folder.
4. In the newly created folder, create an XSL file (for example, named `merged2html5Extension.xsl`) with the following content:

```xml
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
    xmlns:xs="http://www.w3.org/2001/XMLSchema"
    xmlns:dita2html="http://dita-ot.sourceforge.net/ns/200801/dita2html"
    exclude-result-prefixes="xs dita2html"
    version="2.0">

<!-- Create a table that will contain all the glossentries contained in the glossgroup. -->
<xsl:template name="gen-topic">
    <xsl:param name="nestlevel" as="xs:integer">
        <xsl:choose>
            <!-- Limit depth for historical reasons, could allow any depth. -->
            <!-- Previously limit was 5. -->
            <xsl:when test="count(ancestor::*[contains(@class, ' topic/topic ')]) > 9">
                9
            </xsl:when>
            <xsl:otherwise>
                <xsl:sequence select="count(ancestor::*[contains(@class, ' topic/topic ')])"/>
            </xsl:otherwise>
        </xsl:choose>
    </xsl:param>

    <xsl:choose>
        <xsl:when test="parent::dita and not(preceding-sibling::*)">
            <!-- Do not reset xml:lang if it is already set on <html> -->
            <!-- Moved outputclass to the body tag -->
            <!-- Keep ditaval based styling at this point -->
            <!-- (replace DITA-OT 1.6 and earlier call to gen-style) -->
            <xsl:apply-templates
                select="*[contains(@class, ' ditaot-d/ditaval-startprop ')]/@style"
                mode="add-ditaval-style"/>
        </xsl:when>
        <xsl:otherwise>
            <!-- Override DITA-OT 1.6 and earlier behavior for ditaval styles -->
            <xsl:apply-templates select="*[contains(@class, ' ditaot-d/ditaval-startprop ')]/@style"
                mode="add-ditaval-style"/>
        </xsl:otherwise>
    </xsl:choose>
</xsl:template>
</xsl:stylesheet>
```
<xsl:otherwise>
<xsl:call-template name="commonattributes"/>
<xsl:with-param name="default-output-class" select="concat('nested', $nestlevel)"/>
</xsl:call-template>
</xsl:otherwise>
</xsl:choose>
<xsl:call-template name="gen-toc-id"/>
<xsl:call-template name="setidaname"/>
<xsl:choose>
<xsl:when test="contains(@class, 'glossgroup/glossgroup')">
<!-- Custom processing for glossgroup. -->
<xsl:apply-templates select="*[contains(@class, 'topic/title')]"/>
<table class="- glossgroup/table table">
<thead class="- glossgroup/thead thead">
<tr class="- glossgroup/row row">
<th class="- glossgroup/entry entry">Acronym</th>
<th class="- glossgroup/entry entry">Term</th>
<th class="- glossgroup/entry entry">Full Term</th>
<xsl:if test="exists(//*[contains(@class, 'glossentry/glossdef')])">
<th class="- glossgroup/entry entry">Definition</th>
</xsl:if>
</tr>
</thead>
<xsl:apply-templates select="*[contains(@class, 'glossentry/glossentry')]"/>
</table>
</xsl:when>
<xsl:otherwise>
<!-- Default processing. -->
<xsl:apply-templates/>
</xsl:otherwise>
</xsl:choose>
</xsl:template>

<!-- Create a row for each glossentry. -->
<xsl:template match="*[contains(@class, 'glossentry/glossentry')]"
<xsl:variable name="glossentry" as="node()">
</xsl:variable>
<tr>
<xsl:copy-of select="$glossentry/@*"/>
<xsl:copy-of select="$glossentry/*[contains(@class, 'glossentry/glossAlt')]"/>
<xsl:copy-of select="$glossentry/*[contains(@class, 'glossentry/glossterm')]"/>
<xsl:copy-of select="$glossentry/*[contains(@class, 'glossentry/glossSurfaceForm')]"/>
<xsl:copy-of select="$glossentry/*[contains(@class, 'glossentry/glossdef')]"/>
<xsl:copy-of select="$glossentry/* except $glossentry/*[contains(@class, 'glossentry/glossAlt') or contains(@class, 'glossentry/glossterm') or contains(@class, 'glossentry/glossSurfaceForm') or contains(@class, 'glossentry/glossdef')]"/>
</tr>
</xsl:template>

<!-- Process only glossBody’s children nodes. -->
<xsl:template match="*[contains(@class, 'glossentry/glossBody')] [ancestor::*[contains(@class, 'glossgroup/glossgroup')]]">
<xsl:apply-templates/>
</xsl:template>
</xsl:template>

<!-- Create a cell for each glossterm, glossSurfaceForm and glossAlt. -->
<xsl:template match="*[contains(@class, 'glossentry/glossterm')] [ancestor::*[contains(@class, 'glossgroup/glossgroup')]] | *[contains(@class, 'glossentry/glossSurfaceForm')] [ancestor::*[contains(@class, 'glossgroup/glossgroup')]] | *[contains(@class, 'glossentry/glossAlt')] [ancestor::*[contains(@class, 'glossgroup/glossgroup')]]">
<xsl:variable name="glossContent" as="node()">
</xsl:variable>
<td>
<xsl:copy-of select="$glossContent/@*"/>
</td>
5. Open the template descriptor file (on page 1540) associated with your publishing template (the .opt file) and set the XSLT stylesheet created in the previous step with the com.oxygenxml.pdf.css.xsl.merged2html5 XSLT extension point:

```xml
<publishing-template>
  ...
  <pdf>
    ...
    <xslt>
      <extension
        id="com.oxygenxml.pdf.css.xsl.merged2html5"
        file="xslt/merged2html5Extension.xsl"/>
    </xslt>
  </pdf>
</publishing-template>
```

6. Create a css folder in the publishing template directory. In this directory, save a custom CSS file with rules that style the glossary structure. For example:

```css
*[class ~= "glossgroup/table"] {
  width: 100%;
  border: 1px solid black;
  border-collapse: collapse;
}

*[class ~= "glossgroup/table"] th {
  background-color: lightgray;
}

*[class ~= "glossgroup/table"] th,
```
Note:
The `<glossSurfaceForm>` removal part is optional. It is present as an example of how to fully remove a column.

7. Open the template descriptor file (on page 1540) associated with your publishing template (the `.opt` file) and reference your custom CSS file in the `resources` element:

```xml
<publishing-template>
  ...
  <pdf>
    ...
    <resources>
      <css file="css/custom.css"/>
    </resources>
  </pdf>
</publishing-template>
```

8. Edit the DITA Map PDF - based on HTML5 & CSS transformation scenario.
9. In the Templates tab, click the Choose Custom Publishing Template link and select your template.
10. Click OK to save the changes and run the transformation scenario.

**How to Include Sections in the Mini TOC**

By default, the Mini TOC only displays the child topics of a given chapter topic. To add the possibility of also displaying the child sections, use an Oxygen Publishing Template and follow these steps:
1. If you have not already created a Publishing Template, you need to create one. For details, see How to Create a Publishing Template (on page 1546).

2. Link the folder associated with the publishing template to your current project in the Project Explorer view.

3. Using the Project Explorer view, create an xslt folder inside the project root folder.

4. In the newly created folder, create an XSL file (for example, named merged2mergedExtension.xsl) with the following content:

```xml
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform" version="2.0"
                xmlns:openopic-index="http://www.idiominc.com/openopic/index"
                xmlns:openopic="http://www.idiominc.com/openopic"
                xmlns:oxy="http://www.oxygenxml.com/extensions/author"
                xmlns:xsl="http://www.saxon.sf.net/"
                xmlns:xs="http://www.w3.org/2001/XMLSchema"
                exclude-result-prefixes="#all">
  <xsl:template match="*[contains(@class, ' topic/topic ')]">
    <xsl:choose>
      <xsl:when test="($args.chapter.layout = 'MINITOC' or $args.chapter.layout = 'MINITOC-BOTTOM-LINKS') and oxy:is-chapter(/, oxy:get-topicref-for-topic(/, @id)) and *[contains(@class, ' topic/topic ')]">
        <!-- Minitoc. -->
        <xsl:copy>
          <xsl:apply-templates select="@*"/>
          <xsl:apply-templates select="*[contains(@class, ' topic/title ')]"/>
          <xsl:apply-templates select="*[contains(@class, ' topic/prolog ')]"/>
          <xsl:apply-templates select="*[contains(@class, ' topic/titlealts ')]"/>
          <div>
            <xsl:choose>
              <xsl:when test="$args.chapter.layout = 'MINITOC'">
                <xsl:attribute name="class">topic/div chapter/minitoc</xsl:attribute>
                <xsl:call-template name="generate-minitoc-links"/>
                <xsl:call-template name="generate-minitoc-desc"/>
              </xsl:when>
              <xsl:when test="$args.chapter.layout = 'MINITOC-BOTTOM-LINKS'">
                <xsl:attribute name="class">chapter/minitoc-bottom</xsl:attribute>
                <xsl:call-template name="generate-minitoc-desc"/>
                <xsl:call-template name="generate-minitoc-links"/>
              </xsl:when>
            </xsl:choose>
          </div>
        </xsl:copy>
      </xsl:when>
    </xsl:choose>
  </xsl:template>
</xsl:stylesheet>
```
The chapter topic content. This has the role of describing the chapter.
5. Open the **template descriptor file (on page 1540)** associated with your publishing template (the .opt file) and set the XSLT stylesheet created in the previous step with the com.oxygenxml.pdf.css.xsl.merged2merged XSLT extension point:

```
<publishing-template>
  ...
  <pdf>
  ...
  <xslt>
    <extension
      id="com.oxygenxml.pdf.css.xsl.mergedmerged"
      file="xslt/merged2mergedExtension.xsl"/>
  </xslt>
  <parameters>
    <parameter name="args.chapter.layout" value="MINITOC"/>
  </parameters>
</publishing-template>
```

**Note:**

This solution works also with **args.chapter.layout** set to **MINITOC-BOTTOM-LINKS**.

6. Edit the DITA Map PDF - based on HTML5 & CSS transformation scenario.

7. In the **Templates** tab, click the **Choose Custom Publishing Template** link and select your template.

8. Click **OK** to save the changes and run the transformation scenario.
How to Add a Link to the TOC

For making the navigation easier in the PDF, you may want to add a link that sends the reader back to the table of contents. To add this link, use an Oxygen Publishing Template and follow these steps:

1. If you have not already created a Publishing Template, you need to create one. For details, see How to Create a Publishing Template (on page 1546).
2. Link the folder associated with the publishing template to your current project in the Project Explorer view.
3. Using the Project Explorer view, create an xslt folder inside the project root folder.
4. In the newly created folder, create an XSL file (for example, named merged2html5Extension.xsl) with the following content:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
    xmlns:xs="http://www.w3.org/2001/XMLSchema"
    exclude-result-prefixes="xs"
    version="2.0">

    <!-- Add an anchor after the TOC title. -->
    <xsl:template match="*[contains(@class, 'toc/title')]" mode="div-it">
        <div>
            <xsl:attribute name="class" select="'- toc/anchor anchor'"/>
            <xsl:attribute name="id" select="'toc-anchor'"/>
        </div>
    </xsl:template>
</xsl:stylesheet>
```

5. Open the template descriptor file (on page 1540) associated with your publishing template (the .opt file) and set the XSLT stylesheet created in the previous step with the com.oxygenxml.pdf.css.xsl.merged2html5 XSLT extension point:

```xml
<publishing-template>
    ...
    <pdf>
        ...
        <xslt>
            <extension
                id="com.oxygenxml.pdf.css.xsl.merged2html5"
                file="xslt/merged2html5Extension.xsl"/>
        </xslt>
    </pdf>
</publishing-template>
```

6. Create a css folder in the publishing template directory. In this directory, save a custom CSS file with rules that style the glossary structure. For example:
7. Open the template descriptor file (on page 1540) associated with your publishing template (the .opt file) and reference your custom CSS file in the resources element:

```xml
<resources>
  <css file="css/custom.css"/>
</resources>
```

8. Edit the DITA Map PDF - based on HTML5 & CSS transformation scenario.

9. In the Templates tab, click the Choose Custom Publishing Template link and select your template.

10. Click OK to save the changes and run the transformation scenario.

### How to Repeat Note Titles After a Page Break

Suppose that you have large notes that split between pages or columns and you want the note icon and title to be displayed on the next page/column. To add this functionality, use an Oxygen Publishing Template and follow these steps:

1. If you have not already created a Publishing Template, you need to create one. For details, see How to Create a Publishing Template (on page 1546).
2. Link the folder associated with the publishing template to your current project in the Project Explorer view.
3. Using the Project Explorer view, create an xslt folder inside the project root folder.
4. In the newly created folder, create an XSL file (for example, named merged2html5Extension.xsl) with the following content:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
```
```xml
<xs:include xmlns:xs="http://www.w3.org/2001/XMLSchema"
  exclude-result-prefixes="xs"
  version="2.0"/>

<!-- Display notes titles and content in table cells. -->
<xsl:template match="*" mode="process.note.common-processing">
  <xsl:param name="type" select="@type"/>
  <xsl:param name="title">
    <xsl:call-template name="getVariable"
      <xsl:with-param name="id" select="concat(upper-case(substring($type, 1, 1)),
        substring($type, 2))"/>
    </xsl:call-template>
  </xsl:param>
  <table>
    <xsl:call-template name="commonattributes">
      <xsl:with-param name="default-output-class" select="string-join(($type, concat('note_', $type)), ' ')">
        </xsl:call-template>
    </xsl:call-template>
    <xsl:call-template name="setidaname"/>

    <!-- Normal flags go before the generated title; revision flags only go on the content. -->
    <xsl:apply-templates select="*[contains(@class, ' ditaot-d/ditaval-startprop ')]/prop" mode="ditaval-outputflag"/>

    <thead>
      <tr>
        <th class="note__title">
          <xsl:copy-of select="$title"/>
          <xsl:call-template name="getVariable">
            <xsl:with-param name="id" select="'ColonSymbol'"/>
          </xsl:call-template>
        </th>
      </tr>
    </thead>
    <tbody>
      <tr>
        <td>
          <xsl:text> </xsl:text>
          <xsl:apply-templates select="*[contains(@class, ' ditaot-d/ditaval-startprop ')]/revprop" mode="ditaval-outputflag"/>
          <xsl:apply-templates/>
          <xsl:apply-templates select="*[contains(@class, ' ditaot-d/ditaval-endprop ')]" mode="out-of-line"/>
        </td>
      </tr>
    </tbody>
  </table>
</xsl:template>
```
5. Open the template descriptor file (on page 1540) associated with your publishing template (the .opt file) and set the XSLT stylesheet created in the previous step with the com.oxygenxml.pdf.css.xsl.merged2html5 XSLT extension point:

```xml
<publishing-template>
  ...
  <pdf>
    ...
    <xslt>
      <extension id="com.oxygenxml.pdf.css.xsl.merged2html5"
                 file="xslt/merged2html5Extension.xsl"/>
    </xslt>
  </pdf>
</publishing-template>
```

6. Create a css folder in the publishing template directory. In this directory, save a custom CSS file with rules that style the glossary structure. For example:

```css
table.note th, table.note td {
  text-align: left;
  padding: .75em .5em .75em 3em;
}

table.note {
  background-repeat: no-repeat;
  background-image: url("../img/note.svg");
  background-position: .5em .5em;
  border: 1px solid;
}

table.note.note_other { background-image: none; }

table.warning { background-image: url("../img/warning.svg"); }

table.caution { background-image: url("../img/caution.svg"); }

table.trouble { background-image: url("../img/troubleshooting.svg"); }

table.important { background-image: url("../img/important.svg"); }

table.attention { background-image: url("../img/attention.svg"); }

table.notice { background-image: url("../img/notice.svg"); }
```
7. Open the **template descriptor file** (on page 1540) associated with your `publishing template` (the `.opt` file) and reference your custom CSS file in the `resources` element:

```xml
<publishing-template>
  ...
  <pdf>
    ...
    <resources>
      <css file="css/custom.css"/>
    </resources>
  </pdf>
</publishing-template>
```

8. Edit the **DITA Map PDF - based on HTML5 & CSS** transformation scenario.
9. In the **Templates** tab, click the **Choose Custom Publishing Template** link and select your template.
10. Click **OK** to save the changes and run the transformation scenario.

### How to Use XSLT Extension Points for PDF Output from a DITA-OT Plugin

The examples in this section demonstrate how to use XSLT extension points from a **DITA-OT plugin**.
Instead of directly adding plugins inside the embedded DITA-OT, it is highly recommended to use an external Oxygen Publishing Engine so that you will not lose any of your customizations anytime you upgrade the product in the future.

You just need to follow these steps before starting your custom DITA-OT plugins:

1. Download the Oxygen Publishing Engine and unzip it inside a folder where you have full write access.
2. Create your custom plugin(s) inside the DITA-OT-DIR\plugins\ folder.
3. Go to Options > Preferences > DITA, set the DITA Open Toolkit option to Custom, and specify the path to the unzipped folder.

⚠️ Warning:
The path must end with: oxygen-publishing-engine.

### How to Style Codeblocks with a Zebra Effect

Suppose you want your codeblocks to have a particular background color for one line, and another color for the next line. One advantage of this coloring technique is that you can clearly see when text from the codeblock is wrapped.

This effect can be done by altering the HTML5 output, creating a `<div>` for each line from the code block, then styling them.

To add this functionality using a DITA-OT plugin, follow these steps:

1. In the DITA-OT-DIR\plugins\ folder, create a folder for this plugin (for example, com.oxygenxml.pdf.custom.codeblocks).
2. Create a plugin.xml file (in the folder you created in step 1) that specifies the extension point and your customization stylesheet. For example:

```xml
<plugin id="com.oxygenxml.pdf.custom.codeblocks">
  <feature extension="com.oxygenxml.pdf.css.xsl.merged2html5" file="custom_codeblocks.xsl"/>
</plugin>
```

3. Create your customization stylesheet (for example, custom_codeblocks.xsl) with the following content:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
  xmlns:xs="http://www.w3.org/2001/XMLSchema"
  exclude-result-prefixes="xs"
  version="2.0">

  <xsl:template match="*[contains(@class, ' pr-d/codeblock ')]">
    <div class='zebra'>
      <xsl:analyze-string regex="\n" select="."/>
    </div>
  </xsl:template>
</xsl:stylesheet>
```
4. Use the Run DITA-OT Integrator transformation scenario (on page 1193) found in the DITA Map section in the Configure Transformation Scenario(s) dialog box.

5. Create a custom CSS file with rules that style the codeblock structure. For example:

```css
div.zebra {
    font-family: courier, fixed, monospace;
    white-space: pre-wrap;
}

div.zebra > *:nth-of-type(odd){
    background-color: silver;
}
```

6. Edit a DITA Map PDF - based on HTML5 & CSS transformation scenario and reference your custom CSS file (using the args.css parameter).

7. Run the transformation scenario.

**How to Remove the Related Links Section**

Suppose you want the related links sections to be removed from the PDF output.

To add this functionality using a DITA-OT plugin, follow these steps:

1. In the DITA-OT-DIR/plugins/ folder, create a folder for this plugin (for example, com.oxygenxml.pdf.custom.codeblocks).

2. Create a plugin.xml file (in the folder you created in step 1) that specifies the extension point and your customization stylesheet. For example:

```xml
<plugin id="com.oxygenxml.pdf.custom.related.links">
    <feature extension="com.oxygenxml.pdf.css.xsl.merged2merged" file="custom_related_links.xsl"/>
</plugin>
```

3. Create your customization stylesheet (for example, custom_related_links.xsl) with the following content:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
    xmlns:xs="http://www.w3.org/2001/XMLSchema">
```
4. Use the Run DITA-OT Integrator transformation scenario (on page 1193) found in the DITA Map section in the Configure Transformation Scenario(s) dialog box.
5. Run the DITA Map PDF - based on HTML5 & CSS transformation scenario.

How to Use Custom Parameters in XSLT Stylesheets

Suppose you want to add an attribute with a custom value inside a `<div>` element.

To add this functionality using a DITA-OT plugin, follow these steps:

1. In the `DITA-OT-DIR\plugins\` folder, create a folder for this plugin (for example, `com.oxygenxml.pdf.css.param`).
2. Create a `plugin.xml` file (in the folder you created in step 1) that specifies the extension points, your parameter file, and your customization stylesheet. For example:

   ```xml
   <plugin id="com.oxygenxml.pdf.css.param">
     <feature extension="com.oxygenxml.pdf.css.xsl.merged2html5.parameters" file="params.xml"/>
     <feature extension="com.oxygenxml.pdf.css.xsl.merged2html5" file="custom.xsl"/>
   </plugin>
   ```

   **Note:**
   The `com.oxygenxml.pdf.css.xsl.merged2html5` extension point can also be called from a Publishing Template.

3. Create a `params.xml` file that specifies the name of the custom attribute with the following content:

   ```xml
   <dummy xmlns:if="ant:if">
     <param name="custom-param" expression="${custom.param}" if:set="custom.param"/>
   </dummy>
   ```

4. Create your customization stylesheet (for example, `custom.xsl`) with the following content:

   ```xml
   <?xml version="1.0" encoding="UTF-8"?>
   <xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
                   xmlns:xs="http://www.w3.org/2001/XMLSchema"
                   exclude-result-prefixes="xs"
                   version="2.0">
     <xsl:param name="custom-param"/>
   </xsl:stylesheet>
   ```
5. Use the Run DITA-OT Integrator transformation scenario (on page 1193) found in the DITA Map section in the Configure Transformation Scenario(s) dialog box.

6. Duplicate the DITA Map PDF - based on HTML5 & CSS transformation scenario, then in the Parameters tab click New to create a new parameter (e.g. named custom.param with the value of customValue).

7. Run the transformation scenario.

Adding parameters to existing XSLT steps

DITA-OT Extension Points

The DITA-OT CSS-based PDF Publishing Plugin supports DITA-OT extension points that can be used to expand the functionality of the transformation. The extension points are defined in the plugin.xml file. For more information, see DITA Open Toolkit Extension Points.

 Related Information:
XSLT Extensions for PDF Transformations (on page 1738)

How to Contribute a Custom CSS to the Transformation from a DITA-OT Plugin

This topic is intended for publishing architects/developers that need to deploy a customized DITA-OT.

Usually, the CSS styles can be passed to the transformation by referencing the CSS files using the args.css parameter. However, there are cases where you want to add some sort of "built-in" CSS that is applied in conjunction with the publishing template or CSS files referenced in the transformation.

For this, you need to use the com.oxygenxml.pdf.css.init extension point and set the value of the extension.css ANT property to the path of the custom CSS file:

1. In your plugin.xml file, add:

   <feature extension="com.oxygenxml.pdf.css.init" file="init.xml"/>
2. Create a file named init.xml with the following ANT content:

```xml
<root>
  <property name="extension.css" value="${dita.plugin.[com.my.plugin.id].dir}/css/my-custom.css"/>
  <!-- add here more init stuff if needed -->
</root>
```

**Note:**
The name of the root element does not matter. The content of this element will be copied in an initialization template.

**Important:**
Make sure all file references begin with the ANT variable that is expanded to the base directory of your plugin.

**Related Information:**
How to Use XSLT Extension Points for PDF Output from a DITA-OT Plugin (on page 1768)

## Localization

DITA-OT supports more than 40 languages. The full list of supported languages (and their codes) is available here: [https://www.dita-ot.org/3.6/topics/globalization-languages.html](https://www.dita-ot.org/3.6/topics/globalization-languages.html).

There are two ways to switch the labels to a specific language:

- Set the `@xml:lang` attribute on the DITA maps and/or topics root element with one of the supported values (e.g. de, fr-FR, ru, zh-CN).
- Set the `default.language` parameter in the transformation dialog box to the desired language code.

You can create language-dependent CSS rules in your customization CSS (on page 1550) by adding rules using the `:lang` pseudo-class (see [https://developer.mozilla.org/en-US/docs/Web/CSS/:lang](https://developer.mozilla.org/en-US/docs/Web/CSS/:lang)).

**Tip:**
It is recommended that you do this customization on a DITA-OT distribution deployed outside of the Oxygen installation. Otherwise, you will lose the customization when upgrading Oxygen. You can contact the Oxygen support team to ask for the Oxygen Publishing Engine package.

## How to Customize CSS Strings

Some of the labels come from CSS files located in the DITA-OT-DIR/plugins/com.oxygenxml.pdf.css/css/print/i18n directory. These strings can be overridden directly from a
custom CSS stylesheet. Simply identify (by debugging the CSS) and copy the rules that apply on your content and change their values. For example:

```css
/* Title of the TOC page */
*[class ~="toc/title"][empty]:lang(es):before {
  content: "Contenidos";
}
```

**Note:**

If you want to use a language without a corresponding `p-i18n-xx.css` stylesheet, follow these instructions:

1. Copy one of the available stylesheets (located in the `DITA-OT-DIR/plugins/com.oxygenxml.pdf.css/css/print/i18n` directory) into your CSS customization (other than the English one because it does not have the `:lang` pseudo-class since it is the default language).
2. For each rules, replace the `:lang(xx)` pseudo-class with your expected language code, then replace each property value with the expected label.

**Related information**

Debugging the CSS *(on page 1552)*

**How to Modify Existing Strings**

If the label you want to modify is not available from the CSS, you need to modify the XML strings. The default XML strings are available at the following two locations:

- `DITA-OT-DIR/plugins/org.dita.base/xsl/common`
- `DITA-OT-DIR/plugins/com.oxygenxml.pdf.css/resources/localization`

To modify the generated text, you need to create a DITA-OT extension plugin that uses the `dita.xsl.strings` extension point. The following example uses English, but you can adapt it for any language:

1. In the `DITA-OT-DIR\plugins\` folder, create a folder for this plugin (for example, `com.oxygenxml.pdf.css.localization`).
2. Create a `plugin.xm` file (in the folder you created in step 1) that specifies the extension points, your parameter file, and your customization stylesheet. For example:

```xml
<plugin id="com.oxygenxml.pdf.css.localization">
  <require plugin="com.oxygenxml.pdf.css"/>
</plugin>
```
3. Create a *pdf-extension-strings.xml* file with the following content:

```xml
<langlist>
  <lang xml:lang="en" filename="strings-en-us.xml"/>
  <lang xml:lang="en-US" filename="strings-en-us.xml"/>
</langlist>
```

4. Copy the strings you want to change from the default files to the *strings-en-us.xml* file, then replace their values:

```xml
<strings xml:lang="en-US">
  <str name="Figure">Fig</str>
  <str name="Table">Array</str>
</strings>
```

⚠️ **Warning:**
Make sure the string `@name` attribute remains the same, it is used by the process as a key to retrieve the strings text.

5. Use the Run DITA-OT Integrator transformation scenario *(on page 1193)* found in the DITA Map section in the Configure Transformation Scenario(s) dialog box.

6. Run the DITA Map PDF - based on HTML5 & CSS transformation scenario.

### How to Add New Strings

Some strings are not translated in all languages. In this case, they will appear in English. To add a new language for a given string, you need to create a DITA-OT extension plugin that uses the *dita.xsl.strings* extension point. The following example uses Polish, but you can adapt it for any language:

1. In the *DITA-OT-DIR\plugins\* folder, create a folder for this plugin (for example, `com.oxygenxml.pdf.css.localization`).
2. Create a *plugin.xml* file (in the folder you created in step 1) that specifies the extension points, your parameter file, and your customization stylesheet. For example:

```xml
<plugin id="com.oxygenxml.pdf.css.localization">
  <require plugin="com.oxygenxml.pdf.css"/>
  <feature extension="dita.xsl.strings" file="pdf-extension-strings.xml"/>
</plugin>
```

3. Create a *pdf-extension-strings.xml* file with the following content:

```xml
<langlist>
  <lang xml:lang="pl" filename="strings-pl-pl.xml"/>
</langlist>
```
4. Copy the strings you want to change from the default files to the `strings-pl-pl.xml` file, then replace their values:

```xml
<strings xml:lang="pl-PL">
  <str name="Continued">ciąg dalszy</str>
</strings>
```

⚠️ Warning:
Make sure the string `@name` attribute remains the same, it is used by the process as a key to retrieve the strings text.

5. Use the Run DITA-OT Integrator transformation scenario (on page 1193) found in the DITA Map section in the Configure Transformation Scenario(s) dialog box.

6. Run the DITA Map PDF - based on HTML5 & CSS transformation scenario.

**Security**

You can restrict the use of the PDF files by specifying a set of permissions. For example, you may want to set a password on the document, restrict the available actions inside the PDF reader, or encrypt the PDF content.

The `pdf.security.*` parameters listed in the Transformation Parameters (on page 1527) section can be used for this purpose.

**How to Protect PDF Files by Setting Security Permissions**

For example, to permit only the users that have a password to access the document and also to restrict their printing and copying capability, you can use the following parameter combination:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>pdf.security.owner.password</code></td>
<td><code>&lt;OWNER PASSWORD&gt;</code></td>
<td>People using this password will be able to open the document, with full permissions.</td>
</tr>
<tr>
<td><code>pdf.security.user.password</code></td>
<td><code>&lt;USER PASSWORD&gt;</code></td>
<td>People using this password will be able to open the document, but they will not be able to print.</td>
</tr>
<tr>
<td><code>pdf.security.restrict.print</code></td>
<td>yes</td>
<td>Restricts users from printing.</td>
</tr>
<tr>
<td><code>pdf.security.restrict.copy</code></td>
<td>yes</td>
<td>Restricts users from copying content.</td>
</tr>
</tbody>
</table>
Important:
If you specify just the user password (without an owner password), then the people using it will be considered owners, and no restrictions will apply to them.

Troubleshooting

There are cases when the PDF CSS-based processing fails when trying to publish DITA content to a PDF file. This topic lists some of the common problems and possible solutions.

Damaged PDF File

Problem

It is possible to get a PDF that cannot be opened in the PDF viewer. In this case, you might get an error similar to:

```
Error: PDF file is damaged - attempting to reconstruct xref table...
Error: Couldn't find trailer dictionary
Error: Couldn't read xref table
```

Cause

This usually means that your PDF viewer does not support a PDF version greater than 1.4. The main difference with newer PDF versions is that the xref table is compressed in a stream and is not available as a table.

Solution

You need to re-run the PDF transformation with the `pdf.version` parameter set to 1.4.

Error Parsing CSS File - Caused by a Networking Problem

Problem

My custom styles are not applied and in the transformation results console, I get an error containing one of the following: `I/O exception`, `Unknown host`, `Error parsing`.

Cause

One of the CSS files contains references to resources from another website that is currently inaccessible. These resources may include:

- Fonts
- Images
- Other CSS files
Note:
If you exported one of the built-in publishing templates from the transformation scenario dialog, it is possible that the associated CSS files use an imported Google Font.

Remedy

1. Check your proxy settings (ask the system administrator for help).
2. If the server is still inaccessible from the transformation process, download the remote resources using a web browser, save them in the customization CSS file folder, and refer them directly from your CSS.

Note:
If the problem is caused by a remote font, see Using Local Fonts.

Failed to Run Pipeline: The Entity Cannot Be Resolved Through Catalogs

Problem

You can get a Failed to run pipeline error message that looks something like this:

```
Failed to run pipeline: The entity SOME_ENTITY cannot not be resolved through catalogs.
For security reasons files that are not listed in the DITA-OT catalogs and are not located in the DITA-OT directory are not read
```

Cause

This happens when the security checks that are implemented in the default transformation have blocked the reading of files that are not part of the DITA-OT (Oxygen Publishing Engine) installation directory and not part of the transformed DITA map.

Solution

If the origin of the transformed content is known and trusted, you can disable these checks by setting the `args.disable.security.checks` transformation parameter to `yes`.

Disappearing Thin Lines or Cell Borders

Problem

There are cases where thin lines disappear from the PDF viewer at certain zoom levels.

Cause

This is caused by the limited resolution of the display, while a printer has a superior resolution and there should be no problem printing thin lines on paper.
Solution

If the primary PDF target is the display, then you have to use thicker lines in your CSS customization (for example, avoid using 1px and use 1pt or larger instead).

If you are using Adobe Acrobat Reader, then you can enhance the display of thin lines. This behavior can be changed by going to Edit > Preferences > Page Display > Enhance Thin Lines. Deselecting this option makes thin lines displayed as a row of gray pixels (through antialiasing) and they do not disappear. You can experiment by selecting and deselecting the option.

Glossary Entries Referenced Using 'glossref' are not Displayed

Problem

I have a <glossgroup> that contains multiple <glossentry> elements and all the entries are referenced using <glossref> elements inside my map. When I add an <abbreviated-form> element linked to one of my <glossentry> elements (using a @keyref), the entry is not resolved in the PDF output.

Solution

Make sure every <glossentry> has an @id. Then, for each <glossentry>, declare a <glossref> element like this:

```xml
<glossref href="concepts/glossary.dita#flowers.genus" print="yes" keys="genus"/>
```

Important:

For bookmaps, the <glossref> elements should be declared in a separate ditamap.

The format-date() XPath Function Does Not Respect the Specified Locale

Problem

Formatting a date using another language code, as in this example:

```xml
title:before {
    content: oxy_xpath('format-date(current-date(), "\[Mn\] \[Y]\", "ru", () , ()');
}
```

results in an output like: [Language: en]september 2019, with the date being formatted in English.

Cause

The XPath expressions are evaluated using the Saxon HE processor. This processor does not support languages other than English.

Solution

As a solution, you can either switch to a more language-neutral format that avoids the months names:
or you can use a more complex XPath expression like this:

```
title:before{
    content: oxy_xpath("let $cm:= format-date(current-date(), '"[MNn]"') \ 
        return concat( \ 
            if ($cm= 'January') then 'JAN' else \ 
            if ($cm= 'February') then 'FEB' else \ 
            if ($cm= 'March') then 'MAR' else \ 
            if ($cm= 'April') then 'APR' else \ 
            if ($cm= 'May') then 'MAY' else \ 
            if ($cm= 'June') then 'JUNE' else \ 
            if ($cm= 'July') then 'JUL' else \ 
            if ($cm= 'August') then 'AUG' else \ 
            if ($cm= 'September') then 'SEPT' else \ 
            if ($cm= 'October') then 'OCT' else \ 
            if ($cm= 'November') then 'NOV' else ' ' \ 
            ', \ 
            format-date(current-date(), '"[Y0001]"') \ 
            ) ");
}
```
Make sure the entire expression is rendered blue in the CSS editor. Replace the capitalized month names with the translation in the desired language.

### Highlights Span Unexpectedly to the End of the Page

**Problem**

Tracked changes and highlights span beyond what is expected.

**Cause**

If the change tracking insertions, comments, or highlights span over an area that is larger than expected, the markup that signals their end is missing.

**Solution**

To fix this, open the topic where the highlights start and check if the XML processing instructions that define the end of the highlighted interval are correct (it is easiest to see them in **Text** mode). The intervals are defined as follows:

For highlights:

```xml
<?oxy_custom_start type="oxy_content_highlight" color="140,255,140"?>
<?oxy_custom_end?>
```

For comments:

```xml
<?oxy_comment_start author="dan" timestamp="20201102T092905+0200" comment="Test"?>
<?oxy_comment_end?>
```

For inserted text:

```xml
<?oxy_insert_start author="dan" timestamp="20201102T093034+0200"?>
<?oxy_insert_end?>
```

Make sure all the ending processing instructions are located before the root element end tag.

### Unexpected Page Break Before or After an Element

**Problem**

A page break is present before or after an element that has **page-break-before** or **page-break-after** (**break-before** or **break-after**) set to **avoid**.

**Cause**

An empty element (for example `<p>` or `<shortdesc>`) is present before or after the element with the break set to avoid.
Solution

Either remove the empty element from the DITA source topic or set the display to none using the following CSS rule:

```
*[class ~= "topic/shortdesc"]:empty {
  display: none;
}
```

XSL FO-based DITA to PDF Customization

Oxygen XML Editor Eclipse plugin comes bundled with the DITA Open Toolkit that provides a mechanism for converting DITA maps (on page 2654) to PDF output. Oxygen XML Editor Eclipse plugin includes a built-in DITA Map PDF - based on XSL-FO transformation scenario (on page 1187) that converts DITA maps to PDF using an xsl:fo processor.

There are several methods that can be used to customize DITA to PDF output:

- Create a customization directory that contains your customized files and reference that directory in the PDF transformation scenario (using the customization.dir parameter).
- Creating a DITA Open Toolkit plugin that adds extensions to the PDF output. More details can be found in the DITA Open Toolkit Documentation.

Tip:

Some sample plugins are available on GitHub that could help you to get started with creating a plugin:
- Sample Plugin: DITA-OT PDF Customization Plugin for Oxygen User Manual
- Sample Plugin: DITA-OT PDF2 - Generate Numbers Before Topic's Title

Using a Customization Directory

One way to customize the PDF output generated by the DITA Map PDF - based on XSL-FO transformation scenario (on page 1187) is to create a dedicated folder to store customized files. With this approach, you will copy the contents of the built-in customization directory to a new directory where you can customize the files according to your needs and reference the new directory using the customization.dir parameter in the transformation scenario. The biggest advantage of this method is that the contents of your customization directory will remain unaffected when the DITA-OT is upgraded.

How to Create a Customization Directory

Follow this procedure to create a customization directory:
1. Copy all the entire DITA-OT-DIR\plugins\org.dita.pdf2\Customization directory to another location where you have write access.
2. Modify any of the files in whatever way necessary to achieve your specific goal. For inspiration, see Embedding a Company Logo (on page 1783) for a specific example of how you can modify contents of the directory to embed a logo in the output.

Tip:
For other specific examples, see DITA-OT Documentation - PDF Customization Plugin.

3. Edit the DITA Map PDF - based on XSL-FO transformation scenario (on page 1187), go to the Parameters tab, and set the customization.dir parameter to point to the location of your customization directory.

Automatic PDF plugin customization generator by Jarno Elovirta.
DITA-OT Documentation - PDF Customization Plugin

Embedding a Company Logo

The following procedure explains how to embed a company logo image in the front matter of the book for the DITA Map PDF - based on XSL-FO transformation scenario (on page 1187).

1. Create a customization directory (on page 1782) (if you have not already done so).
2. Create a cfg\common\artwork directory structure in your customization directory and copy your logo to that directory (for example, [C:\Customization\common\artwork\logo.png]).

Important:
Make sure that your logo image is named: logo.png.

3. Rename Customization\catalog.xml.orig to: Customization\catalog.xml.

4. Open the catalog.xml in Oxygen XML Editor Eclipse plugin and uncomment this line:

```
<!--uri name="cfg:fo/xsl/custom.xsl" uri="fo/xsl/custom.xsl"/>-->
```

It now looks like this:

```
<uri name="cfg:fo/xsl/custom.xsl" uri="fo/xsl/custom.xsl"/>
```

5. Rename the file Customization\fo\xsl\custom.xsl.orig to: C:\Customization\fo\xsl\custom.xsl

6. Open the custom.xsl file in Oxygen XML Editor Eclipse plugin and create the template called createFrontCoverContents for DITA-OT 4.1.1.
Tip:
You can copy the same template from DITA-OT-DIR\plugins\org.dita.pdf2\xsl\fo\front-matter.xsl and modify it in whatever way necessary to achieve your specific goal. This new template in the custom.xsl file will override the same template from DITA-OT-DIR\plugins\org.dita.pdf2\xsl\fo\front-matter.xsl.

Example:

For example, the custom.xsl could look like this:

```xml
<?xml version='1.0'?>
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
    xmlns:fo="http://www.w3.org/1999/XSL/Format"
    version="2.0">

<xsl:template name="createFrontCoverContents"/>
 <!-- set the title -->
<fo:block xsl:use-attribute-sets="__frontmatter__title">
    <xsl:choose>
        <xsl:when test="$map/*[contains(@class,' topic/title ')][1]">
            <xsl:apply-templates select="$map/*[contains(@class,' topic/title ')][1]/">
        </xsl:when>
        <xsl:when test="$map//*[contains(@class,' bookmap/mainbooktitle ')][1]">
            <xsl:apply-templates select="$map//*[contains(@class,' bookmap/mainbooktitle ')][1]/">
        </xsl:when>
        <xsl:when test="//*[contains(@class, ' map/map ')]/@title">
            <xsl:value-of select="//*[contains(@class, ' map/map ')]/@title"/>
        </xsl:when>
        <xsl:otherwise>
            <xsl:value-of select="/descendant::*[contains(@class, ' topic/topic ')][1]/*[contains(@class, ' topic/title ')]/"/>
        </xsl:otherwise>
    </xsl:choose>
</fo:block>

<!-- set the subtitle -->
<xsl:apply-templates select="$map//*[contains(@class, ' bookmap/booktitlealt ')]/>
<fo:block xsl:use-attribute-sets="__frontmatter__owner">
    <xsl:apply-templates select="$map//*[contains(@class, ' bookmap/bookmeta ')]/>
</fo:block>
<xsl:apply-templates select="$map//*[@contains(@class, ' topic/meta ')]/
    (@class, ' bookmap/bookmeta ')]/>
</fo:block>
```
7. Edit the **DITA Map PDF - based on XSL-FO** transformation scenario *(on page 1187)*, go to the **Parameters** tab, and set the **customization.dir** parameter to point to the location of your customization directory.

**Tip:**
For other specific examples, see **DITA-OT Documentation - Customizing PDF Output**.

**Related Information:**
*Using a Customization Directory (on page 1782)*

### Customizing the Header and Footer in PDF Output

This procedure should only be used for the **DITA Map PDF - based on XSL-FO** transformation scenario *(on page 1187)*.

The XSLT stylesheet **DITA-OT-DIR/plugins/org.dita.pdf2/fo/static-content.xsl** contains templates that output the static header and footers for various parts of the PDF such as the prolog, table of contents, front matter, or body.

The templates for generating a footer for pages in the body are called **insertBodyOddFooter** or **insertBodyEvenFooter**.

These templates get the static content from resource files that depend on the language used for generating the PDF. The default resource file is **DITA-OT-DIR/plugins/org.dita.pdf2/cfg/common-vars/en.xml**. These resource files contain variables (such as **Body odd footer**) that can be set to specific user values.

Instead of modifying these resource files directly, they can be overwritten with modified versions of the resources in a PDF customization directory.
1. Create a customization directory (on page 1782) (if you have not already done so).
2. Locate the stylesheets and templates listed above in your customization directory and modify them in whatever way necessary to achieve your specific goal.

Tip:
For more information and examples, see the Oxygen PDF Customization Plugin project on GitHub.

3. Edit the DITA Map PDF - based on XSL-FO transformation scenario (on page 1187), go to the Parameters tab, and set the customization.dir parameter to point to the location of your customization directory.

Related Information:
Using a Customization Directory (on page 1782)

Adding a Watermark to PDF Output

To add a watermark to the PDF output of a DITA Map PDF - based on XSL-FO transformation scenario (on page 1187), follow this procedure:

1. Create a customization directory (on page 1782) (if you have not already done so).
2. Create a cfg\common\artwork directory structure in your customization directory and copy your watermark image to that directory (for example, C:\Customization\cfg\common\artwork\watermark.png).
3. Rename the Customization\catalog.xml.orig file to: Customization\catalog.xml.
4. Open the catalog.xml in Oxygen XML Editor Eclipse plugin and uncomment this line:

   <!--uri name="cfg:fo/xsl/custom.xsl" uri="fo/xsl/custom.xsl"/-->

The uncommented line should look like this:

   <uri name="cfg:fo/xsl/custom.xsl" uri="fo/xsl/custom.xsl"/>

5. Rename the file: Customization\fo\xsl\custom.xsl.orig to: Customization\fo\xsl\custom.xsl.
6. Open the Customization\fo\xsl\custom.xsl file in Oxygen XML Editor Eclipse plugin to overwrite two XSLT templates:

   ◦ The first template is located in the XSLT stylesheet DITA-OT-DIR\plugins\org.dita.pdf2\xsl\fo\static-content.xsl. Override by copying the original template content in the custom.xsl and specifying a watermark image for every page in the PDF content, using a block-container element that references the watermark image file:

```xml
<fo:static-content flow-name="odd-body-header">
  <fo:block-container absolute-position="absolute">
```

```xml"/>
The second template to override is located in the XSLT stylesheet DITA-OT-DIR\plugins\org.dita.pdf2\xsl\fo\commons.xsl and is used for styling the first page of the output. Override it by copying the original template content in the custom.xsl and adding the block-container element that references the watermark image file:

```xml
<xsl:template name="createFrontMatter_1.0">
  <fo:page-sequence master-reference="front-matter"
    xsl:use-attribute-sets="__force__page__count">
    <xsl:call-template name="insertFrontMatterStaticContents"/>
    <fo:flow flow-name="xsl-region-body">
      <fo:block-container absolute-position="absolute"
        top="-2cm" left="-3cm" width="21cm" height="29.7cm"
        background-image="|concat($artworkPrefix,
          'Configuration/OpenTopic/cfg/common/artwork/watermark.png')|">
        <fo:block/>
      </fo:block-container>
    </fo:flow>
  </fo:page-sequence>
</xsl:template>
```
7. Edit the DITA Map PDF - based on XSL-FO transformation scenario (on page 1187), go to the Parameters tab, and set the customization.dir parameter to point to the location of your customization directory.

Related Information:
Adding a Watermark in DITA Map to XHTML Output (on page 2544)

Adding an Edit Link in PDF Output to Launch Oxygen XML Web Author

You can embed Edit links in the DITA Map PDF - based on XSL-FO transformation scenario (on page 1187) output that will automatically launch a particular document in Oxygen XML Web Author. A reviewer can then simply click the link and they will be redirected to the Oxygen XML Web Author editing page with that particular file open and editable.

To embed an Edit link in the DITA Map PDF output, follow these steps:

1. Edit a DITA Map PDF - based on XSL-FO transformation scenario (on page 1187) and open the Parameters tab.
2. Set values for the following parameters:
   - editlink.ditamap.edit.url - The URL of the DITA map used to publish your content. The easiest way to obtain the URL is to open the map in Web Author and copy the URL from the browser's address bar.
   - editlink.additional.query.parameters - Optional query parameters to be appended to each generated edit link. Each parameter must start with & (e.g. &tags-mode=no-tags).
3. Run the transformation scenario.

Result: In the PDF output, all topics will have an Edit link to the right side of the title and clicking the link will launch that particular document in Oxygen XML Web Author.

Force Page Breaks Between Two Block Elements in PDF Output

The following procedure works for the DITA Map PDF - based on XSL-FO transformation scenario (on page 1187).

Suppose that in your DITA content you have two block elements (on page 2652), such as two paragraphs:

```
<p>First para</p>
<p>Second para</p>
```

and you want to force a page break between them in the PDF output.

Here is how you can implement a DITA Open Toolkit plugin (on page 2657) that would achieve this:
1. Define your custom processing instruction that marks the place where a page break should be inserted in the PDF, for example:

```xml
<p>First para</p>
<?pagebreak?>
<p>Second para</p>
```

2. Locate the DITA Open Toolkit distribution and in the plugins directory create a new plugin folder (for example, DITA-OT-DIR/plugins/pdf-page-break).

3. In this new folder, create a new plugin.xml file with the following content:

```xml
<plugin id="com.yourpackage.pagebreak">
  <feature extension="package.support.name" value="Force Page Break Plugin"/>
  <feature extension="package.support.email" value="support@youremail.com"/>
  <feature extension="package.version" value="1.0.0"/>
  <feature extension="dita.xsl.xslfo" value="pageBreak.xsl" type="file"/>
</plugin>
```

The most important feature in the plugin is that it will add a new XSLT stylesheet to the XSL processing that produces the PDF content.

4. In the same folder, create an XSLT stylesheet named pageBreak.xsl with the following content:

```xml
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
  xmlns:fo="http://www.w3.org/1999/XSL/Format" version="1.0">
  <xsl:template match="processing-instruction('pagebreak')">
    <fo:block break-after="page"/>
  </xsl:template>
</xsl:stylesheet>
```

5. Install your plugin in the DITA Open Toolkit. (on page 2587)

The source code for the plugin can be found on GitHub here: https://github.com/dita-community/org.dita-community.pdf-page-break.

### Show Comments and Tracked Changes in PDF Output

To include comments and tracked changes (stored within your DITA topics) in the DITA Map PDF - based on XSL-FO transformation scenario (on page 1187) output, follow these steps:

1. Edit a DITA Map PDF - based on XSL-FO transformation scenario.

2. In the Parameters tab, set the value of the show.changes.and.comments parameter to yes. If you also want to display change bars for inserted or deleted content in the PDF, set the show.changebars parameter to yes. If you want to only show the changebars, without other styling of the changes, you should set both the show.changes.and.comments and show.changes.and.comments.as.changebars.only parameters to yes.
3. Optionally, you can configure any of these other parameters to adjust the colors of the comments and tracked changes:
   ◦ **ct.insert.color** - Specifies the color for insertion type tracked changes, as a plain color (e.g. red, yellow, blue), or with a hexadecimal equivalent (e.g. #FFFFFF). The default value is 'blue'.
   ◦ **ct.delete.color** - Specifies the color for deletion type tracked changes, as a plain color (e.g. red, yellow, blue), or with a hexadecimal equivalent (e.g. #FFFFFF). The default value is 'red'.
   ◦ **ct.comment.bg.color** - Specifies the background color for comment type tracked changes, as a plain color (e.g. red, yellow, blue), or with a hexadecimal equivalent (e.g. #FFFFFF). The default value is 'yellow'.

4. Click **OK** and then the **Apply Associated** button to run the transformation scenario.

**Result:** Comment threads and tracked changes will now appear in the PDF output. Details about each comment or change will be available in the footer section for each page.

---

### Set a Font for PDF Output Generated with FO Processor

When a [DITA map](on page 2654) is transformed using the [DITA Map PDF - based on XSL-FO transformation scenario](on page 1187) and it contains some Unicode characters that cannot be rendered by the default PDF fonts, a font that is capable of rendering these characters must be configured and embedded in the PDF result.

The settings that must be modified for configuring a font for the built-in FO processor are detailed in [Add a Font to the Built-in FO Processor - Advanced Version](on page 1265).

---

### DITA-OT PDF Font Mapping

The DITA-OT contains a file `DITA-OT-DIR/plugins/org.dita.pdf2/cfg/fo/font-mappings.xml` that maps logical fonts used in the XSLT stylesheets to physical fonts that will be used by the FO processor to generate the PDF output.

The XSLT stylesheets used to generate the XSL-FO output contain code like this:

```xml
<xsl:attribute name="font-family">monospace</xsl:attribute>
```

The font-family is defined to be `monospace`, but `monospace` is just an alias. It is not a physical font name. Therefore, another stage in the PDF generation takes this `monospace` alias and looks in the `font-mappings.xml`.

If it finds a mapping like this:

```xml
<aliases>
  <alias name="monospace">Monospaced</alias>
</aliases>
```

then it looks to see if the `monospace` has a `logical-font` definition and if so, it will use the `physical-font` specified there:
Important:

If no alias mapping is found for a font-family specified in the XSLT stylesheets, the processing defaults to Helvetica.

http://www.elovirta.com/2016/02/18/font-configuration-in-pdf2.html

Adding Libraries to the Built-in FO Processor (DITA-OT)

Starting with Oxygen XML Editor Eclipse plugin version 20.0, both hyphenation and PDF image support are enabled by default in the built-in DITA Map PDF - based on XSL-FO transformation scenario (on page 1187).

For older version of Oxygen XML Editor Eclipse plugin, use the following procedures to enable such support.

Adding Hyphenation Support for DITA-OT Transformation Scenarios

1. Download the pre-compiled JAR (on page 2655) from OFFO.
2. Edit the DITA-OT transformation scenario and switch to the Advanced tab.
3. Click the Libraries button and add the path to the fop-hyph.jar library.

Adding Support for PDF Images

1. Download the fop-pdf-images JAR libraries.
2. Edit the DITA-OT transformation scenario and switch to the Advanced tab.
3. Click the Libraries button and add the path to the libraries.

Adding Support for CGM Images

1. Go to the JCGM page and download the jcgm-image-0.1.1.jar and jcgm-core-0.2.0.jar libraries.
2. Edit the DITA-OT transformation scenario and switch to the Advanced tab.
3. Click the Libraries button and add the path to the libraries.

Debugging DITA PDF Transformations

To debug the DITA Map PDF - based on XSL-FO transformation scenario (on page 1187), follow these steps:
1. Open the Preferences dialog box (on page 70), go to XML > XML Catalog, click Add, and select the file located at \DITA-OT-DIR\plugins\org.dita.pdf2\cfg\catalog.xml. If there are other custom DITA-OT PDF customization plugins that contain XML catalogs, references to those XML catalogs might need to be added as well.

2. Open the map in the DITA Maps Manager (on page 2315) and create a DITA Map PDF - based on XSL-FO transformation scenario.

3. Edit the scenario, go to the Parameters tab and change the value of the clean.temp parameter to no.

4. Run the transformation scenario.

5. Open the stage1.xml file located in the temporary directory and format and indent (on page 337) it.

6. Create a transformation scenario for this XML file by associating the topic2fo_shell_fop.xsl stylesheet located at \DITA-OT-DIR\plugins\org.dita.pdf2.fop\xsl\fo\topic2fo_shell_fop.xsl. If you are specifically using the RenderX XEP or Antenna House FO processors to build the PDF output, you should use the XSL stylesheets topic2fo_shell_xep.xsl or topic2fo_shell_axf.xsl located in the corresponding plugin folders.

   ![Note:]
   For validation purposes, you need to add the main debugged stylesheet (usually topic2fo_shell_fop.xsl) to the Main Files folder (on page 280) in the Project Explorer view.

7. In the transformer drop-down menu, select the Saxon EE XSLT processor (the same processor used when the DITA-OT transformation is executed).

8. Click the Parameters button:
   a. Set the locale parameter (e.g. with the value of en_GB).
   b. Set the work.dir.url parameter with the value ${cfdu}.
   c. Set the customizationDir.url parameter to point to either your customization directory or to the default DITA-OT customization directory. Its value should have a URL syntax like this:

   ```text
   file://c:/path/to/<term keyref="glossentry_dita_ot_dir"/>/plugins/org.dita.pdf2/cfg
   ```

9. You need to reference the extra commonly used JAR libraries by clicking the Extensions button and using wildcards to add a reference to all libraries in this folder: \DITA-OT\plugins\com.oxygenxml.common\lib\*.

10. Apply the transformation to continue the debugging process.

   ![Note:]
   For externally configured DITA Open Toolkit installations or when using custom plugins based on the base PDF2 plugin, the paths to resources described above may need to be adjusted accordingly.

**Related information**

- Debugging XSLT Stylesheets and XQuery Documents (on page 1891)
- How to Enable Debugging for FO Processor Transformations (on page 1266)
DocBook to PDF Output Customization

When the default layout and output of the DocBook to PDF transformation needs to be customized, follow these steps:

   
   You could start from a copy of the file [DocBook XSL directory]/fo/titlepage.templates.xml (for example, [OXYGEN-INSTALL-DIR]/frameworks/docbook/xsl/fo/titlepage.templates.xml) and customize it. More information about the spec file can be found here.

2. Generate a new XSLT stylesheet from the title spec file from the previous step.
   
   Apply [DocBook XSL directory]/template/titlepage.xsl to the title spec file. The result is an XSLT stylesheet (for example, mytitlepages.xsl).

3. Import mytitlepages.xsl in a DocBook customization layer.
   
   The customization layer is the stylesheet that will be applied to the XML document. The mytitlepages.xsl should be imported with an element like this:

   ```xml
   <xsl:import href="dir-name/mytitlepages.xsl"/>
   ```

4. Insert a logo image in the XML document.
   
   The path to the logo image must be inserted in the book/info/mediaobject structure of the XML document.

5. Apply the customization layer to the XML document.
   
   A quick way is to duplicate the transformation scenario DocBook PDF that is included with Oxygen XML Editor Eclipse plugin and set the customization layer in the XSL URL property of the scenario (on page 1202).

Related Information:

Video demonstration for creating a DocBook customization layer in Oxygen XML Editor Eclipse plugin.
12. Working with XPath Expressions

XPath is a language for addressing specific parts of a document. XPath models an XML document as a tree of nodes. An XPath expression is a mechanism for navigating through and selecting nodes from the document. An XPath expression is, in a way, analogous to an SQL query used to select records from a database.

Note:
If an XPath expression is run over a JSON document, it is converted to XML and the XPath is executed over the converted XML document.

There are various types of nodes, including element nodes, attribute nodes, and text nodes. XPath defines a way to compute a string-value for each type of node.

XPath defines a library of standard functions for working with strings, numbers and boolean expressions.

Examples:

- `child::*` - Selects all children of the root node.
- `//name` - Selects all `<name>` elements and descendants of the current node.
- `/catalog/cd[price>10.80]` - Selects all the `<cd>` elements that have a `<price>` element with a value larger than 10.80.
- `//prolog` - Finds all `<prolog>` elements.
- `//prolog[@platform='mac']` - Finds all `<prolog>` elements that have the `@platform` attribute value set to `mac`.
- `//child::prolog` - Selects all `<prolog>` elements and the child content.
- `/*[count(/accountNumber) > 5]` - Searches for instances where more than 5 `<accountNumber>` elements are found.
- `collection('file:/C:/path/to/folder/?select=*.xml')/*[not(/prolog)]` - Finds a list of all XML files that do not contain any `<prolog>` elements.

To find out more about XPath, see [http://www.w3.org/TR/xpath](http://www.w3.org/TR/xpath).

Related Information:
Content Completion in XPath Expressions (on page 660)

XPath Builder View

The XPath/XQuery Builder view allows you to compose complex XPath expressions and execute them over the currently edited XML document. For XPath 2.0 / 3.1, you can use the `doc()` function to specify the source file that will have the expressions executed. When you connect to a database, the expressions are executed.
over that database. If you are using the **XPath/XQuery Builder** view and the current file is an XSLT document, Oxygen XML Editor Eclipse plugin executes the expressions over the XML document in the associated scenario.

**Note:**
If an XPath expression is run over a JSON document, it is converted to XML and the XPath is executed over the converted XML document.

If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

The upper part of the view contains the following actions:

**XPath version chooser drop-down menu**

A drop-down menu that allows you to select the type of the expression you want to execute. You can choose between:

- XPath 1.0 (Xerces-driven)
- XPath 2.0, XPath 2.0 SA, XPath 3.1, XPath 3.1 SA, Saxon-HE XQuery, Saxon-PE XQuery, or Saxon-EE XQuery (all of them are Saxon-driven)
- Custom connection to XML databases that can execute XQuery expressions

**Note:**
The results returned by XPath 2.0 SA and XPath 3.1 SA have a location limited to the line number of the start element (there are no column information and no end specified).

**Note:**
Oxygen XML Editor Eclipse plugin uses Saxon to execute XPath 3.1 expressions. Since Saxon implements a part of the 3.1 functions, when using a function that is not implemented, Oxygen XML Editor Eclipse plugin returns a compilation error.

**Execute XPath button**

Use this button to start the execution of the XPath or XQuery expression you are editing. The result of the execution is displayed in the **Results view (on page 334)** view.

**Favorites button**

Allows you to save certain expressions that you can later reuse. To add an expression as a favorite, click this button and enter a name for it. The star turns yellow to confirm that the expression was saved. Expand the drop-down menu next to the star button to see all your favorites. Oxygen XML Editor Eclipse plugin automatically groups favorites in folders named after the method of execution.

**History drop-down menu**
Oxygen XML Editor Eclipse Plugin 26.0 | 12 - Working with XPath Expressions | 1797

Keeps a list of the last 15 executed XPath expressions. Use the Clear history action from the bottom of the list to remove them.

Settings drop-down menu

Contains the following three options:

- **Update on cursor move**
  
  When selected and you navigate through a document, the XPath expression corresponding to the XML node at the current cursor position is displayed. For JSON documents, it displays the XPath expression for the current property.

- **Evaluate as you type**
  
  When you select this option, the XPath expression you are composing is evaluated in real time.

  **Note:**
  
  This option and the automatic validation are disabled when the scope is other than Current file.

Options

Opens the Preferences page of the currently selected processing engine.

XPath scope menu

Oxygen XML Editor Eclipse plugin allows you to define a scope for the XPath operation to be executed. You can choose where the XPath expression will be executed:

- **Current file** - Currently selected file only.
- **Enclosing project** - All the files of the project that encloses the currently edited file.
- **Workspace selected files** - The files selected in the workspace. The files are collected from the last selected resource provider view (Project Explorer (on page 268) or Package Explorer).
- **All opened files** - All files that are opened in the application.
- **Current DITA Map hierarchy** - All resources referenced in the currently selected DITA map that is open in the DITA Maps Manager view (on page 2315).
- **Opened archive** - Files that are opened in the Archive Browser view (on page 1803).
- **Working sets** - The selected working sets (on page 2659).

At the bottom of the scope menu the following scope configuration actions are available:
Configure XPath working sets - Allows you to configure and manage collections of files and folders, encapsulated in logical containers called working sets (on page 2659).

XPath file filter - You can filter the files from the selected scope that will have the XPath expression executed. By default, the XPath expression will be executed only on XML or JSON files, but you can also define a set of patterns that will filter out files from the current scope.

**Figure 458. XPath/XQuery Builder View**

When you hover your cursor over the version icon, a tooltip is displayed to let you know what engine Oxygen XML Editor Eclipse plugin currently uses.

While you edit an XPath or XQuery expression, Oxygen XML Editor Eclipse plugin assists you with the following features:

- **Content Completion Assistant (on page 2653)** - It offers context-dependent proposals and takes into account the cursor position in the document you are editing. The set of functions proposed by the Content Completion Assistant also depends on the engine version. Select the engine version from the drop-down menu available in the toolbar.
• Syntax Highlighting - Allows you to identify the components of an expression. To customize the colors of the components of the expression, open the Preferences dialog box (on page 70) and go to Editor > Syntax Highlight (on page 176).

• Automatic validation of the expression as you type.

**Note:**
When you type invalid syntax, a red serrated line underlines the invalid fragments.

• Function signature and documentation balloon, when the cursor is located inside a function.

**Related Information:**
XPath Expression Results View (on page 1799)

**XPath Expression Results View**

When you run an XPath expression, Oxygen XML Editor Eclipse plugin displays the results of its execution in the XPath Results view.

This view contains the following columns:

- **Description** - The result that Oxygen XML Editor Eclipse plugin displays when you run an XPath expression.
- **XPath location** - The path to the matched node.
- **Resource** - The name of the document that you run the XPath expression on.
- **System ID** - The path to the document itself.
- **Location** - The location of the result in the document.

To arrange the results depending on a column, click its header. If no information regarding location is available, Oxygen XML Editor Eclipse plugin displays **Not available** in the Location column. Oxygen XML Editor Eclipse plugin displays the results in a valid XPath expression format.

```xml
/node[value]/node[value]/node[value]
```

**XPath Results View Contextual Menu Actions**

The following actions are available when the contextual menu is invoked in this view:

- **Select All**
  
  Extends the selection to all the messages from the view.

- **Copy**
  
  Copies information associated with the selected messages in case you want to paste it elsewhere.

- **Save Results**
Saves the complete list of messages in a file in text format. For each message, the included details are the same as the ones for the **Copy action (on page 1799)**.

**Save Results as XML**

Saves the complete list of messages in a file in XML format. For each message, the included details are the same as the ones for the **Copy action (on page 1799)**.

**Save Results as HTML**

Saves the complete list of messages in a file in HTML format. For each message, the included details are the same as the ones for the **Copy action (on page 1799)**.

**Example:**

The following snippets are taken from a DocBook book based on the DocBook XML DTD. The book contains a number of chapters. To return all the chapter nodes of the book, enter `//chapter` in the XPath expression field and press **Enter**. This action returns all the `chapter` nodes of the DocBook book in the **Results View**. Click a record in the **Results View** to locate and highlight its corresponding chapter element and all its children nodes in the document you are editing.

To find all `example` nodes contained in the `sect2` nodes of a DocBook XML document, use the following XPath expression: `//chapter/sect1/sect2/example`. Oxygen XML Editor Eclipse plugin adds a result in the **Results View** for each `example` node found in any `sect2` node.

For example, if the result of the above XPath expression is:

```
- /chapter[1]/sect1[3]/sect2[7]/example[1]
```

it means that in the edited file, the `example` node is located in the first chapter, third section level one, seventh section level 2.
XPath and XML Catalogs

The evaluation of the XPath expression tries to resolve the locations of documents referenced in the expression through XML Catalogs (on page 2659). These catalogs are configured in the XML Catalog preferences (on page 189) pages and the XML Parser preferences (on page 192).

Example:

As an example, consider the evaluation of the collection(URIofCollection) function (XPath 2.0). To resolve the references from the files returned by the collection() function with an XML catalog, specify the class name of the catalog-enabled parser for parsing these collection files. The class name is ro.sync.xml.parser.CatalogEnabledXMLReader. Specify it as it follows:

```
let $docs := collection(iri-to-uri{
    "file:///D:/temp/test/XQuery-catalog/mydocsdir?recurse=yes;select=*.xml;
    parser=ro.sync.xml.parser.CatalogEnabledXMLReader"})
```

XPath Prefix Mapping

To define default mappings between prefixes and namespace URIs go to the XPath preferences page (on page 203) and enter the mappings in the Default prefix-namespace mappings table. The same preferences panel allows you to configure the default namespace used in XPath 2.0 expressions.
Important:

If you define a default namespace, Oxygen XML Editor Eclipse plugin binds this namespace to the first free prefix from the list: default, default1, default2, and so on. For example, if you define the default namespace `xmlns="something"` and the prefix `default` is not associated with another namespace, you can match tags without prefix in an XPath expression typed in the XPath toolbar by using the prefix `default`. To find all the `<level>` elements when you define a default namespace in the root element, use this expression: `//default:level` in the XPath toolbar.
13. Working with Archives

Oxygen XML Editor Eclipse plugin includes a useful Archive Browser view (on page 1803) that offers the means to work with files directly from various types of archives (for example, opening and saving files directly in archives, or browsing and modifying archive structures). The archive support is available for all ZIP-type archives, including:

- ZIP archives
- EPUB books
- JAR archives (on page 2655)
- Office Open XML (OOXML) files
- Open Document Format (ODF) files
- IDML files (on page 2655)

You can transform, validate, and perform many other operations on files directly from an archive. For instance, you can transform, or validate files directly from OOXML or ODF packages, and the structure and content of the ZIP archives can be opened, edited, and saved, similar to any other ZIP archive browsing tool. Also, when browsing for a URL in various dialog boxes, you can use the Browse for archived file action to browse and select files from a particular archive.

Resources

For more information about working with an EPUB archive in Oxygen XML Editor Eclipse plugin, watch our video demonstration:

https://www.youtube.com/embed/OIGTNQwOCl8

Browsing Archives

To view the contents and structure of an archive, use one of the following methods:

- Open an archive from the Project Explorer view (on page 268). This opens the archive in the main editing pane. The archive is unmounted when the editor is closed.
- Use the Eclipse File System (EFS) by right-clicking the archive in the Project Explorer view and choosing Expand Zip Archive. This expands the archive. All the standard actions are available on the mounted archive. To close the archive, you can use the Collapse ZIP Archive action and any file opened from the expanded archive is closed when the archive in unmounted.
Tip:
If a file is not recognized by Oxygen XML Editor Eclipse plugin as a supported archive type, you can add it in the Archive preferences page (on page 71).

Figure 460. Browsing an Archive

Archive Contextual Menu Actions

The following additional actions are available from the contextual menu for archives:

- **Open**

  Opens a resource from the archive in the editor.

- **Extract**

  Extracts a resource from the archive in a specified folder.

- **New folder**

  Creates a folder as child of the selected folder in the browsed archive.

- **New file**

  Creates a file as child of the selected folder in the browsed archive.

- **Add files**

  Adds existing files as children of the selected folder in the browsed archive.

Note:
On macOS, the Add file action is also available and it allows you to add one file at a time.

- **Rename**

  Renames a resource in the archive.
Cut
Cuts the selected archive resource.

Copy
Copies the selected archive resource.

Paste
Pastes a file or folder into the archive.

Delete
Removes a file or folder from archive.

Copy location
Copies the URL location of the selected resource.

Refresh
Refreshes the selected resource.

Properties
Shows the properties of the selected resource.

Resources
For more information, watch our video demonstration about working with an EPUB in the Archive Browser view:

https://www.youtube.com/embed/OIGTNQwOCI8

Working with Archive Files
Oxygen XML Editor Eclipse plugin includes support for working with various types of archives, including the following:

- **EPUB** - An e-book file format that can be used on many types of devices, such as smart phones, tablets, e-readers, or computers.
- **OOXML** - An XML-based file format for representing spreadsheets, charts, presentations, and word processing documents.
- **ODF** - An free and open-source XML-based file format for electronic office documents, such as spreadsheets, charts, presentations, and word processing documents.

When these types of files are opened in the Project Explorer view or the main editing pane, their internal components are expanded:

- Document content (XHTML and image files).
- Packaging files.
- Container files.
When an archive is expanded, you can add or delete files that compose the archive structure. All changes made to the structure of an archive are saved immediately. You can open files from within the archive to edit them in the main editing pane and save changes back to the archive. You can also use the Open in System Application action to open the archive in the default system application that is associated with that type of file.

**EPUB-Specific Validation**

When working with EPUB archives, Eclipse includes a Validate action on the toolbar that checks the EPUB archive to make sure the structure and content are valid. Oxygen XML Editor Eclipse plugin uses the open-source EpubCheck validator to perform the validation. This validator detects many types of errors, including OCF container structure, OPF and OPS mark-up, as well as internal reference consistency.

**Resources**

For more information about working with an EPUB archive in Oxygen XML Editor Eclipse plugin, watch our video demonstration:

https://www.youtube.com/embed/OIGTNQwOCl8
Creating an Archive

To create an archive from scratch, follow these steps:

1. Go to File > New > New from Templates.
2. Choose your particular type of archive template. For example, select one of the ODF, OOXML, or EPUB templates.
3. Click Next and choose the name and location of the file.
4. Click Finish.
   A skeleton archive is saved on disk and open in Eclipse.

Tip:
Use toolbar and contextual menu actions to edit, add, and remove resources from the archive.
For EPUB archives, you can use the Validate action to verify the integrity of the EPUB archive.

Editing and Saving Files Inside an Archive

You can open files directly from an archive and then edit them in the main editor pane. To open a file, simply double-click it or select Open from the contextual menu.

When saving the file back to the archive, you are prompted to choose if you want the application to make a backup copy of the archive before saving the new content. If you choose Never ask me again, you will not be asked again to make backup copies. You can re-enable the pop-up message from the Archive preferences page (on page 71).

Migrating Archives to DITA or TEI

Certain types of archives can be converted to DITA or TEI. For example, OOXML (Office Open XML) archive files with the DOCX file extension can be migrated to DITA or TEI.

To migrate DOCX files to DITA or TEI, follow these steps:

1. Open and expand the archive in Eclipse.
2. Open the document.xml file contained in the archive.
3. Run one of the following built-in transformation scenarios:
   a. DOCX DITA to migrate to DITA.
   b. DOCX TEI P5 to migrate to TEI.
4. You may need to do some manual reconfiguring to map DOCX styles to DITA or TEI content.

Tip:
Oxygen XML Editor Eclipse plugin also includes a built-in transformation scenario called ODT TEI P5 for converting ODF archive files with the ODT file extension to TEI and a similar process can be used to migrate ODT files to TEI.
14. Databases and SharePoint

Oxygen XML Editor Eclipse plugin provides support for connecting and integrating with various databases and Microsoft SharePoint. This section includes information about the database-related features in Oxygen XML Editor Eclipse plugin. It explains how to connect with the supported databases, presents the actions that are available for each type, and includes information about SharePoint integration.

Working with Databases

XML is a storage and interchange format for structured data and is supported by all major database systems. Oxygen XML Editor Eclipse plugin offers the means for managing the interaction with some of the most commonly used databases (both Relational and Native XML databases). Through this interaction, Oxygen XML Editor Eclipse plugin helps users with browsing, content editing, importing from databases, using XQuery with databases, SQL execution, and generating XML Schema from a database structure.

The types of connections that are supported in Oxygen XML Editor Eclipse plugin include:

- IBM DB2 (on page 1814)
- Microsoft SQL Server (on page 1819)
- Oracle Database (on page 1823)
- PostgreSQL (on page 1828)
- eXist (on page 1833)
- MarkLogic (on page 1838)
- MySQL (on page 1848)
- Generic JDBC (on page 1850)
- JDBC-ODBC (on page 1851)
- BaseX (on page 1853)
- WebDAV (on page 1857)
- Microsoft SharePoint (on page 1870)

Related information
Integration with Microsoft SharePoint (on page 1870)

Data Source Explorer View

The Data Source Explorer view displays your database connections. If the view is not displayed, it can be opened by selecting it from the Window > Show View menu.

You can connect to a database simply by expanding the connection node (click the connection). The database structure can be expanded to resource level, or even all the way to column level for tables inside
relational databases. Oxygen XML Editor Eclipse plugin supports multiple simultaneous database connections and the connection tree in the **Data Source Explorer** view provides an easy method for browsing them.

**Figure 462. Data Source Explorer View**

The objects (nodes) that are displayed in the **Data Source Explorer** view depend on the connection type and structure of the database. Various contextual menu actions are available for each hierarchical level and for some connections you can add or move resources in a container by simply dragging them from the **Project Explorer view (on page 268)**, a file browsing application, or another database.

**Toolbar Actions**

The following actions are available in the toolbar of this view:

- **Filters**
  
  Opens the **Data Sources / Table Filters preferences page (on page 79)**, allowing you to decide which table types are displayed in the **Data Source Explorer** view.

- **Configure Database Sources**
  
  Opens the **Data Sources preferences page (on page 74)** where you can configure both data sources and connections.

**Database-Specific Contextual Menu Actions**

Each specific type of database will also include its own specific contextual menu actions in the **Data Source Explorer** view. The actions depend on the type of database, the type of node, or the hierarchical level of the node where the contextual menu is invoked.
Related Information:  
Data Sources Preferences (on page 74)

Table Explorer View

Relational databases tables in the Data Source Explorer view (on page 1809) can be displayed and edited in the Table Explorer view by selecting the Edit action from the contextual menu of a Table node or by double-clicking one of its fields. To modify the content of a cell, double-click it and start typing. When editing is complete, Oxygen XML Editor Eclipse plugin attempts to update the database with the new cell content.

![Figure 463. Table Explorer View](image)

You can sort the content of a table by one of its columns by clicking its column header.

Note the following:

- The first column is an index (not part of the table structure).
- Every column header contains the field name and its data type.
- The primary key columns are marked with this symbol: 🖼.
- Multiple tables are presented in a tabbed manner.

For performance issues, you can set the maximum number of cells that are displayed in the Table Explorer view (using the Limit the number of cells option in the Data Sources Preferences page (on page 78)). If a table that has more cells than the value set in the options is displayed in the Table Explorer view, a warning dialog box informs you that the table is only partially shown.

You are notified if the value you have entered in a cell is not valid (and thus cannot be updated).
• If the content of the edited cell does not belong to the data type of the column, an information dialog box appears, notifying you that the value you have inserted cannot be converted to the SQL type of that field. For example, if you have a column that contains LONG (numerical) values, and a character or string is inserted into one of its cells, you would get the error message that a string value cannot be converted to the requested SQL type (NUMBER).

• If the constraints of the database are not met (for instance, primary key constraints), an information dialog box will appear, notifying you of the reason the database has not been updated. For example, in the table below, trying to set the second record in the primary key propID column to 8, results in a duplicate entry error since that value has already been used in the first record:

![Figure 464. Duplicate Entry for Primary Key](image)

**Table Explorer Contextual Menu Actions**

Common editing actions (Cut, Copy, Paste, Select All, Undo, Redo) are available in the contextual menu of an edited cell.

The contextual menu, available on every cell in the Table Explorer view, also includes the following actions:

- **Set NULL**
  
  Sets the content of the cell to null. This action is not available for columns that cannot have a value of null.

- **Insert row**
  
  Inserts an empty row in the table.

- **Duplicate row**
  
  Makes a copy of the selected row and adds it in the Table Explorer view. Note that the new row will not be inserted in the database table until all conflicts are resolved.

- **Commit row**
  
  Commits the selected row.
Delete row

Deletes the selected row.

Copy

Copies the content of the cell.

Paste

Pastes copied content into the selected cell.

**Table Explorer Toolbar Actions**

The toolbar of the **Table Explorer** view also includes the following actions:

Export to XML

Opens the Export Criteria dialog box (a thorough description of this dialog box can be found in the Import from database *(on page 1884)* chapter).

Refresh

Performs a refresh for the sub-tree of the selected node.

Insert row

Inserts an empty row in the table.

Duplicate row

Makes a copy of the selected row and adds it in the **Table Explorer** view. Note that the new row will not be inserted in the database table until all conflicts are resolved.

Commit row

Commits the selected row.

Delete row

Deletes the selected row.

**Related Information:**

Data Source Explorer View *(on page 1809)*

**Database Connection Support**

Oxygen XML Editor Eclipse plugin offers support for a variety of *Relational* and *Native XML* database connections. The database drivers and connections for various types of database are configured in the **Data Sources preferences page** *(on page 74)* and once configured, the database connections can be viewed and managed in the **Data Source Explorer** view *(on page 1809)*. Oxygen XML Editor Eclipse plugin also includes a **Database perspective** *(on page 237)* that helps you to manage databases.

The database support in Oxygen XML Editor Eclipse plugin offers a variety of capabilities, including:
• Browsing the structure of databases in the **Data Source Explorer** view *(on page 1809).*
• Viewing relational tables in the **Table Explorer** view *(on page 1811).*
• Executing SQL queries against databases.
• Calling stored procedures with input and output parameters.
• XQuery execution with databases.
• Exporting data from databases to XML.

**Relational Database Support**

Relational databases use a relational model and are based on tables linked by a common key. Oxygen XML Editor Eclipse plugin offers support for the most commonly used relational databases, including:

- IBM DB2
- Oracle 11g
- Microsoft SQL Server
- PostgreSQL
- MySQL

Oxygen XML Editor Eclipse plugin also offers generic support (table browsing and execution of SQL queries) for any JDBC-compliant database (for example, *MariaDB*).

**Native XML Database Support**

Native XML databases have an XML-based internal model and their fundamental unit of storage is XML. They use XML as an interface to specify documents as tree structured data that may contain unstructured text, but on disk the data is stored as optimized binary files. This makes query and retrieval processes faster. Oxygen XML Editor Eclipse plugin offers support for the most commonly used native XML databases, including:

- eXist
- MarkLogic
- Oracle XML DB
- Base X

**Related information**

- WebDAV Connections *(on page 1857)*
- Integration with Microsoft SharePoint *(on page 1870)*

**IBM DB2 Database Connections**

Oxygen XML Editor Eclipse plugin includes support for IBM DB2 database connections. Oxygen XML Editor Eclipse plugin allows you to browse the structure of an IBM DB2 database in the **Data Source Explorer** view *(on page 1809)*, open tables in the **Table Explorer** view *(on page 1811)*, and perform various operations on the resources in the repository.
Configuring an IBM DB2 Database Connection

To configure the support for the IBM DB2 database, follow this procedure:

1. Go to the IBM website and in the DB2 Clients and Development Tools category select the DB2 Driver for JDBC and SQLJ download link. Fill out the download form and download the zip file. Unzip the zip file and use the db2jcc.jar and db2jcc_license_cu.jar files in Oxygen XML Editor Eclipse plugin for configuring a DB2 data source (on page 1815).
2. Configure IBM DB2 Data Source drivers (on page 1815).
3. Configure an IBM DB2 Server Connection (on page 1817).
4. To view your connection, go to the Data Source Explorer view (on page 1809) (if the view is not displayed, it can be opened by selecting it from the Window > Show View menu) or switch to the Database perspective (on page 2656).

How to Configure IBM DB2 Data Source Drivers

Note:
Available in the Enterprise edition only.

To configure a data source for connecting to an IBM DB2 server, follow these steps:
1. Go to the IBM website and in the DB2 Clients and Development Tools category select the DB2 Driver for JDBC and SQLJ download link. Fill out the download form and download the zip file.
2. Unzip the downloaded archive.
3. Open the Preferences dialog box (on page 70) and go to Data Sources.
4. Click the + New button in the Data Sources panel.

The dialog box for configuring a data source is opened.

Figure 466. Data Source Drivers Configuration Dialog Box

5. Enter a unique name for the data source.
6. Select DB2 in the driver Type drop-down menu.
7. Click the Add Files button and select the IBM DB2 driver files from the archive that you downloaded and unzipped.

The IBM DB2 driver files are:

- db2jcc.jar
- db2jcc_license_cisuz.jar
- db2jcc_license_cu.jar

8. Select the most appropriate Driver class.
9. Click the OK button to finish the data source configuration.
10. Continue on to configure your IBM DB2 connection (on page 1817).
How to Configure an IBM DB2 Connection

**Note:**
The support to create an IBM DB2 connection is available in the Enterprise edition only.

To configure a connection to an IBM DB2 server, follow these steps:

1. **Open the Preferences dialog box** *(on page 70)* and go to **Data Sources**.
2. Click the **New** button in the **Connections** panel.
   
The dialog box for configuring a database connection is displayed.

![Connection Configuration Dialog Box](image)

3. Enter a unique name for the connection.
4. Select an **IBM DB2** data source in the **Data Source** drop-down menu.
5. Enter the connection details.
   a. Enter the URL to the installed IBM DB2 engine.
   b. Enter the user name to access the IBM DB2 engine.
   c. Enter the password to access the IBM DB2 engine.
6. Click the **OK** button to finish the connection configuration.
7. To view your connection, go to the **Data Source Explorer view** *(on page 1809)* (if the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu) or switch to the **Database perspective** *(on page 2656)*.
IBM DB2 Contextual Menu Actions

General Contextual Menu Actions

For relational databases, the following general actions are available in the contextual menu of the Data Source Explorer view (on page 1809), depending on the node where it is invoked:

- **Refresh**
  
  Performs a refresh on the selected node.

- **Disconnect (available on Connection nodes)**
  
  Closes the current database connection. If a table is already open, you are warned to close it before proceeding.

- **Configure Database Sources (available on Connection nodes)**
  
  Opens the Data Sources preferences page (on page 74) where you can configure both data sources and connections.

- **Edit (available on Table nodes)**
  
  Opens the selected table in the Table Explorer view (on page 1811).

- **Export to XML (available on Table nodes)**
  
  Opens the Export Criteria dialog box (a thorough description of this dialog box can be found in the Import from Database (on page 1884) chapter).

Database-Specific Contextual Menu Actions

In addition to the general contextual menu actions in the Data Source Explorer view (on page 1809), the various nodes in IBM DB2 connections include the following additional contextual menu actions:

- **XML Schema Repository Level Nodes**

  - **Register**
    
    Opens a dialog box for adding a new schema file in the DB XML repository. In this dialog box, you enter a collection name and the necessary schema files. Schema dependencies management can be done by using the Add and Remove buttons.

- **Schema Level Nodes**

  - **Unregister**
    
    Removes the selected schema from the XML Schema Repository.

  - **View**
    
    Opens the selected schema in Oxygen XML Editor Eclipse plugin.
Microsoft SQL Server Database Connections

Oxygen XML Editor Eclipse plugin includes support for Microsoft SQL Server database connections. Oxygen XML Editor Eclipse plugin allows you to browse the structure of a SQL Server database in the Data Source Explorer view (on page 1809), open tables in the Table Explorer view (on page 1811), and perform various operations on the resources in the repository.

Configuring a Microsoft SQL Server Connection

To configure the support for a Microsoft SQL Server database, follow this procedure:

2. Configure MS SQL Server Data Source drivers (on page 1819).
3. Configure a MS SQL Server Connection (on page 1820).
4. To view your connection, go to the Data Source Explorer view (on page 1809) (if the view is not displayed, it can be opened by selecting it from the Window > Show View menu) or switch to the Database perspective (on page 2656).

How to Configure Microsoft SQL Server Data Source Drivers

Note:
Available in the Enterprise edition only.

To configure a data source for connecting to a Microsoft SQL server, follow these steps:

2. Open the Preferences dialog box (on page 70) and go to Data Sources.
3. Click the + New button in the Data Sources panel.

The dialog box for configuring a data source is opened.
4. Enter a unique name for the data source.
5. Select SQL Server in the driver Type drop-down menu.
6. Click the Add Files button and select the Microsoft SQL Server driver file that you downloaded. The SQL Server driver file is called sqljdbc.jar.
7. Select the most appropriate Driver class.
8. Click the OK button to finish the data source configuration.
9. Continue on to configure your Microsoft SQL Server connection (on page 1820).

How to Configure a Microsoft SQL Server Connection

**Note:**
The support to configure a Microsoft SQL Server connection is available in the Enterprise edition only.

To configure a connection to a Microsoft SQL Server, follow these steps:

1. Open the Preferences dialog box (on page 70) and go to Data Sources.
2. Click the + New button in the Connections panel.
   
The dialog box for configuring a database connection is displayed.
3. Enter a unique name for the connection.

4. Select the SQL Server data source in the Data Source drop-down menu.

5. Enter the connection details.

   a. Enter the URL of the SQL Server server.
      If you want to connect to the server using Windows integrated authentication, you must add ;integratedSecurity=true to the end of the URL. The URL will look like this:
      
      ```
      jdbc:sqlserver://localhost;instanceName=SQLEXPRESS;integratedSecurity=true;
      ```

      **Note:**
      For integrated authentication, leave the User and Password fields empty.

   b. Enter the user name for the connection to the SQL Server.

   c. Enter the password for the connection to the SQL Server.

6. Click the OK button to finish the connection configuration.

7. To view your connection, go to the Data Source Explorer view (on page 1809) (if the view is not displayed, it can be opened by selecting it from the Window > Show View menu) or switch to the Database perspective (on page 2656).
Microsoft SQL Server Contextual Menu Actions

General Contextual Menu Actions

For relational databases, the following general actions are available in the contextual menu of the Data Source Explorer view (on page 1809), depending on the node where it is invoked:

- **Refresh**
  Performs a refresh on the selected node.

- **Disconnect (available on Connection nodes)**
  Closes the current database connection. If a table is already open, you are warned to close it before proceeding.

- **Configure Database Sources (available on Connection nodes)**
  Opens the Data Sources preferences page (on page 74) where you can configure both data sources and connections.

- **Edit (available on Table nodes)**
  Opens the selected table in the Table Explorer view (on page 1811).

- **Export to XML (available on Table nodes)**
  Opens the Export Criteria dialog box (a thorough description of this dialog box can be found in the Import from Database (on page 1884) chapter).

Database-Specific Contextual Menu Actions

In addition to the general contextual menu actions in the Data Source Explorer view (on page 1809), the resource level nodes in Microsoft SQL Server connections include the following additional contextual menu action:

- **XML Schema Repository Level Nodes**
  - **Register**
    Opens a dialog box for adding a new schema file in the DB XML repository. In this dialog box, you enter a collection name and the necessary schema files. Schema dependencies management can be done by using the Add and Remove buttons.

- **Schema Level Nodes**
  - **Add**
    Adds a new schema to the XML Schema files.
  - **Unregister**
    Removes the selected schema from the XML Schema Repository.

- **View**
Opens the selected schema in Oxygen XML Editor Eclipse plugin.

Oracle Database Connections

The Oracle database is a common relational type of database system. Oxygen XML Editor Eclipse plugin comes with built-in support for the 11g version of the database system. The Oracle database also includes a Oracle XML DB component that adds native XML support. Oxygen XML Editor Eclipse plugin allows you to browse Oracle repositories in the Data Source Explorer view (on page 1809), open tables in the Table Explorer view (on page 1811), and perform various operations on the resources in the repository.

![Oracle Database Connection](image)

Figure 470. Oracle Database Connection

Related Information:

Using XQuery with Oracle XML DB

Configuring an Oracle 11g Database Connection

To configure the support for a Oracle 11g database, follow this procedure:

2. Configure Oracle 11g Data Source drivers (on page 1823).
3. Configure an Oracle 11g Connection (on page 1825).
4. To view your connection, go to the Data Source Explorer view (on page 1809) (if the view is not displayed, it can be opened by selecting it from the Window > Show View menu) or switch to the Database perspective (on page 2656).

How to Configure Oracle 11g Data Source Drivers

Note:

Available in the Enterprise edition only.
To configure a data source for connecting to an Oracle 11g server, follow these steps:

2. Open the Preferences dialog box (on page 70) and go to Data Sources.
3. Click the + New button in the Data Sources panel.

The dialog box for configuring a data source is opened.

**Figure 471. Data Source Drivers Configuration Dialog Box**

4. Enter a unique name for the data source.
5. Select Oracle in the driver Type drop-down menu.
6. Click the Add Files button and select the Oracle driver file that you downloaded.
   The Oracle driver file is called ojdbc5.jar.
7. Select the most appropriate Driver class.
8. Click the OK button to finish the data source configuration.
9. Continue on to configure your Oracle connection (on page 1825).
How to Configure an Oracle 11g Connection

Note:
Available in the Enterprise edition only.

To configure a connection to an Oracle 11g server, follow these steps:

1. Open the Preferences dialog box (on page 70) and go to Data Sources.
2. Click the + New button in the Connections panel.

The dialog box for configuring a database connection is displayed.

Figure 472. Connection Configuration Dialog Box

3. Enter a unique name for the connection.
4. Select the Oracle 11g data source in the Data Source drop-down menu.
5. Enter the connection details.
   a. Enter the URL of the Oracle server.
   b. Enter the user name for the connection to the Oracle server.
   c. Enter the password for the connection to the Oracle server.
6. Click the OK button to finish the connection configuration.
7. To view your connection, go to the Data Source Explorer view (on page 1809) (if the view is not displayed, it can be opened by selecting it from the Window > Show View menu) or switch to the Database perspective (on page 2656).
Oracle Database Contextual Menu Actions

General Contextual Menu Actions

For relational databases, the following general actions are available in the contextual menu of the Data Source Explorer view (on page 1809), depending on the node where it is invoked:

- **Refresh**
  Performs a refresh on the selected node.

- **Disconnect (available on Connection nodes)**
  Closes the current database connection. If a table is already open, you are warned to close it before proceeding.

- **Configure Database Sources (available on Connection nodes)**
  Opens the Data Sources preferences page (on page 74) where you can configure both data sources and connections.

- **Edit (available on Table nodes)**
  Opens the selected table in the Table Explorer view (on page 1811).

- **Export to XML (available on Table nodes)**
  Opens the Export Criteria dialog box (a thorough description of this dialog box can be found in the Import from Database (on page 1884) chapter).

Database-Specific Contextual Menu Actions

In addition to the general contextual menu actions in the Data Source Explorer view (on page 1809), the various nodes in Oracle database connections include the following additional contextual menu actions:

- **XML Schema Repository Level Nodes**

  - **Register**
    Opens a dialog box for adding a new schema file in the XML repository. To add an XML Schema, enter the schema URI and location on your file system. Local scope means that the schema is visible only to the user who registers it. Global scope means that the schema is public.

  **Note:**
  Registering a schema may involve dropping/creating types. Hence you need type-related privileges such as DROP TYPE, CREATE TYPE, and ALTER TYPE. You need privileges to delete and register the XML schemas involved in the registering process. You need all privileges on XMLType tables that conform to the registered schemas. For XMLType columns, the ALTER TABLE privilege is needed on corresponding tables. If there are...
schema-based XMLType tables or columns in other database schemas, you need privileges such as the following:

- CREATE ANY TABLE
- CREATE ANY INDEX
- SELECT ANY TABLE
- UPDATE ANY TABLE
- INSERT ANY TABLE
- DELETE ANY TABLE
- DROP ANY TABLE
- ALTER ANY TABLE
- DROP ANY INDEX

To avoid having to grant all these privileges to the schema owner, Oracle recommends that the registration be performed by a DBA if there are XML schema-based XMLType table or columns in other user database schemas.

**XML Repository Level Nodes**

- **Add container**
  Adds a new child container to the current one.

- **Add resource**
  Adds a new resource to the folder.

**Container Level Nodes**

- **Add container**
  Adds a new child container to the current one.

- **Add resource**
  Adds a new resource to the folder.

- **Delete**
  Deletes the current container.

- **Properties**
  Shows various properties of the current container.

**Resource Level Nodes**

- **Open**
  Opens the selected resource in the editor.

- **Open in System Application**
When you use this action, Oxygen XML Editor Eclipse plugin downloads the selected resource to a local temporary folder and opens the selected resource in the system application that is currently set as the default application associated with that type of resource. You can then edit the resource, save it, and when you switch the focus back to the Data Source Explorer view, Oxygen XML Editor Eclipse plugin will detect that there was a change and will ask if you want to upload the edited resource to the server.

**Rename**

Renames the current resource

**Move**

Moves the current resource to a new container (also available through drag and drop).

**Delete**

Deletes the current container.

**Copy location**

Allows you to copy (to the clipboard) an application-specific URL for the resource that can then be used for various actions, such as opening or transforming the resources.

**Properties**

Shows various properties of the current container.

**Compare**

Compares two selected resources.

### PostgreSQL Database Connections

Oxygen XML Editor Eclipse plugin includes support for PostgreSQL database connections. Oxygen XML Editor Eclipse plugin allows you to browse the structure of a PostgreSQL database in the Data Source Explorer view (on page 1809), open tables in the Table Explorer view (on page 1811), and perform various operations on the resources in the repository.
Configuring a PostgreSQL Database Connection

To configure the support for a PostgreSQL database, follow this procedure:

1. Go to [https://jdbc.postgresql.org/download/](https://jdbc.postgresql.org/download/) and download the PostgreSQL JDBC driver specific for your server version.
2. Configure PostgreSQL Data Source drivers (on page 1829).
3. Configure a PostgreSQL Connection (on page 1831).
4. To view your connection, go to the Data Source Explorer view (on page 1809) (if the view is not displayed, it can be opened by selecting it from the Window > Show View menu) or switch to the Database perspective (on page 2656).

How to Configure PostgreSQL Data Source Drivers

To configure a data source for connecting to a PostgreSQL server, follow these steps:

1. Go to [https://jdbc.postgresql.org/download/](https://jdbc.postgresql.org/download/) and download the PostgreSQL JDBC3 driver specific for your server version.
2. Open the Preferences dialog box (on page 70) and go to Data Sources.
3. Click the New button in the Data Sources panel.

The dialog box for configuring a data source is opened.
Figure 474. Data Source Drivers Configuration Dialog Box
4. Enter a unique name for the data source.
5. Select PostgreSQL in the driver Type drop-down list.
6. Click the Add Files button and select the PostgreSQL driver file that you downloaded.
7. Select the most appropriate Driver class.
8. Click the OK button to finish the data source configuration.
9. Continue to configure your PostgreSQL connection (on page 1831).

How to Configure a PostgreSQL Connection

To configure a connection to a PostgreSQL server, follow these steps:

1. Open the Preferences dialog box (on page 70) and go to Data Sources.
2. Click the New button in the Connections panel.

The dialog box for configuring a database connection is displayed.
3. Enter a unique name for the connection.
4. Select the PostgreSQL data source in the Data Source drop-down menu.
5. Enter the connection details.
   a. Enter the URL of the PostgreSQL server.
   b. Enter the user name for the connection to the PostgreSQL server.
   c. Enter the password for the connection to the PostgreSQL server.
6. Click the OK button to finish the connection configuration.
7. To view your connection, go to the Data Source Explorer view (on page 1809) (if the view is not displayed, it can be opened by selecting it from the Window > Show View menu) or switch to the Database perspective (on page 2656).

**PostgreSQL Contextual Menu Actions**

**General Contextual Menu Actions**

For relational databases, the following general actions are available in the contextual menu of the Data Source Explorer view (on page 1809), depending on the node where it is invoked:

- **Refresh**
  - Performs a refresh on the selected node.

- **Disconnect (available on Connection nodes)**
Closes the current database connection. If a table is already open, you are warned to close it before proceeding.

**Configure Database Sources (available on **Connection nodes**)**

Opens the **Data Sources preferences page (on page 74)** where you can configure both data sources and connections.

**Edit (available on **Table nodes**)**

Opens the selected table in the **Table Explorer view (on page 1811)**.

**Export to XML (available on **Table nodes**)**

Opens the **Export Criteria dialog box** (a thorough description of this dialog box can be found in the **Import from Database (on page 1884)** chapter).

**Database-Specific Contextual Menu Actions**

In addition to the general contextual menu actions in the **Data Source Explorer view (on page 1809)**, the resource level nodes in PostgreSQL connections include the following additional contextual menu action:

**Resource Level Nodes**

**Compare**

Compares two selected resources.

**eXist Database Connections**

**Attention:**

Oxygen XML Editor Eclipse plugin has been tested to work with the latest stable **eXist** version (version 6). It might work with previous **eXist** versions, but they have not been tested and cannot be guaranteed to be compatible.

Oxygen XML Editor Eclipse plugin includes support for **eXist** database connections. Oxygen XML Editor Eclipse plugin allows you to browse the structure of a **eXist** database in the **Data Source Explorer view (on page 1809)** and perform various operations on the resources in the repository.
Configuring an eXist Database Connection

There are two ways to configure the support for an eXist database:

- Use the dedicated Create eXist-db XML connection wizard.
- Use the Data Sources preferences page to manually configure your connection.

How to Configure an eXist Connection Using the Built-in Wizard

To configure a connection for an eXist database using the dedicated Create eXist-db XML connection wizard, follow these steps:

1. Open the Preferences dialog box (on page 70), go to Data Sources and click the Create eXist-db XML connection link.
2. Enter your connection details in the connection wizard and click OK.

Important:
To create an eXist connection using this wizard, Oxygen XML Editor Eclipse plugin expects the exist/webstart/exist.jnlp path to be accessible at the provided Host and Port.

Attention:
The connection details dialog box has a Libraries path where it will download JAR libraries from the eXist server. If you are using Oxygen XML Editor Eclipse plugin version 25.0 or older with eXist version 6.2.0 or newer and the final connection to the server does not work, you need
3. To view your connection, go to the Data Source Explorer view (on page 1809) (if the view is not displayed, it can be opened by selecting it from the Window > Show View menu) or switch to the Database perspective (on page 2656).

Attention:
Oxygen XML Editor Eclipse plugin has been tested to work with the latest stable eXist version (version 6). It might work with previous eXist versions, but they have not been tested and cannot be guaranteed to be compatible.

How to Configure an eXist Connection Manually

Attention:
For this manual procedure, you need to already have an eXist database server installed. Also, Oxygen XML Editor Eclipse plugin has been tested to work with the latest stable eXist version (version 6). It might work with previous eXist versions, but they have not been tested and cannot be guaranteed to be compatible.

Tip:
There is an easier way to configure an eXist database connection using a built-in wizard. For more information, see How to Configure an eXist Connection Using the Built-in Wizard (on page 1834).

Step 1: Configure eXist Data Source Drivers

Oxygen XML Editor Eclipse plugin supports eXist database server versions up to and including version 5.0. To configure a data source for an eXist database, follow these steps:

1. Open the Preferences dialog box (on page 70) and go to Data Sources.
2. Click the + New button in the Data Sources panel.
3. Enter a unique name for the data source.
4. Select eXist from the driver Type drop-down menu.
5. Click the Add Files button to add the eXist driver files. The following driver files should be added and they are found in the installation directory of the eXist database server. Make sure you copy the files from the installation of the eXist server where you want to connect from Oxygen XML Editor Eclipse plugin.
The `exist.jar` file located in the base directory (if present, depending on the server version).
- All JAR files in the `lib/core/` directory (if present) or all JAR files located in the `lib` directory except for the JAR libraries with the pattern `log4j-*.jar`, which may interfere with the logging in Oxygen XML Editor Eclipse plugin.

6. Click the OK button to finish the data source configuration.

**Step 2: Configure an eXist Connection**

To configure a connection to an eXist database, follow these steps:

1. Open the Preferences dialog box *(on page 70)* and go to Data Sources.
2. Click the + New button in the Connections panel.
3. Enter a unique name for the connection.
4. Select a previously configured eXist data source from the Data Source drop-down menu.
5. Enter the connection details:
   - Set the URI to the installed eXist engine in the XML DB URI field.
   - Set the user name in the User field.
   - Set the password in the Password field.
   - Enter the start collection in the Collection field.

   eXist organizes all documents in hierarchical collections. Collections are like directories. They are used to group related documents together. This text field allows the user to set the default collection name.

6. Click the OK button to finish the connection configuration.

7. To view your connection, go to the Data Source Explorer view *(on page 1809)* (if the view is not displayed, it can be opened by selecting it from the Window > Show View menu) or switch to the Database perspective *(on page 2656)*.

**Resources**

For more information about running XQuery against an eXist XML database, watch our video demonstration:

https://www.youtube.com/embed/Yoc5h1zSddA

**eXist Contextual Menu Actions**

While browsing eXist database connections in the Data Source Explorer view *(on page 1809)*, the various nodes include the following contextual menu actions:

- **Configure Database Sources**
  
  Opens the Data Sources preferences page *(on page 74)* where you can configure both data sources and connections.
Disconnect (when connected)
   Stops the connection.

C Refresh
   Performs a refresh on the selected node.

Container Level Nodes

New File
   Creates a new file on the connection, in the current folder.

New Collection
   Creates a new collection on the connection.

Import Folders
   Imports folders on the server.

Import Files
   Allows you to add a new file on the connection, in the current folder.

Export
   Allows you to export the folder on the remote connection to a local folder.

Cut
   Removes the current selection and places it in the clipboard.

Paste
   Pastes the copied selection.

C Refresh
   Performs a refresh on the selected node.

Properties
   Shows various properties of the current container.

Resource Level Nodes

Open
   Opens the selected resource in the editor.

Open in System Application
   When you use this action, Oxygen XML Editor Eclipse plugin downloads the selected resource to a local temporary folder and opens the selected resource in the system application that is currently set as the default application associated with that type of resource. You can then edit the resource, save it, and when you switch the focus back to the Data Source Explorer view, Oxygen XML Editor Eclipse
plugin will detect that there was a change and will ask if you want to upload the edited resource to the server.

**Save As**

Allows you to save the selected resource as a file on disk.

**Cut**

Removes the current selection and places it in the clipboard.

**Copy**

Copies the current selection into the clipboard.

**Copy location**

Allows you to copy (to the clipboard) an application-specific URL for the resource that can then be used for various actions, such as opening or transforming the resources.

**Rename**

Renames the current resource.

**Delete**

Deletes the current container.

**Refresh**

Performs a refresh on the selected node.

**Properties**

Shows various properties of the current container.

**Compare**

Compares two selected resources.

---

**MarkLogic Database Connections**

Oxygen XML Editor Eclipse plugin Enterprise edition includes support for MarkLogic database connections. Once you configure a MarkLogic connection *(on page 1840)*, you can use the Data Source Explorer view *(on page 1809)* to display all the application servers that are configured on the MarkLogic server. You can expand each application server and view all of its configured modules, and the Data Source Explorer view *(on page 1809)* allows you to open and edit these modules.

**Note:**

To browse modules located in a database, directory properties must be associated with them. These directory properties are generated automatically if the directory creation property of the database is set to automatic. If this property is set to manual or manual-enforced, add the directory properties of the modules manually, using the XQuery function `xdmp:directory-create()`. For example, for two
documents with the /code/modules/main.xqy and /code/modules/imports/import.xqy IDs, run the following query:

```
(xdmp:directory-create('/code/modules/'), xdmp:directory-create('/code/modules/imports/'))
```

For more information about directory properties, go to: http://blakeley.com/blogofile/2012/03/19/directory-assistance/.

MarkLogic and XQuery

MarkLogic connections can be used in conjunction with XQuery scripts to debug and solve problems with XQuery transformations. XQuery modules can also be validated using a MarkLogic server to allow you to spot possible issues without the need of actually executing the XQuery script.

When debugging XQuery files with MarkLogic (on page 1843), you can use the Data Source Explorer view (on page 1809) to open the files from the application server that is involved in the debugging process. By using the Data Source Explorer view (on page 1809), any imported modules are better identified by the MarkLogic server. You can also use step actions and breakpoints (on page 1845) in the modules to help identify problems.

Modules Container

For each Application server (for example: Bill (HTTP port:8060)), you have access to the XQuery modules that are visible to that server. When editing, executing, or debugging XQuery it is recommended to open the XQuery files from this Modules container.

Note:
You can also manage resources for a MarkLogic database through a WebDAV connection, although it is not recommended if you work with XQuery files since imported modules may not be resolved correctly.

Requests Container

Each MarkLogic application server includes a Requests container. In this container, Oxygen XML Editor Eclipse plugin displays both queries that are stopped for debugging purposes and queries that are still running. To clean up the entire Requests container at the end of your session, right-click it and use the Cancel all requests action (on page 1847).
Configuring a MarkLogic Database Connection

Note that this feature is available in Oxygen XML Editor Eclipse plugin Enterprise edition only.

Follow this procedure to configure the support for a MarkLogic database connection:

1. Download the MarkLogic driver from MarkLogic Community site.
2. Configure MarkLogic Data Source drivers (on page 1840).
3. Configure a MarkLogic Connection (on page 1841).
4. To view your connection, go to the Data Source Explorer view (on page 1809) (if the view is not displayed, it can be opened by selecting it from the Window > Show View menu) or switch to the Database perspective (on page 2656).

Related Information:
MarkLogic Development in Oxygen XML Editor Eclipse plugin (on page 1842)

How to Configure MarkLogic Data Source Drivers

Notes:
- Available in the Enterprise edition only.
- Oxygen XML Editor Eclipse plugin supports MarkLogic version 4.0 or later.

To configure a data source for MarkLogic, follow this procedure:

2. Unzip the downloaded archive.
3. Open the **Preferences** dialog box  *(on page 70)* and go to **Data Sources**.

4. Click the **New** button in the **Data Sources** panel.

5. Enter a unique name for the data source.

6. Select **MarkLogic** from the driver **Type** drop-down list.

7. Click the **Add Files** button and select the MarkLogic driver file from the **lib** folder of the archive that you downloaded and unzipped. The driver file name is `marklogic-xcc-{server_version}.jar`, where `{server_version}` is the MarkLogic server version.

8. Click the **OK** button to finish the data source configuration.

9. Continue on to **configure your MarkLogic Connection** *(on page 1841)*.

**How to Configure a MarkLogic Connection**

**Notes:**

- Available in the Enterprise edition only.
- Oxygen XML Editor Eclipse plugin supports MarkLogic version 4.0 or later.

To configure a connection to a MarkLogic database, follow these steps:

1. Open the **Preferences** dialog box  *(on page 70)* and go to **Data Sources**.

2. Click the **New** button in the **Connections** panel.

3. Enter a unique name for the connection.

4. Select a previously configured MarkLogic data source from the **Data Source** drop-down menu.

5. Enter the connection details.

   a. The host name or IP address of the installed MarkLogic engine in the **XDBC Host** field. Oxygen XML Editor Eclipse plugin uses XCC connector to interact with MarkLogic XDBC server and requires the basic authentication schema to be set. Starting with version MarkLogic 4.0 the default authentication method when you create an HTTP or WebDAV Server is **digest**, so make sure to change it to **basic**.

   b. Set the port number of the MarkLogic engine in the **Port** field. A MarkLogic XDBC application server must be configured on the server on this port. This XDBC server will be used to process XQuery expressions against the server. Later, if you want to change the XDBC server, instead of editing the configuration just use the **Use it to execute queries** action *(on page 1847)* from Data Source Explorer.

   c. Set the user name to access the MarkLogic engine in the **User** field.

   d. Set the password to access the MarkLogic engine in the **Password** field.
e. Optionally, in the WebDAV URL field, set the URL used for browsing the MarkLogic database in the Data Source Explorer view (on page 1809).

The Database field specifies the database that will have the XQuery expressions executed. If you set this option to default, the database associated to the application server of the configured port is used.

6. Click the OK button to finish the connection configuration.

7. To view your connection, go to the Data Source Explorer view (on page 1809) (if the view is not displayed, it can be opened by selecting it from the Window > Show View menu) or switch to the Database perspective (on page 2656).

**MarkLogic Development in Oxygen XML Editor Eclipse plugin**

The Oxygen XML Editor Eclipse plugin support for MarkLogic includes features designed for developers, such as debugging XQuery transformations, remote and collaborative debugging, XQuery editing and validation, and an XQuery builder (on page 789) that helps to improve productivity.

**Working with XQuery Files**

MarkLogic supports working with XQuery files to create queries over stored XML content. You can open an XQuery file, configure a transformation scenario to match your MarkLogic connection, write the XQuery, and then execute it.

When editing XQuery modules stored on the MarkLogic server, the Outline view (on page 787) collects and displays all the functions from all imported modules. The Content Completion Assistant (on page 2653) also presents all of these functions along with the latest built-in XQuery functions in accordance with the server version.

When developing queries for MarkLogic, it is best to open the resources from the Data Source Explorer view (on page 1809). When you execute or debug XQuery files opened from this view, imported modules can be resolved better by the MarkLogic server. Another advantage is that validation is automatically performed on the MarkLogic server, including any imported modules.

**XQuery Debugging**

Oxygen XML Editor Eclipse plugin allows you to use MarkLogic connections to debug real applications that use XQuery (for example, web applications that trigger XQuery executions). By setting the server in debug mode, you can intercept all the XQuery scripts that run on that server. Oxygen XML Editor Eclipse plugin connects to the MarkLogic server, shows you the running XQuery scripts, and allows you to debug them. The remote debugging support also allows you to debug collaboratively. Multiple users can participate in the same debugging session. You can start a debugging session and another user can continue it, and vice versa.

**Working with Modules**

MarkLogic has a concept of two types of XQuery modules, library and main modules. A library module is used to define functions. Library modules cannot be evaluated directly. They are imported, either from other library
modules or from main modules. A main module is used as an entry point that can be executed as an XQuery program. For more information on these types of modules, see XQuery Library Modules and Main Modules.

When working with library modules, you need to create a validation scenario and associate it with the module. In the validation scenario you need to specify a main module as the entry point for validation. The modules need to be deployed on a MarkLogic server because Oxygen XML Editor Eclipse plugin will request the server to validate the modules.

To validate library modules stored on a MarkLogic server, follow these steps:

1. Configure a MarkLogic database connection (on page 1840).
2. Expand the MarkLogic connection in the Data Source Explorer view (on page 1809) and open the library modules. The main module must also be opened from the Data Source Explorer view (on page 1809).
3. Configure a validation scenario (on page 556) for each library module. Specify the main module in the URL of the file to validate field.

Result: Validation is done on the server that contains the main module. The main module and all other library modules involved in the validation must be saved. Otherwise, the server will validate what was saved on the server, without the uncommitted changes. Also, the Content Completion Assistant (on page 2653) and the Outline view (on page 787) should now present the functions from all the modules.

Related Information:
Debugging with MarkLogic (on page 1843)
Configuring a MarkLogic Database Connection (on page 1840)

Debugging with MarkLogic

Oxygen XML Editor Eclipse plugin includes support for debugging XQuery transformations that are executed against a MarkLogic database.

To use a debugging session against the MarkLogic engine, follow these steps:

1. Configure a MarkLogic data source (on page 1840) and a MarkLogic connection (on page 1841).
2. Make sure that the debugging support is enabled in the MarkLogic server that Oxygen XML Editor Eclipse plugin accesses. On the server side, debugging must be activated in the XDBC server and in the Task Server section of the server control console (the switch debug allow). If the debugging is not activated, the MarkLogic server reports a DBG-TASKDEBUGALLOW error.

Note:
An XDBC application server must be running to connect to the MarkLogic server and this XDBC server will be used to process XQuery expressions against the server. You can change the XDBC application server that Oxygen XML Editor Eclipse plugin uses to process XQuery
expressions by selecting the Use it to execute queries action (on page 1847) from the contextual menu in the Data Source Explorer view (on page 1809).

3. Open the XQuery file and start the debugging process.
   ◦ If you want to debug an XQuery file stored on the MarkLogic server, it is recommended to use the Data Source Explorer view (on page 1809) and open the file from the application server that is involved in the debugging process. This improves the resolving of any imported modules.
   ◦ The MarkLogic XQuery debugger integrates seamlessly into the XQuery Debugger perspective (on page 236). If you have a MarkLogic validation scenario configured for the XQuery file, you can choose to debug the scenario (on page 1909) directly.
   ◦ Otherwise, switch to the XQuery Debugger perspective (on page 2656), open the XQuery file in the editor, and select the MarkLogic connection in the XQuery engine selector from the debug control toolbar (on page 1893).

For general information about how a debugging session is started and controlled, see the Working with the Debugger (on page 1909) section.

Note:
Before starting a debugging session, it is recommended that you link the MarkLogic connection with an Eclipse project. To do this, go to the Data Source Explorer view (on page 1809) and select Link to project in the contextual menu of the MarkLogic connection. The major benefit of linking a debugging session with a project is that you can add breakpoints (on page 1912) in the XQuery modules stored on the server. You are also able to access these modules from the Eclipse Project Explorer view and run debugging sessions from them.

In a MarkLogic debugging session, you can use step actions and breakpoints (on page 1912) to help identify problems. When you add a breakpoint (on page 1912) on a line where the debugger never stops, Oxygen XML Editor Eclipse plugin displays a warning message. These warnings are displayed for breakpoints you add either in the main XQuery (which you can open locally or from the server) or for breakpoints you add in any XQuery that is opened from the connection that participates in the debugging session. For more information, see Using Breakpoints for Debugging Queries that Import Modules with MarkLogic (on page 1845).

Remote Debugging with MarkLogic

Oxygen XML Editor Eclipse plugin allows you to debug remote applications that use XQuery (for example, web applications that trigger XQuery executions). Oxygen XML Editor Eclipse plugin connects to a MarkLogic server, shows you the running XQuery scripts and allows you to debug them. You can even pause the scripts so that you can start the debugging queries in the exact context of the application. You can also switch a server to debug mode to intercept all XQuery scripts.
Oxygen XML Editor Eclipse plugin also supports collaborative debugging. This feature allows multiple users to participate in the same debugging session. You can start a debugging session and at a certain point, another user can continue it.

**Important:**
When using the remote debugging feature, the HTTP and the XDBC servers involved in the debugging session must have the same module configuration.

**Resources**
For more information about the XQuery debugger for MarkLogic, watch our video demonstration:

https://www.youtube.com/embed/eQ4ThDZq1bk

**Related Information:**
MarkLogic Development in Oxygen XML Editor Eclipse plugin *(on page 1842)*
Configuring a MarkLogic Database Connection *(on page 1840)*

**Using Breakpoints for Debugging Queries that Import Modules with MarkLogic**

When debugging queries that imports modules stored in the database, it is recommended to place breakpoints *(on page 1912)* in the modules. When starting a new debugging session, make sure that the modules that you will debug are already opened in the editor. This is necessary so that the breakpoints in all the modules will be considered. Also, make sure that there are no other open modules that are not involved in the current debugging session.

To place breakpoints in the modules, use the following procedure:

1. In the Data Source Explorer view *(on page 1809)*, open all the modules from the Modules container of the XDBC application server *(on page 1841)* that performs the debugging.
2. Set breakpoints *(on page 1912)* in the module as needed.
3. Continue debugging *(on page 1909)* the query.

If you get a warning that the breakpoints failed to initialize, try the following solutions:

- Check the Breakpoints view *(on page 1897)* and make sure there are no older breakpoints (set on resources that are not part of the current debugging context).
- Make sure you open the modules from the context of the application server that does the debugging and place breakpoints there.
Peculiarities and Limitations of the MarkLogic Debugger

MarkLogic debugger has the following peculiarities and limitations:

- Debugging support is only available for MarkLogic server versions 4.0 or newer.
- For MarkLogic server versions 4.0 or newer, there are three XQuery syntaxes that are supported: ‘0.9-ml’ (inherited from MarkLogic 3.2), ‘1.0-ml’, and ‘1.0’.
- All declared variables are presented as strings. The Value column of the Variables view contains the expression from the variable declaration. It can be evaluated by copying the expression with the Copy value action from the contextual menu of the Variables view (on page 1907) and pasting it in the XWatch view (on page 1899).
- There is no support for output to source mapping (on page 1910).
- There is no support for showing the trace (on page 1904).
- You can only set breakpoints (on page 1897) in imported modules in one of the following cases:
  - When you open the module from the context of the application server involved in the debugging, using the Data Source Explorer view (on page 1809).
  - When the debugger automatically opens the modules in the Editor.
- No breakpoints (on page 1912) are set in modules from the same server that are not involved in the current debugging session.
- No support for profiling (on page 1913) when an XQuery transformation is executed in the debugger.

MarkLogic Contextual Menu Actions

While browsing MarkLogic connections in the Data Source Explorer view (on page 1809), the various nodes include the following contextual menu actions:

- **Connection Level Nodes**
  - Configure Database Sources
    - Opens the Data Sources preferences page (on page 74) where you can configure both data sources and connections.
  - Disconnect (when connected)
    - Stops the connection.
  - Link to Project
    - Links the connection to a project. This is helpful for MarkLogic debugging sessions (on page 1843).
  - Refresh
    - Performs a refresh on the selected node.
Container Level Nodes

Enable Debug Mode

Switches the server to a debugging mode. For more information, see MarkLogic debugging sessions (on page 1843).

Use it to Execute Queries

The server will be used to process XQuery expressions against it.

Refresh

Performs a refresh on the selected node.

Module or Folder Level Nodes

Export

Allows you to export the folder on the remote connection to a local folder.

Refresh

Performs a refresh on the selected node.

Requests Level Nodes

Refresh

Performs a refresh on the selected node.

Cancel all requests

Cancels all queries that are either running or stopped on the application server. You can use this action to clean up the entire Requests container at the end of your sessions.

Resource Level Nodes

Open

Opens the selected resource in the editor.

Open in System Application

When you use this action, Oxygen XML Editor Eclipse plugin downloads the selected resource to a local temporary folder and opens the selected resource in the system application that is currently set as the default application associated with that type of resource. You can then edit the resource, save it, and when you switch the focus back to the Data Source Explorer view, Oxygen XML Editor Eclipse plugin will detect that there was a change and will ask if you want to upload the edited resource to the server.

Copy location
Allows you to copy (to the clipboard) an application-specific URL for the resource that can then be used for various actions, such as opening or transforming the resources.

**Refresh**

Performs a refresh on the selected node.

**Compare**

Compares two selected resources.

## MySQL Database Connections

Oxygen XML Editor Eclipse plugin includes support for MySQL database connections. Oxygen XML Editor Eclipse plugin allows you to browse the structure of a SQL Server database in the Data Source Explorer view ([on page 1809](#)), open tables in the Table Explorer view ([on page 1811](#)), and perform various operations on the resources in the repository.

### Configuring a MySQL Database Connection

To configure the support for a MySQL database, follow this procedure:

1. Configure MySQL Data Source drivers ([on page 1848](#)).
2. Configure a MySQL Connection. ([on page 1849](#))
3. To view your connection, go to the Data Source Explorer view ([on page 1809](#)) (if the view is not displayed, it can be opened by selecting it from the Window > Show View menu) or switch to the Database perspective ([on page 2656](#)).

### How to Configure MySQL Data Source Drivers

To connect to a MySQL server, you need to create a generic JDBC type data source based on the MySQL JDBC driver available on the MySQL website.

To configure this data source, follow these steps:

1. Go to [https://www.oxygenxml.com/database_drivers.html](https://www.oxygenxml.com/database_drivers.html) and download the appropriate MySQL driver.
2. Open the Preferences dialog box ([on page 70](#)) and go to Data Sources.
3. Click the + New button in the Data Sources panel.

   The dialog box for configuring a data source is opened.
4. Enter a unique name for the data source.
5. Select Generic JDBC in the driver Type drop-down list.
6. Click the Add Files button and select the MySQL driver file that you downloaded.
   The driver file for the MySQL server is called mysql-com.jar.
7. Select the most appropriate Driver class.
8. Click the OK button to finish the data source configuration.
9. Continue on to configure your MySQL connection (on page 1849).

**How to Configure a MySQL Connection**

To configure a connection to a MySQL server, follow these steps:

1. Open the Preferences dialog box (on page 70) and go to Data Sources.
2. Click the + New button in the Connections panel.

   The dialog box for configuring a database connection is displayed.
3. Enter a unique name for the connection.
4. Select the MySQL data source in the Data Source drop-down list.
5. Enter the connection details.
   a. Enter the URL of the MySQL server.
   b. Enter the user name for the connection to the MySQL server.
   c. Enter the password for the connection to the MySQL server.
6. Click the OK button to finish the connection configuration.
7. To view your connection, go to the Data Source Explorer view (on page 1809) (if the view is not displayed, it can be opened by selecting it from the Window > Show View menu) or switch to the Database perspective (on page 2656).

Generic JDBC Database Connections

Oxygen XML Editor Eclipse plugin includes support for Generic JDBC database connections.

Configuring a Generic JDBC Database Connection

To configure the support for a generic JDBC database, follow this procedure:
1. Configure Generic JDBC Data Source drivers (on page 1851).
2. Configure a Generic JDBC Connection (on page 1851).
3. To view your connection, go to the Data Source Explorer view (on page 1809) (if the view is not displayed, it can be opened by selecting it from the Window > Show View menu) or switch to the Database perspective (on page 2656).

How to Configure Generic JDBC Data Source Drivers

Starting with version 17, Oxygen XML Editor Eclipse plugin comes bundled with Java 11, which does not provide built-in access to JDBC-ODBC data sources. To access such sources, you need to find an alternative JDBC-ODBC bridge or use a platform-independent distribution of Oxygen XML Editor Eclipse plugin along with a Java VM version 7 or 6.

To configure a generic JDBC data source, follow these steps:

1. Open the Preferences dialog box (on page 70) and go to Data Sources.
2. Click the + New button in the Data Sources panel.
3. Enter a unique name for the data source.
4. Select Generic JDBC in the driver Type drop-down list.
5. Add the driver file(s) using the Add Files button.
6. Select the most appropriate Driver class.
7. Click the OK button to finish the data source configuration.
8. Continue on to configure a generic JDBC connection (on page 1851).

How to Configure a Generic JDBC Connection

To configure a connection to a generic JDBC database, follow these steps:

1. Open the Preferences dialog box (on page 70) and go to Data Sources.
2. Click the + New button in the Connections panel.
3. Enter a unique name for the connection.
4. Select the Generic JDBC data source in the Data Source drop-down menu.
5. Enter the connection details.
   a. Enter the URL of the generic JDBC database, with the following format: jdbc: <subprotocol>:<subname>.
   b. Enter the user name for the connection to the generic JDBC database.
   c. Enter the password for the connection to the generic JDBC database.
6. Click the OK button to finish the connection configuration.
7. To view your connection, go to the Data Source Explorer view (on page 1809) (if the view is not displayed, it can be opened by selecting it from the Window > Show View menu) or switch to the Database perspective (on page 2656).

JDBC-ODBC Database Connections

Oxygen XML Editor Eclipse plugin includes support for JDBC-ODBC database connections.
How to Configure a JDBC-ODBC Connection

Starting with version 17, Oxygen XML Editor Eclipse plugin comes bundled with Java 11, which does not provide built-in access to JDBC-ODBC data sources. To access such sources, you need to find an alternative JDBC-ODBC bridge or use a platform-independent distribution of Oxygen XML Editor Eclipse plugin along with a Java VM version 7 or 6.

To configure a connection to an ODBC data source, follow these steps:

1. Open the Preferences dialog box (on page 70) and go to Data Sources.
2. Click the + New button in the Connections panel.

   The dialog box for configuring a database connection is displayed.

3. Enter a unique name for the connection.
4. Select JDBC-ODBC Bridge in the Data Source drop-down list.
5. Enter the connection details.
   a. Enter the URL of the ODBC source.
   b. Enter the user name of the ODBC source.
   c. Enter the password of the ODBC source.
6. Click the OK button to finish the connection configuration.
7. To view your connection, go to the Data Source Explorer view (on page 1809) (if the view is not displayed, it can be opened by selecting it from the Window > Show View menu) or switch to the Database perspective (on page 2656).

BaseX Database Connections

Oxygen XML Editor Eclipse plugin includes support for BaseX database connections using a WebDAV connection. BaseX is a light-weight XML database engine and XQuery processor. Oxygen XML Editor Eclipse plugin allows you to browse the structure of a BaseX database in the Data Source Explorer view (on page 1809) and perform XQuery executions.

How to Configure a BaseX Connection

To configure a BaseX connection, follow these steps:

1. First of all, make sure the BaseX HTTP Server is started. For details about starting the BaseX HTTP server, go to http://docs.basex.org/wiki/Startup#BaseX_HTTP_Server. The configuration file for the HTTP server is named .basex and is located in the BaseX installation directory. This file helps you to find out which port the HTTP server is using. The default port for BaseX WebDAV is 8984.
2. To ensure that everything is functioning, open a WebDAV URL inside a browser and check to see if it works. For example, the following URL retrieves a document from a database named TEST: http://localhost:8984/webdav/TEST/etc/factbook.xml.
3. Once you are sure that the BaseX WebDAV service is working, you can configure the WebDAV connection in Oxygen XML Editor Eclipse plugin as described in How to Configure a WebDAV Connection (on page 1857). The WebDAV URL should resemble this: http://{hostname}:{port}/webdav/. If the BaseX server is running on your own machine and it has the default configuration, the data required by the WebDAV connection is:
   - WebDAV URL: http://localhost:8984/webdav
   - User: admin
   - Password: admin
4. Once the WebDAV connection is created, to view your connection, go to the Data Source Explorer view (on page 1809) (if the view is not displayed, it can be opened by selecting it from the Window > Show View menu) or switch to the Database perspective (on page 2656).

BaseX Contextual Menu Actions

While browsing BaseX connections in the Data Source Explorer view (on page 1809), the various nodes include the following contextual menu actions:

- **Configure Database Sources**

  Opens the Data Sources preferences page (on page 74) where you can configure both data sources and connections.
Disconnect (when connected)
  Stops the connection.

New Folder
  Creates a new folder on the connection.

Import Files
  Allows you to add a new file on the connection, in the current folder.

Refresh
  Performs a refresh on the selected node.

Folder Level Nodes

New File
  Creates a new file on the connection, in the current folder.

New Folder
  Creates a new folder on the connection.

Import Folders
  Imports folders on the server.

Import Files
  Allows you to add a new file on the connection, in the current folder.

Export
  Allows you to export the folder on the remote connection to a local folder.

Cut
  Removes the current selection and places it in the clipboard.

Copy
  Copies the current selection into the clipboard.

Paste
  Pastes the copied selection.

Rename
  Renames the current resource

Delete
  Deletes the current container.

Refresh
  Performs a refresh on the selected node.

Resource Level Nodes
Open

Opens the selected resource in the editor.

Open in System Application

When you use this action, Oxygen XML Editor Eclipse plugin downloads the selected resource to a local temporary folder and opens the selected resource in the system application that is currently set as the default application associated with that type of resource. You can then edit the resource, save it, and when you switch the focus back to the Data Source Explorer view, Oxygen XML Editor Eclipse plugin will detect that there was a change and will ask if you want to upload the edited resource to the server.

Cut

Removes the current selection and places it in the clipboard.

Copy

Copies the current selection into the clipboard.

Copy location

Allows you to copy (to the clipboard) an application-specific URL for the resource that can then be used for various actions, such as opening or transforming the resources.

Rename

Renames the current resource.

Delete

Deletes the current container.

Refresh

Performs a refresh on the selected node.

Properties

Shows various properties of the current container.

Compare

Compares two selected resources.

Base X XQJ Connection

XQuery execution is possible in a BaseX connection through an XQJ connection.

Important:
The XQJ connector is only capable of running XQuery 1.0 scrips, therefore XQuery 3.0 and 3.1 scripts are not supported.
BaseX XQJ Data Source

First of all, create an XQJ data source as described in How to Configure an XQJ Data Source (on page 1856). The BaseX XQJ API-specific files that must be added in the configuration dialog box are xqj-api-1.0.jar, xqj2-0.1.0.jar and basex-xqj-1.2.3.jar (the version names of the JAR file may differ). These libraries can be downloaded from xqj.net/basex/basex-xqj-1.2.3.zip. As an alternative, you can also find the libraries in the BaseX installation directory, in the lib sub-directory.

BaseX XQJ Connection

The next step is to create an XQJ connection (on page 1857).

For a default BaseX configuration, the following connection details apply (you can modify them when necessary):

- **Port**: 1984
- **servername**: localhost
- **user**: admin
- **password**: admin

XQuery Execution

Now that the XQJ connection is configured, open the XQuery file you want to execute in Oxygen XML Editor Eclipse plugin and create an XQuery Transformation (on page 1272). In the Transformer drop-down menu, select the name of the XQJ connection you created. Apply the transformation scenario and the XQuery will be executed.

How to Configure an XQJ Data Source

Any transformer that offers an XQJ API implementation can be used when validating XQuery or transforming XML documents. An example of an XQuery engine that implements the XQJ API is Zorba.

1. If your XQJ Implementation is native, make sure the directory containing the native libraries of the engine is added to your system environment variables: to PATH - on Windows, to LD_LIBRARY_PATH - on Linux, or to DYLD_LIBRARY_PATH - on macOS. Restart Oxygen XML Editor Eclipse plugin after configuring the environment variables.
2. Open the Preferences dialog box (on page 70) and go to Data Sources.
3. Click the + New button in the Data Sources panel.
4. Enter a unique name for the data source.
5. Select XQuery API for Java (XQJ) in the Type combo box.
6. Click the Add button to add XQJ API-specific files.
   You can manage the driver files using the Add, Remove, Detect, and Stop buttons.
   Oxygen XML Editor Eclipse plugin detects any implementation of javax.xml.xquery.XQDataSource and presents it in Driver class field.
7. Select the most suited driver in the Driver class combo box.
8. Click the **OK** button to finish the data source configuration.

9. Continue on to configure the XQJ connection *(on page 1857).*

### How to Configure an XQJ Connection

The steps for configuring an XQJ connection are the following:

1. Open the **Preferences** dialog box *(on page 70)* and go to **Data Sources**.
2. Click the **+ New** button in the **Connections** panel.
3. Enter a unique name for the connection.
4. Select one of the previously configured XQJ data sources *(on page 1856)* in the **Data Source** combo box.
5. Fill-in the connection details.
   - The properties presented in the connection details table are automatically detected depending on the selected data source.
6. Click the **OK** button to finish the connection configuration.

### WebDAV Connections

Oxygen XML Editor Eclipse plugin includes support for WebDAV server connections. Oxygen XML Editor Eclipse plugin allows you to browse the structure of a WebDAV connection in the **Data Source Explorer** view *(on page 1809)* and perform various operations on the resources in the repository.

### How to Configure a WebDAV Connection

By default, Oxygen XML Editor Eclipse plugin contains built-in data source drivers for WebDAV connections. Based on this data source, you can create a WebDAV connection for browsing and editing data from a database that provides a WebDAV interface. The connection is available in the **Data Source Explorer** view *(on page 1809)*.

To configure a WebDAV connection, follow these steps:

1. Open the **Preferences** dialog box *(on page 70)* and go to **Data Sources**.
2. Click the **+ New** button in the **Connections** panel.
3. Enter a unique name for the connection.
4. Select one of the WebDAV data sources in the **Data Source** drop-down menu.
5. Enter the connection details:
   a. Set the URL to the WebDAV repository in the field **WebDAV URL**.
   b. Set the user name that is used to access the WebDAV repository in the **User** field.
   c. Set the password that is used to access the WebDAV repository in the **Password** field.
6. Click the **OK** button to finish the connection configuration.
7. To view your connection, go to the **Data Source Explorer** view *(on page 1809)* (if the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu) or switch to the **Database perspective** *(on page 2656).*
For more information about the WebDAV support in Oxygen XML Editor Eclipse plugin, watch our video demonstration:

https://www.youtube.com/embed/vDXO36CqbvM

WebDAV Contextual Menu Actions

While browsing WebDAV connections in the Data Source Explorer view (on page 1809), the various nodes include the following contextual menu actions:

Connection Level Nodes

_configure Database Sources

Opens the Data Sources preferences page (on page 74) where you can configure both data sources and connections.

Disconnect (when connected)

Stops the connection.

New Folder

Creates a new folder on the connection.

Import Files

Allows you to add a new file on the connection, in the current folder.

Refresh

Performs a refresh on the selected node.

Folder Level Nodes

New File

Creates a new file on the connection, in the current folder.

New Folder

Creates a new folder on the connection.

Import Folders

Imports folders on the server.

Import Files

Allows you to add a new file on the connection, in the current folder.

Export

Allows you to export the folder on the remote connection to a local folder.

Cut

Removes the current selection and places it in the clipboard.
Copy
Copes the current selection into the clipboard.

Paste
Pastes the copied selection.

Rename
Renames the current resource

Delete
deletes the current container.

Refresh
Performs a refresh on the selected node.

Resource Level Nodes

Open
Opens the selected resource in the editor.

Open in System Application
When you use this action, Oxygen XML Editor Eclipse plugin downloads the selected resource to a local temporary folder and opens the selected resource in the system application that is currently set as the default application associated with that type of resource. You can then edit the resource, save it, and when you switch the focus back to the Data Source Explorer view, Oxygen XML Editor Eclipse plugin will detect that there was a change and will ask if you want to upload the edited resource to the server.

Cut
Removes the current selection and places it in the clipboard.

Copy
Copies the current selection into the clipboard.

Copy location
Allows you to copy (to the clipboard) an application-specific URL for the resource that can then be used for various actions, such as opening or transforming the resources.

Rename
Renames the current resource

Delete
Deletes the current container.

Refresh
Performs a refresh on the selected node.

Properties

Shows various properties of the current container.

Compare

Compares two selected resources.

**SQL Execution Support**

The database support in Oxygen XML Editor Eclipse plugin includes support for writing SQL statements, syntax highlighting, *folding* (*on page 2655*), and dragging and dropping from the **Data Source Explorer view** (*on page 1809*). It also includes transformation scenarios for executing the statements, and the results are displayed in the **Table Explorer view** (*on page 1811*).

**Drag and Drop from Data Source Explorer View**

Dragging operations from the **Data Source Explorer view** (*on page 1809*) and dropping them in the SQL Editor allows you to create SQL statements quickly by inserting the names of tables and columns in the SQL statements.

1. Configure a database connection (see the specific procedure for your database server in the **Database Connection Support** (*on page 1813*) section).
2. Browse to the table you will use in your statement.
3. Drag the table or a column of the table into the editor where a SQL file is open.

Drag and drop actions are available both on the table and on its fields. A pop-up menu is displayed in the SQL editor.
4. Select the type of statement from the pop-up menu.

Depending on your choice, dragging a table results in one of the following statements being inserted into the document:

- SELECT `field1`, `field2`, ... FROM `catalog`.`table` (for example: `SELECT `DEPT`, `DEPTNAME`, `LOCATION` FROM `camera`.`cameraDesc`)
- UPDATE `catalog`.`table` SET `field1` =, `field2` =,... (for example: `UPDATE `camera`.`cameraDesc` SET `DEPT` =, `DEPTNAME` =, `LOCATION` =)
- INSERT INTO `catalog`.`table` (`field1`, `field2`, ....) VALUES (, , ) (for example: `INSERT INTO `camera`.`cameraDesc` (`DEPT`, `DEPTNAME`, `LOCATION`) VALUES (, , )
- DELETE FROM `catalog`.`table` (for example: `DELETE FROM `camera`.`cameraDesc`)

Depending on your choice, dragging a column results in one of the following statements being inserted into the document:

- SELECT `field` FROM `catalog`.`table` (for example: `SELECT `DEPT` FROM `camera`.`cameraDesc`)
- UPDATE `catalog`.`table` SET `field` = (for example: `UPDATE `camera`.`cameraDesc` SET `DEPT` =)
● `INSERT INTO `catalog`.`table` (`field1`) VALUES ()` (for example: `INSERT INTO `camera`.`cameraDesc` (`DEPT`) VALUES ()`)

● `DELETE FROM `catalog`.`table` (for example: `DELETE FROM `camera`.`cameraDesc` WHERE `DEPT`=`

### SQL Validation

SQL validation support is offered for IBM DB2. Note that if you choose a connection that does not support SQL validation, you will receive a warning when trying to validate. The SQL document is validated using the connection from the associated transformation scenario.

### Executing SQL Statements

The steps for executing an SQL statement on a relational database are as follows:

1. Configure a **transformation scenario** (on page 1167) using the Configure Transformation Scenario(s) action from the toolbar or the XML menu.

   A SQL transformation scenario needs a database connection. You can configure a connection using the Preferences button from the SQL transformation dialog box.

   The dialog box contains the list of existing scenarios that apply to SQL documents.

2. Set parameter values for SQL placeholders using the Parameters button from the SQL transformation dialog box.

   For example, in `SELECT * FROM `test`.`department` where DEPT = ? or DEPTNAME = ?` the two parameters can be configured for the placeholders (?) in the transformation scenario.

   When the SQL statement is executed, the first placeholder is replaced with the value set for the first parameter in the scenario, the second placeholder is replaced by the second parameter value, and so on.

   **Restriction:**

   When a stored procedure is called in an SQL statement executed on an SQL Server database, mixing inline parameter values with values specified using the Parameters button of the scenario dialog box is not recommended. This is due to a limitation of the SQL Server driver for Java applications. An example of stored procedure that is not recommended: `call dbo.Test(22, ?)`.

3. Execute the SQL scenario by clicking the **OK** or Apply associated button.

   The result of a SQL transformation is displayed in a view (on page 334) at the bottom of the Oxygen XML Editor Eclipse plugin window.

4. View more complex return values of the SQL transformation in a separate editor panel.

   A more complex value returned by the SQL query (for example, an XMLTYPE or CLOB value) cannot be displayed entirely in the result table.
a. Right-click the cell containing the complex value.

b. Select the action **Copy cell** from the contextual menu.

   The action copies the value in the clipboard.

c. Paste the value into an appropriate editor.

   For example, you can paste the value in an opened XQuery editor panel of Oxygen XML Editor Eclipse plugin.

### XQuery and Databases

XQuery is a native XML query language that is useful for querying XML views of relational data to create XML results. It also provides the mechanism to efficiently and easily extract information from Native XML Databases (NXD) and relational data. The following database systems supported in Oxygen XML Editor Eclipse plugin offer XQuery support:

- **Native XML Databases**:
  - eXist
  - MarkLogic (validation support available starting with version 5)

- **Relational Databases**:
  - IBM DB2
  - Microsoft SQL Server (validation support not available)
  - Oracle (validation support not available)

### Related information

*Editing XQuery Documents* (on page 783)

### Build Queries with Drag and Drop from the Data Source Explorer View

When a query is edited in the XQuery editor, the XPath expressions can be composed quickly by dragging them from the **Data Source Explorer** view (on page 1809) and dropping them into the editor panel.

1. Configure the data source drivers (on page 1813) for the particular relational database in the **Data Sources** preferences page (on page 74).

2. Configure the connection (on page 1813) for the particular relational database in the **Data Sources** preferences page (on page 74).

3. Browse the connection in the **Data Source Explorer** view (on page 1809), expanded to the table or column that you want to insert in the query.

4. Drag the table or column name to the XQuery editor panel.

5. Drop the table or column name where the XPath expression is needed.

An XPath expression that selects the dragged name is inserted in the XQuery document at the cursor position.
XQuery Validation When Connected to a Database

With Oxygen XML Editor Eclipse plugin, you can validate your XQuery documents when connected to a database. When you open an XQuery document from a connection that supports validation (for example, MarkLogic, or eXist), by default Oxygen XML Editor Eclipse plugin uses this connection for validation. If you open an XQuery file using a MarkLogic connection, the validation resolves imports better.

**Related Information:**
XQuery Validation *(on page 784)*

XQuery Transformation for Databases

XQuery is designed to retrieve and interpret XML data from any source, whether it is a database or document. Data is stored in relational databases but it is often required that the data be extracted and transformed as XML when interfacing to other components and services. Also, it is an XPath-based querying language supported by most NXD vendors. To perform a query, you need an XQuery transformation scenario.

1. **Configure the data source drivers and the connection** *(on page 1813)* for the particular database.
2. **Configure an XQuery transformation scenario.**
   a. Click the **Configure Transformation Scenario** toolbar button or go to menu **Document > Transformation > Configure Transformation Scenario**.
      
      The **Configure Transformation Scenario** dialog box *(on page 1284)* is opened.
   b. Click the **New** button toward the bottom of the dialog box.
   c. Select **XML Transformation with XQUERY** *(on page 1218)*.
      
      The **New Scenario** dialog box for configuring an XQuery scenario is opened.
d. Insert the scenario name in the dialog box for editing the scenario.

e. Choose the database connection in the Transformer drop-down list.

f. Configure any other parameters as needed.

For an XQuery transformation, the output tab has an option called Sequence that allows you to run an XQuery in lazy mode. The amount of data extracted from the database is controlled from the Size limit on Sequence view option (on page 203) in the XQuery preferences page. If you choose Perform FO Processing in the FO Processor tab, the Sequence option is ignored.

g. Click the OK button to finish editing the scenario.

Once the scenario is associated with the XQuery file, the query can include calls to specific XQuery functions that are implemented by that engine. The available functions depend on the target database engine selected in the scenario. For example, for eXist, the Content Completion Assistant (on page 2653) lists the functions supported by that database engine. This is useful for only inserting calls to the supported functions (standard XQuery functions or extension ones) into the query.

3. Run the transformation scenario.

To view a more complex value returned by the query that cannot be entirely displayed in the XQuery query result table at the bottom of the Oxygen XML Editor Eclipse plugin window (for example, an XMLTYPE or CLOB value), do the following:
Right-click that table cell.
Select the Copy cell action from the contextual menu to copy the value into the clipboard.
Paste the value wherever you need it (for example, in an open XQuery editor panel of Oxygen XML Editor Eclipse plugin).

### Related information
- XML Transformation with XQuery ([on page 1218](#))
- XQuery XQJ Transformation ([on page 1866](#))

### XQuery XQJ Transformation

XQuery API for Java (XQJ) refers to the common Java API for the XQuery 1.0 specification. The XQJ API enables you to execute XQuery against an XML data source.

**Important:**
The XQJ connector is only capable of running XQuery 1.0 scrips, therefore XQuery 3.0 and 3.1 scripts are not supported.

Oxygen XML Editor Eclipse plugin supports any transformer that offers an XQJ API implementation and it be used for validating XQuery or transforming XML documents.

To configure the support for XQJ, do the following:

1. Configure an XQJ Data Source ([on page 1856](#)).
2. Configure an XQJ Connection ([on page 1857](#)).
3. To view your connection, go to the Data Source Explorer view ([on page 1809](#)) (if the view is not displayed, it can be opened by selecting it from the Window > Show View menu) or switch to the Database perspective ([on page 2656](#)).

### How to Configure an XQJ Data Source

Any transformer that offers an XQJ API implementation can be used when validating XQuery or transforming XML documents. An example of an XQuery engine that implements the XQJ API is Zorba.

1. If your XQJ Implementation is native, make sure the directory containing the native libraries of the engine is added to your system environment variables: to **PATH** - on Windows, to **LD_LIBRARY_PATH** - on Linux, or to **DYLD_LIBRARY_PATH** - on macOS. Restart Oxygen XML Editor Eclipse plugin after configuring the environment variables.
2. Open the Preferences dialog box ([on page 70](#)) and go to Data Sources.
3. Click the + New button in the Data Sources panel.
4. Enter a unique name for the data source.
5. Select XQuery API for Java (XQJ) in the Type combo box.
6. Click the Add button to add XQJ API-specific files.
   You can manage the driver files using the Add, Remove, Detect, and Stop buttons.
Oxygen XML Editor Eclipse plugin detects any implementation of `javax.xml.xquery.XQDataSource` and presents it in **Driver class** field.

7. Select the most suited driver in the **Driver class** combo box.

8. Click the **OK** button to finish the data source configuration.

9. Continue on to **configure the XQJ connection (on page 1857)**.

### How to Configure an XQJ Connection

The steps for configuring an XQJ connection are the following:

1. Open the **Preferences** dialog box *(on page 70)* and go to **Data Sources**.
2. Click the + **New** button in the **Connections** panel.
3. Enter a unique name for the connection.
4. Select one of the previously configured **XQJ data sources (on page 1856)** in the **Data Source** combo box.
5. Fill-in the connection details.
   - The properties presented in the connection details table are automatically detected depending on the selected data source.
6. Click the **OK** button to finish the connection configuration.

### XQuery Database Debugging

Oxygen XML Editor Eclipse plugin includes a debugging interface that helps you to detect and solve problems with XQuery transformations that are executed against MarkLogic databases.

For more information about the debugging support in Oxygen XML Editor Eclipse plugin, see [Debugging XSLT Stylesheets and XQuery Documents (on page 1891)](#).

### Debugging with MarkLogic

Oxygen XML Editor Eclipse plugin includes support for debugging XQuery transformations that are executed against a MarkLogic database.

To use a debugging session against the MarkLogic engine, follow these steps:

1. Configure a **MarkLogic data source (on page 1840)** and a **MarkLogic connection (on page 1841)**.
2. Make sure that the debugging support is enabled in the MarkLogic server that Oxygen XML Editor Eclipse plugin accesses. On the server side, debugging must be activated in the XDBC server and in the **Task Server** section of the server control console (the switch `debug allow`). If the debugging is not activated, the MarkLogic server reports a **DBG-TASKDEBUGALLOW** error.

**Note:**

An XDBC application server must be running to connect to the MarkLogic server and this XDBC server will be used to process XQuery expressions against the server. You can change the XDBC application server that Oxygen XML Editor Eclipse plugin uses to process XQuery
expressions by selecting the **Use it to execute queries** action (on page 1847) from the contextual menu in the **Data Source Explorer** view (on page 1809).

3. Open the XQuery file and start the debugging process.

   ◦ If you want to debug an XQuery file stored on the MarkLogic server, it is recommended to use the **Data Source Explorer** view (on page 1809) and open the file from the application server that is involved in the debugging process. This improves the resolving of any imported modules.

   ◦ The MarkLogic XQuery debugger integrates seamlessly into the **XQuery Debugger perspective** (on page 236). If you have a MarkLogic validation scenario configured for the XQuery file, you can choose to **debug the scenario** (on page 1909) directly.

   ◦ Otherwise, switch to the **XQuery Debugger perspective** (on page 2656), open the XQuery file in the editor, and select the MarkLogic connection in the XQuery engine selector from the **debug control toolbar** (on page 1893).

For general information about how a debugging session is started and controlled, see the **Working with the Debugger** (on page 1909) section.

---

**Note:**

Before starting a debugging session, it is recommended that you link the MarkLogic connection with an Eclipse project. To do this, go to the **Data Source Explorer** view (on page 1809) and select **Link to project** in the contextual menu of the MarkLogic connection. The major benefit of linking a debugging session with a project is that you can **add breakpoints** (on page 1912) in the XQuery modules stored on the server. You are also able to access these modules from the Eclipse **Project Explorer** view and run debugging sessions from them.

In a MarkLogic debugging session, you can use step actions and **breakpoints** (on page 1912) to help identify problems. When you **add a breakpoint** (on page 1912) on a line where the debugger never stops, Oxygen XML Editor Eclipse plugin displays a warning message. These warnings are displayed for **breakpoints** you add either in the main XQuery (which you can open locally or from the server) or for **breakpoints** you add in any XQuery that is opened from the connection that participates in the debugging session. For more information, see **Using Breakpoints for Debugging Queries that Import Modules with MarkLogic** (on page 1845).

### Remote Debugging with MarkLogic

Oxygen XML Editor Eclipse plugin allows you to debug remote applications that use XQuery (for example, web applications that trigger XQuery executions). Oxygen XML Editor Eclipse plugin connects to a MarkLogic server, shows you the running XQuery scripts and allows you to debug them. You can even pause the scripts so that you can start the debugging queries in the exact context of the application. You can also switch a server to debug mode to intercept all XQuery scripts.
Oxygen XML Editor Eclipse plugin also supports collaborative debugging. This feature allows multiple users to participate in the same debugging session. You can start a debugging session and at a certain point, another user can continue it.

**Important:**
When using the remote debugging feature, the HTTP and the XDBC servers involved in the debugging session must have the same module configuration.

**Resources**

For more information about the XQuery debugger for MarkLogic, watch our video demonstration:

https://www.youtube.com/embed/eQ4ThDZq1bk

**Related Information:**
MarkLogic Development in Oxygen XML Editor Eclipse plugin (on page 1842)
Configuring a MarkLogic Database Connection (on page 1840)

**Using Breakpoints for Debugging Queries that Import Modules with MarkLogic**

When debugging queries that imports modules stored in the database, it is recommended to place breakpoints (on page 1912) in the modules. When starting a new debugging session, make sure that the modules that you will debug are already opened in the editor. This is necessary so that the breakpoints in all the modules will be considered. Also, make sure that there are no other open modules that are not involved in the current debugging session.

To place breakpoints in the modules, use the following procedure:

1. In the Data Source Explorer view (on page 1809), open all the modules from the Modules container of the XDBC application server (on page 1841) that performs the debugging.
2. Set breakpoints (on page 1912) in the module as needed.
3. Continue debugging (on page 1909) the query.

If you get a warning that the breakpoints failed to initialize, try the following solutions:

- Check the Breakpoints view (on page 1897) and make sure there are no older breakpoints (set on resources that are not part of the current debugging context).
- Make sure you open the modules from the context of the application server that does the debugging and place breakpoints there.
Peculiarities and Limitations of the MarkLogic Debugger

MarkLogic debugger has the following peculiarities and limitations:

• Debugging support is only available for MarkLogic server versions 4.0 or newer.
• For MarkLogic server versions 4.0 or newer, there are three XQuery syntaxes that are supported: '0.9-ml' (inherited from MarkLogic 3.2), '1.0-ml', and '1.0'.
• All declared variables are presented as strings. The Value column of the Variables view contains the expression from the variable declaration. It can be evaluated by copying the expression with the Copy value action from the contextual menu of the Variables view (on page 1907) and pasting it in the XWatch view (on page 1899).
• There is no support for output to source mapping (on page 1910).
• There is no support for showing the trace (on page 1904).
• You can only set breakpoints (on page 1897) in imported modules in one of the following cases:
  ◦ When you open the module from the context of the application server involved in the debugging, using the Data Source Explorer view (on page 1809).
  ◦ When the debugger automatically opens the modules in the Editor.
• No breakpoints (on page 1912) are set in modules from the same server that are not involved in the current debugging session.
• No support for profiling (on page 1913) when an XQuery transformation is executed in the debugger.

Integration with Microsoft SharePoint

Restriction:
The SharePoint integration is only available in the Enterprise edition of Oxygen XML Editor Eclipse plugin.

Oxygen XML Editor Eclipse plugin provides support for browsing and managing SharePoint connections in the Data Source Explorer view (on page 1809). You can easily create new resources on the repository, copy and move them using contextual actions or the drag and drop support, or edit and transform the documents in the editor.

There are two types of integrations that are possible:

• SharePoint Online - A new implementation that uses the SharePoint REST API v.2 and it supports OAuth credentials (access tokens). If you need authentication, you must use this type of integration.
• SharePoint - The older implementation that was implemented using SharePoint Web Services (now deprecated) and it does NOT support OAuth credentials (access tokens).
How to Configure a SharePoint Connection

By default, Oxygen XML Editor Eclipse plugin contains built-in data source drivers for SharePoint. Use this data source to create a connection to a SharePoint server that will be available in the Data Source Explorer view.

There are two types of possible SharePoint connections:

- **SharePoint Online** - A new implementation that uses the SharePoint REST API v.2 and it supports OAuth credentials (access tokens). If you need authentication, you must use this type of integration.
- **SharePoint** - The older implementation that was implemented using SharePoint Web Services (now deprecated) and it does NOT support OAuth credentials (access tokens).

**SharePoint Online Connection**

To configure a SharePoint connection, follow these steps:

1. Open the Preferences dialog box (on page 70), go to Data Sources. Select SharePoint Online in the Data Sources pane and in the Connections pane, click the + New button.
2. Enter a unique name for the connection.
3. Make sure SharePoint Online is selected in the Data Source combo box.
4. Enter the Tenant URL for your SharePoint repository and click OK.

**Note:**

If you are still logged in when you close Oxygen XML Editor Eclipse plugin, the authentication persists the next time the application is started. If, for some reason, the authentication fails to recover the
access token, an error is displayed in the Results pane at the bottom of the application. If this happens, you need to re-authenticate Oxygen XML Editor Eclipse plugin.

**SharePoint Connection (Older Version)**

To configure a SharePoint connection, follow these steps:

1. Open the Preferences dialog box *(on page 70)*, go to Data Sources. Select SharePoint Online in the Data Sources pane and in the Connections pane, click the + New button.
2. Enter a unique name for the connection.
3. Make sure SharePoint is selected in the Data Source combo box.
4. Fill-in the connection details:
   a. Enter the SharePoint URL for your SharePoint repository.
   b. Set the server domain in the Domain field. If you are using a SharePoint 365 account, leave this field empty.
   c. Set the user name to access the SharePoint repository in the User field.
   d. Set the password to access the SharePoint repository in the Password field.
5. Click OK.

**Troubleshooting SharePoint Online Connections**

**Allowed SharePoint Online Sites**

SharePoint Online sites supported by Oxygen XML Editor Eclipse plugin have the following syntax:

- https://tenant.SharePoint.com
- https://tenant.SharePoint.com/sites/siteName
- https://tenant.SharePoint.com/sites/siteName/subsiteName1/..../subsiteNameK
- https://tenant.SharePoint.com/teams/siteName
- https://tenant.SharePoint.com/teams/siteName/subsiteName1/..../subsiteNameK

**Authentication Workflow Problems**

Once you configure the SharePoint Online Connection *(on page 1871)* and use the Log in with Microsoft account action, the action will open the default browser for authentication. If this is the first time you access this SharePoint site, you will have to Grant Permissions to Oxygen XML Editor Eclipse plugin *(on page 1873)*.

If the authentication is successful, the browser should display the **Authentication complete** page:
Attention:
If you cannot get past the *This page isn't working* response while using *Google Chrome*, try using a different browser.

Once you go back to Oxygen XML Editor Eclipse plugin, in the *SharePoint Browser* you should see your username details and be able to browse the repository.

**Grant Permissions to Oxygen XML Editor Eclipse plugin**

When you first *Log in* and access your *SharePoint* server, you may need to grant *SharePoint Enterprise Application* permissions for the Oxygen XML Editor Eclipse plugin application to:

- View your basic profile.
- Maintain access to data you have given access to.
- Edit or delete items in all site collections.

The *Permissions requested* form will appear when you first authenticate to your *SharePoint* server from Oxygen XML Editor Eclipse plugin.

If you have administrative privileges, you are able to grant permissions directly from the form:
If you do not have admin rights to give Oxygen XML Editor Eclipse plugin permissions to access the SharePoint server, the Permissions requested form will suggest that you contact the administrator for your SharePoint account so that they can grant the permissions.

The SharePoint global administrator should log in to https://portal.azure.com/, navigate to Manage Azure Active Directory > Enterprise applications, and approve the request under the Admin consent requests category.
The administrator can also check the **User settings** category and configure the **Users can request admin consent to apps they are unable to consent to** options and policies.

More consent settings can be configured by the admin under the **User consent settings** category.

**SharePoint Contextual Menu Actions**

While browsing SharePoint connections in the **Data Source Explorer** view (on page 1809), the following contextual menu actions are available, depending on the type of node:

- **Connection Nodes**

  - **Configure Database Sources**

    Opens the **Data Sources preferences page** (on page 74) where you can configure both data sources and connections.
Log in with Microsoft Account (when not connected)

Opens the Microsoft login page in your default browser and authenticates Oxygen XML Editor Eclipse plugin.

Disconnect (when connected)

Stops the connection.

Refresh

Performs a refresh on the selected node.

Site Nodes / Sub-site Nodes

Copy location

Allows you to copy (to the clipboard) an application-specific URL for the resource that can then be used for various actions, such as opening or transforming the resources.

Refresh

Performs a refresh on the selected node.

Folder Level Nodes

New File

Creates a new file on the connection, in the current folder.

New Folder

Creates a new folder on the connection.

Import Folders

Imports folders on the server.

Import Files

Allows you to add a new file on the connection, in the current folder.

Rename

Renames the current resource

Delete

Deletes the current container.

Refresh

Performs a refresh on the selected node.

Resource Level Nodes

Open

Opens the selected resource in the editor.
Open in System Application

When you use this action, Oxygen XML Editor Eclipse plugin downloads the selected resource to a local temporary folder and opens the selected resource in the system application that is currently set as the default application associated with that type of resource. You can then edit the resource, save it, and when you switch the focus back to the Data Source Explorer view, Oxygen XML Editor Eclipse plugin will detect that there was a change and will ask if you want to upload the edited resource to the server.

Copy location

Allows you to copy (to the clipboard) an application-specific URL for the resource that can then be used for various actions, such as opening or transforming the resources.

Check Out

Checks out the selected document on the server.

Check In

Checks in the selected document on the server. This action opens the Check In dialog box. For SharePoint Online connections, you only have the option to enter a comment and click the Check In button to process it.

For SharePoint (older version), the following options are available:

- **Minor Version** - Increments the minor version of the file on the server.
- **Major Version** - Increments the major version of the file on the server.
- **Overwrite** - Overwrites the latest version of the file on the server.
- **Comment** - Allows you to add a comment for a file that you check in.

Discard Check Out

Discards the previous checkout operation, making the file available to other users.

⚠️ Important:

Due to some API restrictions, the Discard Checkout action may not work when SharePoint Online connections are made directly to a sub-site.

Rename

Renames the current resource

Delete

Deletes the current container.

Refresh

Performs a refresh on the selected node.
Compare

Compares two selected resources.
15. Importing Data

Computer systems and databases contain data in incompatible formats and exchanging data between these systems can be very time consuming. Converting the data to XML can greatly reduce the complexity and create data that can be read by various types of applications.

Oxygen XML Editor Eclipse plugin offers support for importing text files, MS Excel files, Database Data, and HTML files into XML documents. The XML documents can be further converted into other formats using the Transform features (on page 1167).

Import from Text Files

Oxygen XML Editor Eclipse plugin includes the possibility of importing text files (txt or csv file extensions) as XML documents.

To import a text file into an XML file, follow these steps:

1. Go to File > Import/Convert > Oxygen XML Editor Eclipse plugin > Text File to XML and click Next. A Select text file dialog box is displayed.
2. Select the URL of the text file (txt or csv file extensions).
3. Select the encoding of the text file.
4. Click the Next button.
   The Import from text file dialog box is displayed.
5. Configure the settings for the conversion.

a. Select the Field delimiter for the import settings. You can choose between the following: Comma, Semicolon, Tab, Space, or Pipe.

b. The Import settings section presents the input data in a tabular form. By default, all data items are converted to element content (<> symbol), but this can be overridden by clicking the individual column headers. Clicking a column header once causes the data from this column to be converted to attribute values (= symbol). Clicking a second time causes the column data to be ignored (× symbol) when generating the XML file. You can cycle through these three options by continuing to click the column header.

c. First row contains field names - If this option is selected, the default column headers are replaced (where such information is available) by the content of the first row. In other words, the
first row is interpreted as containing the field names. The changes are also visible in the preview panel.

d. **Customize** - This button opens a *Presentation Names* dialog box that allows you to edit the name, XML name, and conversion criterion for the root and row elements. The XML names can be edited by double-clicking the desired item and entering the label. The conversion criteria can also be modified by selecting one of the following options in the drop-down menu: **ELEMENT**, **ATTRIBUTE**, or **SKIPPED**.

e. **Import Settings** - Clicking this button opens the *Import preferences page* (on page 181) that allows you to configure more import options.

f. The **XML Import Preview** panel contains an example of what the generated XML document looks like.

g. **Save in file** - If selected, the new XML document is saved in the specified path.

6. Click **Finish** to generate the XML document.

**Import from MS Excel Files**

Oxygen XML Editor Eclipse plugin provides several methods for importing MS Excel files into an XML file. The first method is to use the Oxygen XML Editor Eclipse plugin **Smart Paste mechanism** (on page 388) by simply copying data from Excel and pasting it into a document in **Author** mode (note that this is only supported in DITA, DocBook, TEI, JATS, and XHTML documents). You can also copy data from Excel and paste it into inserted cells in **Grid** mode, but this is a more manual process. If you want to import an entire Excel file, Oxygen XML Editor Eclipse plugin also offers a configurable import wizard that works with any type of XML document.

**Smart Paste Method in Author Mode**

If you are importing data into DITA, DocBook, TEI, JATS, or XHTML documents, you can open the Excel spreadsheet in your office application, copy its content, and simply paste it into your document in **Author** mode.

The Oxygen XML Editor Eclipse plugin **Smart Paste mechanism** (on page 388) will convert the pasted content to the equivalent XML markup and considers various pasting solutions to keep the resulting document valid, while preserving the original text styling (such as bold, italics, underline) and formatting (such as lists, tables, paragraphs).

**Grid Mode Method**

The **Grid** mode in Oxygen XML Editor Eclipse plugin displays all content in an XML document as a structured grid of nested tables and you can work with the cells in those tables much like you would with any spreadsheet application. When importing Excel data into **Grid** mode, you first need to insert new cells in the particular nested table and then you can paste data from Excel the same as you would in any table or spreadsheet.

1. Copy the particular cells from your Excel spreadsheet that you want to import into an XML file.

2. Switch to **Grid** mode in Oxygen XML Editor Eclipse plugin.
3. Expand the particular nodes and locate the nested table where you want to insert the copied cells.
4. Right-click a particular row or column where you want to insert the data and select \(\text{Insert row}\) or \(\text{Insert column}\), depending on the structure of the copied cells.
5. Paste the copied cells from the clipboard into the newly inserted cells in Grid mode.
6. You may need to make some manual adjustments. For example, if the selection of copied cells contained an empty cell, Oxygen XML Editor Eclipse plugin might ignore that cell.

**Import Wizard Method**

To use the Import wizard to import an Excel file into an XML file, follow these steps:

1. Go to File > Import/Convert > Oxygen XML Editor Eclipse plugin > MS Excel file to XML.
2. Select the URL of the Excel file. The sheets of the document you are importing are presented in the Available Sheets section of this dialog box.
3. Click the Next button to proceed to the next stage of the wizard.
4. Configure the settings for the conversion. This stage of the wizard offers the following options:

Import settings section

Presents the input data in a tabular form. By default, all data items are converted to element content ( symbol), but this can be overridden by clicking the individual column headers. Clicking a column header once causes the data from this column to be converted to attribute values ( symbol). Clicking a second time causes the column data to be ignored ( symbol) when generating the XML file. You can cycle through these three options by continuing to click the column header.

First row contains field names
If this option is selected, the default column headers are replaced (where such information is available) by the content of the first row. In other words, the first row is interpreted as containing the field names. The changes are also visible in the preview panel.

**Customize**

This button opens a Presentation Names dialog box that allows you to edit the name, XML name, and conversion criterion for the root and row elements. The XML names can be edited by double-clicking the desired item and entering the label. The conversion criteria can also be modified by selecting one of the following option in the drop-down menu: ELEMENT, ATTRIBUTE, or SKIPPED.

**Import Settings**

Clicking this button opens the Import preferences page (on page 181) that allows you to configure more import options.

**Import formatted data (as displayed in Excel)**

If this option is selected, the imported data retains the Excel data formatting (such as the representation of numeric values or dates). If deselected, the data formatting is not imported.

**XML Import Preview panel**

Contains an example of what the generated XML document will look like.

**Save in file**

If selected, the new XML document is saved in the specified path.

5. Click Finish to generate the XML document.

**Resources**

For more information about exchanging data between Oxygen XML Editor Eclipse plugin and spreadsheet applications, watch our video demonstration:

https://www.youtube.com/embed/8VwsF58zLkU

**Related information**

Exporting XML Content to Excel (on page 364)

**Import Database Data as an XML Document**

To import the data from a relational database table as an XML document, follow these steps:

1. Go to File > Import/Convert > Oxygen / Database Data to XML and click Next to start the Import wizard.

This opens a Select database table dialog box that lists all the defined database connections:
2. Select the connection to the database that contains the appropriate data. Only connections configured in relational data sources can be used to import data.

3. If you want to edit, delete, or add a data source or connection, click the Configure Database Sources button. The Preferences/Data Sources option page is opened.

4. Click Connect.

5. In the list of sources, expand a schema and choose the required table.

6. Click the Next button. The Import Criteria dialog box is opened with a default query string in the SQL Query pane.
7. Configure the settings for the conversion.

   a. **SQL Preview** - If this button is pressed, the Import settings pane displays the labels that are used in the XML document and the first five lines from the database. By default, all data items are converted to element content (symbol), but this can be overridden by clicking the individual column headers. Clicking a column header once causes the data from this column to be converted to attribute values (symbol). Clicking a second time causes the column data to be ignored (symbol) when generating the XML file. You can cycle through these three options by continuing to click the column header.

   b. **Customize** - This button opens a Presentation Names dialog box that allows you to edit the name, XML name, and conversion criterion for the root and row elements. The XML names can
be edited by double-clicking the desired item and entering the label. The conversion criteria
can also be modified by selecting one of the following option in the drop-down menu: ELEMENT,
ATTRIBUTE, or SKIPPED.

c.  Import Settings - Clicking this button opens the Import preferences page (on page 181) that
allows you to configure more import options.

d.  The XML Import Preview panel contains an example of what the generated XML document
looks like.

e.  Save in file - If selected, the new XML document is saved in the specified path.

f.  Generate XML Schema - Allows you to specify the path of the generated XML Schema file.

8.  Click Finish to generate the XML document.

Import from HTML Files

Oxygen XML Editor Eclipse plugin offers two methods for importing HTML files into an XML document. The
first method is to simply copy data from an HTML document and paste it into a document in Author mode, but
this is only supported in DITA, DocBook, TEI, JATS, and XHTML documents. Oxygen XML Editor Eclipse plugin
also offers a configurable import wizard that works with any type of XML document.

Smart Paste Method

If you are importing data into DITA, DocBook, TEI, JATS, or XHTML documents, you can open the HTML
document in your web browser, copy its content, and paste it into your document in Author mode.

The Oxygen XML Editor Eclipse plugin Smart Paste mechanism (on page 388) will convert the pasted content
to the equivalent XML markup and considers various pasting solutions to keep the resulting document valid,
while preserving the original text styling (such as bold, italics, underline) and formatting (such as lists, tables,
paragraphs).

Import Wizard Method

To use the Import wizard to import from HTML files, follow these steps:

1.  Go to File > Import/Convert > Oxygen XML Editor Eclipse plugin > HTML File to XHTML. The Import
    HTML to XHTML wizard is displayed.
2.  Select a parent folder and file name for the resulting XHTML document.
3.  Enter the URL of the HTML document.
4.  Select the type of the resulting XHTML document:
    ◦  XHTML5
    ◦  XHTML 1.0 Transitional
    ◦  XHTML 1.0 Strict
5.  Click the Finish button.

Result: The resulting document is an XHTML file containing a DOCTYPE declaration that references the
XHTML DTD definition on the Web. The parsed content of the imported file is transformed to XHTML5, XHTML
Transitional, or XHTML Strict depending on the option you chose.
Import Content Dynamically

Along with the built-in support for various useful URL protocols (such as HTTP or FTP), Oxygen XML Editor Eclipse plugin also provides special support for a convert protocol that can be used to chain predefined processors to dynamically import content from various sources.

**Important:**
Starting with version 26, the dynamic conversion protocol is disabled by default. To enable it, you must set the `com.oxygenxml.enable.convert.url.protocol` system property to the value of `true`.

A dynamic conversion URL chains various processors that can be applied, in sequence, on a target resource and has the following general syntax:

```
convert:/processor=xslt;ss=urn:processors:excel2d.xsl/processor=excel!/urn:files:my.xls
```

The previous example first applies a processor (`excel`) on a target identified by the identifier (`urn:files:sample.xls`) and converts the Excel™ resource to XML. The second applied processor (`xslt`) applies an XSLT stylesheet identified using the identifier (`urn:processors:excel2d.xsl`) over the resulting content from the first applied processor. These identifiers are all mapped to real resources on disk via an XML catalog that is configured in the application, as in the following example:

```
<catalog xmlns="urn:oasis:names:tc:entity:xmlns:xml:catalog">
  <rewriteURI uriStartString="urn:files:" rewritePrefix="./resources/"/>
  <rewriteURI uriStartString="urn:processors:" rewritePrefix="./processors/"/>
</catalog>
```

The target resource part of the conversion URL must always follow the `!/` pattern. It can be any of the following:

- An absolute URL that points to a resource.
- An identifier that will be resolved to an actual resource via the XML Catalog (on page 2659) support in the application. In the example above, the `urn:files:sample.xls` target resource is resolved via the XML catalog.
- A relative location. This location can only be resolved to an actual resource URL when the application has enough information about the location where the URL is referenced.

For example, for a DITA map (on page 2654) with a `<topicref>` such as:

```
<topicref href="convert:/.../processor=excel!/resources/sample.xls"/>
```

the `resources/sample.xls` path will be resolved relative to the DITA map location.

This type of URL can be opened in the application by using the Open URL action from the File menu. It can also be referenced from existing XML resources via `xi:include` or as a topic reference from a DITA map.
A GitHub project that contains various dynamic conversion samples for producing DITA content from various sources (and then publishing it) can be found here: https://github.com/oxygenxml/dita-glass.

Conversion Processors

A set of predefined conversion processors is provided in Oxygen XML Editor Eclipse plugin. Each processor has its own parameters that can be set to control the behavior of the conversion process. All parameters that are resolved to resources are passed through the XML catalog mapping.

The following predefined conversion processors are included:

- **xslt Processor** - Converts an XML input using the Saxon EE XSLT processor. The \( ss \) parameter indicates the stylesheet resource to be loaded. All other specified parameters will be set as parameters to the XSLT transformation.

  ```
  convert:/processor=xslt;ss=urn:processors:convert.xsl;p1=v1!/urn:files:sample.xml
  ```

- **xquery Processor** - Converts an XML input using the Saxon EE XQuery processor. The \( ss \) parameter indicates the XQuery script to be loaded. All other specified parameters will be set as parameters to the XSLT transformation.

  ```
  convert:/processor=xquery;ss=urn:processors:convert.xquery;p1=v1!/urn:files:sample.xml
  ```

- **excel Processor** - Converts an Excel™ input to an XML format that can later be converted by other piped processors. It has a single parameter \( sn \), which indicates the name of the sheet that needs to be converted. If this parameter is missing, the XML will contain the combined content of all sheets included in the Excel™ document.

  ```
  convert:/processor=excel;sn=test!/urn:files:sample.xls
  ```

- **java Processor** - Converts an input to another format by applying a specific Java method. The \( jars \) parameter is a comma-separated list of JAR (on page 2655) libraries, or folders that libraries will be loaded from. The \( ccn \) parameter is the fully qualified name of the conversion class that will be instantiated. The conversion class needs to have a method with the following signature:

  ```java
  public void convert(String systemID, String originalSourceSystemID,
  InputStream is, OutputStream os, LinkedHashMap<String, String> properties)
  throws IOException
  ```

  ```
  convert:/processor=java;jars=libs;ccn=test.JavaToXML!/urn:files:java/WSEditorBase.java
  ```

- **js Processor** - Converts an input to another format by applying a JavaScript method. The \( js \) parameter indicates the script that will be used. The \( fn \) parameter is the name of the method that will be called from the script. The method must take a string as an argument and return a string. If any of the parameters are missing, an error is thrown and the conversion stops.

  ```
  convert:/processor=js;js=urn:processors:md.js;fn=convertExternal!/urn:files:sample.md
  ```

- **json Processor** - Converts a JSON input to XML. It has no parameters.

  ```
  convert:/processor=json!/urn:files:personal.json
  ```
• **xhtml Processor** - Converts HTML content to well-formed XHTML. It has no parameters.

```
convert:/processor=xhtml!/urn:files:test.html
```

• **wrap Processor** - Wraps content in a tag name making it well-formed XML. The `rn` parameter indicates the name of the root tag to use. By default, it is `wrapper`. The `encoding` parameter specifies the encoding that should be used to read the content. By default, it is `UTF8`. As an example, this processor can be used if you want to process a comma-separated values file with an XSLT stylesheet to produce XML content. The CSV file is first wrapped as well-formed XML, which is then processed with an `xslt` processor.

```
convert:/processor=wrap!/urn:files:test.csv
```

• **cache Processor** - Caches the converted content obtained from the original document to a temporary file. The cache will be used on subsequent uses of the same URL, thus increasing the speed for the application returning the converted content. If the original URL points to the local disk, the cache will be automatically invalidated when the original file content gets modified. Otherwise, if the original URL points to a remote resource, the cache will need to be invalidated by reloading (Reload (F5) from the toolbar) the URL content that is opened in the editor.

```
convert:/processor=cache/processor=xslt;….!/urn:files:test.csv
```

### Reverse Conversion Processors

All processors defined above can also be used for saving content back to the target resource if they are defined in the URL as reverse processors. Reverse processors are evaluated right to left. These reverse processors allow *round-tripping* content to and from the target resource.

As an example, the following URL converts HTML to DITA when the URL is opened using the `h2d.xsl` stylesheet and converts DITA to HTML when the content is saved in the application using the `d2h.xsl` stylesheet.

```
convert:/processor=xslt;ss=h2d.xsl/rprocessor=xslt;ss=d2h.xsl!/urn:files:sample.html
```

⚠️ **Important:**

If you are publishing a *DITA map* that has such conversion URL references inside, you need to edit the transformation scenario and set the value of the parameter `fix.external.refs.com.oxygenxml` to `true`. This will instruct Oxygen XML Editor Eclipse plugin to resolve such references during a special pre-processing stage. Depending on the conversion, you may also require additional libraries to be added using the Libraries button in the Advanced tab of the transformation scenario.

16.

Debugging XSLT Stylesheets and XQuery Documents

Oxygen XML Editor Eclipse plugin includes a powerful debugging interface that helps you to detect and solve problems with XSLT and XQuery transformations.

**XSLT Debugger Perspective**

The XSLT Debugger perspective (on page 2656) allows you to detect problems in an XSLT transformation by executing the process step by step. To switch the focus to this perspective, select Window > Open Perspective > Other > Oxygen XSLT Debugger.

**XQuery Debugger Perspective**

The XQuery Debugger perspective (on page 2656) allows you to detect problems in an XQuery transformation process by executing the process step by step in a controlled environment and inspecting the information provided in the special views. To switch the focus to this perspective, select Window > Open Perspective > Other > Oxygen XQuery Debugger.

**XSLT/XQuery Debugging Overview**

The XSLT Debugger and XQuery Debugger perspectives (on page 2656) allows you to test and debug XSLT 1.0 / 2.0 / 3.0 stylesheets and XQuery 1.0 / 3.0 documents including complex XPath 2.0 / 3.0 expressions. The interface presents simultaneous views of the source XML document, the XSLT/XQuery document and the result document. As you go step by step through the XSLT/XQuery document the corresponding output is generated step by step, and the corresponding position in the XML file is highlighted. At the same time, special views provide various types of debugging information and events useful to understand the transformation process.

The following set of features allow you to test and solve XSLT/XQuery problems:

- Support for XSLT 1.0 stylesheets (using Saxon 6.5.5 and Xalan XSLT engines), XSLT 2.0 / 3.0 stylesheets and XPath 2.0 / 3.0 expressions that are included in the stylesheets (using Saxon 12.3 XSLT engine) and XQuery 1.0 / 3.0 (using Saxon 12.3 XQuery engine).
- Stepping capabilities: step in, step over, step out, run, run to cursor, run to end, pause, stop.
- Output to source mapping between every line of output and the instruction element / source context that generated it.
- Breakpoints (on page 1912) on both source and XSLT/XQuery documents.
- Call stack on both source and XSLT/XQuery documents.
- Trace history on both source and XSLT/XQuery documents.
- Support for XPath expression evaluation during debugging.
- Step into imported/included stylesheets as well as included source entities.
• Available templates and hits count.
• Variables view.
• Dynamic output generation.

Resources
For even more information, watch our video demonstration:

https://www.youtube.com/embed/m9d8c4V-LJw

Debugger Layout
The XML and XSL files are displayed in **Text mode (on page 305)**. The other modes (**Author mode (on page 241)**, **Grid mode (on page 241)**) are available only in the **Editor perspective (on page 233)**.

The **XSLT/XQuery Debugger perspective (on page 2656)** contains the following components:

• **Source Document View (XML)** - Displays and allows the editing of XML files (documents).
• **XSLT/XQuery Document View (XSLT/XQuery)** - Displays and allows the editing of XSL files (stylesheets) or XQuery documents.
• **Output View** - Displays the output that results from inputting a document (XML) and a stylesheet (XSL) or XQuery document in the transformer. The transformation result is written dynamically while the transformation is processed (using the ➔ **Run button on the Control toolbar (on page 1895)**). Several actions are available in the contextual menu for this view, including **Find/Replace**, **Copy**, and **Format and Indent**. There are two types of output views: a text-based **Output** view (with XML syntax highlights) and **HTML** view.
• **Control Toolbar (on page 1893)** - Contains a variety of actions to help you configure and control the debugging process.
• **Information Views (on page 1896)** - The information views at the bottom of the editor display various types of information to help you understand the transformation process.

**Tip:**
The **Output** view and the various other information views are **dockable (on page 2653)** so that you can configure the workspace according to your preferences.
XML documents and XSL stylesheets or XQuery documents that were opened in the Editor perspective (on page 2656) are automatically sorted into the first two panes. When multiple files of each type are opened, the individual documents and stylesheets are separated using the familiar tab management system that you are used to in the Editor perspective. Selecting a tab brings the document or stylesheet into focus and enables editing without the need to go back to the Editor perspective.

During debugging, the current execution node is highlighted in both document (XML) and XSLT/XQuery views.

**Related Information:**
- Steps in a Typical Debugging Process (on page 1909)
- Identify the XSLT / XQuery Expression that Generated Particular Output (on page 1910)
- Supported Processors for XSLT / XQuery Debugging (on page 1918)
- Performance Profiling of XSLT Stylesheets and XQuery Documents (on page 1913)

**Control Toolbar**

The Control toolbar contains all the actions that you need to configure and control the debugging process. The following actions are described as they appear in the toolbar from left to right.

**Figure 491. Control Toolbar**

XML source selector
The current selection represents the source document used as input by the transformation engine. The selection list contains all open files (XML files being emphasized). This option allows you to use other file types also as source documents. In an XQuery debugging session this selection field can be set to the default value **NONE**, because usually XQuery documents do not require an input source.

**XSL / XQuery selector**

The current selection represents the stylesheet or XQuery document to be used by the transformation engine. The selection list contains all open files (XSLT / XQuery files being emphasized).

**Link with editor**

When selected, the XML and XSLT/XQuery selectors display the names of the files open in the central editor panels. This button is toggled off by default.

**Output selector**

The selection represents the output file specified in the associated transformation scenario. You can specify the path by using the text field, the ![Insert Editor Variables](on page 218) button, or the ![Browse](button).

**Configure parameters**

Opens a dialog box that allows you to configure the XSLT / XQuery parameters to be used by the transformation.

**Edit extensions**

Allows you to add and remove the Java classes and **JARS** (on page 2655) used as XSLT extensions.

**Turn on/off profiling**

Enables / Disables current transformation profiling.

**Enable XHTML output**

Enables the rendering of the output in the **HTML output view (on page 1892)** during the transformation process. For performance issues, disable XHTML output when working with very large files. Note that only XHTML conformant documents can be rendered by this view. To view the output result of other formats, such as HTML, save the **Text output** area to a file and use an external browser for viewing.

When starting a debug session from the **Editor perspective (on page 2656)** by using the **Debug Scenario** action, the state of this toolbar button reflects the state of the **Show as XHTML** output option from the scenario.

**Turn on/off output to source mapping**

Enables or disables the output to source mapping between every line of output and the instruction element / source context that generated it.
Debugger preferences

Quick link to Debugger preferences page (on page 201).

XSLT / XQuery engine selector

Lists the processors available for debugging XSLT and XQuery transformations (on page 1918).

XSLT / XQuery engine advanced options

If Saxon HE/PE/EE is selected, you can click this button to open the Advanced Saxon Transformation Options page (on page 1205).

Step into F7

Starts the debugging process and runs until the next instruction is encountered.

Step over F8 (Option + F8 on macOS)

Run until the current instruction and its sub-instructions are over. Usually this will advance to the next sibling instruction.

Step out Shift + F7 (Command + F8 on macOS)

Run until the parent of the current instruction is over. Usually this will advance to the next sibling of the parent instruction.

Run Shift + F5

Starts the debugging process. The execution of the process is paused when a breakpoint (on page 1897) is encountered or the transformation ends.

Run to cursor Ctrl + F5

Starts the debugging process and runs until one of the following conditions occur: the line of cursor is reached, a valid breakpoint (on page 1912) is reached or the execution ends.

Run to end Alt + F5

Runs the transformation until the end, without taking into account enabled breakpoints (on page 1912), if any.

Pause Shift + F6

Request to pause the current transformation as soon as possible.

Stop F6

Request to stop the current transformation without completing its execution.

Show current execution nodes

Reveals the current debugger context showing both the current instruction and the current node in the XML source. Possible displayed states:
- Entering (π) or leaving (π) an XML execution node.
- Entering (π) or leaving (π) an XSL execution node.
- Entering (π) or leaving (π) an XPath execution node.

**Note:**
When you set a MarkLogic server as a processor, the **Show current execution nodes** button is named **Refresh current session context from server**. Click this button to refresh the information in all the views.

**Note:**
For some XSLT processors (Saxon-HE/PE/EE), the debugger could be configured to step into the XPath expressions affecting the behavior of the following debugger actions: **Step into**, **Step over** or **Step Out**.

### Related Information:
[Advanced Saxon HE/PE/EE XQuery Transformation Options](on page 1222)

### Debugging Information Views

The information views at the bottom of the editor is comprised of two panes that are used to display various types of information used to understand the transformation process. For each information type there is a corresponding tab. While running a transformation, relevant events are displayed in the various information views. This enables the developer to obtain a clear view of the transformation progress. By using the debug controls, developers can easily isolate parts of stylesheet. Therefore, they may be more easily understood and modified.

The information types include the following:

**Left side information views**

- **Breakpoints** view ([on page 1897](page_1897))
- **XWatch** view ([on page 1899](page_1899))
- **Context** view ([on page 1898](page_1898))
- **Messages** view ([on page 1900](page_1900)) (XSLT only)
- **Variables** view ([on page 1907](page_1907))
- **Invocation Tree** view ([on page 1915](page_1915))

**Right side information views**

- **Stack** view ([on page 1901](page_1901))
- **Output Mapping Stack** view ([on page 1902](page_1902))
- **Trace** view ([on page 1904](page_1904))
• **Templates view** (on page 1905) (XSLT only)
• **Nodes/Values Set view** (on page 1906)
• **Hotspots view** (on page 1916)

**Tip:**
The information views are **dockable** (on page 2653) so that you can configure the workspace according to your preferences.

---

**Breakpoints View**

The **Breakpoints** view lists all **breakpoints** (on page 1912) that are set on open documents. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu. **Breakpoints can be inserted** (on page 1912) in the XML source document or the XSLT/XQuery document in debugging sessions.

Once you insert a **breakpoint**, it is automatically added to the list in the **Breakpoints** view and you can edit its associated **condition**. A **breakpoint** can have an associated break condition that represents an XPath expression evaluated in the current debugger context. For them to be processed, their evaluation result should be a boolean value. A **breakpoint** with an associated condition only stops the execution of the Debugger if the **breakpoint condition** is evaluated as **true**.

**Figure 492. Breakpoints View**

![Breakpoints View](image)

The **Breakpoints** view contains the following columns:

- **Enabled** - If selected, the current condition is evaluated and taken into account.
- **Resource** - Resource file and number of the line where the **breakpoint** is set.
- **Condition** - XSLT/XQuery expression to be evaluated during debugging. The expression will be evaluated at every debug step.

Clicking a record highlights the **breakpoint** line in the document.

**Note:**
The **breakpoints** list is not deleted at the end of a transformation (it is preserved between debugging sessions).
The following actions are available in the contextual menu of the table:

**Go to**

Moves the cursor to the source of the *breakpoint*.

**Run to Breakpoint**

Runs the debugger up to the point of this particular *breakpoint* and ignores the others (regardless of whether they were previously enabled or disabled).

**Enable**

Enables the *breakpoint*.

**Disable**

Disables the *breakpoint*. A disabled *breakpoint* will not be evaluated by the Debugger.

**Add**

Allows you to add a new *breakpoint* and *breakpoint condition*.

**Edit**

Allows you to edit an existing *breakpoint*.

**Remove**

Deletes the selected *breakpoint*.

**Enable all**

Enables all *breakpoints*.

**Disable all**

Disables all *breakpoints*.

**Remove all**

Removes all *breakpoints*.

**Related Information:**

Using Breakpoints *(on page 1912)*

**Context View**

The context node is valid only for XSLT debugging sessions and is a source node corresponding to the XSL expression that is evaluated. It is also called the context of execution. The context node implicitly changes as the processor hits various steps (at the point where XPath expressions are evaluated). This node has the same value as evaluating `.` (dot) XPath expression in XWatch view *(on page 1899)*. The value of the context node is presented as a tree in the Context view. If the view is not displayed, it can be opened by selecting it from the Window > Show View menu.
The context nodes are presented in a tree-like fashion. Nodes from a defined namespace bound to a prefix are displayed using the qualified name. If the namespace is not bound to a prefix, the namespace URI is presented before the node name. The value of the selected attribute or node is displayed in the right side panel. The **Context** view also presents the current mode of the XSLT processor if this mode differs from the default one.

**XPath Watch (XWatch) View**

The **XWatch** view shows XPath expressions evaluated during the debugging process. If the view is not displayed, it can be opened by selecting it from the Window > Show View menu.

Expressions are evaluated dynamically as the processor changes its source context. When you type an XPath expression in the **Expression** column, Oxygen XML Editor Eclipse plugin supports you with syntax highlight and content completion assistance (on page 660).

**Table 43. XWatch columns**

<table>
<thead>
<tr>
<th>Column</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Expression</td>
<td>XPath expression to be evaluated (XPath 1.0 or 2.0 / 3.0 compliant).</td>
</tr>
</tbody>
</table>
Table 43. XWatch columns (continued)

<table>
<thead>
<tr>
<th>Column</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Value</td>
<td>Result of XPath expression evaluation. Value has a type (see the possible values (on page 1907) in the Variables View (on page 1907)) section. For Node Set results, the number of nodes in the set is shown in parenthesis.</td>
</tr>
</tbody>
</table>

![Important:](image)

Notes about working with the XWatch view:

- Expressions that reference variable names are not evaluated.
- The expression list is not deleted at the end of the transformation (it is preserved between debugging sessions).
- To insert a new expression, click the first empty line of the Expression column and start typing.
- To delete an expression, click its Expression column and delete its content.
- If the expression result type is a Node Set, click it (Value column) and its value is displayed in the Nodes/Values Set view (on page 1906).

Messages View

Using an `xsl:message` instruction is one way to signal special situations encountered during transformation as well as a raw way of doing the debugging. The Messages view is available only for XSLT debugging sessions and shows all `xsl:message` calls executed by the XSLT processor during transformation. If the view is not displayed, it can be opened by selecting it from the Window > Show View menu.

![Figure 495. Messages View](image)

Table 44. Messages columns

<table>
<thead>
<tr>
<th>Column</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Message</td>
<td>Message content.</td>
</tr>
<tr>
<td>Terminate</td>
<td>Signals whether or not the processor terminates the transformation once it encounters the message (yes/no respectively).</td>
</tr>
</tbody>
</table>
Table 44. Messages columns (continued)

<table>
<thead>
<tr>
<th>Column</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Resource</td>
<td>Resource file where xsl:message instruction is defined and the message line number.</td>
</tr>
</tbody>
</table>

The following actions are available in the contextual menu:

**Go to**

Highlight the XSL fragment that generated the message.

**Copy**

Copies to clipboard message details (system ID, severity info, description, start location, terminate state).

**Clear all**

Removes all messages from the view.

**Important:**

- Clicking a record from the table highlights the xsl:message declaration line.
- Message table values can be sorted by clicking the corresponding column header. Clicking the column header switches the sorting order between: ascending, descending, no sort.

**Stack View**

The **Stack** view shows the current execution stack of both source and XSLT/XQuery nodes. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

During the transformation, two stacks are managed. One for source nodes being processed and the other for XSLT/XQuery nodes being processed. Oxygen XML Editor Eclipse plugin shows both node types in one common stack. The source (XML) nodes are preceded by a red color icon while XSLT/XQuery nodes are preceded by a green color icon. The advantage of this approach is that you can always see the source scope on which an XSLT/XQuery instruction is executed (the last red color node on the stack). The stack is oriented upside down.
The contextual menu contains one action: **Go to**, which moves the selection in the editor panel to the line containing the XSLT element that is displayed on the selected line from the view.

<table>
<thead>
<tr>
<th>Column</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Order number, represents the depth of the node (0 is the stack base).</td>
<td><strong>#</strong></td>
</tr>
<tr>
<td>Node from source or stylesheet document currently being processed. One particular stack node is the document root, noted as #document.</td>
<td><strong>XML/XSL/XQuery Node</strong></td>
</tr>
<tr>
<td>Attributes (a list of id=&quot;value&quot; pairs).</td>
<td><strong>Attributes</strong></td>
</tr>
<tr>
<td>Resource file where the node is located.</td>
<td><strong>Resource</strong></td>
</tr>
</tbody>
</table>

**Important:**

**Remarks:**

- Clicking a record from the stack highlights that node's location inside resource.
- Using Saxon, the stylesheet elements are qualified with XSL proxy, while using Xalan you only see their names. (example: `xsl:template` using Saxon and `template` using Xalan).
- Only the Saxon processor shows element attributes.
- The Xalan processor shows also the built-in rules.

**Output Mapping Stack View**

The **Output Mapping Stack** view displays context data ([on page 1910](#)) and presents the XSLT templates/XQuery elements that generated specific areas of the output. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.
Figure 497. Output Mapping Stack view

![Output Mapping Stack view](image)

The **Go to** action of the contextual menu takes you to the line that contains the XSLT element displayed in the **Output Mapping Stack** view.

**Table 46. Output Mapping Stack Columns**

<table>
<thead>
<tr>
<th>Column</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>#</td>
<td>The order number in the stack of XSLT templates/XQuery elements. Number 0 corresponds to the bottom of the stack in the status of the XSLT/XQuery processor. The highest number corresponds to the top of the stack.</td>
</tr>
<tr>
<td>XSL/XQuery Node</td>
<td>The name of an XSLT template/XQuery element that participated in the generation of the selected output area.</td>
</tr>
<tr>
<td>Attributes</td>
<td>The attributes of the XSLT template/XQuery.</td>
</tr>
<tr>
<td>Resource</td>
<td>The name of the file containing the XSLT template/XQuery element.</td>
</tr>
</tbody>
</table>

**Important:**

- Clicking a record highlights that XSLT template definition/XQuery element inside the resource (XSLT stylesheet file/XQuery file).
- Saxon only shows the applied XSLT templates having at least one hit from the processor. Xalan shows all defined XSLT templates, with or without hits.
- The table can be sorted by clicking the corresponding column header. When clicking a column header the sorting order switches between: ascending, descending, no sort.
- Xalan shows also the built-in XSLT rules.
Trace View

Usually, the XSLT/XQuery processors signal the following events during transformation:

- → - Entering a source (XML) node.
- ← - Leaving a source (XML) node.
- → - Entering an XSLT/XQuery node.
- ← - Leaving an XSLT/XQuery node.

The Trace view catches all of these events, so you can see how the process evolved. If the view is not displayed, it can be opened by selecting it from the Window > Show View menu.

The red icon lines denote source nodes while the green icon lines denote XSLT/XQuery nodes. It is possible to save the element trace in a structured XML document (using the Export to XML action in the contextual menu). Thus, you have the possibility of comparing the trace results from multiple debug sessions.

The contextual menu contains the following actions:

**Go to**

Moves the selection in the editor panel to the line containing the XSLT element or XML element that is displayed on the selected line from the view;

**Export to XML**

Saves the entire trace list in XML format.
Table 47. Trace History Columns

<table>
<thead>
<tr>
<th>Column</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Depth</td>
<td>Shows you how deep the node is nested in the XML or stylesheet structure. The bigger the number, the more nested the node is. A depth 0 node is the document root.</td>
</tr>
<tr>
<td>XML/XSLT/XQuery Node</td>
<td>Represents the node from the processed source or stylesheet document. One particular node is the document root, noted as #document. Every node is preceded by an arrow that represents what action was performed on it (entering or leaving the node).</td>
</tr>
<tr>
<td>Attributes</td>
<td>Attributes of the node (a list of id=&quot;value&quot; pairs).</td>
</tr>
<tr>
<td>Resource</td>
<td>Resource file where the node is located.</td>
</tr>
</tbody>
</table>

**Important:**

Remarks:

- Clicking a record highlights that node's location inside the resource.
- Only the Saxon processor shows the element attributes.
- The Xalan processor shows also the built-in rules.

**Templates View**

The **xsl:template** is the basic element for stylesheets transformation. The **Templates** view is only available during XSLT debugging sessions and shows all **xsl:template** instructions used by the transformation. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

Being able to see the number of **hits** for each of the templates allows you to get an idea of the stylesheet coverage by template rules with respect to the input source.

**Figure 499. Templates view**

The contextual menu contains one action: **Go to**, which moves the selection in the editor panel to the line that contains the XSLT template displayed on the selected line from the view.
Table 48. Templates columns

<table>
<thead>
<tr>
<th>Column</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Match</td>
<td>The <em>match</em> attribute of the <em>xsl:template</em>.</td>
</tr>
<tr>
<td>Hits</td>
<td>The number of hits for the <em>xsl:template</em>. Shows how many times the XSLT processor used this particular template.</td>
</tr>
<tr>
<td>Priority</td>
<td>The template priority as established by XSLT processor.</td>
</tr>
<tr>
<td>Mode</td>
<td>The <em>mode</em> attribute of the <em>xsl:template</em>.</td>
</tr>
<tr>
<td>Name</td>
<td>The <em>name</em> attribute of the <em>xsl:template</em>.</td>
</tr>
<tr>
<td>Resource</td>
<td>The resource file where the template is located.</td>
</tr>
</tbody>
</table>

**Important:**

**Remarks:**

- Clicking a record highlights that template definition inside the resource.
- Saxon only shows the applied templates having at least one hit from the processor. Xalan shows all defined templates, with or without hits.
- Template table values can be sorted by clicking the corresponding column header. When clicking a column header the sorting order switches between: ascending, descending, no sort.
- Xalan shows also the built-in rules.

**Nodes/Values Set View**

The Nodes/Values Set view is always used in relation with the Variables view (on page 1907) and XWatch view (on page 1899). If the view is not displayed, it can be opened by selecting it from the Window > Show View menu. It shows an XSLT node set value in a tree form. This view is updated as a response to the following events:

- You click a variable that has a node set value in the Variables (on page 1907) or XWatch view (on page 1899).
- You click a tree fragment in the Variables (on page 1907) or XWatch view (on page 1899).
- You click an XPath expression evaluated to a node set in the Variables (on page 1907) or XWatch view (on page 1899).
The nodes / values set is presented in a tree-like fashion. Nodes from a defined namespace bound to a prefix are displayed using the qualified name. If the namespace is not bound to a prefix, the namespace URI is presented before the node name. The value of the selected attribute or node is displayed in the right side panel.

**Important:**

**Remarks:**

- For longer values in the right side panel, the interface displays it with an ellipsis (...) at the end. A more detailed value is available as a tooltip when hovering over it.
- Clicking a record highlights the location of that node in the source or stylesheet view.

**Variables View**

The **Variables** view displays variables and parameters (local and global), along with their values. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

Variables and parameters play an important role during an XSLT/XQuery transformation. Oxygen XML Editor Eclipse plugin uses the following icons to differentiate variables and parameters:

- **V** - Global variable.
- **{V}** - Local variable.
- **P** - Global parameter.
- **{P}** - Local parameter.

The following value types are available:

- **Boolean**
- **String**
- **Date** - XSLT 2.0 / 3.0 only.
- **Number**
- **Set**
- **Object**
- **Fragment** - Tree fragment.
- **Any**
- **Undefined** - The value was not yet set, or it is not accessible.

**Note:**

When Saxon 6.5 is used, if the value is unavailable, then the following message is displayed in the **Value** field: "The variable value is unavailable".

When Saxon 9 is used:

- If the variable is not used, the **Value** field displays "The variable is declared but never used".
- If the variable value cannot be evaluated, the **Value** field displays "The variable value is unavailable".

- **Document**
- **Element**
- **Attribute**
- **ProcessingInstruction**
- **Comment**
- **Text**
- **Namespace**
- **Evaluating** - Value under evaluation.
- **Not Known** - Unknown types.

**Figure 501. Variables View**

![Variables View](image)

**Table 49. Variables Columns**

<table>
<thead>
<tr>
<th>Column</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of variable/parameter.</td>
</tr>
<tr>
<td>Value Type</td>
<td>Type of variable/parameter.</td>
</tr>
</tbody>
</table>
Table 49. Variables Columns (continued)

<table>
<thead>
<tr>
<th>Column</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Value</td>
<td>Current value of variable / parameter.</td>
</tr>
</tbody>
</table>

The value of a variable (the Value column) can be copied to the clipboard for pasting it to other editor areas with the Copy value action from the contextual menu. This is useful if you have long and complex values that cannot be easily remembered just by looking at them once.

### Important:

Remarks:

- Local variables and parameters are the first entries presented in the table.
- Clicking a record highlights the variable definition line.
- Variable values could differ depending on the transformation engine used or stylesheet version set.
- If the value of the variable is a node set or a tree fragment, clicking it causes the Node Set view (on page 1906) to be shown with the corresponding set of values.
- Variable table values can be sorted by clicking the corresponding column header. Clicking the column header switches between the orders: ascending, descending, no sort.

### Multiple Output Documents in XSLT 2.0 and XSLT 3.0

For XSLT 2.0 and XSLT 3.0 stylesheets that store the output in multiple files by using the `xsl:result-document` instruction, the content of the file created in this way is displayed in an output view after the transformation is finished. There is one tab for each `xsl:result-document` instruction in the Result Documents view so that the output is not mixed while still being presented in multiple views.

### Steps in a Typical Debugging Process

Depending on your situation and needs, the debugging process might be more complex, but the following procedure is an example of a typical debugging process:

1. Open the source XML document and the XSLT/XQuery document.
2. If you are in the Editor perspective (on page 2656), switch to the XSLT Debugger or XQuery Debugger perspective (on page 2656) with one of the following actions:
   - Select Window > Open Perspective > Other > Oxygen XSLT Debugger/XQuery Debugger.
   - Select the Debug scenario action on the toolbar. This action initializes the Debugger perspective (on page 2656) with the parameters of the transformation scenario. Any modification applied to the scenario parameters (the transformer engine, XSLT parameters, transformer extensions, etc.) will be saved back in the scenario when exiting from the Debugger perspective.
3. Select the source XML document in the **XML source selector of the Control toolbar (on page 1893)**. In the case of XQuery debugging, if your XQuery document has no implicit source, set the source selector value to **NONE**.

4. Select the XSLT/XQuery document in the **XSL/XQuery selector of the Control toolbar (on page 1894)**.

5. Set XSLT/XQuery parameters using the **Configure parameters** button on the Control toolbar (on page 1894).

6. Set one or more breakpoints (on page 1912).

7. Step through the stylesheet using the **following buttons available on the Control toolbar (on page 1895)**:
   - Step into
   - Step over
   - Step out
   - Run
   - Run to cursor
   - Run to end
   - Pause
   - Stop

8. Examine the data in the information views to find the bug in the transformation process.

For more information about fixing bugs in the transformation, see: **Identify the XSLT / XQuery Expression that Generated Particular Output (on page 1910)**.

**Related Information:**

Identify the XSLT / XQuery Expression that Generated Particular Output (on page 1910)

---

**Identify the XSLT / XQuery Expression that Generated Particular Output**

To quickly spot the XSLT templates or XQuery expressions with problems, it is important to know what XSLT template in the XSLT stylesheet (or XQuery expression in the XQuery document) and what element in the source XML document generated a specified area in the output.

Some of the debugging capabilities (for example, **Step in**) can be used for this purpose. Using **Step in**, you can see how output is generated and link it with the XSLT/XQuery element being executed in the current source context. However, this can become difficult on complex XSLT stylesheets or XQuery documents that generate a large output.

You can click particular text in the **Output** view and the editor will select the XML source context and the XSLT template/XQuery element that generated that text. Also, inspecting the whole stack of XSLT templates/XQuery elements that determined the state of the XSLT/XQuery processor at the moment of generating the specified output area speeds up the debugging process.

This is an example of a typical procedure for identifying an expression that generated particular output:
1. Switch to the XSLT Debugger or XQuery Debugger perspective (on page 2656) with one of the following actions:
   ◦ Select **Window > Open Perspective > Other > Oxygen XSLT Debugger/XQuery Debugger**.
   ◦ Select the Debug scenario action on the toolbar. This action initializes the Debugger perspective (on page 2656) with the parameters of the transformation scenario. Any modification applied to the scenario parameters (the transformer engine, XSLT parameters, transformer extensions, etc.) will be saved back in the scenario when exiting from the Debugger perspective.

2. Select the source XML document in the XML source selector of the Control toolbar (on page 1893). In the case of XQuery debugging, if your XQuery document has no implicit source, set the source selector value to NONE.

3. Select the XSLT/XQuery document in the XSL/XQuery selector of the Control toolbar (on page 1894).

4. Select the appropriate engine in the XSLT/XQuery engine selector of the Control toolbar (on page 1895).

5. Set XSLT/XQuery parameters using the Configure parameters button on the Control toolbar (on page 1894).

6. Apply the XSLT stylesheet or XQuery transformation using the Run to end button that is available on the Control toolbar (on page 1895).

7. Inspect the mapping by clicking a section of the output in the Output view.

---

**Figure 502. Text Output to Source Mapping**

![Diagram of text output to source mapping]
This action will highlight the XSLT / XQuery element and the XML source context. This XSLT template/XQuery element that is highlighted in the XSLT/XQuery editor represents only the top of the stack of XSLT templates/XQuery elements that determined the state of the XSLT/XQuery processor at the moment of generating the clicked output section. In the case of complex transformations, inspecting the whole stack of XSLT templates/XQuery elements speeds up the debugging process. This stack is available in the **Output Mapping Stack view** *(on page 1902)*.

---

**Related Information:**
- Output Mapping Stack View *(on page 1902)*
- Trace View *(on page 1904)*
- Templates View *(on page 1905)*

---

**Using Breakpoints**

The Oxygen XML Editor Eclipse plugin XSLT/XQuery Debugger allows you to interrupt XSLT/XQuery processing to gather information about variables and processor execution at particular points. To ensure breakpoints are persistent between work sessions, they are saved at project level. You can set a maximum of 100 breakpoints per project.

**Inserting Breakpoints**

To insert a breakpoint, follow these steps:

1. Click the line where you want to insert the breakpoint in the XML source document or the XSLT/XQuery document. Breakpoints are automatically created on the ending line of a start tag, even if you click a different line.

2. Right-click the vertical stripe on the left side of the editor panel and select **Add breakpoint**.

**Result:**

Once you insert a breakpoint, it is automatically added to the list in the Breakpoints view and you can edit its associated condition. A breakpoint can have an associated break condition that represents an XPath expression evaluated in the current debugger context. For them to be processed, their evaluation result should be a boolean value. A breakpoint with an associated condition only stops the execution of the Debugger if the breakpoint condition is evaluated as **true**.

---

**Figure 503. Example: Breakpoints**

```
4        <title></title>
5        <body>
6        <p></p>
7        <table frame="all" rowsep="1"
8        <title>test</title>
9        <tgroup cols="2">
```
Removing Breakpoints

To remove a breakpoint, Right-click the breakpoint icon (●) in the vertical stripe on the left side of the editor panel and select Remove breakpoint.

Related Information:
Breakpoints View (on page 1897)

Performance Profiling of XSLT Stylesheets and XQuery Documents

Whether you are trying to identify a performance issue that is causing your production XSLT/XQuery transformation to not meet customer expectations or you are trying to proactively identify issues prior to deploying your XSLT/XQuery transformation, using the XSLT/XQuery profiler feature is essential to helping you save time and ultimately ensure a better performing, more scalable XSLT/XQuery transformation.

The XSLT/XQuery profiling feature can use any available XSLT/XQuery processor that can be used for debugging and it is available from the debugging perspective (on page 2656).

Enabling the Profiler

Enabling and disabling the profiler is controlled by the Profiler button from the debugger Control toolbar (on page 1894). The XSLT/XQuery profiler is off by default. This option is not available during a debugger session so you need to set it before starting the transformation. For information about a common debugging procedure, see Steps in a Typical Debugging Process (on page 1909).

Profiling Information Views

Immediately after enabling the profiler, two new information views are added to the current debugger information views (on page 1896):

- Invocation tree view (on page 1915) on left side
- Hotspots view (on page 1916) on right side

Profiling data is available only after the transformation ends successfully.

On the left side (Invocation tree view (on page 1915)), you can examine how style instructions are processed. This result view is also named call-tree, as it represents the order of style processing. The profiling result shows the duration time for each of the style-instruction including the time needed for its called children.
On the right side (Hotspots view (on page 1916)), you can immediately spot the time the processor spent in each instruction. As an instruction usually calls other instructions, the used time of the called instruction is extracted from the duration time of the caller (the hotspot only presents the inherent time of the instruction).

**Source Backmapping**

In either the Invocation tree (on page 1915) or Hotspots view (on page 1916), you can use the backmapping feature to find the XSLT stylesheet or XQuery expression definition. Clicking the selected item causes Oxygen XML Editor Eclipse plugin to highlight the XSLT stylesheet or XQuery expression source line where the instruction is defined.

![Figure 504. Source Backmapping](image)

**Saving and Customizing Profiling Data**

The profiling data can be saved (exported) into XML and HTML format. In either the Invocation tree (on page 1915) or Hotspots view (on page 1916), right-click anywhere in the view and select Export to XML or Export to HTML. The HTML report can be customized based upon the profiling raw data. When you select Export to HTML, Oxygen XML Editor Eclipse plugin will save it as XML and apply an XSLT stylesheet to render the report as XML. You can customize these stylesheets to suit your needs. By default, they are located in: `{OXYGEN_INSTALL_DIR}/frameworks/profiler/`.

**Other Profiling Notes**

- If you want to change the XSLT/XQuery profiler settings (on page 202), use the contextual menu and choose the corresponding View settings entry.
- Profiling exhaustive transformations may run into an OutOfMemory error due to the large amount of information being collected. If this is the case, you can close unused projects when running the profiling or use high values for Java VM options `-Xms` and `-Xmx`. If this does not help you can shorten your source XML file and try again.
Resources

For more information about the XSLT/XQuery Profiler, watch our video demonstration:

https://www.youtube.com/embed/4ftHschjLqA

Invocation Tree View

The Invocation Tree view shows a top-down call tree that represents how XSLT instructions or XQuery expressions are processed. If the view is not displayed, it can be opened by selecting it from the Window > Show View menu.

Figure 505. Invocation Tree View

The entries in the invocation tree include a few possible icons that indicate the following:

- Points to a call whose inherent time is insignificant compared to its total time.
- Points to a call whose inherent time is significant compared to its total time (greater than 1/3rd of its total time).

Every entry in the invocation tree includes textual information that depends on the XSLT/XQuery profiler settings (on page 202):

- A percentage number of the total time that is calculated with respect to either the root of the tree or the calling instruction.
- A total time measurement in milliseconds or microseconds. This is the total execution time that includes calls into other instructions.
- A percentage number of the inherent time that is calculated with respect to either the root of the tree or the calling instruction.
- An inherent time measurement in milliseconds or microseconds. This is the inherent execution time of the instruction.
- An invocation count that shows how often the instruction has been invoked on this call-path.
- An instruction name that contains also the attributes description.

The Invocation Tree view also includes the following contextual menu actions:

Export to HTML
Selecting this option will save the profiling data as XML and then apply an XSLT stylesheet to render the report as HTML. These stylesheets are included in the subfolder: 

[OXYGEN_INSTALL_DIR]/frameworks/profiler/. You can use them to customize your own report based on the profiling raw data.

**Export to XML**

Use this option to save the profiling data as an XML file in a specified location.

**View settings**

Opens the XSLT/XQuery Profiler preferences page (on page 202) that allows you to configure various profiling settings.

**Hotspots View**

The Hotspots view displays a list of all instruction calls that lie above the threshold defined in the XSLT/XQuery profiler settings (on page 202). If the view is not displayed, it can be opened by selecting it from the Window > Show View menu.

![Figure 506. Hotspots View](image)

By opening a hotspot instruction entry, the tree of back-traces leading to that instruction call are calculated and shown.

Every hotspot is described by the values from the following columns:

- **Instruction** - The name of the instruction.
- **Percentage** - The percentage number for this hotspot entry with respect to the total time.
- **Time** - The inherent time in milliseconds or microseconds of how much time has been spent in the hotspot. All calls into this instruction are summed up regardless of the particular call sequence.
- **Calls** - The invocation count of the hotspot entry.

If you click the ⚠️ handle on the left side of a hotspot, a tree of back-traces will be shown.
Every entry in the backtrace tree has textual information attached to it that depends on the XSLT/XQuery profiler settings (on page 202):

- A percentage number that is calculated with respect to either the total time or the called instruction.
- A time measured in milliseconds or microseconds of how much time has been contributed to the parent hotspot on this call-path.
- An invocation count that shows how often the hotspot has been invoked on this call-path.

**Note:**
This is not the number of invocations of this instruction.

- An instruction name that also contains its attributes.

The Hotspots view also includes the following contextual menu actions:

**Export to HTML**

Selecting this option will save the profiling data as XML and then apply an XSLT stylesheet to render the report as HTML. These stylesheets are included in the subfolder: `\[OXYGEN_INSTALL_DIR\]/frameworks/profiler/`. You can use them to customize your own report based on the profiling raw data.

**Export to XML**

Use this option to save the profiling data as an XML file in a specified location. 

**View settings**

Opens the XSLT/XQuery Profiler preferences page (on page 202) that allows you to configure various profiling settings.

### Debugging XSLT that Call Java Extensions

It is possible to debug an XSLT that calls Java extensions. This is achieved through a transformation scenario where the Java extensions are specified, and the debugging can be done based upon the same scenario.

To debug XSLT with Java extensions, follow this procedure:

1. Create an XSLT transformation scenario (on page 1248) for your XSLT document (select Configure Transformation Scenario(s) action from the toolbar, then click New, and select XSLT transformation).
2. In the New scenario dialog box, click the Extensions button (in the XSLT tab), specify the Java extensions (JAR libraries) that are needed, and click OK.
3. Once you are finished configuring the transformation scenario, click OK, then select Save and close.
4. Use the Debug scenario action on the toolbar and the debugging will be based upon the same transformation scenario you just configured and saved.
Tip:
You could achieve this during a typical debugging process (on page 1909) by specifying the Java extensions using the Edit extensions button on the debugger control toolbar (on page 1894).

Related Information:
Validating XSLT Stylesheets that Call Java Extensions (on page 655)

Debugging Java Extensions

The XSLT/XQuery debugger does not step into Java classes that are configured as XSLT/XQuery extensions of the transformation. To step into Java classes, inspect variable values, and set breakpoints (on page 1912) in Java methods, you can set up a Java debug configuration in an IDE (such as the Eclipse SDK) as described in the following steps:

1. Create a debug configuration.
   a. Make sure the \(\text{OXYGEN_INSTALL_DIR}/\text{lib/oxygen.jar}\) file and your Java extension classes are on the Java classpath.
      The Java extension classes should be the same classes that were set as an extension (on page 1894) of the XSLT/XQuery transformation in the debugging perspective (on page 2656).
   b. Set the class ro.sync.exml.Oxygen as the main Java class of the configuration.
      The main Java class ro.sync.exml.Oxygen is located in the oxygen.jar file.

2. Start the debug configuration.
   Now you can set breakpoints and inspect Java variables as in any Java debugging process executed in the selected IDE (Eclipse SDK, and so on.).

Supported Processors for XSLT / XQuery Debugging

The following built-in XSLT processors are integrated in the debugger and can be selected in the Control Toolbar (on page 1893):

- **Saxon 12.3 HE (Home Edition)** - a limited version of the Saxon 9 processor, capable of running XSLT 1.0, XSLT 2.0 / 3.0 basic and XQuery 1.0 transformations, available in both the XSLT debugger and the XQuery one,
- **Saxon 12.3 PE (Professional Edition)** - capable of running XSLT 1.0 transformations, XSLT 2.0 basic ones and XQuery 1.0 ones, available in both the XSLT debugger and the XQuery one,
- **Saxon 12.3 EE (Enterprise Edition)** - a schema-aware processor, capable of running XSLT 1.0 transformations, XSLT 2.0 / 3.0 basic ones, XSLT 2.0 / 3.0 schema-aware ones and XQuery 1.0 / 3.0 ones, available in both the XSLT debugger and the XQuery debugger,
- **Saxon 6.5.5** - capable of running only XSLT 1.0 transformations, available only in the XSLT debugger,
- **Xalan 2.7.2** - capable of running only XSLT 1.0 transformations, available only in the XSLT debugger.
17. Framework and Author Mode Customization

This section contains information and tutorials about customizing the authoring experience through custom frameworks and customizing the Author editing mode through CSS styling or API extensions.

Creating and Configuring Custom Frameworks

Oxygen XML Editor Eclipse plugin includes built-in, configured frameworks (on page 2655) for DocBook, DITA, TEI, XHTML, and JATS, but you can also create your own customization to handle other types of documents. A common use-case is wanting to customize the interface to accommodate the needs of your authoring team.

Fully configuring a framework usually involves customizing CSS stylesheets, XML schemas, GUI components (menu actions, toolbars, inline components, content completion proposals, and more), configuring other more general settings, then bundling the framework to share with your team. The CSS and GUI components are used to customize the interface, while other general settings can be configured to accommodate custom document templates, XML catalogs, transformation scenarios, and more.

Advanced users who are familiar with API development can also create custom Author mode operations (on page 1966) for a particular framework.

This section includes information about numerous possibilities for creating and customizing a framework, and how to share your customization with others.

Tip:
A sample framework customization package is available that you can dabble with and use to help you get started. It can be downloaded from: https://www.oxygenxml.com/maven/com/oxygenxml/samples/oxygen-sample-framework/24.0.0.0/oxygen-sample-framework-24.0.0.0-package.zip. The package includes a sample CSS file, XSL file, schema files, document templates, an XML catalog file, custom icons, and other resources.

Creating a Framework through the Configuration Dialog

The easiest way to create a custom framework (on page 2655) (document type) is by extending an existing built-in framework, such as DITA or DocBook, and then making modifications to it. You can then easily share the custom framework (on page 2077) with your team.

To create a custom framework by extending an existing one, follow these steps:
1. In a location where you have full write access, create a folder structure similar to this:
   `custom_frameworks/dita-extension`

2. Open the Preferences dialog box (on page 70) and go to Document Type Association > Locations (on page 90). Add the path to your `custom_frameworks` folder in the Additional frameworks directories list and click OK or Apply to save your changes.

3. Go to the Document Type Association preferences page (on page 88) and select an existing framework configuration (for example, DITA) and use the Extend button to create an extension for it.

   **Step Result:** This opens the Document Type Configuration dialog box (on page 90) where you can define the set of rules and settings for your custom framework.

4. Give the extension an appropriate name, select External for the Storage option, click the browsing button ( ) to specify the location of the custom directory you created in step 1.

5. Continue to configure the extension using the tabs on the bottom half of the dialog box. For details about each of those tabs, see the child topics in the Document Type Configuration dialog box (on page 90) section. For even more information about customizing the extended framework, see the various topics and tutorials in the Creating and Configuring Custom Frameworks (on page 1919) section. Make sure that you save any resources you reference in your framework configuration (CSS files, new document templates, schemas used for validation, catalogs, etc.) in your custom framework directory you created in step 1.

6. Click OK to close the configuration dialog box and then OK or Apply to save your changes.

   **Results:** You now have a fully functional framework that can be shared with others (on page 2077).

- Webinar: Creating Frameworks Using an Extension Script

---

**Creating a Framework Using an Extension Script**

A custom framework (on page 2655) (document type) can be created using a special XML descriptor file, either from scratch or by extending an existing built-in framework (such as DITA or DocBook) and then making modifications to it. You can then easily share the custom framework (on page 2077) with your team.

The easiest way to create such a descriptor is to use the New document wizard (on page 245) and choose the Extend Framework Script or Create Framework Script template.

**Tip:**
To see a visual, detailed look at how to create frameworks with an extension script, watch our webinar: Creating Frameworks Using an Extension Script (some samples are also available on that events page).
Creating a Custom Framework Starting from an Existing Framework

To create a custom framework by extending an existing one, follow these steps:

1. In a location where you have full write access, create a folder structure similar to this:
   
   ```
   custom_frameworks/dita-extension.
   ```
   
2. Open the Preferences dialog box (on page 70) and go to Document Type Association > Locations (on page 90). Add the path to your custom_frameworks folder in the Additional frameworks directories list and click OK or Apply to save your changes and close the dialog box.

3. Click the New button on the toolbar and select the Extend Framework Script template. Save it inside the previously configured framework path (e.g. custom_frameworks/dita-extension).

4. Set the `@base` attribute on the script element to the value of the name of the extended framework (e.g. DITA).

   **Note:**
   Removing the `@base` attribute will create a framework from scratch.

5. Edit the script as described in Framework Extension Script File (on page 1922).

   To test your customization, open a document that matches the newly created framework and inspect how your settings apply or go to Options > Preferences > Document Type Association and inspect the resulting framework structure.

   **Note:**
   If you want to use the framework in an older Oxygen XML Editor Eclipse plugin version that does not have support for these scripts, you can compile the script to obtain the *.framework file by using the Compile Framework Extension script action from the contextual menu or by running the scripts/compileFrameworkScript.bat external tool.

Creating a Custom Framework Without a Base Framework

To create a custom framework without starting from an existing one, follow these steps:

1. In a location where you have full write access, create a folder structure similar to this:
   
   ```
   custom_frameworks/dita-extension.
   ```
   
2. Open the Preferences dialog box (on page 70) and go to Document Type Association > Locations (on page 90). Add the path to your custom_frameworks folder in the Additional frameworks directories list and click OK or Apply to save your changes and close the dialog box.

3. Click New button on the toolbar and select the Create Framework Script template. Save it inside the previously configured framework path, custom_frameworks/dita-extension.

4. Edit the script as described in Framework Extension Script File (on page 1922).
To test your customization, open a document that matches the newly created framework and inspect how your settings apply or go to Options > Preferences > Document Type Association and inspect the newly generated framework structure.

**Note:**
If you want to use the framework in an older Oxygen XML Editor Eclipse plugin version that does not have support for these scripts, you can compile the script to obtain the *.framework file by using the Compile Framework Extension script action from the contextual menu or by running the scripts/compileFrameworkScript.bat external tool.

### Framework Extension Script File

The framework extension file is used to describe a new framework configuration. Optionally, you can extend an existing built-in framework configuration (such as DITA or DocBook) and then make additions and changes to it.

The easiest way to create such a file is to use the New document wizard (on page 245) and choose the Extend Framework Script or Create Framework Script template.

The following examples assume that the newly created framework extends a built-in one.

### Basic Information

Once you have created a new script file, you need to:

- Specify the name of the framework using the `<name>` element. Optionally, you can also add a description using the `<description>` element.
- If you want to extend an existing framework (such as DITA or DocBook), specify the name of the extended framework using the `@base` attribute on the `<script>` element.
- The `<priority>` element might be needed to instruct Oxygen XML Editor Eclipse plugin to use this new framework instead of the one being extended or another framework that matches the same document.

**Example: Extending the Built-in DITA Framework**

```xml
<script xmlns="http://www.oxygenxml.com/ns/framework/extend"
xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
xsi:schemaLocation="http://www.oxygenxml.com/ns/framework/extend
base="DITA">
  <name>My custom DITA framework</name>
  <description>A custom framework based on the built-in DITA framework</description>
</script>
```
<priority>High</priority>

</script>

Changing the Association Rules

Oxygen XML Editor Eclipse plugin identifies the type of a document when the document matches at least one of the association rules.

Example: Instructing the Built-in Associations to Inherit None to Add Your Own

```xml
<associationRules inherit="none">
  <addRule rootElementLocalName="concept"/>
  <addRule fileName="test.xml"/>
</associationRules>
```

Setting the Initial Editing Mode

You can set the default editing mode that is loaded when a document is opened for the first time. For example, if the files are usually edited in the Author mode, you can set it as the initial page. For more details on the possible values, see Document Type Configuration Dialog Box - Initial Edit Mode (on page 91).

Example: Setting the Initial Editing Mode to Author

```xml
<initialPage>Author</initialPage>
```

Changing the Classpath

The Classpath tab displays a list of folders and JAR (on page 2655) libraries that hold implementations for API extensions, implementations for custom Author mode operations, various resources (such as stylesheets), and framework (on page 2655) translation files. Oxygen XML Editor Eclipse plugin loads the resources looking in the folders in the order they appear in the list.

Example: Customizing and Extending the Classpath Inherited From the Base Framework

```xml
<classpath inherit="all">
  <!-- Contribute this resource before the ones inherited from the base framework because Oxygen loads the resources looking in the folders in the order they appear in the list. -->
  <addEntry path="${framework}/resources_2x" position="before"/>
  <removeEntry path="${baseFramework}/refactoring"/>
</classpath>
```

Notice:

Relative paths in the framework extension file are automatically resolved to the location of the script file.
Note:
When removing entries with framework editor variables, take into consideration how they were added in the base framework.

- An entry present in the base framework with the path `${framework}/file` can be removed using an identical path or by using the `${baseFramework}` variable: `${baseFramework}/file`.
- An entry present in the base framework with the path `${frameworkDir}/file` can be removed using an identical path or by using the `${baseFrameworkDir}` variable: `${baseFrameworkDir}/file`.

Sharing a Plugin Class Loader

If your framework uses the same JAVA extensions/classes as a plugin (on page 2657), it is recommended that they share the same classloader. This way, the common classes are loaded by only one Class Loader and they will both use the same static objects and have the ability to cast objects between one another.

```xml
<classpath parentClassLoaderID="com.oxygenxml.git.plugin"/>
```

Setting a Default Schema

You can specify a default schema for Oxygen XML Editor Eclipse plugin to use if an XML document does not contain a schema declaration and no default validation scenario is associated with it.

Example: Setting a Default XML Schema Relative to the Script Location

```xml
<defaultSchema schemaType="xmlschema" href="xsd/my-schema.xsd"/>
```

Changing XML Catalogs

For cases where you need to reference the location of a schema file from a remote web location and an internet connection may not be available, an XML Catalog (on page 2659) may be used to map the web location to a local file system entry.

Example: Customizing and Extending the XML Catalogs Inherited From the Base Framework

```xml
<xmlCatalogs inherit="all">
  <!-- Contribute this resource before the ones inherited from the base framework because Oxygen loads the resources looking in the folders in the order they appear in the list. -->
  <addEntry path="${framework}/catalog.xml" position="before"/>
  <removeEntry path="${baseFramework}/oldCatalog.xml"/>
</xmlCatalogs>
```
Changing the Document Templates

You can create your own custom document templates or remove templates inherited from the base framework.

**Example: Customizing and Extending the XML Catalogs Inherited From the Base Framework**

```xml
<documentTemplates inherit="all">
    <!-- Contribute this resource before the ones inherited from the base framework to make them appear first in the list. -->
    <addEntry path="${framework}/newTemplates" position="before"/>
    <removeEntry path="${baseFramework}/oldTemplates"/>
</documentTemplates>
```

Adding New Transformation Scenarios and Removing Existing Ones

You can create new transformation scenarios and export them in one of the following locations:

- The Transformation Scenarios View (on page 1290).
- The Configure Transformation Scenario(s) Dialog Box (on page 1284).
- The Transformation Tab (on page 115).

**Example: Importing New Transformation Scenarios**

The `@href` attribute from the `<addScenarios>` element is used to point to the location of the scenarios export file. Relative paths are resolved relative to the script's location. The `${framework}` editor variable also resolves to the script's location. You can also remove any scenario inherited from the base framework or set the default scenario (the one used when another specific scenario is not specified).

```xml
<transformationScenarios>
    <addScenarios href="scenarioExport.scenarios"/>
    <removeScenario name="DITA HTML5"/>
    <defaultScenarios>
        <name>DITA</name>
    </defaultScenarios>
</transformationScenarios>
```
Adding New Validation Scenarios and Removing Existing Ones

You can create new validation scenarios and export them in one of the following locations:

- The Configure Validation Scenario Dialog Box (on page 556).
- The Validation Tab (on page 116).

Example: Importing New Validation Scenarios

The @href attribute from the <addScenarios> element is used to point to the location of the scenarios export file. Relative paths are resolved relative to the script's location. The ${framework} editor variable also resolves to the script's location. You can also remove any scenario inherited from the base framework or set the default scenario (the one used when another specific scenario is not specified).

```xml
<validationScenarios>
  <addScenarios href="validationScenarioExport.scenarios"/>
  <removeScenario name="DITA"/>
  <defaultScenarios>
    <name>DITA Validation</name>
    <name>XML Validation</name>
  </defaultScenarios>
</validationScenarios>
```

Customizing the Author Mode Through New CSS Files

The Author mode layout is driven by CSS rules. To customize it, you need to create new CSS files and add them in the new framework.

Example: Using Larger Fonts in Titles

```xml
<author>
  <css>
    <!-- Adding CSS after the ones in the base gives the opportunity to override rules from previous CSSs. -->
    <removeCss path="${framework}/base.css"/>
    <addCss path="${framework}/titles.css" position="after"/>
  </css>
</author>
```

The ${framework}/titles.css file contains a rule like this:
Example: Creating an Alternate CSS That Activates When the User Selects it in the Styles Menu

```xml
<author>
  <css>
    <addCss path="${framework}/pink.css" title="Pink titles" alternate="true"/>
  </css>
</author>
```

The `${framework}/pink.css` file contains a rule like this:

```css
*[class~='topic/title'] {
  font-size: larger;
}
```

Control How CSS Styles are Handled in the Author mode

The **Author** mode layout is driven by CSS rules. You can configure how CSS styles are handled in the framework by using the following attributes in the script file:

**selectMultipleAlternateCSS**

If set to `true`, any number of alternate CSS files can be activated and they will be applied like layers. If set to false, the alternate styles are treated like a main CSS style and only one can be selected at a time.

**Example: Using the selectMultipleAlternateCSS Attribute in the Script**

```xml
<css selectMultipleAlternateCSS="true"/>
```

**mergeDocumentCSS**

Controls how CSS files are handled if there are CSS styles specified in the document. If set to true, they will be merged with the CSS files from the framework. If set to false, they will be ignored.

**Example: Using the mergeDocumentCSS Attribute in the Script**

```xml
<css mergeDocument="true"/>
```

**Example: Changing the styling in the author mode**

We add a new CSS located in the new framework directory and we remove a CSS contributed by the base framework.

```xml
<author>
  <css>
    ...
  </css>
</author>
```
Defining Author Actions for the New Framework

Create external author actions (on page 1936), save them in a specific subdirectory of your particular framework directory (on page 1939), and they will be loaded automatically.

Removing Author Actions from the Base Framework

Suppose that the base framework configuration defines some author actions (on page 1936) that are added in the main menu (on page 107), contextual menu (on page 107), toolbar (on page 109), or content completion window (on page 110). If you do not want to inherit one of these actions in the new framework and you also want to remove it from all the GUI elements, you can use the `<removeAction>` element:

```xml
<author>
  <authorActions>
    <removeAction id="action.to.remove"/>
  </authorActions>
</author>
```

Note:

If the new framework has an external author action (on page 1936) with the same ID as one of the actions specified in a `<removeAction>` element, the action will not be removed from the GUI elements (menus, toolbars, content completion window).

Replacing Author Actions from the Base Framework

Suppose that the base framework configuration defines some author actions (on page 1936) that are added in the main menu (on page 107), contextual menu (on page 107), toolbar (on page 109), or content completion window (on page 110). If you want to keep one of these actions in all the GUI elements, but to perform differently in the new framework, just create an external author action (on page 1936) with the same ID as the action to replace and save it in the specific subdirectory within your new framework directory (on page 1939).

Author Toolbar Configuration

The Author mode-specific toolbars for the new framework can be customized by:
• Adding or removing actions from toolbars.
• Changing toolbar groups by adding or removing actions.
• Creating new toolbars and action groups.

**Example: Customizing the Toolbar**

```xml
<author>
  <toolbars>
    <toolbar>
      <!-- Remove an action inherited from the base framework. -->
      <removeAction id="bold"/>

      <!-- Insert an action into an existing group -->
      <group name="${i18n(link)}">
        <addAction id="insert.note"/>
      </group>

      <!-- Add actions, separators and new groups-->
      <separator/>
      <addAction id="insert.note"/>

      <group name="New group">
        <addAction id="insert.note"/>
        <addAction id="insert.table"/>
      </group>
    </toolbar>
  </toolbars>
</author>
```

**Note:**
If you create a toolbar or group configuration and a toolbar/group with the same name already exists in the base framework, you will change the one inherited instead of creating a new one. You can inspect the names of the existing toolbars/groups inherited from the base framework in the **Toolbar Subtab (on page 109)**.

**Example: Creating a New Toolbar**

A new toolbar is created if the `@name` attribute does not match a toolbar inherited from the base.

```xml
<author>
  <toolbars>
    <toolbar name="Extra Toolbar">
      <!-- Add actions, separators and new groups-->
    </toolbar>
  </toolbars>
</author>
```
Example: Adding an Action in the Toolbar at a Specific Location

You can insert items (actions or groups) relative to other items already present in the toolbar because they were inherited from the base framework configuration. The `@anchor` attribute specifies either the ID of an action or the name of a group already present in the toolbar and the `@position` attribute specifies whether the new item should be added before or after it.

Note:
If the `@anchor` attribute is missing, the entries will be added either first or last, according to `@position` value.

Author Menu and Contextual Menu Configuration

The `Author` mode-specific menus for the new framework can be customized by:

- Adding or removing actions and submenus.
- Changing existing submenus by adding or removing actions.

Example: Customizing the Contextual Menu
Oxygen XML Editor Eclipse Plugin 26.0 | 17 - Framework and Author Mode Customization | 1931

<!-- Contribute to an existing submenu -->
<submenu name="${i18n(section)}">
  <addAction id="paragraph"/>
</submenu>

<!-- Remove a submenu inherited from the base framework. -->
<removeSubmenu name="${i18n(link)}"/>
</contextualMenu>

Note:
The framework main menu is configured similarly, inside a <menu> container.

Tip:
You can inspect the names of the submenus inherited from the base framework in the Contextual Menu Subtab (on page 107) and Menu Subtab (on page 107).

Example: Adding an Action in the Contextual Menu at a Specific Location

You can insert new actions and submenus relative to other actions and submenus already present in the menu because they were inherited from the base framework configuration. The <anchor> attribute specifies the ID of an Author mode action or a name of a submenu already present in the menu and the <position> attribute specifies whether the new action should be added before or after it.

Note:
If the <anchor> attribute is missing, the entries will be added either first or last, according to <position> value.

<contextualMenu>
  <addAction id="insert.note" anchor="edit.image.map" position="before"/>

  <submenu name="Table menu" anchor="${i18n(insert)}" position="after">
    <addAction id="insert.table"/>
  </submenu>
</contextualMenu>

Configuring the Content Completion in Author Mode

You can replace content completion entries obtained from the associated schema with Author mode actions (on page 1936).
In the `<authorActions>` container, you can specify the Author mode actions to be contributed. Optionally, you can mark them as a replacement for an existing schema proposal with the `@replacedElement` attribute.

The `<schemaProposals>` element allows you to remove proposals detected from the associated schema through the `<removeProposal>` element. If some proposals were removed in the base framework configuration and you want them re-added, you can do so through the `<addProposal>` element.

**Example: Customizing the Content Completion Assistant**

```xml
<contentCompletion>
  <authorActions>
    <addAction id="insert.note" replacedElement="note" inCCWindow="true"/>
  </authorActions>

  <schemaProposals>
    <removeProposal renderName="table"/>

    <!-- The base framework removed the "list" element proposal. We want it back... -->
    <addProposal renderName="list"/>
  </schemaProposals>
</contentCompletion>
```

**Using Framework Extension Points**

The Extensions tab specifies implementations of Java interfaces used to provide advanced functionality to the document type. Libraries that contain the implementations must be present in the classpath of your framework (on page 1923). The Javadoc available at https://www.oxygenxml.com/InstData/Editor/SDK/javadoc/ contains details about how each API implementation functions.

**Example: Setting a Custom Extensions Bundle**

```xml
<extensionPoints>
  <extension
    name="extensionsBundleClassName"
    value="ro.sync.ecss.extensions.dita.map.DITAMapExtensionsBundle"/>
</extensionPoints>
```

**Reusing Parts of the Script Using XInclude**

Elements in the script can be specified in dedicated files that can then be referenced using XInclude in the script.

**Example: Using XInclude to Reference Elements in the Script**

```xml
<script xmlns="http://www.oxygenxml.com/ns/framework/extend">
  <name>New framework</name>
Customizing the Author Mode Editing Experience for a Framework

You can customize the editing experience in Author mode for you and any other user who shares the same framework. This includes the ability to configure actions, menus, toolbars, icons, structure insertion shortcuts, and content completion proposals specifically for a particular framework (on page 2655) (document type). Advanced users who are familiar with API development can also create custom Author mode operations (on page 1966) for a particular framework.

Configuring and Managing Multiple CSS Styles for a Framework

Oxygen XML Editor Eclipse plugin provides a Styles drop-down menu on the toolbar that allows you to select one main (non-alternate) CSS style (on page 2656) and multiple alternate CSS styles (on page 2652). This makes it easy to change the look of the document as it appears in Author mode.

An example of a common use case is when content authors want to use custom styling within a document. You can select a main CSS stylesheet that styles the whole document and then apply alternate styles, as layers, to specific parts of the document.

Managing the CSS Styles

The main (on page 2656) and alternate (on page 2652) styles that are listed in the Styles drop-down menu can be controlled in the Document Type configuration dialog box (on page 90). To access it, follow these steps:

1. Open the Preferences dialog box (on page 70).
2. Go to Document Type Association.
3. Select the appropriate document type and click the Edit button.
Important:
If you do not have access rights to the folder where the framework (on page 2655) files are stored, you can either elevate read/write permissions on that framework folder or you can extend the framework and customize the CSS stylesheets in the extension. If you want to share the customized extension with the rest of your team, see Sharing the Extended Framework (on page 2077).

The CSS styles (CSS files) associated with the particular document type are listed in the CSS subtab (on page 96) of the Author tab.

Figure 507. Main and Alternate CSS Styles in the Document Type Configuration Dialog Box

You can Add, Edit, or Delete styles from this dialog box to manage the main (on page 2656) and alternate (on page 2652) styles associated to the particular document type. You can also change the order of the styles by using the Move Up and Move Down buttons. This also changes the order that they appear in the Styles drop-down menu. The alternate styles are combined with the main CSS sequentially, in the order that they appear in this list. Therefore, if the same style rules are included in multiple CSS files, the alternate style that is listed last in this list takes precedence, since it is the last one to be combined (applied as a layer).

The URI column shows the path of each CSS file. The names listed in the Styles drop-down menu match the values in the Title column. The value in the Alternate column determines whether it is a main or alternate CSS.
If the value is no, it is a main CSS. If the value is yes, it is an alternate CSS and the style can be combined with a main CSS or other alternate styles when using the Styles drop-down menu.

### Note:
To group alternate styles into categories (submenus), use a vertical bar character (|) in the Title column. You can use multiple vertical bars for multiple submenus. The text before each vertical bar will be rendered as the name of a submenu entry in the Styles drop-down menu, while the text after the final vertical bar is rendered as the name of the style inside the submenu.

**Example:** Suppose that you want to add two alternate stylesheets in separate submenus, with the Title column set to My Styles|User Assistance|Hints and My Styles|User Actions|Inline Actions, respectively.

<table>
<thead>
<tr>
<th>URI</th>
<th>Title</th>
<th>Alternate</th>
</tr>
</thead>
<tbody>
<tr>
<td>$(framework)/css/hints/hints.css</td>
<td>My Styles</td>
<td>User Assistance</td>
</tr>
<tr>
<td>$(framework)/css/actions/actions.css</td>
<td>My Styles</td>
<td>User Actions</td>
</tr>
</tbody>
</table>

Oxygen XML Editor Eclipse plugin will add a My Styles submenu with two submenus (User Assistance that contains the Hints style, and User Actions that contains the Inline Actions style) in the Styles drop-down menu.

The Enable multiple selection of alternate CSSs checkbox (on page 96) at the bottom of the pane must be selected for the alternate CSS styles (on page 2652) to be combined. They are applied like layers and you can activate any number of them. If this option is not selected, the alternate styles are treated like main CSS styles (on page 2656) and you can only select one at a time. By default, this option is selected. There are also a few options that allow you to specify how to handle the CSS if there are CSS styles specified in the document. You can choose to ignore or merge them.

The following rules apply for merging CSS styles:

- CSS files with the same title will be merged.
- CSS files without a title will contribute to all others.
- They are merged sequentially, in the order that they appear in the list.

**Related information**
- Changing the Look of Documents in Author Mode Using the Styles Menu (on page 367)
- CSS Subtab (on page 96)
- Adding an extra CSS to customize the DITA visual editor
Creating and Customizing Author Mode Actions for a Framework

There are several possibilities for creating new Author mode actions:

- You can create new actions for a framework or edit existing ones using the Actions subtab of the Document Type configuration dialog box (on page 90). In this case, the actions are stored internally in the *.framework file.
- You can export existing actions from the Document Type configuration dialog box (on page 90) into individual XML files or use a built-in template to create a new XML file that defines a single action. In this case, the actions are stored externally as separate XML files. The benefits of using this approach are explained in the Creating or Editing Actions Using an Individual XML File for Each Action (on page 1936) section below.

Creating or Editing Actions Using the Document Type Configuration Dialog Box

To add or configure Author mode actions for a framework (on page 2655) (document type) using the Document Type configuration dialog box (on page 90), follow this procedure:

1. Open the Preferences dialog box (on page 70), go to Document Types Association, and select the framework.
2. Select your framework and click the Edit button (or you can use the Duplicate or Extend button to create an extension of the framework (on page 1919)).
3. In the resulting Document Type configuration dialog box (on page 90), go to the Author tab, then the Actions subtab.
4. To create a new action, click the + New button. To edit an existing action, select the action and click the 💼 Edit button.

   Step Result: In either case, this opens the Action configuration dialog box (on page 98) where you can configure numerous aspects of the action.

5. Once you are finished, click OK several times to exit the configuration dialog box.

Result: Your changes are stored in the *.framework file for your particular framework.

Creating or Editing Actions Using an Individual XML File for Each Action

It is possible to work with Author mode actions outside the Document Type configuration dialog box (on page 90) and store them externally from the *.framework file. You can either export existing actions or use a template to create a new action from scratch. The benefits of using this approach are:

- You can share, copy, or reuse each individual action across multiple projects or frameworks.
- It is easier to develop and test action configurations. After configuring the XML file that defines an action, you can test its functionality by opening a document from your particular framework and invoking the action to see if it works as expected. If you did not get the desired result, you can simply repeat the process until you are happy with the result without having to navigate through the framework configuration dialog box.
**Exporting Actions**

To export existing **Author** mode actions into individual XML files, follow this procedure:

1. Open the **Preferences** dialog box (*on page 70*), go to **Document Types Association**, and select the framework.
2. Select your framework and click the **Edit** button (or you can use the **Duplicate** or **Extend** button to create an extension of the framework (*on page 1919*)).
3. In the resulting **Document Type** configuration dialog box (*on page 90*), go to the **Author** tab, then the **Actions** subtab.
4. **[Important]** Make sure the **Storage** option (*on page 91*) in the top part of the dialog box is set to **External** and the external location must be a subdirectory of your current framework directory (see the Notes About the Storage Path section (*on page 1939*)).
5. Select the action (or multiple actions) you want to export, right-click, and use the `Export` action (this action is also located at the bottom of the table of actions).

**Step Result:** If you choose to export a single action, a resulting dialog box will allow you to select the destination path for the new XML file that contains the configuration details of the action. If you export multiple actions, they will automatically be saved as individual XML files inside a newly created folder (it will have `_externalAuthorActions` at the end of the folder name) inside your current framework directory.

6. **[Important]** Click **OK** several times to confirm your changes and exit the **Preferences** dialog box. The files will not be created until you exit this dialog box.

**Step Result:** Each exported action is extracted from the framework configuration file and exported as an individual XML file.

7. To configure and test a particular action, you can open its corresponding XML file in **Oxygen XML Editor Eclipse plugin**, make changes, save the file, then open a document from your framework, test the action and repeat until you get the desired result.

**Note:**

You can add or edit the action files outside of **Oxygen XML Editor Eclipse plugin**, but you will need to restart the application each time to reload the changes.

**Creating New Actions**

To create a new **Author** mode action outside the framework configuration dialog box, follow these steps:

1. Open the **New from templates** wizard (*on page 252*), search for a template called **Author Action**, and choose a storage path and file name. Remember that ultimately, it must be saved in a subdirectory of your particular framework directory (see the Notes About the Storage Path section (*on page 1939*)). Complete the creation process.
**Step Result:** The resulting XML file contains some hints and it is an example of an action configuration that will insert a new paragraph.

2. Configure the action as needed and save your changes.

**Note:**
You can use XInclude to reuse different fragments (such as XPath expressions or configured operations between actions).

**Example: Reusing and XPath Expression**

```xml
<a:operations>
  <a:operation id="InsertFragmentOperation">
    <a:xpathCondition>
      <xi:include href="expression.txt"
                   xmlns:xi="http://www.w3.org/2001/XInclude" parse="text"/>
    </a:xpathCondition>
    <a:arguments>
      <a:argument name="insertLocation">
        <xi:include href="expression.txt"
                     xmlns:xi="http://www.w3.org/2001/XInclude" parse="text"/>
      </a:argument>
    </a:arguments>
  </a:operation>
</a:operations>
```

Where the content of the `expression.txt` file is `self::para`.

**Example: Reusing an Entire Operation**

```xml
<a:operations xmlns:a="http://www.oxygenxml.com/ns/author/external-action">
  <xi:include href="operation.xml" xpointer="element(/1/1)"
               xmlns:xi="http://www.w3.org/2001/XInclude"/>
</a:operations>
```

Where the content of `operation.xml` is:

```xml
<a:operations xmlns:a="http://www.oxygenxml.com/ns/author/external-action">
  <a:operation id="ToggleSurroundWithElementOperation">
    <a:xpathCondition>ancestor-or-self::p</a:xpathCondition>
    <a:arguments>
      <a:argument name="element">i</a:argument>
    </a:arguments>
  </a:operation>
</a:operations>
```
Step Result: At this point, the action has been created but it needs to be added to the UI (in a toolbar or menu).

3. Add the new action to a UI component. For example, to add it in a toolbar, open the Document Type configuration dialog box (on page 90), go to the Author tab, then the Toolbar subtab (on page 109), and add the action.

4. To test the action, you can open a document from your framework and test the action. If you don't get the desired result, open the action file, make changes, then test them again. Repeat until you get the desired result.

Note:
You can add or edit the action files outside of Oxygen XML Editor Eclipse plugin, but you will need to restart the application each time to reload the changes.

Notes About the Storage Path

As mentioned above, it is imperative that the action configuration files be stored in a specific subdirectory of your particular framework directory.

There are two possible naming conventions for this subdirectory:

- `{framework_directory}/externalAuthorActions` - If there are multiple framework subdirectories inside `{framework_directory}`, using this path structure will make the actions available to all of them.
- `{framework_directory}/(framework_file_name)_externalAuthorActions` - Using this path structure will make the actions only available in the framework stored inside the `{framework_file_name}.framework` file.

Note:
When exporting actions from the UI (on page 1937), this is the directory structure that is used.

Action Configuration Tips

- If an action is configured to insert a fragment that contains entities, you need to wrap it in CDATA markup.
- For a list of default operation, see Built-in Author Mode Operations (on page 1940).

Resources

For more information about customizing Author mode actions, see the following resources:

- Webinar: Improving the Authoring Experience Through Custom Actions.
- Webinar: Working with DITA in Oxygen - Customizing the Editing Experience.
Built-in Author Mode Operations

This topic lists the default operations for the Author mode.

ChangeAttributeOperation

This operation allows you to add/modify/remove an attribute. You can use this operation in your own custom Author mode action to modify the value for a certain attribute on a specific XML element. The arguments of the operation are:

- **name**
  The attribute local name.

- **namespace**
  The attribute namespace.

- **elementLocation**
  The XPath location that identifies the element.

- **value**
  The new value for the attribute. If empty or null the attribute will be removed.

- **editAttribute**
  If an in-place editor exists for this attribute, it will automatically activate the in-place editor and start editing.

- **removeIfEmpty**
  The possible values are true and false. True means that the attribute should be removed if an empty value is provided. The default behavior is to remove it.

ChangeAttributesOperation

This operation allows you to add/modify/remove multiple attributes. You can use this operation in your own custom Author mode action to modify the value for one or more attributes for one or more XML elements. The arguments of the operation are:

- **elementLocations**
  The XPath location that identifies the elements whose attributes will be affected. If not defined, the element at the cursor location will be used.

- **attributeNames**
  The names of the attributes to add, modify, or remove, separated by the new-line character (\n). The values can be local names or Clark notations.
values

The new attributes values, each on a new line, separated by the new-line character (\n). An empty value will remove the attribute if `removeIfEmpty` is set to `true`.

removeIfEmpty

The possible values are `true` (default) and `false`. `True` means that the attribute will be removed if an empty value is provided.

**ChangePseudoClassesOperation**

Operation that sets a list of pseudo-class values to nodes identified by an XPath expression. It can also remove a list of values from nodes identified by an XPath expression. The operation accepts the following parameters:

- **setLocations**
  
  An XPath expression indicating a list of nodes that will have the specified list of pseudo-classes set. If it is not defined, then the element at the cursor position will be used.

- **setPseudoClassNames**
  
  A space-separated list of pseudo-class names that will be set on the matched nodes.

- **removeLocations**
  
  An XPath expression indicating a list of nodes that will have the specified list of pseudo-classes removed. If it is not defined, then the element at the cursor position will be used.

- **removePseudoClassNames**
  
  A space-separated list of pseudo-class names that will be removed from the matched nodes.

- **includeAllNodes**
  
  The possible values are `yes` and `no`. If set to `yes`, comments, CDATA, and text nodes are included when evaluating XPath expressions. If set to `no`, they are ignored.

**DeleteElementOperation**

Deletes the node indicated by the `elementLocation` parameter XPath expression. If missing, the operation will delete the node at the cursor location.

**DeleteElementsOperation**

Deletes the nodes indicated by the `elementLocations` parameter XPath expression. If missing, the operation will delete the node at the cursor location.

**ExecuteCommandLineOperation**

This operation allows you to start a process executing a given command line. It has the following arguments:

- **name**
The name of the operation (or name of the console panel that corresponds to the process run by an action built over this operation).

**workingDirectory**

The path to the directory where the command line is executed. The default value is "." (current directory).

**cmdLine**

The command line to be executed (accepts editor variables (on page 1957)).

**showConsole**

If set to true, the console panel will be displayed in Oxygen XML Editor Eclipse plugin. The default value is false.

**wait**

If set to true, the command line will wait for the operation to finish. The default value is false.

### ExecuteCustomizableTransformationScenarioOperation

Allows you to run a publishing transformation scenario configured at framework level with a specified set of parameters.

**Notice:**

This operation is not applicable to the Oxygen XML Author Component or the Oxygen XML Web Author.

It supports the following arguments:

**scenarioName**

The name of the transformation scenario to execute.

**scenarioParameters**

Provided parameters for the transformation scenario. The parameters are inserted as name=value pairs separated by line breaks. The set parameters are taken into account for XSLT, DITA, Chemistry, and ANT transformation scenario types.

**markInProgressXPathLocation**

XPath expression that identifies the element(s) on which a specific -oxy-transformation-in-progress pseudo class is set before transformation is started. The pseudo class is reset when the transformation ends or is cancelled. If this XPath expression is not defined, the current node is used.

**markOthersInProgressXPathLocation**
XPath expression that identifies other elements on which a specific `oxy-transformation-in-progress-others` pseudo class is set before the transformation is started. The pseudo class is reset when the transformation ends.

**ExecuteMultipleActionsOperation**

This operation allows the execution of a sequence of actions, defined as a list of action IDs. The actions must be defined by the corresponding framework, or one of the common actions for all frameworks supplied by Oxygen XML Editor Eclipse plugin.

**actionIDs**

The action IDs list that will be executed in sequence, the list must be a string sequence containing the IDs separated by commas or new lines.

**ExecuteMultipleWebappCompatibleActionsOperation**

An implementation of an operation that runs a sequence of Oxygen XML Web Author-compatible actions, defined as a list of IDs.

**ExecuteTransformationScenariosOperation**

This operation allows running one or more transformation scenarios defined in the current document type association (on page 2654), in the project options, or in the global options. A use case would be to add a toolbar button that triggers publishing to various output formats. The argument of the operation is:

**scenarioNames**

The list of scenario names that will be executed, separated by new lines.

**ExecuteValidationScenariosOperation**

This operation allows running one or more validation scenarios defined in the current document type association (on page 2654), in the project options, or in the global options. The single argument for the operation is:

**scenarioNames**

The list of scenario names that will be executed, separated by new lines.

**InsertEquationOperation**

Inserts a fragment containing a MathML equation at the cursor offset. The argument of this operation is:

**fragment**

The XML fragment containing the MathML content that should be inserted.
**InsertFragmentOperation**

Inserts an XML fragment at the current cursor position. The selection, if there is one, remains unchanged. The fragment will be inserted in the current context of the cursor position meaning that if the current XML document uses some namespace declarations then the inserted fragment must use the same declarations. The namespace declarations of the inserted fragment will be adapted to the existing namespace declarations of the XML document. For more details about its list of parameters, see Arguments of [InsertFragmentOperation](on page 1963).

**InsertOrReplaceFragmentOperation**

Similar to [InsertFragmentOperation](on page 1944), except it removes the selected content before inserting the fragment. Also, the `insertPosition` parameter has another possible value: `Replace`. If this value is used, the operation deletes the node selected by the XPath expression denoted by the `insertLocation` parameter. For more details about its list of parameters, see Arguments of [InsertFragmentOperation](on page 1963).

**InsertOrReplaceTextOperation**

Inserts a text at current position removing the selected content, if any. The argument of this operation is:

`text`

The text section to insert.

**InsertXIncludeOperation**

Insert an `xInclude` element at the cursor offset. Opens a dialog box that allows you to browse and select content to be included in your document and automatically generates the corresponding XInclude instruction.

**JSOperation**

Allows you to call the Java API from custom JavaScript content. For some sample `JSOperation` implementations, see [https://github.com/oxygenxml/javascript-sample-operations](https://github.com/oxygenxml/javascript-sample-operations).

Notice:

For the Oxygen XML Web Author, this operation cannot be invoked using the JavaScript API. However, it can be used when configuring an Action for Author mode using the Document Type Configuration dialog box (on page 101).

This operation accepts the following parameter:

`script`

The JavaScript content to execute. It must have a function called `doOperation()`, which can use the predefined `authorAccess` variable. The `authorAccess` variable has access to the entire `ro.sync.ecss.extensions.api.AuthorAccess` Java API.
The following example is a script that retrieves the current value of the `type` attribute on the current element, allows the end-user to edit its new value and sets the new value in the document:

```javascript
function doOperation(){
    //The current node is either entirely selected...
    currentNode = authorAccess.getEditorAccess().getFullySelectedNode();
    if(currentNode == null){
        //or the cursor is placed in it
        caretOffset = authorAccess.getEditorAccess().getCaretoffset();
        currentNode = authorAccess.getDocumentController().getNodeAtOffset(caretOffset);
    }
    //Get current value of the @type attribute
    currentTypeValue = "";
    currentTypeValueAttr = currentNode.getAttribute("type");
    if(currentTypeValueAttr != null){
        currentTypeValue = currentTypeValueAttr.getValue();
    }
    //Ask user for new value for attribute.
    newTypeValue = javax.swing.JOptionPane.showInputDialog("Input @type value", currentTypeValue);
    if(newTypeValue != null){
        //Create and set the new attribute value for the @type attribute.
        attrValue = new Packages.ro.sync.ecss.extensions.api.node.AttrValue(newTypeValue);
        authorAccess.getDocumentController().setAttribute("type", attrValue, currentNode);
    }
}
```

**Tip:**
You can call functions defined inside a script called `commons.js` from your custom script content so that you can use that external script file as a library of functions. Note that this `commons.js` file must be placed in the root of the `framework` directory (for example, `[OXYGEN_INSTALL_DIR]/frameworks/dita/commons.js`) because that is the only location where Oxygen XML Editor Eclipse plugin will look for it.

**MoveCaretOperation**

Flexible operation for moving the cursor within a document and it is also capable of performing a selection. The operation accepts the following arguments:

- `xpathLocation`
An XPath expression that identifies the node relative to where the cursor will be moved. If the expression identifies more than one node, only the first one will be taken into account.

**position**

The position relative to the node obtained from the XPath expression where the cursor will be moved. When also choosing to perform a selection, you can use the following possible values:

- **Before** - Places the cursor at the beginning of the selection.
- **Inside, at the beginning** - Places the cursor at the beginning of the selection.
- **After** - Places the cursor at the end of the selection.
- **Inside, at the end** - Places the cursor at the end of the selection.

**selection**

Specifies if the operation should select the element obtained from the XPath expression, its content, or nothing at all. The possible values of the argument are: None, Element, and Content.

**MoveElementOperation**

Flexible operation for moving an XML element to another location from the same document. XPath expressions are used to identify the source element and the target location. The operation takes the following parameters:

**sourceLocation**

XPath expression that identifies the content to be moved.

**deleteLocation**

XPath expression that identifies the node to be removed. This parameter is optional. If missing, the sourceLocation parameter will also identify the node to be deleted.

**surroundFragment**

A string representation of an XML fragment. The moved node will be wrapped in this string before moving it in the destination.

**targetLocation**

XPath expression that identifies the location where the node must be moved to.

**insertPosition**

Argument that indicates the insert position.

**moveOnlySourceContentNodes**

When set to true, only the content of the source element is moved.

**processTrackedChangesForXPathLocations**

When nodes are located via an XPath expression and the nodes are deleted with Change Tracking (on page 2659) enabled, they are considered as being present by default (thus, the change tracking is ignored). If you set this argument to true and change tracking is enabled,
deleted nodes will be ignored when the XPath locations are computed (thus, the change tracking is NOT ignored).

alwaysPreserveTrackedChangesInMovedContent

When set to true, tracked changes are included when a copied fragment is inserted in a document, regardless of the current state of the Track Changes feature.

OpenInSystemAppOperation

Opens a resource in the system application that is associated with the resource in the operating system. The arguments of this operation are:

resourcePath

An XPath expression that, when executed, returns the path of the resource to be opened. Editor variables (on page 218) are expanded in the value of this parameter, before the expression is executed.

isUnparsedEntity

Possible values are true or false. If the value is true, the value of the resourcePath argument is treated as the name of an unparsed entity.

ReloadContentOperation

Reloads the content of the editor by re-reading the information from the URL used to open it. It accepts the following argument:

markAsNotModified

The possible values are true and false. After reloading the editor, the content may appear as modified and in some cases where the content is already present on the file server, you would not want the user to save it again. You can set this flag to true to prevent the editor from showing the content as modified.

RemovePseudoClassOperation

An operation that removes a pseudo-class from an element. Accepts the following parameters:

name

Name of the pseudo-class to be removed.

includeAllNodes

The possible values are yes and no. If set to yes, comments, CDATA, and text nodes are included when evaluating XPath expressions. If set to no, they are ignored.

elementLocation
The XPath location that identifies the element. If it is not defined, then the element at the cursor position is used. It can also identify multiple elements, in which case the pseudo class will be removed from all of them.

Example:

Suppose that there is a pseudo-class called `myClass` on the element `paragraph` and there are CSS styles matching the pseudo-class.

```
paragraph:myClass{
  font-size:2em;
  color:red;
}
paragraph{
  color:blue;
}
```

In the previous example, by removing the pseudo-class, the layout of the `paragraph` is rebuilt by matching the other rules (in this case, the foreground color of the `paragraph` element will become blue.

**RenameElementOperation**

This operation allows you to rename all occurrences of the elements identified by an XPath expression. The operation requires two parameters:

- **elementName**
  The new element name.

- **elementLocation**
  The XPath expression that identifies the element occurrences to be renamed. If this parameter is missing, the operation renames the element at current cursor position.

**ReplaceElementContentOperation**

An operation that replaces the content of the element at the cursor location (or fully selected element). The operation accepts the following parameters:

- **fragment**
  Specifies the fragment that will be inserted as the element content.

- **elementLocation**
  An XPath expression that identifies the element. If it is not defined, then the element at the cursor position is used.
SetPseudoClassOperation

An operation that sets a pseudo-class to an element. The operation accepts the following parameters:

- **elementLocation**
  An XPath expression that identifies the element that will have the pseudo-class set. If it is not defined, then the element at the cursor position is used.

- **name**
  The pseudo-class local name.

- **includeAllNodes**
  The possible values are *yes* and *no*. If set to *yes*, comments, CDATA, and text nodes are included when evaluating XPath expressions. If set to *no*, they are ignored.

ShowElementDocumentationOperation

Opens the associated specification HTML page for the current element. The operation accepts as parameter a URL pattern that points to the HTML page containing the documentation.

StopCurrentTransformationScenarioOperation

Allows you to stop the transformation scenario that is currently running.

**Notice:**

This operation is not applicable to the Oxygen XML Author Component or the Oxygen XML Web Author.

SurroundWithFragmentOperation

Surrounds the selected content with a text fragment. Since the fragment can have multiple nodes, the surrounded content will be always placed in the first leaf element. If there is no selection, the operation will simply insert the fragment at the cursor position. For more details about the list of parameters go to: Arguments of SurroundWithFragmentOperation (on page 1965).

SurroundWithTextOperation

This operation has two arguments (two text values) that will be inserted before and after the selected content. If there is no selected content, the two sections will be inserted at the cursor position. The arguments of the operation are:

- **header**
  The text that is placed before the selection.

- **footer**
  The text that is placed after the selection.
TogglePseudoClassOperation

An implementation of an operation to toggle on/off the pseudo-class of an element. Accepts the following parameters:

name

   Name of the pseudo-class to be toggled on/off.

includeAllNodes

   The possible values are yes and no. If set to yes, comments, CDATA, and text nodes are included when evaluating XPath expressions. If set to no, they are ignored.

elementLocation

   The XPath location that identifies one or more elements that will have the pseudo class toggled. If it is not defined, then the element at the cursor position is used.

Example:

```xml
paragraph:myClass{
    color:red;
}
paragraph{
    color:blue;
}
```

By default, the paragraph content is rendered in blue. Suppose that you have a TogglePseudoClassOperation configured for the myClass pseudo-class. Invoking it the first time will set the myClass pseudo-class and the paragraph will be rendered in red. Invoking the operation again, will remove the pseudo-class and the visible result will be a blue rendered paragraph element.

ToggleSurroundWithElementOperation

This operation allows wrapping and unwrapping content in a specific wrapper element that can have certain attributes specified on it. It is useful to implement toggle actions such as highlighting text as bold, italic, or underline. The operation supports processing multiple selection intervals, such as multiple cells within a table column selection. The arguments of the operation are:

element

   The element to wrap or unwrap content.

schemaAware

   This argument applies only on the surround with element operation and controls whether or not the insertion is valid, based upon the schema. If the insertion is not valid, then wrapping action will be broken up into smaller intervals until the wrapping action is valid. For example, if you try
to wrap a *paragraph* element with a *bold* element, it would not be valid, so the operation will wrap the text inside the paragraph instead, since it would be valid at that position.

**ToggleCommentOperation**

This operation allows for commenting or un-commenting the selected content. It does not have any arguments. If the selection is text, the operation wraps the selection in a comment. If the selection is a comment, the operation removes the comment.

**UnwrapTagsOperation**

This operation allows removing the element tags either from the current element or for an element identified with an XPath location. The argument of the operation is:

- `unwrapElementLocation`
  
  An XPath expression that identifies the element to unwrap. If it is not defined, the element at the cursor position is unwrapped.

**XQueryUpdateOperation**

Allows you to execute an XQuery Update script directly over content in **Author** mode.

**Notice:**

This operation is not applicable to the Oxygen XML Author Component or the Oxygen XML Web Author.

It supports the following arguments:

- `script`
  
  The XQuery Update script to be executed. The value can either be an XQuery script or a URL that points to the XQuery Update script. You can use the `$\{framework\}` or `$\{frameworkDir\}` editor variables to refer the scripts from the framework directory.

  The script will be executed in the context of the node at the cursor position. If the script declares the following variable, it will also receive the selected nodes (assuming that entire nodes are selected):

  ```
  declare variable $oxyxq:selection external;
  ```

  In the example below (on page 1952), you can see how this argument is used.

- `externalParams`

  A string that can assign multiple key-value pairs separated by a comma or a new line character.

  For example, if an XQuery script declares two external parameters like this:
You can pass custom values for each parameter by setting the `externalParams` to `param1=value1,param2=value2`.

**expandXincludeReferences**

Makes all `Xinclude` elements transparent to the XQuery transformer. When the `Xinclude` references are transparent, the `XQueryUpdateOperation` can use the referenced elements for further processing in the current document, but it cannot change their values in the original document. The default value is `false`, which means the `Xinclude` elements are not transparent.

An example of an `XQuery Update Script` that converts paragraphs to list items:

```xml
declare namespace oxyxq = "http://www.oxygenxml.com/ns/xqu";
(
); This variable will be linked to the selected nodes assuming that there are actually fully selected nodes. For example this selection will return null:
<p>{SEL_START}text{SEL_END} in para</p>
but this will give two "p" elements:
{SEL_END}<p>text</p><p>text2</p>{SEL_END}

If a multiple selection exists it will also be processed and forwarded.
Again, only fully selected nodes will be passed.

(): We will process either the selection or the context node :)
let $toProcess := if (empty($oxyxq:selection)) then
  (.)
else
  ($oxyxq:selection)
return if (not(empty($toProcess))) then
  {
    (: Create the list :)}
  let $ul :=
    <ul>
      { for $sel in $toProcess
        return
          <li>{$sel}</li>
        }
    </ul>

```
XSLTOperation and XQueryOperation

Applies an XSLT or XQuery script on a source element and then replaces or inserts the result in a specified target element.

Notice:

For Oxygen XML Web Author, these operations cannot be invoked using the JavaScript API.

These operations accept the following parameters:

sourceLocation

An XPath expression indicating the element that the script will be applied on. If it is not defined, then the element at the cursor position will be used.

There may be situations where you want to look at an ancestor of the current element and make decisions in the script based on that. To do this, you can set the sourceLocation to point to an ancestor node then use the oxy:current-element() function to access the current element, as in the following example:

```xml
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform" version="2.0"
    xpath-default-namespace="http://docbook.org/ns/docbook"
    xmlns:oxygen="http://www.oxygenxml.com/ns/author/xpath-extension-functions"
    exclude-result-prefixes="oxy">
    <xsl:template match="/">
        <xsl:apply-templates select="oxy:current-element()"/>
    </xsl:template>

    <xsl:template match="para">
        <!-- And the context is again inside the current element, but we can use information from the entire XML -->
    </xsl:template>
</xsl:stylesheet>
```
targetLocation

An XPath expression indicating the insert location for the result of the transformation. If it is not defined then the insert location will be at the cursor location.

script

The script content (XSLT or XQuery). The base system ID for this will be the framework file, so any include/import reference will be resolved relative to the .framework file that contains this action definition.

For example, for the following script, the imported xslt_operation.xsl needs to be located in the current framework directory.

```xml
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
    version="1.0">
    <xsl:import href="xslt_operation.xsl"/>
</xsl:stylesheet>
```

You can also use a path for an included or imported reference. When using a path, the following apply:

- A relative path is resolved to the framework directory.
- The $[framework] editor variable (on page 225) can also be used to reference resources from the framework directory.
- The path is passed through the catalog mappings. It helps to use an absolute URL (for instance, http://www.oxygenxml.com/fr/testy.xsl) and map it in the catalog.xml file from the framework directory to a resource from the framework.

action

The insert action relative to the node determined by the target XPath expression. It can be: Replace, At cursor position, Before, After, Inside as first child or Inside as last child.

caretPosition

The position of the cursor after the action is executed. It can be: Preserve, Before, Start, First editable position, End, or After. If this parameter is not set, you can still indicate the position of the cursor by using the $[caret] editor variable (on page 223) in the inserted content.

expandEditorVariables
Parameter controlling the expansion of editor variables (on page 218) returned by the script processing. Expansion is enabled by default.

**suspendTrackChanges**

It has 2 possible values (`true` and `false`). The default value is `false`. When set to `true`, the Track Changes (on page 2659) feature is deactivated. When using this argument, after the action is finished, the state of the Track Changes feature is restored to its initial value.

**externalParams**

A string that can assign multiple key-value pairs separated by a comma or a new line character.

For example, if an XQuery script declares two external parameters like this:

```
declare variable $param1 external;
declare variable $param2 external;
```

You can pass custom values for each parameter by setting the **externalParams** to `param1=value1,param2=value2`.

**escapeEntityRefs**

Escapes entity references in processed content to plain text and unescapes them back in the returned content.

**XSLTOperation Example: Sort a list with respect to the language declared on the root element:**

Suppose you want an action that will sort a list with respect to the language declared on the root element and you have an XML file like this:

```
<article xml:lang="en">
  <ul>
    <li>B</li>
    <li>C</li>
    <li>A</li>
  </ul>
</article>
```

The XSLTOperation needs to be configured as follows:

- **sourceLocation** is set to `/*` so that the script has access to the root element and its children.
- **targetLocation** is left untouched (assuming that the action is active only when the cursor is inside the list).

The XSLT script would look like this:

```xml
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
 xmlns:oxygen="http://www.oxygenxml.com/ns/author/xpath-extension-functions"
 xmlns:xs="http://www.w3.org/2001/XMLSchema"
 exclude-result-prefixes="xs oxy" version="2.0">
```
Using Entities and Xincludes with the XSLTOperation

- **Entities** are treated as plain text and not expanded.
- **Xincludes** are resolved in the result, and you can alter the XML obtained afterward using the XSLT/XQuery script of the operation, but you cannot alter the included document itself.
Editor Variables in Author Mode Operations

**Author** mode operations can include parameters that contain the following **editor variables** *(on page 218):*

- **${caret}** - The position where the cursor is located. This variable can be used in a code template, in **Author** mode operations, or in a **selection plugin**.

  Note:
  
  The **${caret}** editor variable is available only for parameters that take XML content as values. It is replaced with the **${UNIQUE_CARET_MARKER_FOR_AUTHOR}** macro. The default **Author** operations process this macro and position the cursor at the designated offset.

- **${selection}** - The currently selected text content in the currently edited document. This variable can be used in a code template, in **Author** mode operations, or in a **selection plugin**.

- **${ask('message', type, ('real_value1':'rendered_value1'; 'real_value2':'rendered_value2'; ...), 'default-value', @id)}** - To prompt for values at runtime, use the **ask('message', type, ('real_value1':'rendered_value1'; 'real_value2':'rendered_value2'; ...), 'default-value'')** editor variable. You can set the following parameters:
  - **'message'** - The displayed message. Note the quotes that enclose the message.
  - **'default-value'** - Optional parameter. Provides a default value.
  - **@id** - Optional parameter. Used for identifying the variable to reuse the answer using the **${answer(@id)}** editor variable.
  - **type** - Optional parameter (defaults to **generic**), with one of the following values:

    Note:
    
    The title of the dialog box will be determined by the type of parameter and as follows:
    - For **url** and **relative_url** parameters, the title will be the name of the parameter and the value of the **'message'**.
    - For the other parameters listed below, the title will be the name of that respective parameter.
    - If no parameter is used, the title will be "Input".
Notice:
Editor variables that are used within a parameter of another editor variable must be escaped within single quotes for them to be properly expanded. For example:

```
${ask('Provide a date', generic, '${date(yyyy-MM-dd'T'HH:MM)}')}
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Format: <code>${ask('message', parameter, 'default')}</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>generic</td>
<td>Description: The input is considered to be generic text that requires no special handling.</td>
</tr>
</tbody>
</table>
|             | Example:  
|             | • `${ask('Hello world!')}` - The dialog box has a *Hello world!* message displayed.  
|             | •`${ask('Hello world!', generic, 'Hello again!')}` - The dialog box has a *Hello world!* message displayed and the value displayed in the input box is *Hello again!* |
| url         | Description: Input is considered a URL. Oxygen XML Editor Eclipse plugin checks that the provided URL is valid. |
|             | Example:  
|             | • `${ask('Input URL', url)}` - The displayed dialog box has the name *Input URL*. The expected input type is URL.  
|             | •`${ask('Input URL', url, 'http://www.example.com')}` - The displayed dialog box has the name *Input URL*. The expected input type is URL. The input field displays the default value *http://www.example.com* |
| relative_url| Description: Input is considered a URL. This parameter provides a file chooser, along with a text field. Oxygen XML Editor Eclipse plugin tries to make the URL relative to that of the document you are editing. |

Note:
If the $ask editor variable is expanded in content that is not yet saved (such as an untitled file, whose path cannot be determined), then Oxygen XML Editor Eclipse plugin will transform it into an absolute URL.
| Parameter | Format: `${ask('message', password, 'default')}`
|-----------|--------------------------------------------------|
| password  | **Description:** The input is hidden with bullet characters. **Example:**
|           | • `${ask('Input password', password)}` - The displayed dialog box has the name 'Input password' and the input is hidden with bullet symbols.
|           | • `${ask('Input password', password, 'abcd')}` - The displayed dialog box has the name 'Input password' and the input hidden with bullet symbols. The input field already contains the default **abcd** value. |
| combobox  | **Description:** Displays a dialog box that offers a drop-down menu. The drop-down menu is populated with the given rendered_value values. Choosing such a value will return its associated value (real_value).
|           | **Note:** The list of 'real_value':rendered_value' pairs can be computed using `${xpath_eval()}`.
|           | **Note:** The 'default' parameter specifies the default-selected value and can match either a key or a value. **Example:**
|           | • `${ask('Operating System', combobox, ('win':'Microsoft Windows';'macos':'macOS';'lnx':'Linux/UNIX'), 'macos')}` - The dialog box has the name 'Operating System'. The drop-down menu displays the three given operating systems. The associated value will be returned based upon your selection.
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Note:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>In this example, the default value is indicated by the osx key. However, the same result could be obtained if the default value is indicated by macOS, as in the following example: ${ask('Operating System', combobox, ('win':'Microsoft Windows';'macos':'macOS';'lnx':'Linux/UNIX'), 'macOS')}</td>
</tr>
<tr>
<td>editable_combobox</td>
<td>• ${ask('Mobile OS', combobox, ('ios':'iOS';'and':'Android'), 'Android')}</td>
</tr>
<tr>
<td></td>
<td>• ${ask('Mobile OS', combobox, (${xpath_eval(for $pair in ([‘ios’, ‘iOS’], [‘and’, ‘Android’]) return ‘’</td>
</tr>
<tr>
<td>Format: ${ask('message', editable_combobox, (‘real_value1’:’rendered_value1’;…;’real_valueN’:’rendered_valueN’), ‘default’)}</td>
<td>Description: Displays a dialog box that offers a drop-down menu with editable elements. The drop-down menu is populated with the given rendered_value values. Choosing such a value will return its associated real value (real_value) or the value inserted when you edit a list entry.</td>
</tr>
<tr>
<td></td>
<td>• ${ask('Operating System', editable_combobox, (‘win’:’Microsoft Windows’;’macos’:’macOS’;’lnx’:’Linux/UNIX’), ’macos’)} - The dialog box has the name ’Operating System’. The drop-down menu displays the three given operating systems and also allows you to edit the entry. The associated value will be returned based upon your selection or the text you input.</td>
</tr>
<tr>
<td>Description:</td>
<td>The list of ‘real_value’:‘rendered_value’ pairs can be computed using ${xpath_eval()}.</td>
</tr>
<tr>
<td></td>
<td>The ’default’ parameter specifies the default-selected value and can match either a key or a value.</td>
</tr>
<tr>
<td>Example:</td>
<td>• ${ask('Operating System', editable_combobox, (‘win’:’Microsoft Windows’;’macos’:’macOS’;’lnx’:’Linux/UNIX’), ’macos’)} - The dialog box has the name ’Operating System’. The drop-down menu displays the three given operating systems and also allows you to edit the entry. The associated value will be returned based upon your selection or the text you input.</td>
</tr>
</tbody>
</table>
### Parameter

<table>
<thead>
<tr>
<th>radio</th>
</tr>
</thead>
</table>

**Format:** \${\text{ask('message', radio, (‘real_value1’:’rendered_value1’;…;’real_valueN’:’rendered_valueN’), ‘default’)}}

**Description:** Displays a dialog box that offers a series of radio buttons. Each radio button displays a ‘rendered_value’ and will return an associated `real_value`.

**Note:**
The list of `real_value`:’rendered_value’ pairs can be computed using `\${xpath_eval()}`.

**Note:**
The ‘default’ parameter specifies the default-selected value and can match either a key or a value.

**Example:**

- \${\text{ask('Operating System', radio, (’win’:’Microsoft Windows’;’macos’:’macOS’;’lnx’:’Linux/UNIX’), ’macos’)}} - The dialog box has the name ‘Operating System’. The radio button group allows you to choose between the three operating systems.
  
  **Note:**
  In this example, `macOS` is the default-selected value and if selected, it would return `macos` for the output.

**Examples:**

- `\${timeStamp}` - The timestamp, which is the current time in Unix format. For example, it can be used to save transformation results in multiple output files on each transformation.
- `\${uuid}` - Universally unique identifier, a unique sequence of 32 hexadecimal digits generated by the Java UUID class.
- `\${id}` - Application-level unique identifier. It is a short sequence of 10-12 letters and digits that is not guaranteed to be universally unique.
- `\${cfm}` - Current file name without the extension and parent folder. The current file is the one currently open and selected.
- `\${cfne}` - Current file name with extension. The current file is the one currently open and selected.
- `\${cf}` - Current file as file path, that is the absolute file path of the currently edited document.
• ${{cfd}} - Current file folder as file path, that is the path of the currently edited document up to the name of the parent folder.
• ${{frameworksDir}} - The path (as file path) of the frameworks directory. When used to define references inside a framework configuration, it expands to the parent folder of that specific framework folder. Otherwise, it expands to the main frameworks folder defined in the Document Type Association > Locations preferences page.
• ${{pd}} - The file path to the folder that contains the current project file (.xpr).
• ${{oxygenInstallDir}} - Oxygen XML Editor Eclipse plugin installation folder as file path.
• ${{homeDir}} - The path (as file path) of the user home folder.
• ${{pn}} - Current project name.
• ${{env(VAR_NAME)}} - Value of the VAR_NAME environment variable. The environment variables are managed by the operating system. If you are looking for Java System Properties, use the ${{system(var.name)}} editor variable.
• ${{date(pattern)}} - Current date. The allowed patterns are equivalent to the ones in the Java SimpleDateFormat class. Example: yyyy-MM-dd.

Note:
This editor variable supports both the xs:date and xs:datetime parameters. For details about xs:date, go to: http://www.w3.org/TR/xmlschema-2/#date. For details about xs:datetime, go to: http://www.w3.org/TR/xmlschema-2/#dateTime.

How to Find More Information About the Arguments of an Operation

If you need to find more information about the arguments of an operation, there are several places where this information is available:

• In the API documentation for the particular operation.
• By invoking the getArguments() method on the operation.
• In the source code of the operation.
• In Oxygen XML Editor Eclipse plugin:
  1. Go to Options > Preferences > Document Type Association, select a document type and click the New, Edit, Duplicate, or Extend button (on page 88).
  2. Go to the Author tab and then the Actions subtab. At the bottom of this subtab, click + New to open the Action dialog box (on page 98).
  3. Locate the Operation field and click the Choose button on the right side. This will open a dialog box that displays the default operations.
  4. Double-click the operation (or select it and click OK).

The arguments for the operation will now be displayed in the Action dialog box (on page 98).
Arguments of InsertFragmentOperation

fragment

This argument has a textual value. This value is parsed by Oxygen XML Editor Eclipse plugin as it was already in the document at the cursor position. You can use entity references declared in the document and it is namespace aware. The fragment may have multiple roots.

You can even use namespace prefixes that are not declared in the inserted fragment, if they are declared in the document where the insertion is done. For the sake of clarity, you should always prefix and declare namespaces in the inserted fragment!

If the fragment contains namespace declarations that are identical to those found in the document, the namespace declaration attributes will be removed from elements contained by the inserted fragment.

There are two possible scenarios:

• **Prefixes that are not bound explicitly**

For instance, the fragment:

```xml
<x:item id="dty2"/>
&ent;
<x:item id="dty3"/>
```

Can be correctly inserted in the document: ('|' marks the insertion point):

```xml
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE x:root [  
  <!ENTITY ent "entity">  
]>

<x:root xmlns:x="nsp">
  |
</x:root>
```

Result:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE x:root [  
  <!ENTITY ent "entity">  
]>

<x:root xmlns:x="nsp">
  <x:item id="dty2"/>
  &ent;
  <x:item id="dty3"/>
</x:root>
```
• **Default namespaces**

If there is a default namespace declared in the document and the *document fragment (on page 2653)* does not declare a namespace, the elements from the fragment are considered to be in **no namespace**.

For instance, the fragment:

```xml
<item id="dty2"/>
<item id="dty3"/>
```

Inserted in the document:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<root xmlns="nsp">
  |
</root>
```

Gives the result document:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<root xmlns="nsp">
  <item xmlns="" id="dty2"/>
  <item xmlns="" id="dty3"/>
</root>
```

**insertLocation**

An XPath expression that is relative to the current node. It selects the reference node for the fragment insertion. When missing, the fragment will be inserted at the cursor position.

**insertPosition**

Specifies where the insertion is made relative to the reference node selected by the *insertLocation*. It can be one of the following constants:

- **Inside as first child** (default value) - The fragment is inserted as first child of the reference node.
- **Inside as last child** - The fragment is inserted as the last child of the reference node.
- **After** - The fragment is inserted after the reference node.
- **Before** - The fragment is inserted before the reference node.

**goToNextEditablePosition**

After inserting the fragment, the first editable position is detected and the cursor is placed at that location. It handles any in-place editors used to edit attributes. It will be ignored if the fragment specifies a cursor position using the `$({caret})` editor variable (*on page 223*). The possible values of this action are **true** and **false**.
**schemaAware**

This argument applies only on the surround with element operation and controls whether or not the insertion is valid, based upon the schema. If the insertion is not valid, then wrapping action will be broken up into smaller intervals until the wrapping action is valid. For example, if you try to wrap a `paragraph` element with a `bold` element, it would not be valid, so the operation will wrap the text inside the paragraph instead, since it would be valid at that position.

**insertEvenIfInvalid**

The possible values of this argument are `true` and `false`. If `true`, the content that would make the document invalid is accepted. If `false` and the insertion is not valid, the operation will not be executed and an error message will be displayed.

**Arguments of SurroundWithFragmentOperation**

**fragment**

The XML fragment that will surround the selection. For example, consider the fragment:

```xml
<F>
  <A>
  </A>
  <B>
    <C></C>
  </B>
</F>
```

and the document:

```xml
<doc>
  <X></X>
  <Y></Y>
  <Z></Z>
</doc>
```

Considering the selected content to be surrounded is the sequence of elements ₱ and ₲, then the result is:

```xml
<doc>
  <F>
    <A>
      <X></X>
      <Y></Y>
    </A>
  </F>
</doc>
```
Since the element was the first leaf in the fragment, it received the selected content. The fragment was then inserted in the place of the selection.

Note:
If the first leaf is not the desired location for the surrounded fragment, you can use `ro.sync.ecss.extensions.commons.operations.InsertOrReplaceFragmentOperation` and set the following arguments:

- **fragment**
  The XML fragment that will surround the selection. Use the `${selection}` editor variable in the location you want to place the surrounded fragment.

- **schemaAware**
  Set it to `false` to avoid moving the fragment if it is not valid at the given location.

**schemaAware**
This argument applies only on the surround with element operation and controls whether or not the insertion is valid, based upon the schema. If the insertion is not valid, then wrapping action will be broken up into smaller intervals until the wrapping action is valid. For example, if you try to wrap a `paragraph` element with a `bold` element, it would not be valid, so the operation will wrap the text inside the paragraph instead, since it would be valid at that position.

Note:
If a selection exists, the surround with fragment operation is not schema aware.

Adding a Custom Operation to an Existing Framework
This task explains how to add a custom Author mode operation to an existing framework (document type).

1. Set up a sample project.
2. A variety of classes implement the `ro.sync.ecss.extensions.api.AuthorOperation` interface. Depending on your use-case, modify one of these classes.
3. Pack the operation class inside a Java JAR library.
4. Copy the JAR library to your framework directory (for example, `{OXYGEN_INSTALL_DIR}/frameworks/[FRAMEWORK_DIR]`).
5. Open the Preferences dialog box (on page 70), go to Document Type Association, and edit the document type (you need write access to the `{OXYGEN_INSTALL_DIR}`) to open the Document Type configuration dialog box (on page 90).
a. In the **Classpath** tab, add a reference to your JAR library (for example, \${framework}/customAction.jar).

b. Go to the **Author** tab, then go to the **Actions** subtab.

c. Click the **New** button and use the **Action dialog box** *(on page 98)* to create a new action that uses your custom operation.

d. Mount the action to the toolbars or menus. You can also define a shortcut key.

6. **Share the modifications** *(on page 2077)* with your colleagues. The files that should be shared are your customAction.jar library and the .framework configuration file from the \{OXYGEN_INSTALL_DIR\}/frameworks/[FRAMEWORK_DIR] directory.

**Related Information:**

*AuthorOperation API*

**Example: Configuring the Insert Section Action for a Framework**

This topic describes the procedure for defining the **Insert Section** action for a custom framework *(on page 2655)*. It is assumed that the icon files, ![Section16.gif](#) for the menu item and ![Section20.gif](#) for the toolbar, are already available. Although you could use the same icon size for both the menu and toolbar, usually the icons from the toolbars are larger than the ones found in the menus. These files should be placed in your custom framework directory ([OXYGEN_INSTALL_DIR]\frameworks\[CUSTOM_FRAMEWORK_DIR]).

**Figure 508. Action Dialog Box**
1. Set the **ID** field to *insert_section*. This is a unique action identifier.
2. Set the **Name** field to *Insert Section*. This will be the action’s name, displayed as a tooltip when the action is placed in the toolbar, or as the menu item name.
3. Set the **Menu access key** to *i*. On Windows, the menu items can be accessed using **Alt+letter** keys combination, when the menu is visible. The *letter* is visually represented by underlining the first letter from the menu item name having the same value.
4. Add a **Description**.
5. Set the **Large icon (20x20)** field to *${framework}/Section20.gif*. A good practice is to store the image files inside the *framework* directory and use editor variable *(on page 218)* *${framework}* to make the image relative to the *framework* location. If the images are bundled in a *JAR* *(on page 2655)* archive together with some Java operations implementation, for instance, it might be convenient for you to reference the images not by the file name, but by their relative path location in the class-path. If the image file *Section20.gif* is located in the *images* directory inside the *JAR* archive, you can reference it by using */images/Section20.gif*. The *JAR* file must be added into the *Classpath* list.
6. Set the **Small icon (16x16)** field to *${framework}/Section16.gif*.
7. Click the text field next to **Shortcut key** and set it to **Ctrl+Shift+S** *(Meta+Shift+S on macOS)*. This will be the key combination to trigger the action using the keyboard only. The shortcut is enabled only by adding the action to the main menu of **Author mode** *(on page 1970)*, which contains all the actions that the author will have in a menu for the current document type.
8. At this time the action has no functionality added to it. Next you must define how this action operates. An action can have multiple operation modes. The first action mode enabled by the evaluation of its associated XPath expression will be executed when the action is triggered by the user. The XPath expression needs to be version 2.0 and its scope must be only element and attribute nodes of the edited document. Otherwise, the expression will not return a match and will not trigger the action. If the expression is left empty, the action will be enabled anywhere in the scope of the root element. For this example, suppose you want the action to add a section only if the current element is either a *<book>* , *<article>* , or another *<section>*.
   a. Set the XPath expression field to:
      
      ```
      local-name()='section' or local-name()='book' or
      local-name()='article'
      ```
   b. Set the **invoke operation** field to *InsertFragmentOperation* built-in operation, designed to insert an XML fragment at the cursor position. This belongs to a set of built-in operations, a complete list of which can be found in the **Author Default Operations** *(on page 1940)* section. This set can be expanded with your own Java operation implementations.
   c. Configure the arguments section as follows:
      
      ```
      <section xmlns="http://www.oxygenxml.com/sample/documentation">
      ```
Example: Configuring the Insert Table Action for a Framework

This topic describes the procedure for defining the Insert Table action for a custom framework (on page 2655). Suppose that you want to create an action that inserts a table with three rows and three columns into a document and the first row is the table header. As with the insert section action (on page 1967), you will use the InsertFragmentOperation built-in operation.

Place the icon files for the menu item, and for the toolbar, in your custom framework directory ([OXYGEN_INSTALL_DIR]/frameworks/[CUSTOM_FRAMEWORK_DIR]).

1. Set ID field to insert_table.
2. Set Name field to Insert table.
3. Set Menu access key field to t.
4. Set Description field to Adds a table element.
5. Set Toolbar icon to ${framework} / toolbarIcon.png.
6. Set Menu icon to ${framework} / menuIcon.png.
7. Set Shortcut key to Ctrl + Shift + T (Command + Shift + T on macOS).
8. Set up the action's functionality:

   a. Set XPath expression field to true().
      true() is equivalent with leaving this field empty.

   b. Set Invoke operation to use InsertFragmentOperation built-in operation that inserts an XML fragment to the cursor position.

   c. Configure operation's arguments as follows:

      fragment - set it to:

      ```xml
      <table xmlns="http://www.oxygenxml.com/sample/documentation">
      <header><td/> <td/> <td/> </header>
      <tr><td/> <td/> <td/> </tr>
      <tr><td/> <td/> <td/> </tr>
      <tr><td/> <td/> <td/> </tr>
      </table>
      ```

      insertLocation - to add tables at the end of the section use the following code:

      ```xml
      ancestor::section/*[last()]
      ```

      insertPosition - Select After.
Using Retina/HiDPI Icons for the Actions from a Framework

Higher resolution icons can also be included in customized frameworks (on page 2655) for rendering them in a Retina or HiDPI display. The icons can be referenced directly from the Document Type Configuration dialog box (on page 90) (from the Action dialog box (on page 98)) or from an API (ro.sync.exml.workspace.api.node.customizer.XMLNodeRendererCustomizer (on page 2058)).

As with any image, the higher resolution icons are stored in the same images folder as the normal resolution images and they are identified by a scaling factor that is included in the name of the image files. For instance, icons with a Retina scaling factor of 2 will include @2x in the name (for example, myIcon@2x.png).

Developers should not specify the path of the alternate icons (@2x or @3x) in the Action dialog box (on page 98) or the XMLNodeRendererCustomizer API (on page 2058). When using a Retina or HiDPI display, Oxygen XML Editor Eclipse plugin automatically searches the folder of the normal icon for a corresponding image file with a Retina scaling factor in the name. If the higher resolution icon file does not exist, the normal icon is scaled and used instead.

Related Information:
Retina/HiDPI Images in Author Mode (on page 494)

Customizing the Menu for a Framework

Defined actions can be grouped into customized menus in the Oxygen XML Editor Eclipse plugin menu bar.

1. Open the Document Type configuration dialog box (on page 90), select your custom framework (on page 2655), and go to the Author tab.
2. Go to the Menu subtab. In the left side you have the list of actions and some special entries:
   ◦ Submenu - Creates a submenu. You can nest an unlimited number of menus.
   ◦ Separator - Creates a separator into a menu. This way you can logically separate the menu entries.
3. The right side of the panel displays the current actions for that menu tree. To change its name, click this label to select it, then click the Edit button.
4. Select the Submenu label in the left panel section and the appropriate label in the right panel section, then click the Add as child button. Change the submenu name to Table, using the Edit button.
5. Select the Insert section action in the left panel section and the Table label in the right panel section, then click the Add as sibling button.
6. Now select the Insert table action in the left panel section and the Table in the right panel section. Click the Add as child button.
When opening a test document for a custom framework in Author mode, the menu you created is displayed in between the Tools and the Document menus. The upper part of the menu contains generic Author mode actions (common to all document types) and the two actions created previously (with Insert table under the Table submenu).

Customizing the Contextual Menu for a Framework

The contextual menu is displayed when you right-click in the Author editing area. You can only configure the bottom part of the menu, since the top part is reserved for a list of generic actions (such as Copy, Paste, Undo, etc.)

1. Open the Document Type configuration dialog box (on page 90) for the particular framework (on page 2655) and go to the Author tab. Next, go to the Contextual Menu subtab.
2. Follow the same steps as explained in the Configuring the Main Menu (on page 1970), except changing the menu name because the contextual menu does not have a name.

Note:
You can choose to reuse a submenu that contains general authoring actions. In this case, all actions (both general and framework-specific ones) are grouped together under the same submenu.
To test it, open the test file, and open the contextual menu. In the lower part there is shown the Table submenu and the Insert section action.

**Customizing the Content Completion Assistant for Author Mode Only**

You can customize the content of the following Author controls, adding items (which, when invoked, perform custom actions) or filtering the default contributed ones:

- **Content Completion Assistant** *(on page 2653)* window
- **Elements** view *(on page 408)*
- **Insert Element** menus (from the Outline view *(on page 325)* or breadcrumb *(on page 377)* contextual menus)

You can use the content completion customization support in a custom framework *(on page 2655)* by following this procedure:

1. Open the Document type configuration dialog box *(on page 90)* for your custom framework and select the Author tab. Next, go to the Content Completion tab *(on page 110).*
The top side of the Content Completion section contains the list with all the actions defined within the custom framework and the list of actions that you decided to include in the Content Completion Assistant list of proposals. The bottom side contains the list with all the items that you decided to remove from the Content Completion Assistant list of proposals.

2. If you want to add a custom action to the list of current Content Completion proposals, select the action item from the Available actions list and click the Add as child or Add as sibling button to include it in the Current actions list. A Content Completion Item dialog box appears, giving you the possibility to select where to provide the selected action.

3. If you want to exclude a certain item from the Content Completion proposals, you can use the Add button from the Filter - Remove content completion items list. The Remove item dialog box is
displayed, allowing you to input the item name and to choose the controls that filter it. The **Item name** combo box accepts wildcards.

**Figure 514. Remove Item Dialog Box**

<table>
<thead>
<tr>
<th>Remove item</th>
<th>✓</th>
</tr>
</thead>
<tbody>
<tr>
<td>Item name:</td>
<td>&lt;SPLIT&gt; table</td>
</tr>
<tr>
<td>Remove item from:</td>
<td></td>

<tr>
<td>□ Element Insert Menus</td>
<td></td>
</tr>
<tr>
<td>□ Entities View</td>
<td></td>
</tr>
</tbody>
</table>

**Note:**

In the **Item name** drop-down menu, **<SPLIT>** refers to the action of splitting the element and creating a new one, while **<ENTER>** refers to the action of inserting a new line.

**Related Information:**

- Customizing the Content Completion Assistant Using a Configuration File *(on page 1980)*
- Customizing the Toolbars for a Framework *(on page 2655)*

**Customizing the Toolbars for a Framework**

This procedure describes how to add defined actions to a toolbar for a custom framework *(on page 2655)*. You can also create additional custom toolbars with existing or custom actions.

1. Open the **Document Type** configuration dialog box *(on page 90)* for your custom framework and select the **Author** tab.

2. Go to the **Toolbar** subtab.
Figure 515. Configuring the Toolbar

The panel is divided into two sections. The left side contains a list of actions, while the right side contains an action tree, displaying the list of actions added in the toolbar. The special entry called Separator allows you to visually separate the actions in the toolbar.

3. To add an action, select it in the left panel and select the particular toolbar label where you want it added in the right panel section, then click the Add as child or Add as sibling button.

Result: When opening a document for the particular framework in Author mode, the toolbar with the new buttons will be displayed in the toolbar area.

Tip:
If you have many custom toolbar actions, or want to group actions according to their category, add more toolbars with custom names and split the actions to better suit your purpose. If your toolbar is not displayed when switching to the Author mode, right-click the main toolbar, select Configure Toolbars, and make sure the appropriate toolbar (such as the Author Custom Actions toolbar) is selected.

Note:
A maximum of 16 toolbars can be added. If you add more, all extra toolbars will be automatically converted to sub-toolbars for the last added toolbar.

Customizing Text-to-Markup Shortcut Patterns

Some built-in frameworks include a configuration file that defines shortcut patterns that can be used in Author mode to automatically insert a certain XML structure. More specifically, the XML structure (fragment) automatically replaces a specific prefix pattern. For example, if you are editing a DITA document using the built-in DITA framework, entering a hyphen (-) followed by a space at the beginning of a paragraph would
automatically replace them with an unordered list element (\texttt{ul}) with a child list item element (\texttt{li}). This is made possible by the \textit{AutoCorrect} mechanism in Oxygen XML Editor Eclipse plugin.

It is possible to customize the particular configuration file (\texttt{structureAutocorrect.xml}) to define your own markup insertion shortcut patterns by following these steps:

1. Create a new \texttt{resources} folder (if it does not already exist) in the \texttt{frameworks} directory for the particular document type (for example, \texttt{OXYGEN_INSTALL_DIR/frameworks/dita/resources}).
2. Open the Preferences dialog box (on page 70) and go to Document Type Association. Select the particular document type, click the Edit button, and in the Classpath tab (on page 95) add a link to that resources folder (if it does not already exist).
3. Create a new \texttt{structureAutocorrect.xml} file or edit an existing one (this file already exists in the resources folder of particular document types and you can use an existing file as a starting point for your customization).
4. Make the appropriate changes to your \texttt{structureAutocorrect.xml} file. The file should look like this:

```
<structure-autocorrect>
  <!-- Unordered lists -->
  <prefix-replacement prefix="-">
    <ul><li/></ul>
  </prefix-replacement>
  <!-- Ordered lists -->
  <prefix-replacement prefix="1.">
    <ol><li/></ol>
  </prefix-replacement>
  <!-- Code block -->
  <prefix-replacement prefix="```">
    <codeblock/>
  </prefix-replacement>
</structure-autocorrect>
```

Using this example, when a user enters one of the defined prefixes at the start of an element that allows the corresponding fragment, Oxygen XML Editor Eclipse plugin will automatically replace the prefix with its corresponding fragment. For example, entering a hyphen (-) at the beginning of a paragraph followed by a space would automatically replace them with an unordered list element (\texttt{ul}) with a child list item element (\texttt{li}). Any subsequently added content would be placed inside the first node/element that does not have a child node/element (in this example, the cursor would be placed in the first \texttt{li} element).

5. Save the file in the resources folder for the particular document type, using the fixed name: \texttt{structureAutocorrect.xml} (for example, \texttt{OXYGEN_INSTALL_DIR/frameworks/dita/resources/structureAutocorrect.xml}).
Customizing Smart Paste Support

The *Smart Paste feature (on page 388)* preserves certain style and structure information when copying content from some of the most common applications and pasting into frameworks (document types) that support *Smart Paste (on page 389)* in Oxygen XML Editor Eclipse plugin. For other document types, the default behavior of the paste operation is to keep only the text content without the styling.

The style of the pasted content can be customized by editing an XSLT stylesheet for a particular document type (*framework (on page 2655)*). The XSLT stylesheet must accept an XHTML flavor of the copied content as input, and transform it to the equivalent XML markup that is appropriate for the target document type of the paste operation.

How to Customize the Smart Paste Mapping

To customize the mapping between the markup of the copied content and the markup of the pasted content for a particular document type, follow these steps:

1. Make sure the particular *framework* contains a folder named *resources* in the following path structure:

   `/frameworks/[Document Type]/resources`

2. Create an XSLT file named `xhtml2content.xsl` and save it in the *resources* folder for the particular *framework*.

   For example: `/frameworks/[Document Type]/resources/xhtml2content.xsl`

3. Add your customized styling in the XSLT file. A list of supported parameters can be found in the *Supported Parameters for the Custom Smart Paste XSLT (on page 1978)* section below.

   **Tip:**
   
   The built-in DITA framework includes an `xhtml2ditaDriver.xsl` file (in `[OXYGEN_INSTALL_DIR]/frameworks/dita/resources`) that imports various other stylesheets that apply cleanup and handle the conversion from the pasted HTML content to DITA. If you are using a custom extension of the DITA framework, you can copy the entire

6. Restart the application and open a document for your particular framework to test your customization.

   **Note:**
   
   Once the file is created, changes that you make to it are processed by Oxygen XML Editor Eclipse plugin when you press the *Reload* toolbar button.
4. You can test modifications done in the stylesheet by pasting content without having to restart Oxygen XML Editor Eclipse plugin.

**Result:** When you paste content from external applications (such as a web browser or an Office document) to a document that is open in **Author** mode, and that matches the particular **framework**, the styling from the **xhtml2content.xsl** stylesheet will be applied on the clipboard contents.

**Customized Smart Paste Stylesheet Sample:**

```xml
<xsl:stylesheet version="1.0"
    xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
    xmlns:xhtml="http://www.w3.org/1999/xhtml"
    xmlns="urn:hl7-org:v3"
    exclude-result-prefixes="xsl xhtml">

    <xsl:output method="xml" indent="no" omit-xml-declaration="yes"/>

    <xsl:template match="xhtml:b | xhtml:strong">
        <content styleCode="bold">
            <xsl:apply-templates select="@* | node()"/>
        </content>
    </xsl:template>

    <xsl:template match="*">
        <xsl:apply-templates select="@* | node()"/>
    </xsl:template>

    <xsl:template match="@* | node()">
        <xsl:copy>
            <xsl:apply-templates select="@* | node()"/>
        </xsl:copy>
    </xsl:template>

</xsl:stylesheet>
```

**Supported Parameters for the Custom Smart Paste XSLT**

The following parameters can be used in your XSLT stylesheet for customizing the **Smart Paste** mechanism:

inTableContext
The custom XSLT stylesheet receives this parameter with a value of true if the end-user is pasting content inside a table.

**folderOfPasteTargetXml**

A URL pointing to the folder where the currently edited XML document is located. This is used to save images relative to the current XML document.

**context.path.names**

A sequence of element names showing the current context in the XML document where the paste occurred.

**context.path.uris**

A sequence of namespaces, one for each context path name.

**context.path.separator**

The separator between the path names. Its value can be used to split the context path names to a sequence.

By default, there is an extra check in place to ensure that the applied XSLT does not remove the original text from the pasted content. If there is a file called `externalPasteOptions.xml` in the `resources` folder, you can use it to specify the default behavior for checking if the XSLT stylesheet loses content during conversion:

```xml
<!-- Options that control external paste (automatic conversions when pasting HTML and URL flavors from the clipboard). -->
<pasteOptions>
  <!-- True to check if the entire sequence of words which get pasted are converted to the target vocabulary. If the check fails, the content will be inserted as a simple sequence of words without any formatting. -->
  <checkEntireContentIsFullyPreserved>true</checkEntireContentIsFullyPreserved>
</pasteOptions>
```

**Customize the Content Completion Assistant**

Oxygen XML Editor Eclipse plugin gathers information from the associated schemas (DTDs, XML Schema, RelaxNG) to determine the proposals that appear in the Content Completion Assistant (on page 2653). Oxygen XML Editor Eclipse plugin also includes support that allows you to customize the Content Completion Assistant to suit your specific needs.

There are two ways to customize the Content Completion Assistant in Oxygen XML Editor Eclipse plugin:
You can add, modify, or remove actions that are proposed for each particular document type (framework (on page 2655)) by using the Content Completion subtab in the Document Type Association configuration dialog box (on page 110). To access this subtab, open the Preferences dialog box (on page 70), go to Document Type Association, use the New, Edit, Duplicate, or Extend button (on page 88), click on the Author tab, and then the Content Completion subtab.

**Note:**
This works only for Author visual mode.

You can use a cc_config.xml configuration file that is specific to each document type (framework) to configure the values that are proposed in certain contexts, to customize the attributes or elements that are proposed, or to customize how certain aspects of the proposals are rendered in the interface. The rest of the topics in this section explain how you can use this configuration file to customize the content completion.

**Resources**

To see more ideas for various advanced customization possibilities (including how to insert or reject proposals for the content completion assistant), watch our Webinar: Working with DITA in Oxygen - Customizing the Editing Experience.

**Customizing the Content Completion Assistant Using a Configuration File**

Oxygen XML Editor Eclipse plugin gathers information from the associated schemas (DTDs, XML Schema, RelaxNG) to determine the proposals that appear in the Content Completion Assistant (on page 2653). Oxygen XML Editor Eclipse plugin also includes support that allows you to customize the Content Completion Assistant to suit your specific needs.

There are two ways to customize the Content Completion Assistant in Oxygen XML Editor Eclipse plugin:

- You can add, modify, or remove actions that are proposed for each particular document type (framework (on page 2655)) by using the Content Completion subtab in the Document Type Association configuration dialog box (on page 110). To access this subtab, open the Preferences dialog box (on page 70), go to Document Type Association, use the New, Edit, Duplicate, or Extend button (on page 88), click on the Author tab, and then the Content Completion subtab.

- You can use a cc_config.xml configuration file that is specific to each document type (framework) to configure the values that are proposed in certain contexts, to customize the attributes or elements that are proposed, or to customize how certain aspects of the proposals are rendered in the interface. The rest of the topics in this section explain how you can use this configuration file to customize the content completion.

Customizing the Content Completion Assistant for Author Mode Only (on page 1972)

Configuring the Proposals for Elements and Attributes

There are many cases where elements have a relaxed content model and can accept a large number of child elements. For example, the DITA list item element (<li>) accepts more than 60 child elements. Oxygen XML Editor Eclipse plugin includes support to allow the content architect to put some constraints on the possible elements or attributes, or to impose some best practices in the way content is edited.

For an example of a specific use-case, suppose that you want to restrict DITA list item elements (<li>) to only accept paragraph elements (<p>). In this case, the Content Completion Assistant (on page 2653) should not offer any element other than a paragraph (<p>) when a list item (<li>) is inserted into a document. It would also be helpful if the required child element (<p>) was automatically inserted whenever a list item (<li>) is inserted.

One method of changing the content model is to alter the element definition in the associated schema (XML Schema, DTD, RelaxNG), but this may be complicated in some cases. Fortunately, Oxygen XML Editor Eclipse plugin offers a simple, alternative method of using a configuration file to customize the content completion proposals for each element.

Setting up the Content Completion Configuration File

To customize the configuration file for the Content Completion Assistant (on page 2653), follow these steps:

1. Create a new resources folder (if it does not already exist) in the frameworks directory for the particular document type (for example, OXYGEN_INSTALL_DIR/frameworks/dita/resources).
2. Open the Preferences dialog box (on page 70) and go to Document Type Association. Select the particular document type, click the Edit button, and in the Classpath tab (on page 95) add a link to that resources folder (if it does not already exist).
3. Create a new configuration file or edit an existing one.
   a. To easily create a new configuration file, you can use the Content Completion Configuration document template that is included in Oxygen XML Editor Eclipse plugin (File > New > New from Templates > Framework templates > Oxygen Extensions > Content Completion Configuration). The document template includes details about how each element and attribute is used in the configuration file.
   b. If a configuration file (cc_config.xml) already exists for the particular document type (in the resources folder), you can modify this existing file.
c. If you extend a framework, you need to copy the content of the \texttt{cc\_config.xml} file from the base framework and modify it (e.g. create a \texttt{resources} folder in your framework extension folder and place the file there). You also need to make sure that the folder that contains the \texttt{cc\_config.xml} file in your extension (e.g. \texttt{resources}) is listed in the \texttt{Classpath} tab (on page 95) before the one from the base framework.

If you only want to make small changes or add extra rules in your custom content completion configuration file, you need to name it \texttt{cc\_config\_ext.xml} and all the rules inside it are merged with the base \texttt{cc\_config.xml} file. The merging is done by taking all the rules specified in the \texttt{cc\_config\_ext.xml} file into consideration after processing the set of rules from the base \texttt{cc\_config.xml} file.

4. Make the appropriate changes to your custom configuration file.
5. Save the file in the \texttt{resources} folder for the particular document type, using the fixed name: \texttt{cc\_config.xml} (for example, \texttt{OXYGEN\_INSTALL\_DIR/frameworks/dita/resources/cc\_config.xml}).
6. Restart the application and open an XML document. In the \texttt{Content\ Completion\ Assistant} you should see your customizations.

\textbf{Tip:}

In some cases, you can simply use the \texttt{F5} action to test your customizations, without having to restart the application.

\textbf{Attention:}

In the \texttt{Classpath} tab (on page 95), if you have references to multiple \texttt{resources} folders, each with its own \texttt{cc\_config.xml} file, the first reference listed in the \texttt{Classpath} tab takes precedence and the multiple configuration files are not combined.

\section*{Configuring Elements or Attributes that are Proposed for Each Element}

For the purposes of customizing the elements or attributes that are proposed for each individual element, the configuration file (\texttt{cc\_config.xml}) uses \texttt{<elementProposals>} elements. This element allows you to customize or filter the child elements and attributes for an element.

\textbf{Warning:}

Note that you can only choose elements or attributes that are already allowed by the schema in a particular context. For example, you cannot specify an element that is not allowed by the schema as a child of a particular node.

\section*{Elements:}

To control the \texttt{elements} that are proposed for an element, you can use the following attributes for the \texttt{<elementProposals>} element:
- **path** - A path within the document that matches the element that will have its content completion proposals changed. For example, "title" matches all the `<title>` elements in the document, while "chapter/title" matches only the `<title>` elements that are direct children of the `<chapter>` element. You can use simplified forms of XPath in this attribute.

The XPath expressions can accept multiple attribute conditions and inside each condition you can use **AND/OR** boolean operators and parentheses to override the priority.

You can use one or more of the following attribute conditions (default attribute values are not taken into account):

- `element[@attr]` - Matches all instances of the specified element that include the specified attribute.
- `element[not(@attr)]` - Matches all instances of the specified element that do not include the specified attribute.
- `element[@attr = "value"]` - Matches all instances of the specified element that include the specified attribute with the given value.
- `element[@attr != "value"]` - Matches all instances of the specified element that include the specified attribute and its value is different than the one given.

**Example:** The following are examples of how you could use multiple boolean operators and parentheses inside an attribute condition:

```
[@a and @b or @c and @d]
[@a and (@b or @c) and @d]
```

The following are just examples of how simplified XPath expressions might look like:

- `elementName`
- `//elementName`
- `/elementName1[elementName2]/elementName3`
- `//xs:localName`
- `//xs:documentation[@lang="en"]`

**Note:**

Using a namespace prefix requires that you declare it on the `<elementProposals>` element or on an ancestor element. For example:

```
<elementProposals xmlns:db5="http://docbook.org/ns/docbook"
path="db5:listitem" insertElements="db5:para" />
```

**Other Important Notes:**

- If the `path` attribute is missing, the customization will apply to the proposals for all elements. You can intentionally omit this attribute and use **possibleElements (on page 1984)** or **rejectElements (on page 1985)** to specify or restrict particular elements for a **framework (on page 2655)**.
For example, suppose that in your DITA documents, you want to restrict your users from using `<image>` and `<fig>` elements because you do not want images to be included in your output. The configuration file should look like this:

```xml
<elementProposals rejectElements="image fig" />
```

Since the `@path` attribute is missing, the specified element will be filtered out from the proposals for the entire framework.

- If the particular document type has name namespaces, the `@path` should contain the qualified name. For example, in TEI documents, if you want to set a list of possible attributes for the `<span>` element, you need to use a qualified name like this (notice the declaration of the namespace prefix "t" and its usage):

```xml
<config
   xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
   xsi:schemaLocation="http://www.oxygenxml.com/ns/ccfilter/config
                      http://www.oxygenxml.com/ns/ccfilter/config/ccConfigSchemaFilter.xsd"
   xmlns="http://www.oxygenxml.com/ns/ccfilter/config"
   xmlns:t="http://www.tei-c.org/ns/1.0">

  <elementProposals path="t:span" possibleAttributes="type"/>

</config>
```

- `insertElements` - A space-separated sequence of child element names. Each time the element specified in the `@path` attribute is inserted into the document, these child elements will also be inserted in the order that they are listed. For example, `insertElements="b i"` will insert exactly one `<b>` element, followed by an `<i>` element. An empty value ("") means that no child elements should be inserted.

  **Note:**
  If this attribute is missing, the default required child elements will be inserted, as specified in the associated schema for the document.

- `possibleElements` - A space-separated list of element names that will be shown in the content completion list when invoked inside an element that is specified in the `@path` attribute. For example, "b i codeph ph" means that the Content Completion Assistant will contain these four elements when invoked on the element specified in the `@path` attribute. The following other possible values are also supported:
  - **NONE** - There will be no proposals in the content completion list.
  - **ALL** - All the possible elements specified in the associated schema will be presented in the content completion list. This is also the default behavior if this attribute is missing.
  - **INSERTED** - The proposals will be the same list of elements that are defined in the `@insertElements` attribute.

When using this attribute to specify multiple elements, only use one entry with the element names separated by a space:
• **rejectElements** - A space-separated list of element names that will be filtered out from the list of proposals that are presented in the content completion list. Each time the element specified in the `@path` attribute is inserted into the document, the list of proposals in the Content Completion Assistant will include the entries that are defined in the associated schema, minus the elements specified in this attribute.

**Note:**

This setting makes the application behave as if the rejected elements were not allowed by the schema in that location. Most of the toolbar actions take the schema into account when inserting content. If the inserted content is not allowed by the schema in that particular location, the application tries to find another location within close proximity where the content is allowed.

For example, suppose you reject the insertions of images in paragraphs. If a user has the cursor inside a paragraph and uses the toolbar action that inserts an image, the image will be inserted after the current paragraph rather than at the current location.

If you want to avoid having users insert an element directly from the content completion mechanism and want them to use a toolbar action instead, it is better to use the Document Type Configuration *(on page 110)* dialog box to remove the element.

When using this attribute to specify multiple elements, only use one entry with the element names separated by a space:

```xml
<elementProposals rejectElements="image fig imagemap foreign" />
```

• **contentType** - Forces an element to have an imposed content type. The possible values are: `elementOnly`, `mixed`, or `empty`.

```xml
<elementProposals path="section" insertElements="title p" contentType="elementOnly"/>
```

• **merge** - By default, if there are multiple element proposal rules that match the current element context, then only the rule that has the most specific path is used. By setting the `@merge` attribute to `true` on the proposal rules that might match the same element context, all the rules will be applied. Example:

```xml
<elementProposals
    path="/*[not(@xml:lang='ja')]/**
    rejectElements="japaneseTag"
    merge="true"/>

<elementProposals
    path="/*[@xml:lang!='he']/**
    rejectElements="hebrewTag"/>```
Attributes:

To control the attributes that are proposed for an element, you can use the following attributes for the `<elementProposals>` element:

- **path** - A path within the document that matches the element that will have its attribute proposals changed. For example, "title" matches all the `<title>` elements in the document, while "chapter/title" matches only the `<title>` elements that are direct children of the `<chapter>` element. You can use simplified forms of XPath in this attribute. For examples of such forms of XPath expressions, see the note in XML Preferences (on page 168).

  ![Note:]

  If this attribute is missing, the customization will apply to the proposals for all elements. You can intentionally omit this attribute and use possibleAttributes (on page 1986) or rejectAttributes (on page 1987) to specify or restrict attributes for an entire framework.

  For example, suppose that you only want to allow a limited set of attributes in a customized framework. The configuration file should look like this:

  ```xml
  <elementProposals path="ol/li" possibleAttributes="id domains href scope format type conref props keyref class"/>
  ```

  Since the `@path` attribute is missing, this applies to the entire framework and only the specified attributes will be proposed.

- **insertAttributes** - A space-separated sequence of attribute names that will be inserted along with the element.

  ```xml
  <elementProposals path="ol/li" insertAttributes="product platform"/>
  ```

- **insertAttribute** - This is similar to the preceding attribute, but this one also allows you to specify a value for the attribute that will be inserted. This attribute should be used like this:

  ```xml
  <elementProposals path="ol/li">
    <insertAttribute name="platform" value="test"/>
  </elementProposals>
  ```

- **possibleAttributes** - A space-separated list of attribute names that will be shown in the content completion list when invoked inside an element that is specified in the `@path` attribute.

  When using this attribute to specify multiple attributes, only use one entry with the attribute names separated by a space:
• \texttt{rejectAttributes} - A space-separated list of attribute names that will be filtered out from the list of proposals that are presented in the content completion list. Each time the element specified in the \texttt{@path} attribute is inserted into the document, the list of proposals in the \textit{Content Completion Assistant} will include the entries that are defined in the associated schema, minus the attributes specified in this attribute.

When using this attribute to specify multiple attributes, only use one entry with the attribute names separated by a space:

\begin{verbatim}
<elementProposals rejectAttributes="importance platform product"/>
\end{verbatim}

Other Important Notes About the Configuration File

\begin{itemize}
  \item Important:
  \begin{itemize}
    \item By default, the element names that do not have a namespace prefix are considered from \textit{no-namespace}. Consider declaring the namespace mapping on the root of the configuration file and prefixing the element names from the \texttt{@elementPath} and \texttt{@model} attributes.
    \item This configuration file only affects the content completion assistance. It has no effect on validation or operations invoked from other areas in the interface (such as the toolbar or menus).
    \item To test the effects of your changes, you should restart the application, although in some cases, you can simply use the \texttt{Reload (F5)} action to test your customizations.
    \item When an XML element from the document is matched against a list of configured \texttt{elementProposals}, the first one in sequence takes precedence. Therefore, make sure you place the more specific \texttt{elementProposals} (those with a longer path) first in your configuration file.
    \item Simple wildcard patterns can be used in the following attributes: \texttt{@possibleElements}, \texttt{@rejectElements}, \texttt{@possibleAttributes}, and \texttt{@rejectAttributes}. For example, \texttt{code*}, \texttt{*block}, \texttt{con*ref}, \texttt{_.}
    \item \textit{Editor variables (on page 218)} can be used in the \texttt{@value} attribute of the \texttt{<insertAttribute>} element. For example:
      \begin{verbatim}
      <elementProposals path="prolog/critdates/created">
        <insertAttribute name="date" value="${date(yyyy-MM-dd)}"/>
      </elementProposals>
      \end{verbatim}
    \item Only simple recursion cases are detected and avoided by the editor, and logged to the console. Therefore, if complex \texttt{elementProposals} patterns are defined, you should avoid \textit{infinite recursions}.
  \end{itemize}
\end{itemize}
Examples: Configuring the Element Proposals

- **Example 1: Automatically Insert Elements**

  Suppose that you want to automatically insert a paragraph element (`<p>`) whenever a DITA ordered list item element (`<ol/li>`) is inserted, and also to not allow any other element besides a paragraph inside the ordered list items.

  To achieve this, the configuration file should include the following:

  ```xml
  <elementProposals path="ol/li" insertElements="p"
  possibleElements="_INSERTED_/">
  </elementProposals>
  ```

  **Tip:**
  This particular example modifies an action that inserts a list in a DITA document. There are several ways to invoke this action in the interface. For example, there is a toolbar button and an action in the DITA menu that inserts a list. However, since the configuration file only affects the *Content Completion Assistant*, this modification will have no effect on the behavior of the toolbar or menu action. Those actions would need to be configured separately if you want the result to be the same as the content completion proposal. For more information, see Customizing the Author Mode Editing Experience for a Framework (on page 1933).

- **Example 2: Insert Complex Element Structure**

  For a more complex example, suppose that you want to insert a complex structure whenever a DITA `<prolog>` element is inserted.

  For instance, if you want to insert the following structure inside `<prolog>` elements:

  ```xml
  <prolog>
  <author/>
  <metadata>
    <keywords>
      <keyword/>
      <keyword/>
    </keywords>
  </metadata>
  </prolog>
  ```

  the configuration file should include the following:

  ```xml
  <elementProposals path="prolog" insertElements="author metadata"/>
  <elementProposals path="prolog/metadata" insertElements="keywords"/>
  <elementProposals path="prolog/metadata/keywords" insertElements="keyword, keyword"/>
  ```

- **Example 3: Limit Possible Elements**
Suppose that you also want to limit the proposals for the `<keywords>` element to only allow the user to insert `<audience>` or `<keyword>` elements. The configuration file should include the following:

```
<elementProposals path="prolog/metadata" insertElements="keywords"
    possibleElements="audience keywords"/>
```

Suppose that you want to simply restrict your users from inserting `<image>` elements inside DITA list item elements `<li>`, but still propose all the other elements that are defined in the associated schema. The configuration file should look like this:

```
<elementProposals path="li" rejectElements="image"/>
```

**Examples: Configuring the Attributes Proposals**

- **Example 1: Automatically Insert Attributes**

  Suppose that you want to insert an `@id` attribute (with an empty value) whenever a DITA list item element `<li>` is inserted. The configuration file should include the following:

  ```
  <elementProposals path="li" insertAttributes="id"/>
  ```

- **Example 2: Limit Possible Attributes**

  Suppose that you also want to limit the number of choices for attributes that are presented to the user whenever a DITA list item element `<li>` is inserted. The configuration file should look like this:

  ```
  <elementProposals path="li" insertAttributes="id"
      possibleAttributes="id product platform audience"/>
  ```

  Suppose that you want to simply restrict your users from inserting `@conref` attributes inside DITA topics `<topic>` element, but still propose all the other attributes that are defined in the associated schema. The configuration file should look like this:

  ```
  <elementProposals path="topic" rejectAttributes="conref"/>
  ```

**Related information**

- Configuring the Proposals for Attribute and Element Values (on page 1989)
- Customizing the Rendering of Elements (on page 1996)

**Configuring the Proposals for Attribute and Element Values**

Oxygen XML Editor Eclipse plugin includes support for configuring the proposed values that appear in the Content Completion Assistant (on page 2653). To do so, a configuration file is used, along with the associated schema, to add or replace possible values for attributes or elements that are proposed in the Content Completion Assistant.

For an example of a specific use-case, suppose that you want the Content Completion Assistant to propose several possible values for the language code when you use an `@xml:lang` attribute.
Setting up the Content Completion Configuration File

To customize the configuration file for the Content Completion Assistant (on page 2653), follow these steps:

1. Create a new resources folder (if it does not already exist) in the frameworks directory for the particular document type (for example, OXYGEN_INSTALL_DIR/frameworks/dita/resources).

2. Open the Preferences dialog box (on page 70) and go to Document Type Association. Select the particular document type, click the Edit button, and in the Classpath tab (on page 95) add a link to that resources folder (if it does not already exist).

3. Create a new configuration file or edit an existing one.
   a. To easily create a new configuration file, you can use the Content Completion Configuration document template that is included in Oxygen XML Editor Eclipse plugin (File > New > New from Templates > Framework templates > Oxygen Extensions > Content Completion Configuration). The document template includes details about how each element and attribute is used in the configuration file.
   b. If a configuration file (cc_config.xml) already exists for the particular document type (in the resources folder), you can modify this existing file.
   c. If you extend a framework, you need to copy the content of the cc_config.xml file from the base framework and modify it (e.g. create a resources folder in your framework extension folder and place the file there). You also need to make sure that the folder that contains the cc_config.xml file in your extension (e.g. resources) is listed in the Classpath tab (on page 95) before the one from the base framework.

   If you only want to make small changes or add extra rules in your custom content completion configuration file, you need to name it cc_config_ext.xml and all the rules inside it are merged with the base cc_config.xml file. The merging is done by taking all the rules specified in the cc_config_ext.xml file into consideration after processing the set of rules from the base cc_config.xml file.

4. Make the appropriate changes to your custom configuration file.

5. Save the file in the resources folder for the particular document type, using the fixed name: cc_config.xml (for example, OXYGEN_INSTALL_DIR/frameworks/dita/resources/cc_config.xml).

6. Restart the application and open an XML document. In the Content Completion Assistant you should see your customizations.
Tip:
In some cases, you can simply use the Refresh (F5) action to test your customizations, without having to restart the application.

Attention:
In the Classpath tab (on page 95), if you have references to multiple resources folders, each with its own cc_config.xml file, the first reference listed in the Classpath tab takes precedence and the multiple configuration files are not combined.

Configuring Proposed Values

For the purposes of adding or replacing the values that are proposed, the configuration file (cc_config.xml) includes a series of valueProposals instructions that will match an element or attribute name and has the following attributes:

- **path** - A path within the document that matches the element or attribute that will have its content completion proposals changed. For example:
  - `path="title"` matches all the `<title>` elements in the document.
  - `path="chapter/title"` matches only the `<title>` elements that are direct children of the `<chapter>` element.
  - `path="@xml:lang"` matches all the `@xml:lang` attributes in the document.
  - `path="title/@xml:lang"` matches only the `@xml:lang` attributes that appear on `<title>` elements.

You can use simplified forms of XPath in this attribute. The XPath expressions can accept multiple attribute conditions and inside each condition you can use AND/OR boolean operators and parentheses to override the priority.

You can use one or more of the following attribute conditions (default attribute values are not taken into account):

- `element[@attr]` - Matches all instances of the specified element that include the specified attribute.
- `element[not(@attr)]` - Matches all instances of the specified element that do not include the specified attribute.
- `element[@attr = "value"]` - Matches all instances of the specified element that include the specified attribute with the given value.
- `element[@attr ! = "value"]` - Matches all instances of the specified element that include the specified attribute and its value is different than the one given.

**Example:** The following are examples of how you could use multiple boolean operators and parentheses inside an attribute condition:

```
*[@a and @b or @c and @d]
*[@a and (@b or @c) and @d]
```
The following are just examples of how simplified XPath expressions might look like:

- `elementName`
- `//elementName`
- `/elementName1/elementName2/elementName3`
- `//xs:localName`
- `//xs:documentation[@lang="en"]`

**Note:**
Using a namespace prefix requires that you declare it on the `<elementProposals>` element or on an ancestor element. For example:

```xml
<elementProposals xmlns:db5="http://docbook.org/ns/docbook"
                   path="db5:listitem" insertElements="db5:para" />
```

- `editable` - Specifies the editable state of the attribute values, as reflected in the **Attributes view (on page 403)** and the **In-place Attributes Editor (on page 405)**. The possible values for the `@editable` attribute are:
  - `true` - The attribute values can be edited by choosing from a combo box or manually providing a value.
  - `false` - The attribute values cannot be edited.
  - `onlyAllowedItems` - The attribute values can be edited, but only by choosing from a list of proposed values, in a non-editable combo box.

The new value proposals are specified in the `<valueProposals>` element through:

- One or more `<item>` elements, which are grouped inside an `<items>` element.

**Tip:**
The `<item>` element can have a `@listValue` attribute, which can be set to `true` if you want those items to be part of a list attribute value (such as `attr="item1 item2"`).

- An `<xslt>` element that references an XSLT script that gets executed and must return an `<items>` element.

The behavior of the `<items>` or `<xslt>` elements are specified with the help of the `@action` attribute, which can have any of the following values:

- `append` - Adds new values to appear in the proposals list (default value).
- `addIfEmpty` - Adds new values to the proposals list only if no other values are contributed by the schema.
- `replace` - Replaces the values contributed by the schema with new values to appear in the proposals list.
The values in the configuration file can be specified either directly or by calling an external XSLT file that will extract data from an external source. An `<xslt>` element must be used in this situation.

Note:

`valueProposals` offers more flexibility compared to the old `match` element that was marked as deprecated.

```xml
<match elementName="lg" elementNS="http://www.oxygenxml.com/ns/samples">
  <items action="replace">
    <item value="stanza"/>
    <item value="refrain"/>
  </items>
</match>
```

Other Important Notes About the Configuration File

**Important:**

- This configuration file only affects the content completion assistance, not validation.
- To test the effects of your changes, you should Refresh the source document (on page 524).

Example: Specifying Values Directly

If you want to specify the values directly, the configuration file should look like this:

```xml
<!-- Replaces the values for an element with the local name "lg", from the given namespace -->
<valueProposals path="x:lg" xmlns:x="http://www.oxygenxml.com/ns/samples">
  <items action="replace">
    <item value="stanza"/>
    <item value="refrain"/>
  </items>
</valueProposals>

<!-- Adds two values for an attribute "type", from no namespace -->
<valueProposals path="@type" editable="onlyAllowedItems">
  <items>
    <item value="stanza"/>
    <item value="refrain"/>
  </items>
</valueProposals>
```
Example: Using Attribute Conditions

The possible values of an attribute depend on the value of another attribute from the same element:

```xml
<valueProposals path="property[@name='color']">
  <items>
    <item value="red"/>
    <item value="blue"/>
  </items>
</valueProposals>

<valueProposals path="property[@name='shape']">
  <items>
    <item value="rectangle"/>
    <item value="square"/>
  </items>
</valueProposals>
```

Example: Calling an External XSLT Script

If you want to collect values from an external XSLT script, the configuration file should include something like this:

```xml
<xslt href="../xsl/get_values_from_db.xsl" useCache="false" action="replace"/>
```

In this example, the `get_values_from_db.xsl` is executed to extract values from a database.

**Tip:**

You can use `xsl:message` as a debugging mechanism. These messages are presented in the results area at the bottom of the application whenever the Content Completion Assistant is invoked.

**Note:**

A comprehensive XSLT sample is included in the Content Completion Configuration document template (in the Framework Templates > Oxygen Extensions section of the New from templates wizard (on page 252)).

**Note:**

If `@useCache` is set to `false`, then the XSLT will be invoked any time the proposals are needed. If `@useCache` is set to `true`, then the XSLT is executed once and the obtained proposals are kept in a cache and returned every time the proposals are requested again. You can use the Validate action to drop the cached values and recompute them.
Configuring Proposed Values in the Context Where the Content Completion was Invoked

Web Author Customization Note:
This particular scenario is not supported for an Oxygen XML Web Author customization.

A more complex scenario is if you want to choose the possible values to propose, depending on the context of the element where the content completion was invoked.

Suppose that you want to propose certain possible values for one property (for example, color) and other values for another property (for example, shape). If the property represents a color, then the values should represent applicable colors, while if the property represents a shape, then the values should represent applicable shapes. See the following code snippets:

Your main document:

```xml
<sampleArticle>
  <!-- The possible values for @value should be "red" and "blue" -->
  <property name="color" value=""/>
  <!-- The possible values for @value should be "square" and "rectangle" -->
  <property name="shape" value=""/>
</sampleArticle>
```

The content completion configuration file:

```xml
<config xmlns="http://www.oxygenxml.com/ns/ccfilter/config">
  <valueProposals path="property/@value">
    <xslt href="get_values.xsl" useCache="false" action="replace"/>
  </valueProposals>
</config>
```

The stylesheet that defines the possible values based on the context of the property on which the content completion was invoked:

```xml
<xsl:stylesheet
  xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
  xmlns:xs="http://www.w3.org/2001/XMLSchema"
  exclude-result-prefixes="xs"
  version="3.0">

  <xsl:param name="documentSystemID" as="xs:string"/>
  <xsl:param name="contextElementXPathExpression" as="xs:string"/>

  <xsl:template name="start">
    <xsl:apply-templates select="doc($documentSystemID)"/>
  </xsl:template>
</xsl:stylesheet>
```
The `contextElementXPathExpression` parameter will be bound to an XPath expression that identifies the element in the context where the content completion was invoked.

### Related information
- Configuring the Proposals for Elements and Attributes (on page 1981)
- Customizing the Rendering of Elements (on page 1996)

### Customizing the Rendering of Elements

In addition to the support for configuring the proposals that appear in the Content Completion Assistant (on page 2653), Oxygen XML Editor Eclipse plugin also includes support for customizing how the elements are rendered. You can do this by using the `XMLNodeRendererCustomizer` API extension (on page 2058), but you can also use the same configuration file that is used to configure the content completion proposals.

For an example of a specific use-case, suppose that in DITA you want the names of paragraph elements (`<p>`) to be rendered as "Paragraph" instead of "p" in the various components in Author mode (such as in the Outline view (on page 325), Elements view (on page 408), Attributes view (on page 403), and the breadcrumb navigation bar). To achieve this, you can use the `<elementRenderings>` element in the configuration file.

### Setting up the Content Completion Configuration File

To customize the configuration file for the Content Completion Assistant (on page 2653), follow these steps:
1. Create a new `resources` folder (if it does not already exist) in the `frameworks` directory for the particular document type (for example, `OXYGEN_INSTALL_DIR/frameworks/dita/resources`).

2. Open the `Preferences` dialog box (on page 70) and go to `Document Type Association`. Select the particular document type, click the `Edit` button, and in the `Classpath` tab (on page 95) add a link to that `resources` folder (if it does not already exist).

3. Create a new configuration file or edit an existing one.
   a. To easily create a new configuration file, you can use the `Content Completion Configuration` document template that is included in Oxygen XML Editor Eclipse plugin (File > New > New from Templates > Framework templates > Oxygen Extensions > Content Completion Configuration). The document template includes details about how each element and attribute is used in the configuration file.
   b. If a configuration file (`cc_config.xml`) already exists for the particular document type (in the `resources` folder), you can modify this existing file.
   c. If you extend a framework, you need to copy the content of the `cc_config.xml` file from the base framework and modify it (e.g. create a `resources` folder in your framework extension folder and place the file there). You also need to make sure that the folder that contains the `cc_config.xml` file in your extension (e.g. `resources`) is listed in the `Classpath` tab (on page 95) before the one from the base framework.

   If you only want to make small changes or add extra rules in your custom content completion configuration file, you need to name it `cc_config_ext.xml` and all the rules inside it are merged with the base `cc_config.xml` file. The merging is done by taking all the rules specified in the `cc_config_ext.xml` file into consideration after processing the set of rules from the base `cc_config.xml` file.

4. Make the appropriate changes to your custom configuration file.

5. Save the file in the `resources` folder for the particular document type, using the fixed name: `cc_config.xml` (for example, `OXYGEN_INSTALL_DIR/frameworks/dita/resources/cc_config.xml`).

6. Restart the application and open an XML document. In the `Content Completion Assistant` you should see your customizations.

   **Tip:**
   In some cases, you can simply use the `Refresh (F5)` action to test your customizations, without having to restart the application.

   **Attention:**
   In the `Classpath` tab (on page 95), if you have references to multiple `resources` folders, each with its own `cc_config.xml` file, the first reference listed in the `Classpath` tab takes precedence and the multiple configuration files are not combined.
Changing the Rendering of Elements (Their Names, Annotations, and Icons)

For the purposes of customizing how the content completion elements are rendered, you can use the `<render>` element inside a `<elementRenderings>` element to specify how element names, their annotations, and their icons are rendered.

The `<elementRenderings>` element supports the `@platform` attribute, which can have one of the following values:

- `webapp`
  The element renderings are only applied to Oxygen XML Web Author.

- `standalone`
  The element renderings are only applied to standalone distributions of Oxygen.

- `eclipse`
  The element renderings are only applied to Eclipse plugin distributions of Oxygen.

Note: If the `@platform` attribute is missing, the element renderings are applied to all types of distributions.

You can use the following attributes for the `<render>` element:

- `element`
  Identifies the element to be customized, in the form of a qualified name. If it does not have a prefix, it is considered to be from `noNamespace`.

- `as`
  Provides the name (label) that will be displayed for the element in various components in Author mode (the Content Completion Assistant, the breadcrumb navigation bar, the Full Tags display mode (on page 370), and the Outline (on page 325), Elements (on page 408), and Attributes (on page 403) views). This attribute is optional. If it is missing, the name of the element is used.

If you want to translate this label into another language, use the `$$i18n(key_name)$$` editor variable (on page 225). The following code snippet shows how the DITA paragraph elements (`<p>`) can be translated:

```xml
<elementRenderings>
  <render element="p" as="$$i18n(cc_p)$$"/>
</elementRenderings>
```

Note: The `cc_p` id is a key that identifies the translations available for the paragraph element.

- `iconPath`
Optional attribute that specifies the icon for the element. This is shown in the Content Completion Assistant and the Outline view (on page 325) in Author mode. If it is a relative path, the full path of the icon image file will be computed starting from the directory of the configuration file (for example, a value of "myImg.png" will cause Oxygen XML Editor Eclipse plugin to load "frameworks/${framework}/resources/myImg.png"). If you want to access a built-in resource, the value can begin with a forward slash "/", and the image file will be searched for in the Oxygen XML Editor Eclipse plugin classpath resources (for example,"/images/OrderedList16.png" will load an icon from the built-in Oxygen XML Editor Eclipse plugin JAR file resources.

xml:lang ( Deprecated)

It is recommended to use the $i18n(key_name) editor variable (on page 225) instead. Optional attribute that could be used to render the same element differently, depending on the language. If there are multiple <render> elements for the same @element attribute (element name) and the @xml:lang attribute is missing on one of them, that one will be considered the default fallback value to be used if none of the others match the language specified in the interface.

Note:
The default entry should be listed first, since the application tries to match them in sequence and the last match found is the one that is used.

For example, suppose that you want the name of DITA paragraph elements (<p>) to be rendered as "Paragraphe" if the language is French, "Absatz" if the language is German, and "Paragraph" if the language is English (or any other language). Your configuration file should look something like this:

```xml
<elementRenderings>
  <render element="p" as="Paragraph"/>
  <render element="p" as="Paragraphe" xml:lang="fr"/>
  <render element="p" as="Absatz" xml:lang="de"/>
</elementRenderings>
```

You can also use the configuration file to customize the annotations for elements. For this purpose, the <render> element also accepts the following element to change the tooltip annotations for an element (in both Author mode and Text mode):

```
annotation
```

This element can be used within the <render> element to customize the tooltip annotations that are displayed for the element in various components in Author mode (such as tooltips shown in the Content Completion Assistant documentation window, the breadcrumb navigation bar, the Full Tags display mode (on page 370), and the Outline (on page 325), Elements (on page 408), Attributes (on page 403) views), as well as the tooltips that are displayed when you hover over
elements in Text mode. You can use HTML content to style the annotations (see the example below (on page 2001)).

**Note:**
If this element is missing, the styling for the annotations for that element is collected from the associated schema (on page 395).

**Tip:**
The annotations can also be translated in the configuration file. For example:

```xml
<elementRenderings>
  <render element="p" as="${i18n(cc_p)}">
    <annotation>${i18n(cc_p)}</annotation>
  </render>
</elementRenderings>
```

Other Important Notes About the Configuration File for Rendering Elements

**Important:**
- This configuration file only affects the content completion assistance, not validation.
- To test the effects of your changes, you should restart the application, although in some cases, you can simply use the Reload (F5) action to test your customizations.
- If the framework (on page 2655) has an associated style guide, then the annotations defined in the configuration file will take precedence over those defined in the style guide. To check to see if your framework uses a style guide, look for the following folder: `${oXygenInstallDir}frameworks/${framework}/styleguide/`. If that folder exists, it is recommended that you make your annotation changes directly in the style guide, rather than in the configuration file.
- If an XMLNodeRendererCustomizer API extension (on page 2058) has been implemented for the framework and a configuration file is also used, the rendering customization for an element will be the result of merging the two. For example, if the XMLNodeRendererCustomizer implementation customizes the element name, while the configuration file specifies an icon for the element, the properties of both customizations will be rendered. However, if both implementations define the same property (for example, both specify the rendering of an element name), the customizations defined in the configuration file take precedence.
- The rendering customizations defined in the configuration file also apply to aspects of the Oxygen XML Web Author interface.
Example: Changing the Rendering of an Element

Suppose that you want to render the name of the DITA `<title>` element to begin with a capital letter, use a custom icon for it, and provide specific documentation for that element in Author mode. The configuration file should look like this:

```
<elementRenderings>
  <render element="title" as="Title" iconPath="cimg/AcceptAll16.png">
    <annotation>
      <html xmlns="http://www.w3.org/1999/xhtml">
        <head>
          <title>Documentation for the Title Element</title>
        </head>
        <body>
          <p>A <i>heading</i> or <b>label</b> for the main parts of a topic</p>
        </body>
      </html>
    </annotation>
  </render>
</elementRenderings>
```

Related Information:

Schema Annotations in Author Mode (on page 395)
Customizing Annotations in the Content Completion Assistant (on page 2001)

Customizing Annotations in the Content Completion Assistant

Oxygen XML Editor Eclipse plugin gathers documentation from the associated schemas (DTD, XML Schema, RelaxNG) and presents it for each element or attribute. For example, if you open the Content Completion Assistant (on page 2653) for a recognized XML vocabulary, documentation is displayed for each element provided by the associated schema. Similar information is displayed when you hover over tag names presented in the Elements view (on page 408). If you hover over attributes in the Attributes view (on page 403) you also see information about each attribute, gathered from the same schema.

If you have a framework configuration (on page 90) set up for your XML vocabulary, there is a special XML configuration file that can be added to provide additional documentation information or links to additional information for certain elements and attributes.

To provide this additional information in the Content Completion Assistant, follow these steps:
1. Create a new folder in the configuration directory for the document type.

   **Example:** OXYGEN_INSTALL_DIR/frameworks/dita/styleguide

2. Use the **New** document wizard to create a file using the **Content Completion Styleguide** document template (in the Framework Templates > Oxygen Extensions section).

3. Save the file in the folder created in step 1, using the fixed name:
   
   contentCompletionElementsMap.xml.

4. **Open the Preferences dialog box** *(on page 70)*, go to **Document Type Association**, and edit the document type configuration for your XML vocabulary. Now you need to indicate where Oxygen XML Editor Eclipse plugin will locate your mapping file by doing one of the following:

   - In the **Classpath** tab add a link to the newly created folder.
   - In the **Catalogs** tab add a new catalog file *(on page 593)*. The selected file needs to contain the following:

     ```xml
     <?xml version="1.0" encoding="UTF-8"?>
     <!DOCTYPE catalog PUBLIC "-//OASIS//DTD XML Catalogs V1.1//EN"
     "http://www.oasis-open.org/committees/entity/release/1.1/catalog.dtd">
     <catalog xmlns="urn:oasis:names:tc:entity:xmlns:xml:catalog">
     <uri name="http://www.oxygenxml.com/{processed_dt_name}/styleguide/contentCompletionElementsMap.xml" uri="contentCompletionElementsMap.xml"/>
     </catalog>
     ```

     where `{processed_dt_name}` is the name of the document type in lower case and with spaces replaced by underscores.

   **Note:** If Oxygen XML Editor Eclipse plugin finds a mapping file in both locations, the one in the **Catalogs** tab takes precedence.

5. Make the appropriate changes to your custom mapping file.

   **Example:** You can look at how the DITA mapping file is configured: OXYGEN_INSTALL_DIR/frameworks/dita/styleguide/contentCompletionElementsMap.xml

   The associated XML Schema contains additional details about how each element and attribute is used in the mapping file.

6. Re-open the application and open an XML document.

   In the **Content Completion Assistant** *(on page 2653)*, you should see the additional annotations for each element.
Translating Annotations

Annotations in the Content Completion Assistant can be displayed in various languages. Based on the language set for the interface, Oxygen XML Editor Eclipse plugin looks for several filename formats to determine the information to load for the content completion annotations. These files that begin with the name `contentCompletionElementsMap`, are located in the `styleguide` folder for each built-in framework (for example, `OXYGEN_INSTALL_DIR/frameworks/dita/styleguide`).

For example, for English, the files are loaded in the following order (from specific to more general):

- `contentCompletionElementsMap_en_US.xml` or `contentCompletionElementMap_en_UK.xml`, and so on
- `contentCompletionElementsMap_en.xml`
- `contentCompletionElementsMap.xml`

If you want the annotations to be displayed in another language, you need to create similar files for the particular language. For example, to show annotations in German, create a file with one of the following names (and store it in the `styleguide` folder for your framework):

- `contentCompletionElementsMap_de_DE.xml`
- `contentCompletionElementsMap_de.xml`

**Related Information:**

- Customizing the Rendering of Elements (on page 1996)

Customizing the Content Completion Assistant for Author Mode Only

You can customize the content of the following **Author** controls, adding items (which, when invoked, perform custom actions) or filtering the default contributed ones:

- *Content Completion Assistant (on page 2653)* window
- *Elements* view (on page 408)
- *Insert Element* menus (from the *Outline view (on page 325)* or breadcrumb (on page 377) contextual menus)

You can use the content completion customization support in a custom **framework (on page 2655)** by following this procedure:

1. Open the **Document type** configuration dialog box (on page 90) for your custom framework and select the **Author** tab. Next, go to the **Content Completion** tab (on page 110).
Figure 516. Customize Content Completion

The top side of the Content Completion section contains the list with all the actions defined within the custom framework and the list of actions that you decided to include in the Content Completion Assistant list of proposals. The bottom side contains the list with all the items that you decided to remove from the Content Completion Assistant list of proposals.

2. If you want to add a custom action to the list of current Content Completion proposals, select the action item from the Available actions list and click the Add as child or Add as sibling button to include it in the Current actions list. A Content Completion Item dialog box appears, giving you the possibility to select where to provide the selected action.

Figure 517. Content Completion Item Dialog Box

3. If you want to exclude a certain item from the Content Completion proposals, you can use the Add button from the Filter - Remove content completion items list. The Remove item dialog box is
displayed, allowing you to input the item name and to choose the controls that filter it. The **Item name** combo box accepts wildcards.

**Figure 518. Remove Item Dialog Box**

```
Remove item

Item name: <SPLIT> table

Remove item from:
- [ ] Content Completion Window
  - [ ] Elements View
  - [ ] Element Insert Menus
  - [ ] Entities View

OK Cancel
```

**Note:**
In the **Item name** drop-down menu, **<SPLIT>** refers to the action of splitting the element and creating a new one, while **<ENTER>** refers to the action of inserting a new line.

**Related Information:**
Customizing the Content Completion Assistant Using a Configuration File *(on page 1980)*

**Configuring Transformation Scenarios for a Framework**

When distributing a framework *(on page 2655)* to users, it is a good idea to have the transformation scenarios already configured. This helps the content authors publish their work in various formats. By being contained in the **framework** configuration, the scenarios can be distributed along with the actions, menus, toolbars, and catalogs.

To create a transformation scenario for your framework, follow these steps:

1. Create an **xsl** folder inside your custom **framework** directory
   
   ```bash
   [OXYGEN_INSTALL_DIR]\frameworks\[CUSTOM_FRAMEWORK_DIR]\xsl
   ```

   The folder structure for the documentation **framework** should be:

   ```bash
   oxygen
   frameworks
      [CUSTOM_FRAMEWORK_DIR]
         schema
         css
         templates
         xsl
   ```
2. Create an `xsl` file and save it in the `xsl` folder. To help you get started, you can use the sample `sdf.xsl` file found in the sample framework customization package.

3. **Open the Preferences dialog box** *(on page 70)* and go to **Document Type Associations**. Select the particular framework, click the **Edit** button to open **Document Type Configuration dialog box** *(on page 90)*, and choose the **Transformation** tab. Click the **+ New** button and choose the appropriate type of transformation (for example, **XML transformation with XSLT**).

   In the **New scenario** dialog box, fill in the following fields:
   - Fill in the **Name** field with the name of your transformation scenario.
   - Set the **XSL URL** field to path of your custom stylesheet (for example, `${framework}/xsl/mycustom.xsl`).

![Figure 519. Configuring a New XSLT Transformation Scenario](image)

4. **Change to the Output tab**. Configure the fields as follows:
   - Set the **Save as** field to `${cfd}/${cfn}.html`. This means the transformation output file will have the name of the XML file and the `html` extension and will be stored in the same folder.
   - Select the **Open in Browser/System Application** option.
To set the browser or system application that will be used, go to Window > Preferences > General > Web Browser and specify it there. This will take precedence over the default system application settings.

Select the Saved file option.

5. Click the OK button to save the new scenario.

Now the scenario is listed in the Transformation tab:

![Figure 520. Transformation Tab](image)

To test the transformation scenario that you just created, you can use the sample sdf.xml file found in the sample framework customization package. Click the Apply Transformation Scenario(s) button to display the Transform with dialog box. The scenario list contains the scenario you defined earlier. Select the SDF to HTML scenario that you just defined and click the Apply associated button. The HTML file is saved in the same folder as the XML file and displayed in the browser.

Configuring Validation Scenarios for a Framework

You can distribute a framework with a series of already configured validation scenarios. Also, this provides enhanced validation support that allows you to use multiple grammars to check the document. For example, you can use Schematron rules to impose guidelines that are otherwise impossible to enforce using conventional validation.

![Note: If a main file is associated with the current file, the validation scenarios defined in the main file, along with any Schematron schema defined in the default scenarios for that particular framework, are used for the validation. These take precedence over other types of validation units defined in the default scenarios for the particular framework. For more information on main files, see Contextual Project Operations Using 'Main Files' Support (on page 277) or Modular Contextual XML Editing Using 'Main Files' Support (on page 596).]

To associate a validation scenario with a specific framework, follow these steps:
1. Open the Preferences dialog box (on page 70) and go to Document Type Association.
2. Select the document type and click the Edit button to open the Document Type Configuration dialog box (on page 90), then choose the Validation tab. This tab displays a list of document types. To set one or more of the validation scenarios listed in this tab to be used as the default validation scenario (when another one is not specified in the validation process) for a specific document type, check the Default box for that specific document type.
3. To edit an existing scenario, select the scenario and click the Edit button. To add a new scenario, click the New button.

In either case, a scenario configuration dialog box is displayed. It lists all the validation units for the scenario.

Figure 521. Validation Scenario Configuration Dialog Box

This scenario configuration dialog box allows you to configure the following information and options:

**Name**

The name of the validation scenario.

**URL of the file to validate**

The URL of the main module that includes the current module. It is also the entry module of the validation process when the current one is validated. To edit the URL, click its cell and specify the URL of the main module by doing one of the following:

- Enter the URL in the text field or select it from the drop-down list.
- Use the Browse drop-down button to browse for a local, remote, or archived file.
- Use the Insert Editor Variable button to insert an editor variable (on page 218) or a custom editor variable (on page 227).
Figure 522. Insert an Editor Variable

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>$(start-dir)</td>
<td>Start directory of custom validator</td>
</tr>
<tr>
<td>$(standard-params)</td>
<td>List of standard parameters</td>
</tr>
<tr>
<td>$(current-file-name-no-ext)</td>
<td>Current file name without extension</td>
</tr>
<tr>
<td>$(current-file-url)</td>
<td>Path of the currently edited file (URL)</td>
</tr>
<tr>
<td>$(current-dir-url)</td>
<td>Path of current file directory (URL)</td>
</tr>
<tr>
<td>$(oxygen-frameworks)</td>
<td>Oxygen frameworks directory (URL)</td>
</tr>
<tr>
<td>$(project-dir-url)</td>
<td>Project directory (URL)</td>
</tr>
<tr>
<td>$(oxygen-home)</td>
<td>Oxygen installation directory (URL)</td>
</tr>
<tr>
<td>$(home)</td>
<td>Path to user home directory (URL)</td>
</tr>
<tr>
<td>$(env(VAR_NAME))</td>
<td>Value of environment variable \VAR_NAME</td>
</tr>
<tr>
<td>$(system(var-name))</td>
<td>Value of system variable \var_name</td>
</tr>
</tbody>
</table>

**File type**

The type of the document that is validated in the current validation unit. Oxygen XML Editor Eclipse plugin automatically selects the file type depending on the value of the **URL of the file to validate** field.

**Validation engine**

You can select one of the engines available in Oxygen XML Editor Eclipse plugin for validation of the particular document type:

- **Default engine** - The default engine is used to run the validation for the current document type, as specified in the preferences page for that type of document (for example, XSLT preferences page (on page 206), XQuery preferences page (on page 203), XML Schema preferences page (on page 195)).

- **DITA Validation** engine - Performs DITA-specific checks in the context of the specifications (it is similar to the process when using the Validate and Check for Completeness action (on page 2360) in the DITA Maps Manager, but for a local file rather than an entire DITA map (on page 2654)).

- **DITA Map Validation and Completeness Check** engine - Performs a validation process that checks the DITA map document and all referenced topics and maps (it is similar to the process when using the Validate and Check for Completeness action (on page 2360) in the DITA Maps Manager).

- **DITA-OT Project Validation and Completeness Check** engine - Performs a validation process that checks each context from the provided DITA-OT project file (it is similar to the process when using the Validate and Check for Completeness action (on page 2360) in the DITA Maps Manager).

- **Table Layout Validation** engine - Looks for table layout problems (for more information, see the Report table layout problems option (on page 2365)).

**Automatic validation**

If this option is selected, the validation operation defined by this row is also applied by the automatic validation feature (on page 545). If the Automatic validation feature is disabled
in the Document Checking preferences page (on page 133), then this option is ignored, as the preference setting has a higher priority.

**Schema**

This option becomes active when you set the **File type** to **XML Document** and allows you to specify the schema used for the validation unit.

**Settings**

Depending on the selected validation engine, clicking the **Settings** button either opens the **Specify Schema** dialog box or the **Configure validation engine** dialog box.

- **Specify Schema Dialog Box**

  This dialog box allows you to specify a custom schema to be used for the validation process.

  ![Specify Schema Dialog Box](image)

  The **Specify Schema** dialog box contains the following options:

  **Use detected schema**

  Uses the schema detected for the particular document (on page 583).

  **Use custom schema**

  Allows you to specify the schema using the following options:

  - **URL** - Allows you to specify or select a URL for the schema. It also keeps a history of the last used schemas. The URL must point to the schema file that can be loaded from the local disk or from a remote server through HTTP(S), FTP(S). You can specify the URL by using the text field, the history drop-down, the **Insert Editor Variables** (on page 218) button, or the browsing actions in the **Browse** drop-down list.
• **Schema type** - Select a possible schema type from this combo box that is populated based on the extension of the schema file that was entered in the URL field. The possible schema types are: XML Schema, DTD, Relax NG, Relax NG Compact, Schematron, or NVDL.

• **Embedded Schematron rules** - If you have selected XML Schema or Relax NG schemas with embedded Schematron rules and you want to use those embedded rules, select this option.

• **Extensions** - Opens a dialog box that allows you to specify Java extension JARs (on page 2655) to be used during the validation.

• **Public ID** - Allows you to specify a public ID if you have selected a DTD.

• **Schematron phase** - If you select a Schematron schema, this drop-down list allows you to select a Schematron phase that you want to use for validation. The listed phases are defined in the Schematron document.

**Configure Validation Engine Dialog Box**

This dialog box allows you to configure options for checking the DITA map document and all referenced topics and maps (similar to the process done when using the Validate and Check for Completeness action (on page 2360) in the DITA Maps Manager).

**Note:**
The options presented in the Configure validation engine dialog box depends on type of validation engine. For example, when configuring the DITA-OT Project Validation and Completeness Check validation engine, the dialog box has slightly fewer options (omitting those that are not applicable).
The **Configure Validation Engine** dialog box contains the following options:

**Batch validate referenced DITA resources**

This option specifies the level of validation that applies to referenced DITA files:

- If the checkbox is left unchecked (default setting), the DITA files will be validated using the rules defined in the DTD or XML Schema declared in the document.
- If the checkbox is selected, the DITA files will be validated using rules defined in their associated validation scenario (*on page 555*).

**Check the existence of non-DITA references resources**

Extends the validation of referenced resources to non-DITA files.
Include remote resources

Select this option if you want to check that remote referenced binary resources (such as images, movie clips, ZIP archives) exist at the specified location.

Use DITAVAL filters

The content of the map is filtered by applying a profiling condition set before validation. You can choose between the following options:

- **From the current condition set** - The map is filtered using the condition set currently applied in the DITA Maps Manager view (on page 2315). Clicking the Details icon opens a topic in the Oxygen XML Editor Eclipse plugin User Guide that explains how to create a profiling condition set.

- **From all available condition sets** - For each available condition set, the map content is filtered using that set before validation.

- **From the associated transformation scenario** - The filtering condition set is specified explicitly as a DITAVAL file in the current transformation scenario associated with the DITA map.

- **Other DITAVAL files** - For each DITAVAL file from this list, the map content is filtered using the DITAVAL file before validation. Use the Add or Remove buttons to configure the list. The Add button opens a dialog box that allows you to select a local or remote path to a DITAVAL file. You can specify the path by using the text field, its history drop-down, the Insert Editor Variables (on page 218) button, or the browsing actions in the Browse drop-down list.

Report references to resources outside of the DITA map folder

If selected, it will report any references to DITA resources that are located outside the main DITA map (on page 2658) folder.

Report links to topics not referenced in DITA maps

Checks that all the topics referenced by other topics are also linked in the DITA map. Also reports related links defined in relationship tables whose target topics are not referenced in the DITA Map.

Report multiple references to the same topic

If selected, it will report warnings when a topic is referenced multiple times in the DITA map, unless a unique @copy-to attribute is used on the <topicref> element for any topic that is referenced multiple times.
For example, it will not report a warning if there is a topic referenced twice, but the second `<topicref>` has a `@copy-to` attribute set:

```xml
<topicref href="topic.dita"/>
....
<topicref href="topic.dita" copy-to="topic2.dita"/>
```

On the other hand, it will report a warning if there is a topic referenced twice and none of the reference-type elements has a `@copy-to` attribute set or both of them have the `@copy-to` attribute set to the same value:

```xml
<topicref href="topic.dita" copy-to="topic2.dita"/>
....
<topicref href="topic.dita" copy-to="topic2.dita"/>
```

**Check for duplicate topic IDs within the DITA map context**

Checks for multiple topics with the same ID in the context of the entire map.

**Report duplicate key definitions**

Checks the DITA map for multiple key references with the same key defined for them. This is helpful because if you have two different resources with the same value for the `@keys` attribute, all references will point to the first one encountered and the other will be ignored.

**Note:**

This option takes key scopes (on page 2480) into account. For example, if you have something like this:

```xml
<topicref href="t2.dita" keys="k2"/>
<topicgroup keyscope="k2">
  <topicref href="t2.dita" keys="k2"/>
</topicgroup>
```

it will not report the "k2" key as a duplicate because it is defined in a key scope (on page 2480) on the second occurrence.

**Report unreferenced key definitions**

Checks the entire DITA map and reports any key definitions that are not referenced anywhere. Note that if the Use DITAVAL filters option is selected, this check will search for unreferenced key definitions based upon your selected filter.

**Report unreferenced reusable elements**
Checks the entire DITA map and reports any detected reusable elements that are not referenced anywhere. It looks for elements that have an ID specified in the following types of topic references:

- Any `<topicref>` that contains a `@processing-role` attribute set to `resource-only`.
- Any other referenced topic that contains elements that are reused elsewhere through a `@conref` or `@conkeyref`.

**Report table layout problems**

Looks for table layout problems. The types of errors that may be reported include:

- If a row has fewer cells than the number of columns detected.
- For a CALS table, if a cell has a vertical span greater than the available rows count.
- For a CALS table, if the number of `<colspecs>` is different than the number of columns detected from the table `@cols` attribute.
- For a CALS table, if the number of columns detected from the table `@cols` attribute is different than the number of columns detected in the table structure.
- For a CALS table, if the value of the `@cols`, `@rowsep`, or `@colsep` attributes are not numeric.
- For a CALS table, if the `@namest`, `@nameend`, or `@colname` attributes point to an incorrect column name.

**Identify possible conflicts in profile attribute values**

When the profiling attributes of a topic contain values that are not found in parent topic profiling attributes, the content of the topic is overshadowed when generating profiled output. This option reports these possible conflicts.

**Report attributes and values that conflict with profiling preferences**

Looks for profiling attributes and values that are not defined in the Profiling / Conditional Text preferences page (on page 145) (you can click the ⎪ Profiling Preferences button to open this preferences page). It also checks if profiling attributes defined as `single-value` have multiple values set in the searched topics.

**Additional Schematron checks**

Allows you to select a Schematron file that Oxygen XML Editor Eclipse plugin will use for the validation of DITA resources. You can specify the path by using the text field, its history drop-down, the ➤ Insert Editor Variables (on page 218) button, or the browsing actions in the ➤ Browse drop-down list.
Advanced Tip:

Some APIs are available that retrieve information about DITA keys that are referenced within a topic. The APIs can be called from XSLT Stylesheets (including XML Refactoring operations) or Schematron schemas. For details, see API Documentation: DITAXSLTExtensionFunctionUtil.

Move Up

Moves the selected validation unit up one spot in the list.

Move Down

Moves the selected validation unit down one spot in the list.

Add

Adds a new validation unit to the list.

Remove

Removes an existing validation unit from the list.

4. Configure any of the existing validation units according to the information above, and you can use the buttons at the bottom of the table to add, remove, or move validation units. Note that if you add a Schematron validation unit, you can also select the validation phase.

5. Click Ok.

The newly created validation scenario is now included in the list of scenarios in the Validation tab (on page 116). You can use the Default checkbox to specify that the new scenario be used as the default validation scenario when another specific scenario is not specified in the validation process.

Customizing New Document Templates for a Framework

You can create your own custom document templates and attach them to a custom framework (on page 2655). You can then share the custom framework (on page 2077) so that all users will have access to the templates in the New from templates wizard (on page 252).

To create your own custom document template and have it appear in the new document wizard, follow these steps:

1. Create a new file and customize it to become a starting point for creating new files of this type.

Tip:

You can use editor variables (on page 218) in the template file content and they will be expanded when the files are opened. Also, see Customizing Document Templates (on page 254) for other template customization tips (for example, you could add placeholders or hints (on page 257) to assist authors).
2. Save the new template in a directory (for example, called templates) within your custom framework directory.

Attention:
The name that you use to save the template will be the name that appears in the new document wizard, including capitalization, space, and characters (for example, My Custom Template1.xml will appear in the new file wizard as My Custom Template1). You can also configure the displayed name in a properties file by following the procedure found in the Configure the Displayed Names for Document Templates (on page 256) section.

3. Open the Document Type configuration dialog box (on page 90) for that specific framework, go to the Templates tab (on page 113), and click the + button in the bottom-right corner to add your new directory to the list. It is recommended that the reference be made relative to the framework directory (for example, $(frameworkDir)/templates). Binding to an absolute file (e.g.: C:some_dir\templates) makes the association difficult to share between users.

4. Click OK for all of the dialog boxes to save your changes.

5. To test the template, open the new document wizard (New toolbar button or File > New > New from Templates) and you should see your custom template in the folder for your custom framework (in the Framework templates section).

Related information
Customizing Document Templates (on page 254)

Configuring XML Catalogs

For cases where you need to reference the location of a schema file from a remote web location and an Internet connection may not be available, an XML Catalog (on page 2659) may be used to map the web location to a local file system entry. The following procedure presents an example of using an XML catalog in a custom framework (on page 2655) by modifying an XML Schema file.

1. Create a catalog file that will help the parser locate the schema for validating the XML document. The file must map the location of the schema to a local version of the schema.

Example:

Create a new XML file called catalog.xml and save it in your custom framework directory ([OXYGEN_INSTALL_DIR]\frameworks\[CUSTOM_FRAMEWORK_DIR]). The content of the file should look like this:

```xml
<?xml version="1.0"?>
<catalog xmlns="urn:oasis:names:tc:entity:xmlns:xml:catalog">
  <uri name="http://www.oxygenxml.com/SDF/abs.xsd">
    url="schema/abs.xsd"/>
  <uri name="http://www.oxygenxml.com/SDF/abs.xsd"/>
</catalog>
```
2. Add catalog files to your custom framework using the Catalogs tab (on page 114) from the Document Type configuration dialog box (on page 90).

To test the catalog settings, restart Oxygen XML Editor Eclipse plugin and try to validate a new sample document for your custom framework. There should be no errors.

Example:

The schema that validates the document refers the other file abs.xsd through an import element:

```xml
<xs:import namespace="http://www.oxygenxml.com/sample/documentation/abstracts"
           schemaLocation="http://www.oxygenxml.com/SDF/abs.xsd"/>
```

The @schemaLocation attribute references the abs.xsd file:

```xml
xsi:schemaLocation="http://www.oxygenxml.com/sample/documentation/abstracts"
                 http://www.oxygenxml.com/SDF/abs.xsd"/>
```

The catalog mapping is:

```xml
http://www.oxygenxml.com/SDF/abs.xsd -> schema/abs.xsd
```

This means that all the references to http://www.oxygenxml.com/SDF/abs.xsd must be resolved to the abs.xsd file located in the schema directory (note that the schema directory needs to be in the same folder as the XML Catalog). The URI element is used by URI resolvers (for example, to resolve a URI reference used in an XSLT stylesheet).

Localizing Frameworks

Oxygen XML Editor Eclipse plugin supports framework (on page 2655) localization (translating framework actions, buttons, and menu entries to various languages). This lets you develop and distribute a framework to users that speak other languages without changing the distributed framework.

To localize the content of a framework, follow this procedure:

1. Create a translation.xml file that contains all the translation (key, value) mappings. The translation.xml has the following format:

```xml
<translation>
  <languageList>
    <language description="English" lang="en_US"/>
    <language description="German" lang="de_DE"/>
    <language description="French" lang="fr_FR"/>
  </languageList>
  <key value="list"/>
</translation>
```
Oxygen XML Editor Eclipse plugin matches the GUI language with the language set in the translation.xml file. If this language is not found, the first available language declared in the <languagelist> tag for the corresponding framework is used.

2. The translation.xml file must be stored in a directory named i18n located in the framework folder. You also need to add a reference to the i18n directory in the Classpath list corresponding to the edited document type (on page 95).

```
${framework}/i18n/ file:/D:/Programs/oxygen/frameworks/TRANSLATIONS/i18n/
```

Note:

If you are working with an extension of a framework, you have to add the reference to your directory after (below) the reference to the i18n directory for the base directory:

```
${baseFramework}/i18n/ file:/D:/Programs/oxygen/frameworks/dita/i18n/
${framework}/i18n/ file:/D:/Programs/oxygen/frameworks/TRANSLATIONS/i18n/
```

3. After you create this file, you can use the keys defined in it to customize the name and description of the following:
   - Actions
   - Menu entries
   - Contextual menus
   - Toolbars
   - Static CSS content

For example, if you want to localize the bold action, open the Preferences dialog box (on page 70) and go to Document Type Association. Use the New or Edit button to open the Document type configuration dialog box (on page 90), go to Author > Actions, and rename the bold action to $i18n(translation_key). Actions with a name format other than $i18n(translation_key) are not localized. Translation_key corresponds to the key from the translation.xml file.

4. Next, open the translation.xml file and edit the translation entry if it exists or create one if it does not exist. This is an example of an entry in the translation.xml file:

```
<key value="translation_key">
  <comment>Bold action name.</comment>
</key>
```
To use a description from the `translation.xml` file in the Java code used by your custom framework, use the new `ro.sync.ecss.extensions.api.AuthorAccess.getAuthorResourceBundle()` API method to request the associated value for a certain key. This allows all the dialog boxes that you present from your custom operations to have labels translated in multiple languages.

You can also reference a key directly in the CSS content:

```css
title:before{
  content:${i18n(title.key)} : "
}
```

Tip:
You can enter any language you want in the `<languagelist>` tag and any number of keys.

DocBook Example:

The `translation.xml` file for the DocBook framework is located here: `[OXYGEN_INSTALL_DIR]/frameworks/docbook/i18n/translation.xml`. In the Classpath list corresponding to the DocBook document type, the following entry was added: `$(framework)/i18n/`.

To see how the DocBook actions are defined to use these keys for their name and description, open the Preferences dialog box (on page 70) and go to Document Type Association > Author > Actions. If you look in the Java class `ro.sync.ecss.extensions.docbook.table.SADocbookTableCustomizerDialog` available in the `oxygen-sample-framework` module of the Oxygen SDK Maven archetype, you can see how the new `ro.sync.ecss.extensions.api.AuthorResourceBundle` API is used to retrieve localized descriptions for various keys.

Framework Java Extensibility Guide

You can add extensions (on page 2657) to your custom framework (on page 2655) (document type) by using the Extensions tab from the Document Type configuration dialog box (on page 90).

If you want to customize the Eclipse plugin, you can look at the Eclipse IDE Integration Sample Project to see how an Eclipse plugin can interact with the Oxygen APIs.

Configuring an Extensions Bundle

All extensions (on page 2657) that are provided by Oxygen XML Editor Eclipse plugin are included in a single bundle.
Note:
The individual extensions can still be set (open the Preferences dialog box (on page 70), go to Document Type Association, double-click a document type, and go to the extension tab), and if present, they take precedence over the single provider. However, this practice is discouraged and the single provider should be used instead.

The extensions bundle is represented by the ro.sync.ecss.extensions.api.ExtensionsBundle class. The provided implementation of the ExtensionsBundle is instantiated when the Document Type Association (on page 2654) rules defined for the custom framework (on page 2655) matches a document opened in the editor. Therefore, references to objects that need to be persistent throughout the application running session must not be kept in the bundle because the next detection event can result in creating another ExtensionsBundle instance.

To configure an extensions bundle, follow this procedure:

1. Create a new Java project in your IDE. Create a lib folder in the Java project folder and copy in it the oxygen.jar file from the /OXYGEN_INSTALL_DIR/lib folder.
2. Create the class (for example, simple.documentation.framework.SDFExtensionsBundle) to extend the abstract class ro.sync.ecss.extensions.api.ExtensionsBundle.
   
   For example:

   ```java
   public class SDFExtensionsBundle extends ExtensionsBundle {
   }
   ```

3. A Document Type ID and a short description should be defined by implementing the getDocumentTypeID and getDescription methods. The Document Type ID is used to uniquely identify the current framework. Such an ID must be provided especially if options related to the framework need to be persistently stored and retrieved between sessions.
   
   For example:

   ```java
   public String getDocumentTypeID() {
   }
   
   public String getDescription() {
       return "A custom extensions bundle used for the Simple Document" +
               "Framework document type";
   }
   ```

4. [Optional] To be notified about the activation of the custom Author Extension in relation with an open document, ro.sync.ecss.extensions.api.AuthorExtensionStateListener should be implemented. The activation and deactivation events received by this listener should be used to perform custom initializations and to register or remove listeners such as ro.sync.ecss.extensions.api.AuthorListener, ro.sync.ecss.extensions.api.AuthorMouseListener, or ro.sync.ecss.extensions.api.AuthorCaretListener. The custom Author Extension state listener should be provided by implementing the createAuthorExtensionStateListener method.
For example:

```java
public AuthorExtensionStateListener createAuthorExtensionStateListener() {
    return new SDFAuthorExtensionStateListener();
}
```

The `AuthorExtensionStateListener` is instantiated and notified about the activation of the framework when the rules of the Document Type Association match a document opened in the Author editing mode. The listener is notified about the deactivation when another framework is activated for the same document, the user switches to another mode or the editor is closed. A complete description and implementation of `ro.sync.ecss.extensions.api.AuthorExtensionStateListener` can be found in Implementing an Author Extension State Listener (on page 2034).

If Schema-Aware mode (on page 154) is active in Oxygen XML Editor Eclipse plugin, all actions that can generate invalid content will be redirected toward the `ro.sync.ecss.extensions.api.AuthorSchemaAwareEditingHandler`. The handler can resolve a specific case, let the default implementation take place, or reject the edit entirely by throwing `ro.sync.ecss.extensions.api.InvalidEditException`. The actions that are forwarded to this handler include typing, delete, or paste.

For more details about this handler, see Handling Schema-Aware Editing Events (on page 2072).

5. [Optional] You can customize the content completion proposals by creating a schema manager filter extension. The interface that declares the methods used for content completion proposals filtering is `ro.sync.contentcompletion.xml.SchemaManagerFilter`. The filter can be applied on elements, attributes, or on their values. The `createSchemaManagerFilter` method is responsible for creating the content completion filter. A new `SchemaManagerFilter` will be created each time a document matches the rules defined by the Document Type Association that contains the filter declaration.

For example:

```java
public SchemaManagerFilter createSchemaManagerFilter() {
    return new SDFSchemaManagerFilter();
}
```

A detailed presentation of the schema manager filter can be found in the Configuring a Content Completion Handler (on page 2027) section.

6. [Optional] The Author mode supports link-based navigation between documents and document sections. Therefore, if the document contains elements defined as links to other elements (for example, links based on the `@id` attributes), the extension should provide the means to find the referenced content. To do this, an implementation of the `ro.sync.ecss.extensions.api.link.ElementLocatorProvider` interface should be returned by the `createElementLocatorProvider` method. Each time an element pointed by a link needs to be located, the method is invoked.

For example:
public ElementLocatorProvider createElementLocatorProvider() {
    return new DefaultElementLocatorProvider();
}

For more information on how to implement an element locator provider, see the Configuring a Link Target Element Finder (on page 2052) section.

7. [Optional] The drag and drop functionality can be extended by implementing the ro.sync.xml.editor.xmleditor.pageauthor.AuthorDnDListener interface. Relevant methods from the listener are invoked when the mouse is dragged, moved over, or exits the Author editing mode, when the drop action changes, and when the drop occurs. Each method receives the DropTargetEvent containing information about the drag and drop operation. The drag and drop extensions are available in Author mode for both Oxygen XML Editor Eclipse plugin Eclipse plugin and standalone application. The Text mode corresponding listener is available only for Oxygen XML Editor Eclipse plugin Eclipse plugin. The methods corresponding to each implementation are: createAuthorAWTDndListener, createTextSWTDndListener, and createAuthorSWTDndListener.

public AuthorDnDListener createAuthorAWTDndListener() {
    return new SDFAuthorDndListener();
}

For more details about the Author mode drag and drop listeners, see the Configuring a custom Drag and Drop Listener (on page 2030) section.

8. [Optional] Another extension that can be included in the bundle is the reference resolver. For example, the references represented by the ref element and the attribute indicating the referenced resource is location. To be able to obtain the content of the referenced resources you will have to implement a Java extension class that implements ro.sync.ecss.extensions.api.AuthorReferenceResolver. The method responsible for creating the custom references resolver is createAuthorReferenceResolver. The method is called each time a document opened in an Author editing mode matches the Document Type Association where the extensions bundle is defined. The instantiated references resolver object is kept and used until another extensions bundle corresponding to another document type is activated as result of the detection process. For example:

public AuthorReferenceResolver createAuthorReferenceResolver() {
    return new ReferencesResolver();
}

A more detailed description of the references resolver can be found in the Configuring a References Resolver (on page 2030) section.

9. [Optional] To be able to dynamically customize the default CSS styles for a certain ro.sync.ecss.extensions.api.node.AuthorNode, an implementation of ro.sync.ecss.extensions.api.StylesFilter can be provided. The extensions bundle method responsible
for creating the StylesFilter is `createAuthorStylesFilter`. The method is called each time a document opened in an Author editing mode matches the Document Type Association where the extensions bundle is defined. The instantiated filter object is kept and used until another extensions bundle corresponding to another document type is activated as a result of the detection process. For example:

```java
public StylesFilter createAuthorStylesFilter() {
    return new SDFStylesFilter();
}
```

See the Configuring CSS Styles Filter (on page 2051) section for more details about the styles filter extension.

10. [Optional] To edit data in custom tabular format, implementations of the `ro.sync.ecss.extensions.api.AuthorTableCellSpanProvider` and the `ro.sync.ecss.extensions.api.AuthorTableColumnWidthProvider` interfaces should be provided. The two methods from the `ExtensionsBundle` specifying these two extension points are `createAuthorTableCellSpanProvider` and `createAuthorTableColumnWidthProvider`. For example:

```java
public AuthorTableCellSpanProvider createAuthorTableCellSpanProvider() {
    return new TableCellSpanProvider();
}

public AuthorTableColumnWidthProvider createAuthorTableColumnWidthProvider() {
    return new TableColumnWidthProvider();
}
```

The two table information providers are not reused for different tables. The methods are called for each table in the document so new instances should be provided every time. Read more about the cell span and column width information providers in Configuring a Table Cell Span Provider (on page 2043) and Configuring a Table Column Width Provider (on page 2038) sections.

If the functionality related to one of the previous extension points does not need to be modified, then the developed `ro.sync.ecss.extensions.api.ExtensionsBundle` should not override the corresponding method and leave the default base implementation to return `null`.

11. [Optional] An XML vocabulary can contain links to various areas of a document. If the document contains elements defined as links, you can choose to present a more relevant text description for each link. To do this, an implementation of the `ro.sync.ecss.extensions.api.link.LinkTextResolver` interface should be returned by the `createLinkTextResolver` method. This implementation is used each time the `oxy_link-text()` function (on page 2153) is encountered in the CSS styles associated with an element. For example:
public LinkTextResolver createLinkTextResolver() {
    return new DitaLinkTextResolver();
}

12. Pack the compiled class into a JAR (on page 2655) file.
13. Copy the JAR file into your custom framework directory (for example, frameworks/sdf).
14. Add the JAR file to the class path. To do this, open the Preferences dialog box (on page 70), go to Document Type Association, select the document type (for example, SDF), click the Edit button, select the Classpath tab, and click the Add button. In the displayed dialog box, enter the location of the JAR file relative to the Oxygen XML Editor Eclipse plugin frameworks folder.
15. Register the Java class by going to the Extensions tab. Click the Choose button and select the name of the class (for example, SDFExtensionsBundle).

**Note:**
The complete source code for framework customization examples can be found in the oxygen-sample-framework module of the Oxygen SDK, available as a Maven archetype on the Oxygen XML Editor Eclipse plugin website.

Sample DITA (framework) extension that sets a custom ExtensionsBundle implementation for customizing links

### Adding a Custom Image Decorator for Author Mode

The `AuthorImageDecorator` extension point allows you to add a custom decorator over images in Author mode. For example, you could use it to add a message over an image informing the user that they can double-click the image to edit it.

**How to Implement an AuthorImageDecorator**

To implement your own `AuthorImageDecorator`, follow this procedure:

1. Implement the `ro.sync.ecss.extensions.api.AuthorImageDecorator` interface.
2. To instruct Oxygen XML Editor Eclipse plugin to use this newly created implementation, use either of the following methods:
a. If you have configured an extensions bundle (on page 2020), you can return the AuthorImageDecorator implementation using the ro.sync.ecss.extensions.api.ExtensionsBundle.getAuthorImageDecorator() method.

b. Specify the AuthorImageDecorator in the Author image decorator individual extension in the Extensions tab (on page 117) of the Document Type configuration dialog box (on page 90) for your particular document type.

Example

The following example illustrates an implementation for presenting a simple message over an image that informs the user that they can double-click the image to edit it:

```java
/**
 * Custom Author image decorator for drawing string over images.
 */
public class CustomAuthorImageDecorator extends AuthorImageDecorator {

    /**
     * @see ro.sync.ecss.extensions.api.AuthorImageDecorator#paint
     * (ro.sync.exml.view.graphics.Graphics, int, int, int, int,
     * ro.sync.exml.view.graphics.Rectangle,
     * ro.sync.ecss.extensions.api.node.AuthorNode,
     * ro.sync.ecss.extensions.api.AuthorAccess, boolean)
     */
    @Override
    public void paint(Graphics g, int x, int y, int imageWidth, int imageHeight,
                      Rectangle originalSize, AuthorNode element,
                      AuthorAccess authorAccess, boolean wasAnnotated) {
        if ("image".equals(CommonsOperationsUtil.getLocalName(element.getName()))) {
            g.drawString("[Double-click to edit image]",
                         // Draw near the top-left corner
                         x + 15,
                         y + 15);
        }
    }
}
```

Example result: In the top-left corner of the image, the following message will be displayed: [Double-click to edit image].

Adding Custom Persistent Highlights

The Author API includes a class that allows you to create or remove custom persistent highlights, set new properties for the highlights, and customize their appearance. An example of a possible use case would be
if you want to implement your own way of editing review comments. The custom persistent highlights get serialized in the XML document as processing instructions, with the following format:

```xml
<?oxy_custom_start prop1="val1"....?> xml content <?oxy_custom_end?>
```

This functionality is available through the `AuthorPersistentHighlighter` class that is accessible through the `AuthorEditorAccess#getPersistentHighlighter()` method.

For more information, see the JavaDoc details for this class at https://www.oxygenxml.com/InstData/Editor/SDK/javadoc/ro/sync/ecss/extensions/api/highlights/AuthorPersistentHighlighter.html.

### Configuring the Automatic ID Generation and Unique Attributes Recognizer

The `ro.sync.ecss.extensions.api.UniqueAttributesRecognizer` interface can be implemented if you want to provide for your framework (on page 2655) the following features:

- **Automatic ID generation** - You can automatically generate unique IDs for newly inserted elements. Implementations are already available for the DITA and DocBook frameworks (on page 2655). The following methods can be implemented to accomplish this: `assignUniqueIDs(int startOffset, int endOffset)`, `isAutoIDGenerationActive()`

- **Avoiding copying unique attributes when "Split" is called inside an element** - You can split the current `block element` (on page 2652) by pressing the "Enter" key and then choosing "Split". This is a very useful way to create new paragraphs, for example. All attributes are by default copied on the new element but if those attributes are IDs you sometimes want to avoid creating validation errors in the editor. Implementing the following method, you can decide whether or not an attribute should be copied during the split: `boolean copyAttributeOnSplit(String attrQName, AuthorElement element)`

**Tip:**

The `ro.sync.ecss.extensions.commons.id.DefaultUniqueAttributesRecognizer` class is an implementation of the interface that can be extended by your customization to provide easy assignment of IDs in your framework (on page 2655). You can also check out the DITA and DocBook implementations of `ro.sync.ecss.extensions.api.UniqueAttributesRecognizer` to see how they were implemented and connected to the extensions bundle.

**Note:**

The complete source code for framework customization examples can be found in the `oxygen-sample-framework` module of the Oxygen SDK, available as a Maven archetype on the Oxygen XML Editor Eclipse plugin website.

### Configuring Content Completion Proposals

You can filter or contribute to proposals offered for content completion by implementing the `ro.sync.contentcompletion.xml.SchemaManagerFilter` interface.
public class SDFSXMLSchemaManagerFilter implements SchemaManagerFilter {

You can implement the various callbacks of the interface either by returning the default values given by Oxygen XML Editor Eclipse plugin or by contributing to the list of proposals. The filter can be applied on elements, attributes or on their values. Attributes filtering can be implemented using the filterAttributes method and changing the default content completion list of `ro.sync.contentcompletion.xml.CIAttribute` for the element provided by the current `ro.sync.contentcompletion.xml.WhatAttributesCanGoHereContext` context. For example, the `SDFSXMLSchemaManagerFilter` checks if the element from the current context is the `table` element and adds the `frame` attribute to the `table` list of attributes.

```java
/**
 * Filter attributes of the "table" element.
 */
public List<CIAttribute> filterAttributes(List<CIAttribute> attributes,
WhatAttributesCanGoHereContext context) {
    // If the element from the current context is the 'table' element add the
    // attribute named 'frame' to the list of default content completion proposals
    if (context != null) {
        ContextElement contextElement = context.getParentElement();
        if ("table".equals(contextElement.getQName())) {
            CIAttribute frameAttribute = new CIAttribute();
            frameAttribute.setName("frame");
            frameAttribute.setRequired(false);
            frameAttribute.setFixed(false);
            frameAttribute.setDefaultValue("void");
            if (attributes == null) {
                attributes = new ArrayList<CIAttribute>();
            }
            attributes.add(frameAttribute);
        }
    }
    return attributes;
}
```
The elements that can be inserted in a specific context can be filtered using the `filterElements` method. The `SDFSchemaManagerFilter` uses this method to replace the `<td>` child element with the `<th>` element when `<header>` is the current context element.

```java
public List<CIElement> filterElements(List<CIElement> elements, WhatElementsCanGoHereContext context) {
    // If the element from the current context is the 'header' element remove the
    // 'td' element from the list of content completion proposals and add the
    // 'th' element.
    if (context != null) {
        Stack<ContextElement> elementStack = context.getElementStack();
        if (elementStack != null) {
            ContextElement contextElement = context.getElementStack().peek();
            if ("header".equals(contextElement.getQName())) {
                if (elements != null) {
                    for (Iterator<CIElement> iterator = elements.iterator(); iterator.hasNext();) {
                        CIElement element = iterator.next();
                        // Remove the 'td' element
                        if ("td".equals(element.getQName())) {
                            elements.remove(element);
                            break;
                        }
                    }
                } else {
                    elements = new ArrayList<CIElement>();
                }
                // Insert the 'th' element in the list of content completion proposals
                CIElement thElement = new SDFElement();
                thElement.setName("th");
                elements.add(thElement);
            }
        } else {
            // If the given context is null then the given list of content completion
            // elements contains global elements.
        }
    }
    return elements;
}
```
The elements or attributes values can be filtered using the `filterElementValues` or `filterAttributeValues` methods.

**Note:**
The complete source code for framework customization examples can be found in the oxygen-sample-framework module of the Oxygen SDK, available as a Maven archetype on the Oxygen XML Editor Eclipse plugin website.

### Configuring a Custom Drag and Drop Listener

Sometimes it is useful to perform various operations when certain objects are dropped from outside sources in the editing area. You can choose from three interfaces to implement depending on whether you are using the Eclipse plugin or the standalone version of the application, or if you want to add the handler for the Text or Author modes.

#### Interfaces for the Drag and Drop Listener

- `ro.sync.exml.editor.xmleditor.pageauthor.AuthorDnDListener`
  Receives callbacks from the standalone application for Drag And Drop in Author mode.
- `com.oxygenxml.editor.editors.author.AuthorDnDListener`
  Receives callbacks from the Eclipse plugin for Drag And Drop in Author mode.
- `com.oxygenxml.editor.editors.TextDnDListener`
  Receives callbacks from the Eclipse plugin for Drag And Drop in Text mode.

**Note:**
The complete source code for framework customization examples can be found in the oxygen-sample-framework module of the Oxygen SDK, available as a Maven archetype on the Oxygen XML Editor Eclipse plugin website.

To configure how dropped URLs or XHTML fragments are handled in documents, see Handling When URLs or XHTML Fragments are Dropped or Pasted in Author Mode (on page 2074).

**Related Information:**
Customizing Smart Paste Support (on page 1977)

### Configuring a Reference Resolver

This information is helpful if you need to provide a handler for resolving references and obtain the content they reference. For example, suppose the element that has references is `ref` and the attribute indicating the referenced resource is `location`. You need to implement a Java extension class for obtaining the referenced resources.
1. Create the class `simple.documentation.framework.ReferencesResolver`. This class must implement the `ro.sync.ecss.extensions.api.AuthorReferenceResolver` interface.

```java
import ro.sync.ecss.extensions.api.AuthorReferenceResolver;
import ro.sync.ecss.extensions.api.AuthorAccess;
import ro.sync.ecss.extensions.api.node.AttrValue;
import ro.sync.ecss.extensions.api.node.AuthorElement;
import ro.sync.ecss.extensions.api.node.AuthorNode;

public class ReferencesResolver
    implements AuthorReferenceResolver {

    public boolean hasReferences(AuthorNode node) {
        boolean hasReferences = false;
        if (node.getType() == AuthorNode.NODE_TYPE_ELEMENT) {
            AuthorElement element = (AuthorElement) node;
            if ("ref".equals(element.getLocalName())) {
                AttrValue attrValue = element.getAttribute("location");
                hasReferences = attrValue != null;
            }
        }
        return hasReferences;
    }

    public String getDisplayName(AuthorNode node) {
        String displayName = "ref-fragment";
        if (node.getType() == AuthorNode.NODE_TYPE_ELEMENT) {
            AuthorElement element = (AuthorElement) node;
            if ("ref".equals(element.getLocalName())) {
                AttrValue attrValue = element.getAttribute("location");
                if (attrValue != null) {
                    displayName = attrValue.getValue();
                }
            }
        }
        return displayName;
    }
```

2. The `hasReferences` method verifies if the handler considers the node to have references. It takes `AuthorNode` as an argument that represents the node that will be verified. The method will return `true` if the node is considered to have references. In the following example, to be a reference, the node must be an element with the name `ref` and it must have an attribute named `location`.

3. The method `getDisplayName` returns the display name of the node that contains the expanded referenced content. It takes `AuthorNode` as an argument that represents the node that needs the display name. The referenced content engine will ask this `AuthorReferenceResolver` implementation for the display name for each node that is considered a reference. In the following example, the display name is the value of the `location` attribute from the `ref` element.
4. The method `resolveReference` resolves the reference of the node and returns a `SAXSource` with the parser and its input source. It takes `AuthorNode` as an argument that represents the node that needs the reference resolved, the `systemID` of the node, the `AuthorAccess` with access methods to the `Author` mode data model and a `SAX EntityResolver` that resolves resources that are already opened in another editor or resolve resources through the `XML Catalog (on page 2659)`. In the implementation, you need to resolve the reference relative to the `systemID`, and create a parser and an input source over the resolved reference.

```java
public SAXSource resolveReference(
    AuthorNode node,
    String systemID,
    AuthorAccess authorAccess,
    EntityResolver entityResolver) {
    SAXSource saxSource = null;

    if (node.getType() == AuthorNode.NODE_TYPE_ELEMENT) {
        AuthorElement element = (AuthorElement) node;
        if ("ref".equals(element.getLocalName())) {
            AttrValue attrValue = element.getAttribute("location");
            if (attrValue != null) {
                String attrStringVal = attrValue.getValue();
                try {
                    URL absoluteUrl = new URL(new URL(systemID),
                        authorAccess.getUtilAccess().correctURL(attrStringVal));

                    InputSource inputSource = entityResolver.resolveEntity(null,
                        absoluteUrl.toString());
                    if (inputSource == null) {
                        inputSource = new InputSource(absoluteUrl.toString());
                    }
                    XMLReader xmlReader = authorAccess.newNonValidatingXMLReader();
                    xmlReader.setEntityResolver(entityResolver);
                    saxSource = new SAXSource(xmlReader, inputSource);
                } catch (MalformedURLException e) {
                    logger.error(e, e);
                } catch (SAXException e) {
                    logger.error(e, e);
                } catch (IOException e) {
                    logger.error(e, e);
                }
            }
        }
    }
    return displayName;
}
```
5. The method `getReferenceUniqueID` should return a unique identifier for the node reference. The unique identifier is used to avoid resolving the references recursively. The method takes `AuthorNode` as an argument that represents the node with the reference. In the following example, the unique identifier is the value of the `location` attribute from the `ref` element.

```java
public String getReferenceUniqueID(AuthorNode node) {
    String id = null;
    if (node.getType() == AuthorNode.NODE_TYPE_ELEMENT) {
        AuthorElement element = (AuthorElement) node;
        if ("ref".equals(element.getLocalName())) {
            AttrValue attrValue = element.getAttribute("location");
            if (attrValue != null) {
                id = attrValue.getValue();
            }
        }
    }
    return id;
}
```

6. The method `getReferenceSystemID` should return the `systemID` of the referenced content. It takes `AuthorNode` as an argument that represents the node with the reference and the `AuthorAccess` with access methods to the `Author` mode data model. For example, the value of the `location` attribute is used from the `ref` element and resolved relatively to the XML base URL of the node.

```java
public String getReferenceSystemID(AuthorNode node, AuthorAccess authorAccess) {
    String systemID = null;
    if (node.getType() == AuthorNode.NODE_TYPE_ELEMENT) {
        AuthorElement element = (AuthorElement) node;
        if ("ref".equals(element.getLocalName())) {
            AttrValue attrValue = element.getAttribute("location");
            if (attrValue != null) {
                String attrStringVal = attrValue.getValue();
                try {
                    URL absoluteUrl = new URL(node.getXMLBaseURL(),
                                              authorAccess.getUtilAccess().correctURL(attrStringVal));
                    systemID = absoluteUrl.toString();
                }
            }
        }
    }
    return systemID;
}
```
In the listing below, the XML document contains the ref element:

```xml
<ref location="referenced.xml">Reference</ref>
```

When no reference resolver is specified, the reference has the following layout:

![Figure 525. Reference with no specified reference resolver](image_url)

When the above implementation is configured, the reference has the expected layout:

![Figure 526. Reference with reference resolver](image_url)

Note:
The complete source code for framework customization examples can be found in the oxygen-sample-framework module of the Oxygen SDK, available as a Maven archetype on the Oxygen XML Editor Eclipse plugin website.

Configuring a State Listener for Author Mode

The ro.sync.ecss.extensions.api.AuthorExtensionStateListener implementation is notified when the Author mode extension (where the listener is defined) is activated or deactivated in the document type detection process.

```java
import ro.sync.ecss.extensions.api.AuthorAccess;
import ro.sync.ecss.extensions.api.AuthorExtensionStateListener;

public class SDFAuthorExtensionStateListener implements AuthorExtensionStateListener {
```
When the association rules of the framework (on page 2655) (document type) configuration match that of a document open in the Author editing mode, the activation event received by this listener should be used to perform custom initializations and to register listeners such as ro.sync.ecss.extensions.api.AuthorListener, ro.sync.ecss.extensions.api.AuthorMouseListener, or ro.sync.ecss.extensions.api.AuthorCaretListener.

```java
private AuthorListener sdfAuthorDocumentListener;
private AuthorMouseListener sdfMouseListener;
private AuthorCaretListener sdfCaretListener;
private OptionListener sdfOptionListener;

public void activated(AuthorAccess authorAccess) {
    // Get the value of the option.
    String option = authorAccess.getOptionsStorage().getOption("sdf.custom.option.key", ";");
    // Use the option for some initializations...

    // Add an OptionListener.
    authorAccess.getOptionsStorage().addOptionListener(sdfOptionListener);

    // Add author DocumentListeners.
    sdfAuthorDocumentListener = new SDFAuthorListener();
    authorAccess.getDocumentController().addAuthorListener(sdfAuthorDocumentListener);

    // Add MouseListener.
    sdfMouseListener = new SDFAuthorMouseListener();
    authorAccess.getEditorAccess().addAuthorMouseListener(sdfMouseListener);

    // Add CaretListener.
    sdfCaretListener = new SDFAuthorCaretListener();
    authorAccess.getEditorAccess().addAuthorCaretListener(sdfCaretListener);

    // Other custom initializations...
}
```

The authorAccess parameter received by the activated method can be used to gain access to specific Author mode actions and informations related to components such as the editor, document, workspace, tables, or the change tracking manager.

If options specific to the custom developed Author Extension need to be stored or retrieved, a reference to the ro.sync.ecss.extensions.api.OptionsStorage can be obtained by calling the getOptionsStorage method from the authorAccess. The same object can be used to register ro.sync.ecss.extensions.api.OptionListener.
listeners. An option listener is registered in relation with an option **key** and will be notified about the value changes of that option.

An **AuthorListener** can be used if events related to the **Author** mode document modifications are of interest. The listener can be added to the `ro.sync.ecss.extensions.api.AuthorDocumentController`. A reference to the document controller is returned by the `getDocumentController` method from the **authorAccess**. The document controller can also be used to perform operations involving document modifications.

To provide access to the **Author** mode component-related functionality and information, the **authorAccess** has a reference to the `ro.sync.ecss.extensions.api.access.AuthorEditorAccess` that can be obtained when calling the `getEditorAccess` method. At this level, **AuthorMouseListener** and **AuthorCaretListener** can be added to provide notification of mouse and cursor events that occur in the **Author** editor mode.

The **deactivation** event is received when another **framework** is activated for the same document, the user switches to another editor mode or the editor is closed. The **deactivate** method is typically used to unregister the listeners previously added on the **activate** method and to perform other actions. For example, options related to the deactivated **Author Extension** can be saved at this point.

```java
public void deactivated(AuthorAccess authorAccess) {
    // Store the option.
    authorAccess.getOptionsStorage().setOption("sdf.custom.option.key", optionValue);

    // Remove the OptionListener.
    authorAccess.getOptionsStorage().removeOptionListener(sdfOptionListener);

    // Remove DocumentListeners.
    authorAccess.getDocumentController().removeAuthorListener(sdfAuthorDocumentListener);

    // Remove MouseListener.
    authorAccess.getEditorAccess().removeAuthorMouseListener(sdfMouseListener);

    // Remove CaretListener.
    authorAccess.getEditorAccess().removeAuthorCaretListener(sdfCaretListener);

    // Other actions...
}
```

**Note:**
The complete source code for **framework** customization examples can be found in the **oxygen-sample-framework** module of the **Oxygen SDK**, available as a Maven archetype on the **Oxygen XML Editor Eclipse plugin website**.
Configuring Tables

There are standard CSS properties used to indicate what elements are tables, table rows and table cells. What CSS is missing is the possibility to indicate the cell spanning, row separators or the column widths. Oxygen XML Editor Eclipse plugin offers support for adding extensions to solve these problems.

The table in this example is a simple one. The header must be formatted in a different way than the ordinary rows, so it will have a background color.

```
table{
    display:table;
    border:1px solid navy;
    margin:1em;
    max-width:1000px;
    min-width:150px;
}

table[width] {
    width:attr(width, length);
}

tr, header{
    display:table-row;
}

header{
    background-color: silver;
    color: inherit
}

td{
    display:table-cell;
    border:1px solid navy;
    padding:1em;
}
```

Suppose that in the schema, the `<td>` tag has the attributes `@row_span` and `@column_span` that are not automatically recognized by Oxygen XML Editor Eclipse plugin, a Java extension will be implemented that will provide information about the cell spanning. See the section Configuring a Table Cell Span Provider (on page 2043).

Suppose the column widths are specified by the `@width` attribute of the `<customcol>` elements that are not automatically recognized by Oxygen XML Editor Eclipse plugin. It is necessary to implement a Java extension
that will provide information about the column widths. For more information, see Configuring a Table Column Width Provider (on page 2038).

The table from the example does not make use of the attributes @colsep and @rowsep (which are automatically recognized) but if you want the rows to be separated by horizontal lines, it is necessary to implement a Java extension that will provide information about the row and column separators. For more information, see Configuring a Table Cell Row and Column Separator Provider (on page 2047).

Configuring a Table Column Width Provider

In a custom framework (on page 2655), the <table> element as well as the table columns can have specified widths. For these widths to be considered by Author mode, you need to provide the means for determining them. As explained in Configuring Tables (on page 2037), if you use the table element attribute width Oxygen XML Editor Eclipse plugin can determine the table width automatically. In this example the table has <col> elements with @width attributes that are not recognized by default. You will need to implement a Java extension class to determine the column widths.

1. Create the class simple.documentation.framework.TableColumnWidthProvider. This class must implement the ro.sync.ecss.extensions.api.AuthorTableColumnWidthProvider interface.

```java
import ro.sync.ecss.extensions.api.AuthorAccess;
import ro.sync.ecss.extensions.api.AuthorOperationException;
import ro.sync.ecss.extensions.api.AuthorTableColumnWidthProvider;
import ro.sync.ecss.extensions.api.WidthRepresentation;
import ro.sync.ecss.extensions.api.node.AuthorElement;

public class TableColumnWidthProvider

    implements AuthorTableColumnWidthProvider {

    public void init(AuthorElement tableElement) {
        this.tableElement = tableElement;
        AuthorElement[] colChildren = tableElement.getElementsByTagName("customcol");

        if (colChildren != null && colChildren.length > 0) {
            for (int i = 0; i < colChildren.length; i++) {
                AuthorElement colChild = colChildren[i];
                if (i == 0) {
                    colsStartOffset = colChild.getStartOffset();
                }
                if (i == colChildren.length - 1) {
                    colsEndOffset = colChild.getEndOffset();
                }
            // Determine the 'width' for this col.
        }
    }
```

2. Method init is taking as argument an ro.sync.ecss.extensions.api.node.AuthorElement that represents the XML <table> element. In our case the column widths are specified in <col> elements from the <table> element. In such cases you must collect the span information by analyzing the <table> element.
3. The method `isTableAcceptingWidth` should check if the table cells are a `<td>` element.

```java
public boolean isTableAcceptingWidth(String tableCellsTagName) {
    return "td".equals(tableCellsTagName);
}
```

4. The method `isTableAndColumnsResizable` should check if the table cells are a `<td>` element. This method determines if the table and its columns can be resized by dragging the edge of a column.

```java
public boolean isTableAndColumnsResizable(String tableCellsTagName) {
    return "td".equals(tableCellsTagName);
}
```

5. Methods `getTableWidth` and `getCellWidth` are used to determine the table and column width. The table layout engine will ask this `ro.sync.ecss.extensions.api.AuthorTableColumnWidthProvider` implementation what is the table width for each table element and the cell width for each cell element from the table that was marked as cell in the CSS using the property `display:table-cell`. The implementation is simple and just parses the value of the `width` attribute. The methods must return `null` for the tables / cells that do not have a specified width.

```java
public WidthRepresentation getTableWidth(String tableCellsTagName) {
    WidthRepresentation toReturn = null;
    if (tableElement != null && "td".equals(tableCellsTagName)) {
        AttrValue widthAttr = tableElement.getAttribute("width");
        if (widthAttr != null) {
            String width = widthAttr.getValue();
            if (width != null) {
                toReturn = new WidthRepresentation(width, true);
            }
        }
    }
    return toReturn;
}
```
public List<WidthRepresentation> getCellWidth(AuthorElement cellElement, int colNumberStart, int colSpan) {
    List<WidthRepresentation> toReturn = null;
    int size = colWidthSpecs.size();
    if (size >= colNumberStart && size >= colNumberStart + colSpan) {
        toReturn = new ArrayList<WidthRepresentation>(colSpan);
        for (int i = colNumberStart; i < colNumberStart + colSpan; i++) {
            // Add the column widths
            toReturn.add(colWidthSpecs.get(i));
        }
    }
    return toReturn;
}

6. Methods `commitTableWidthModification` and `commitColumnWidthModifications` are used to commit changes made to the width of the table or its columns when using the mouse drag gestures.

    public void commitTableWidthModification
    (AuthorDocumentController authorDocumentController,
        int newTableWidth, String tableCellsTagName) throws AuthorOperationException {
        if (!"td".equals(tableCellsTagName)) {
            if (newTableWidth > 0) {
                if (tableElement != null) {
                    String newWidth = String.valueOf(newTableWidth);
                    authorDocumentController.setAttribute("width", new AttrValue(newWidth),
                        tableElement);
                } else {
                    throw new AuthorOperationException("Cannot find the table element.");
                }
            }
        }
    }

    public void commitColumnWidthModifications
    (AuthorDocumentController authorDocumentController,
        WidthRepresentation[] colWidths, String tableCellsTagName)
    throws AuthorOperationException {
        if (!"td".equals(tableCellsTagName)) {
            if (colWidths != null && tableElement != null) {
                if (colsStartOffset >= 0 && colsEndOffset >= 0 && colsStartOffset < colsEndOffset) {
                    authorDocumentController.delete(colsStartOffset, colsEndOffset);
                }
            }
        }
    }
String xmlFragment = createXMLFragment(colWidths);
int offset = -1;
AuthorElement[] header = tableElement.getElementsByTagName("header");
if (header != null && header.length > 0) {
    // Insert the cols elements before the 'header' element
    offset = header[0].getStartOffset();
}
if (offset == -1) {
    throw new AuthorOperationException(
        "No valid offset to insert column width");
}
authorDocumentController.insertXMLFragment(xmlFragment, offset);
}

private String createXMLFragment(WidthRepresentation[] widthRepresentations) {
    StringBuffer fragment = new StringBuffer();
    String ns = tableElement.getNamespace();
    for (int i = 0; i < widthRepresentations.length; i++) {
        WidthRepresentation width = widthRepresentations[i];
        fragment.append("<customcol";
        String strRepresentation = width.getWidthRepresentation();
        if (strRepresentation != null) {
            fragment.append(" width=" + width.getWidthRepresentation() + ")
        }
        if (ns != null && ns.length() > 0) {
            fragment.append(" xmlns=" + ns + ")
        }
        fragment.append("/">
    }
    return fragment.toString();
}

7. The following three methods are used to determine what type of column width specifications the table column width provider support. In our case all types of specifications are allowed:

    public boolean isAcceptingFixedColumnWidths(String tableCellsTagName) {
        return true;
    }

    public boolean isAcceptingPercentageColumnWidths(String tableCellsTagName) {
        return true;
    }
public boolean isAcceptingProportionalColumnWidths(String tableCellsTagName) {
    return true;
}

Note:
The complete source code for framework customization examples can be found in the oxygen-sample-framework module of the Oxygen SDK, available as a Maven archetype on the Oxygen XML Editor Eclipse plugin website.

In the listing below, the XML document contains the table element:

```
<table width="300">
    <customcol width="50.0px"/>
    <customcol width="1*"/>
    <customcol width="2*"/>
    <customcol width="20%"/>
    <header>
        <td>C1</td>
        <td>C2</td>
        <td>C3</td>
        <td>C4</td>
    </header>
    <tr>
        <td/cs=1, rs=1></td>
        <td/cs=1, rs=1></td>
        <td row_span="2">cs=1, rs=2</td>
        <td row_span="3">cs=1, rs=3</td>
    </tr>
    <tr>
        <td/cs=1, rs=1></td>
        <td/cs=1, rs=1></td>
    </tr>
    <tr>
        <td column_span="3">cs=3, rs=1</td>
    </tr>
</table>
```

When no table column width provider is specified, the table has the following layout:
Figure 527. Table layout when no column width provider is specified

When the above implementation is configured, the table has the correct layout:

Figure 528. Columns with custom widths

Note:
The complete source code for framework customization examples can be found in the oxygen-sample-framework module of the Oxygen SDK, available as a Maven archetype on the Oxygen XML Editor Eclipse plugin website.

Configuring a Table Cell Span Provider

In a custom framework (on page 2655), the <table> element can have cells that span over multiple columns and rows. As explained in Configuring Tables (on page 2037), you need to indicate Oxygen XML Editor Eclipse plugin a method to determine the cell spanning. If you use the @rowspan and @colspan attributes, Oxygen XML Editor Eclipse plugin can determine the cell spanning automatically. In the following example, the <td> element uses the @row_span and @column_span attributes that are not recognized by default. You will need to implement a Java extension class for defining the cell spanning.
1. Create the class `simple.documentation.framework.TableCellSpanProvider`. This class must implement the `ro.sync.ecss.extensions.api.AuthorTableCellSpanProvider` interface.

   ```java
   import ro.sync.ecss.extensions.api.AuthorTableCellSpanProvider;
   import ro.sync.ecss.extensions.api.node.AttrValue;
   import ro.sync.ecss.extensions.api.node.AuthorElement;

   public class TableCellSpanProvider
       implements AuthorTableCellSpanProvider {
   }
   ```

2. The `init` method takes `ro.sync.ecss.extensions.api.node.AuthorElement` that represents the XML `<table>` element as its argument. In this example, the cell span is specified for each of the cells so you leave this method empty. However, there are cases (such as the CALS table model) when the cell spanning is specified in the `<table>` element. In such cases, you must collect the span information by analyzing the `<table>` element.

   ```java
   public void init(AuthorElement table) {
   }
   ```

3. The `getColSpan` method is taking as argument the table cell. The table layout engine will ask this `AuthorTableSpanSupport` implementation what is the column span and the row span for each XML element from the table that was marked as cell in the CSS using the property `display:table-cell`. The implementation is simple and just parses the value of `column_span` attribute. The method must return `null` for all the cells that do not change the span specification.

   ```java
   public Integer getColSpan(AuthorElement cell) {
       Integer colSpan = null;
       AttrValue attrValue = cell.getAttribute("column_span");
       if(attrValue != null) {
           // The attribute was found.
           String cs = attrValue.getValue();
           if(cs != null) {
               try {
                   colSpan = new Integer(cs);
               } catch (NumberFormatException ex) {
                   // The attribute value was not a number.
               }
           }
       }
       return colSpan;
   }
   ```

4. The row span is determined in a similar manner:

   ```java
   public Integer getRowSpan(AuthorElement cell) {
       Integer rowSpan = null;
   }
   ```
AttrValue attrValue = cell.getAttribute("row_span");
if(attrValue != null) {
    // The attribute was found.
    String rs = attrValue.getValue();
    if(rs != null) {
        try {
            rowSpan = new Integer(rs);
        } catch (NumberFormatException ex) {
            // The attribute value was not a number.
        }
    }
}
return rowSpan;

5. The method `hasColumnSpecifications` always returns `true` considering column specifications always available.

```java
public boolean hasColumnSpecifications(AuthorElement tableElement) {
    return true;
}
```

**Note:**
The complete source code for framework customization examples can be found in the `oxygen-sample-framework` module of the Oxygen SDK, available as a Maven archetype on the Oxygen XML Editor Eclipse plugin website.

6. In the listing below, the XML document contains the table element:

```xml
<table>
    <header>
        <td>C1</td>
        <td>C2</td>
        <td>C3</td>
        <td>C4</td>
    </header>
    <tr>
        <td>cs=1, rs=1</td>
        <td column_span="2" row_span="2">cs=2, rs=2</td>
        <td row_span="3">cs=1, rs=3</td>
    </tr>
    <tr>
        <td>cs=1, rs=1</td>
    </tr>
</table>
```
When no table cell span provider is specified, the table has the following layout:

Figure 529. Table layout when no cell span provider is specified

![Table showing different values for the column and row span when no span provider is specified.]

When the above implementation is configured, the table has the correct layout:
Configuring a Table Cell Row and Column Separator Provider

In a custom framework (on page 2655), the `<table>` element has separators between rows. As explained in Configuring Tables (on page 2037), you need to indicate a method to determine the way rows and columns are separated. If you use the `@rowsep` and `@colsep` cell element attributes, or your table is conforming to the CALS table model, Oxygen XML Editor Eclipse plugin can determine the cell separators. Even if there are no attributes that define the separators, you can still force a separator between rows by implementing a Java extension.

1. Create the class `simple.documentation.framework.TableCellSepProvider`. This class must implement the `ro.sync.ecss.extensions.api.AuthorTableCellSepProvider` interface.

```java
import ro.sync.ecss.extensions.api.AuthorTableCellSepProvider;
import ro.sync.ecss.extensions.api.node.AuthorElement;

public class TableCellSepProvider implements AuthorTableCellSepProvider {
```

2. The `init` method takes the `ro.sync.ecss.extensions.api.node.AuthorElement` interface that represents the XML `<table>` element as its argument. If the separator information is implicit, it does not depend on the current table, so you leave this method empty. However, there are cases (such as the CALS table
model) when the cell separators are specified in the `<table>` element. In such cases, you should initialize your provider based on the given argument.

```java
public void init(AuthorElement table) {
}
```

3. The `getColSep` method takes the table cell as its argument. The table layout engine will ask this `AuthorTableCellSepProvider` implementation if there is a column separator for each XML element from the table that was marked as cell in the CSS using the property `display:table-cell`. The following example returns `false`, meaning there will not be column separators.

```java
/**
 * @return false - No column separator at the right of the cell.
 */
@override
public boolean getColSep(AuthorElement cellElement, int columnIndex) {
    return false;
}
```

4. The row separators are determined in a similar manner. This time the example returns `true`, forcing a separator between the rows.

```java
/**
 * @return true - A row separator below each cell.
 */
@override
public boolean getRowSep(AuthorElement cellElement, int columnIndex) {
    return true;
}
```

**Note:**
The complete source code for framework customization examples can be found in the `oxygen-sample-framework` module of the Oxygen SDK, available as a Maven archetype on the Oxygen XML Editor Eclipse plugin website.

5. In the example below, the XML document contains the table element:

```xml
<table>
    <header>
        <td>H1</td>
        <td>H2</td>
        <td>H3</td>
        <td>H4</td>
    </header>
    <tr>
        <td>C11</td>
    </tr>
</table>
```
When the borders for the `<td>` element are removed from the CSS, the row separators become visible:

Figure 531. Row separators provided by the Java implementation.

<table>
<thead>
<tr>
<th>H1</th>
<th>H2</th>
<th>H3</th>
<th>H4</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>C11</td>
<td>C12</td>
<td>C13</td>
<td>C14</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>C21</td>
<td>C22</td>
<td>C23</td>
<td>C24</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>C31</td>
<td>C32</td>
<td>C33</td>
<td>C34</td>
</tr>
</tbody>
</table>

Note:
The complete source code for framework customization examples can be found in the `oxygen-sample-framework` module of the Oxygen SDK, available as a Maven archetype on the Oxygen XML Editor Eclipse plugin website.

Customizing Attribute Value Editors

The `CustomAttributeValueEditor` extension point allows you customize the attribute value editing mechanisms in Oxygen XML Editor Eclipse plugin. It changes the Browse button found in the attribute editors to an Edit button. When a user clicks that Edit button, your custom attribute value editor will be presented.
The **Edit** button can be accessed in the following attribute editors:

- The **Attributes view in Author mode** *(on page 403)* (when the Expand button is used to reveal an expanded panel).
- The **Attributes view in Text mode** *(on page 328)* (when the Expand button is used to reveal an expanded panel).
- The **In-place Attributes Editor** *(on page 405)* when invoked in Author mode.
- The **In-place Attributes Editor** invoked in the **Outline view** *(on page 325)*.

**How to Implement a **CustomAttributeValueEditor**

To implement your own **CustomAttributeValueEditor**, follow this procedure:

1. Extend the `ro.sync.ecss.extensions.api.CustomAttributeValueEditor` abstract class.
2. To instruct Oxygen XML Editor Eclipse plugin to use this newly created implementation, use either of the following methods:
   a. If you have configured an extensions bundle *(on page 2020)*, you can return the `CustomAttributeValueEditor` implementation using the `ro.sync.ecss.extensions.api.ExtensionsBundle.createCustomAttributeValueEditor()` method.
   b. Specify the `CustomAttributeValueEditor` in the **Author custom attribute value editor** individual extension in the **Extensions tab** *(on page 117)* of the **Document Type configuration dialog box** *(on page 90)* for your particular document type.

**Example**

The following example creates a very simple custom attribute value editor:

```java
/**
 * A custom attribute value editor.
 */
public class MyCustomAttributeValueEditor extends CustomAttributeValueEditor {

    /**
     * @see ro.sync.ecss.extensions.api.Extension#getDescription()
     */
    @Override
    public String getDescription() {
        return "My custom attribute value editor";
    }

    /**
     * @see ro.sync.ecss.extensions.api.CustomAttributeValueEditor#getAttributeValue
     * (ro.sync.ecss.extensions.api.EdittedAttribute, java.lang.Object)
     */
```
public String getAttributeValue(EditedAttribute attribute, Object parentComponent) throws CancelledByUserException {
    // Show an input dialog for collecting the new value
    return JOptionPane.showInputDialog("Set a new value for " + attribute.getAttributeQName() + ":");
}

/**
 * @see ro.sync.ecss.extensions.api.CustomAttributeValueEditor#shouldHandleAttribute
 */
@Override
public boolean shouldHandleAttribute(EditedAttribute attribute) {
    // Handle all attributes
    return true;
}

Example result: If a user were to click the Edit button in any of the attribute editors, the following dialog box would be displayed that allows the user to insert a value for the particular attribute:

Customizing the CSS Styles Filter

You can modify the CSS styles for each ro.sync.ecss.extensions.api.node.AuthorNode rendered in the Author mode using an implementation of ro.sync.ecss.extensions.api.StylesFilter. You can implement the various callbacks of the interface either by returning the default value given by Oxygen XML Editor Eclipse plugin or by contributing to the value. The received styles ro.sync.ecss.css.Styles can be processed and values can be overwritten with your own. For example, you can override the KEY_BACKGROUND_COLOR style to return your own implementation of ro.sync.exml.view.graphics.Color or override the KEY_FONT style to return your own implementation of ro.sync.exml.view.graphics.Font.

For instance, in this simple document example, the filter can change the value of the KEY_FONT property for the <table> element:

package simple.documentation.framework;
import ro.sync.ecss.css.Styles;
import ro.sync.ecss.extensions.api.StylesFilter;
import ro.sync.ecss.extensions.api.node.AuthorNode;
import ro.sync.exml.view.graphics.Font;

public class SDFStylesFilter implements StylesFilter {
  public Styles filter(Styles styles, AuthorNode authorNode) {
    if (AuthorNode.NODE_TYPE_ELEMENT == authorNode.getType()
      && "table".equals(authorNode.getName())) {
      styles.setProperty(Styles.KEY_FONT, new Font(null, Font.BOLD, 12));
    }
    return styles;
  }
}

Note:
The complete source code for framework customization examples can be found in the oxygen-sample-framework module of the Oxygen SDK, available as a Maven archetype on the Oxygen XML Editor Eclipse plugin website.

Customizing Elements that Wrap Profiled Content

For each framework (on page 2655) (document type), you can configure the phrase-type elements that wrap the profiled content by setting a custom ro.sync.ecss.extensions.api.ProfilingConditionalTextProvider. This configuration is set by default for DITA and DocBook frameworks.

Customizing the Link Target Reference Finder

The link target reference finder represents the support for finding references from links that indicate specific elements inside an XML document. This support will only be available if a schema is associated with the document type.

If you do not define a custom link target reference finder, the DefaultElementLocatorProvider implementation (on page 2053) will be used by default. The interface that should be implemented for a custom link target reference finder is ro.sync.ecss.extensions.api.link.ElementLocatorProvider. As an alternative, the ro.sync.ecss.extensions.commons.DefaultElementLocatorProvider implementation can also be extended.

The used ElementLocatorProvider will be queried for an ElementLocator when a link location must be determined (when a link is clicked). Then, to find the corresponding (linked) element, the obtained ElementLocator will be queried for each element from the document.
Creating a Custom Link Target Reference Finder

If you need to create a custom link target reference finder you can do so by creating the class that will implement the `ro.sync.ecss.extensions.api.link.ElementLocatorProvider` interface. As an alternative, your class could extend `ro.sync.ecss.extensions.commons.DefaultElementLocatorProvider`, the default implementation.

Default Link Target Reference Finder

The `DefaultElementLocatorProvider` implementation is used by default to find link target references. It offers support for the most common types of links:

- Links based on ID attribute values (on page 2054).
- XPointer element() scheme (on page 2055).

The method `getElementLocator` determines what `ElementLocator` should be used. In the default implementation, it checks if the link is an XPointer element() scheme. Otherwise, it assumes it is an ID. A non-null `IDTypeVerifier` will always be provided if a schema is associated with the document type.

The `link` string argument is the `anchor (on page 2652)` part of the URL that is composed from the value of the link property specified for the link element in the CSS.

```java
public ElementLocator getElementLocator(IDTypeVerifier idVerifier, String link) {
    ElementLocator elementLocator = null;
    try {
        if (link.startsWith("element(")) {
            // xpointer element() scheme
            elementLocator = new XPointerElementLocator(idVerifier, link);
        } else {
            // Locate link element by ID
            elementLocator = new IDElementLocator(idVerifier, link);
        }
    }
    return elementLocator;
}
```
catch (ElementLocatorException e) {
    logger.warn("Exception when create element locator for link: " + link + ". Cause: " + e, e);
}

return elementLocator;

ID Element Locator

The **IDElementLocator** is an implementation of the abstract class
ro.sync.ecss.extensions.api.link.ElementLocator for links that use an ID.

The constructor only assigns field values and the method **endElement** is empty for this implementation.

The method **startElement** checks each of the element’s attribute values and when one matches the link, it considers the element found if one of the following conditions is satisfied:

- The qualified name of the attribute is `xml:id`.
- The attribute type is ID.

The attribute type is checked with the help of the method **IDTypeVerifier.hasIDType**.

```java
public boolean startElement(String uri, String localName, String name, Attr[] atts) {
    boolean elementFound = false;
    for (int i = 0; i < atts.length; i++) {
        if (link.equals(atts[i].getValue())) {
            if("xml:id".equals(atts[i].getQName())) {
                // xml:id attribute
                elementFound = true;
            } else {
                // check if attribute has ID type
                String attrLocalName = ExtensionUtil.getLocalName(atts[i].getQName());
                String attrUri = atts[i].getNamespace();
                if (idVerifier.hasIDType(localName, uri, attrLocalName, attrUri)) {
                    elementFound = true;
                }
            }
        }
    }

    return elementFound;
}
```
XPointer Element Locator

XPointerElementLocator is an implementation of the abstract class ro.sync.ecss.extensions.api.link.ElementLocator for links that have one of the following XPointer element() scheme patterns:

- **element (elementID)**
  
  Locate the element with the specified ID.

- **element (/1/2/3)**
  
  A child sequence appearing alone identifies an element by means of stepwise navigation, which is directed by a sequence of integers separated by slashes (/). Each integer n locates the nth child element of the previously located element.

- **element (elementID/3/4)**
  
  A child sequence appearing after a NCName identifies an element by means of stepwise navigation, starting from the element located by the given name.

The constructor separates the ID/Integers, which are delimited by slashes (/) into a sequence of identifiers (an XPointer path). It will also check that the link has one of the supported patterns of the XPointer element() scheme.

```java
public XPointerElementLocator(IDTypeVerifier idVerifier, String link)
    throws ElementLocatorException {
    super(link);
    this.idVerifier = idVerifier;

    link = link.substring("element ".length(), link.length() - 1);

    StringTokenizer stringTokenizer = new StringTokenizer(link, "/", false);
    xpointerPath = new String[stringTokenizer.countTokens()];
    int i = 0;
    while (stringTokenizer.hasMoreTokens()) {
        xpointerPath[i] = stringTokenizer.nextToken();
        boolean invalidFormat = false;

        // Empty xpointer component is not supported
        if(xpointerPath[i].length() == 0){
            invalidFormat = true;
        }
        if(i > 0){
            try {
                Integer.parseInt(xpointerPath[i]);
            }
        }
    }
```
The method `startElement` will be invoked at the beginning of every element in the XML document (even when the element is empty). The arguments it takes are

- `uri`  
  The namespace URI, or the empty string if the element has no namespace URI or if namespace processing is disabled.

- `localName`  
  Local name of the element.

- `qName`  
  Qualified name of the element.

- `atts`  
  Attributes attached to the element. If there are no attributes, this argument will be empty.

The method returns `true` if the processed element is found to be the one indicated by the link.

The `XPointerElementLocator` implementation of the `startElement` will update the depth of the current element and keep the index of the element in its parent. If the `xpointerPath` starts with an element ID then the current
element ID is verified to match the specified ID. If this is the case the depth of the XPointer is updated taking into account the depth of the current element.

If the XPointer path depth is the same as the current element depth then the kept indices of the current element path are compared to the indices in the XPointer path. If all of them match then the element has been found.

```java
public boolean startElement(String uri, String localName, String name, Attr[] atts) {
    boolean linkLocated = false;
    // Increase current element document depth
    startElementDepth ++;

    if (endElementDepth != startElementDepth) {
        // The current element is the first child of the parent
        currentElementIndexStack.push(new Integer(1));
    } else {
        // Another element in the parent element
        currentElementIndexStack.push(new Integer(lastIndexInParent + 1));
    }

    if (startWithElementID) {
        // This the case when xpointer path starts with an element ID.
        String xpointerElement = xpointerPath[0];
        for (int i = 0; i < atts.length; i++) {
            if (xpointerElement.equals(atts[i].getValue())){
                if (idVerifier.hasIDType(localName, uri, atts[i].getQName(), atts[i].getNamespace())){
                    xpointerPathDepth = startElementDepth + xpointerPath.length - 1;
                    break;
                }
            }
        }
        if (xpointerPathDepth == startElementDepth){
            // check if xpointer path matches with the current element path
            linkLocated = true;
            try {
                int xpointerIdx = xpointerPath.length - 1;
                int stackIdx = currentElementIndexStack.size() - 1;
                int stopIdx = startWithElementID ? 1 : 0;
                while (xpointerIdx >= stopIdx && stackIdx >= 0) {
```
int xpointerIndex = Integer.parseInt(xpointerPath[xpointerIdx]);
int currentElementIndex =
((Integer)currentElementIndexStack.get(stackIdx)).intValue();
if(xpointerIndex != currentElementIndex) {
    linkLocated = false;
    break;
}
xpointerIdx--;
stackIdx--;
}

} catch (NumberFormatException e) {
    logger.warn(e,e);
}

return linkLocated;

The method `endElement` will be invoked at the end of every element in the XML document (even when the element is empty).

The `XPointerElementLocator` implementation of the `endElement` updates the depth of the current element path and the index of the element in its parent.

```java
public void endElement(String uri, String localName, String name) {
    endElementDepth = startElementDepth;
    startElementDepth --;
    lastIndexInParent = ((Integer)currentElementIndexStack.pop()).intValue();
}
```

**Customizing XML Node Rendering**

You can use this API extension to customize the way an XML node is rendered in the **Outline view** (on page 325) in **Author** mode, **breadcrumb navigation bar** (on page 377) in **Author** mode, **Outline view** (on page 325) in **Text** mode, **Content Completion Assistant** (on page 2653) window, or **DITA Maps Manager** view (on page 2315).

**Note:**

There are two methods to provide an implementation of
ro.sync.exml.workspace.api.node.customizer.XMLNodeRendererCustomizer:

- As a part of a bundle, returning it from the createXMLNodeCustomizer() method of the
  ExtensionsBundle associated with your document type in the Document type configuration dialog box
  (on page 90) (Extensions bundle field in the Extensions tab).
- As an individual extension, associated with your document type in the Document type configuration
dialog box (on page 90) (XML node renderer customizer field in the Individual extensions section of
  the Extensions tab).

Support for Retina/HiDPI Displays

To support Retina or HiDPI displays, the icons provided by the XMLNodeRendererCustomizer should be
backed up by a copy of larger size using the proper Retina/HiDPI naming convention (on page 494).

For example, for the <title> element, if the XMLNodeRendererCustomizer returns the path
${framework}/images/myImg.png, then to support Retina images with a scaling factor of 2, an
extra file (myImg@2x.png) should be added to the same images directory (${framework}/images/
myImg@2x.png). If the higher resolution icon (the @2x file) does not exist, the normal icon is scaled and used
instead.

For more information about using Retina/HiDPI images, refer to the Using Retina/HiDPI Images in Author
Mode (on page 494) section.

Note:
The complete source code for framework customization examples can be found in the oxygen-
sample-framework module of the Oxygen SDK, available as a Maven archetype on the Oxygen XML
Editor Eclipse plugin website.

Related Information:
Customizing the Rendering of Elements (on page 1996)
Using Retina/HiDPI Icons for the Actions from a Framework (on page 1970)

Customizing Author Operations

Oxygen XML Editor Eclipse plugin Author mode has a built-in set of operations covering the insertion of
text and XML fragments (see the Author Default Operations (on page 1940)) and the execution of XPath
expressions on the current document edited in Author mode. However, there are situations where you need to
extend this set. The following examples are just a few of the possible situations:

- You need to enter an element whose attributes will be edited by the user through a graphical user
  interface.
- The user must send selected element content (or the whole document) to a+ server for some kind of
  processing.
• Content authors need to extract pieces of information from a server and insert it directly into the edited XML document.
• You need to apply an XPath expression on the current document and process the nodes of the resulting node set.

To extend the Oxygen XML Editor Eclipse plugin Author mode functionality through Java, you will need the Oxygen SDK available on the Oxygen XML Editor Eclipse plugin website. It includes the source code of the Author mode operations in the built-in document types and the full documentation (in Javadoc format) of the public API available for Author mode custom actions.

The subsequent Java examples make use of AWT classes. If you are developing extensions for the Oxygen XML Editor Eclipse plugin XML Editor plugin for Eclipse, you will have to use their SWT counterparts.

⚠️ **Attention:**
Make sure the Java classes of your custom Author mode operations are compiled with the same Java version used by Oxygen XML Editor Eclipse plugin. Otherwise, the classes may not be loaded by the Java virtual machine. For example, if you run a version of Oxygen XML Editor Eclipse plugin with a Java 11 virtual machine but the Java classes of your custom Author mode operations are compiled with a Java 12 or later virtual machine, then the custom operations cannot be loaded and used by the Java 11 virtual machine.

⚠️ **Important:**
From a legal standpoint, you can freely develop and share extensions using the Oxygen SDK ONLY if you have a legal, active license to use Oxygen XML Editor Eclipse plugin and ONLY if such extensions are used from inside Oxygen XML Editor Eclipse plugin. To use such extensions outside of Oxygen XML Editor Eclipse plugin (for example, a 3rd-party application that has Oxygen XML Editor Eclipse plugin built in to it), an additional license must be purchased to use the SDK according the Oxygen XML SDK Licensing Policy.

https://www.oxygenxml.com/InstData/Editor/SDK/javadoc/ro/sync/ecss/extensions/api/AuthorOperation.html

Example 1 - Simple Use of a Dialog Box from an Author Mode Operation

In this example, functionality is added for inserting images in a custom framework (on page 2655). The images are represented by the `<image>` element. The location of the image file is represented by the value of the `@href` attribute. In the Java implementation, a dialog box will be displayed with a text field where the user can enter a full URL or browse for a local file.
1. Set up a sample project following this set of instructions. The framework project is `oxygen-sample-framework`.

2. Modify the `simple.documentation.framework.InsertImageOperation` class that implements the `ro.sync.ecss.extensions.api.AuthorOperation` interface. This interface defines three methods: `doOperation`, `getArguments` and `getDescription`.

A short description of these methods follows:

- The `doOperation` method is invoked when the action is performed either by pressing the toolbar button, by selecting the menu item or by pressing the shortcut key. The arguments taken by this method can be one of the following combinations:
  - An object of type `ro.sync.ecss.extensions.api.AuthorAccess` and a map.
  - Argument names and values.
- The `getArguments` method is used by Oxygen XML Editor Eclipse plugin when the action is configured. It returns the list of arguments (name and type) that are accepted by the operation.
- The `getDescription` method is used by Oxygen XML Editor Eclipse plugin when the operation is configured. It returns a description of the operation.

**Example:**

Here is the implementation of these three methods:

```java
/**
 * Performs the operation.
 */
public void doOperation(
    AuthorAccess authorAccess,
    ArgumentsMap arguments)
    throws IllegalArgumentException,
    AuthorOperationException {
    JFrame oxygenFrame = (JFrame) authorAccess.getWorkspaceAccess().getParentFrame();
    String href = displayURLDialog(oxygenFrame);
    if (href.length() != 0) {
        // Creates the image XML fragment.
        String imageFragment = "<image xmlns='http://www.oxygenxml.com/sample/documentation' href='" + href + ">
        // Inserts this fragment at the cursor position.
        int caretPosition = authorAccess.getEditorAccess().getCaretOffset();
        authorAccess.getDocumentController().insertXMLFragment (imageFragment, caretPosition);
    }
```
/**
 * Has no arguments.
 * @return null.
 */
public ArgumentDescriptor[] getArguments() {
    return null;
}

/**
 * @return A description of the operation.
 */
public String getDescription() {
    return "Inserts an image element. Asks the user for a URL reference.";
}

**Note:**
The complete source code for framework customization examples can be found in the oxygen-sample-framework module of the Oxygen SDK, available as a Maven archetype on the Oxygen XML Editor Eclipse plugin website.

**Important:**
Make sure you always specify the namespace of the inserted fragments.

3. Package the compiled class into a JAR (on page 2655) file. An example of an Ant script that packages the classes folder content into a JAR archive named sdf.jar is listed below:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<project name="project" default="dist">
  <target name="dist">
    <jar destfile="sdf.jar" basedir="classes">
      <fileset dir="classes">
        <include name="**/*"/>
      </fileset>
    </jar>
  </target>
</project>
```
4. Copy the `sdf.jar` file into your custom `framework` directory
   `([OXYGEN_INSTALL_DIR]\frameworks\[CUSTOM_FRAMEWORK_DIR])`.

5. Add the `sdf.jar` to the class path. To do this, open the Preferences dialog box (on page 70), go to Document Type Association, select SDF, and click the Edit button.

6. Select the Classpath tab in the lower part of the Document Type configuration dialog box (on page 90) and click the Add button. In the displayed dialog box, enter the location of the JAR file, relative to the Oxygen XML Editor Eclipse plugin frameworks folder.

7. Next, create the action that will use the defined operation. Go to the Actions subtab. Copy the icon files for the menu item and for the toolbar in your custom framework directory `([OXYGEN_INSTALL_DIR]\frameworks\[CUSTOM_FRAMEWORK_DIR])`.

8. Define the action’s properties:
   - Set ID to `insert_image`.
   - Set Name to Insert image.
   - Set Menu access key to letter i.
   - Set Toolbar action to `${framework}/toolbarImage.png`.
   - Set Menu icon to `${framework}/menuItem.png`.
   - Set Shortcut key to Ctrl (Meta on macOS)+Shift+i.

9. Next, set up the operation. You want to add images only if the current element is a `<section>`, `<book>`, or `<article>.
   - Set the value of XPath expression to
     ```
     local-name()='section' or local-name()='book'
     or local-name()='article'
     ```
   - Set the Invoke operation field to `simple.documentation.framework.InsertImageOperation`.
10. Add the action to the toolbar, using the **Toolbar** panel.

To test the action, open or create an XML file and place the cursor at a valid location. Then click the button associated with the action from the toolbar. In the dialog box, select an image URL and click **OK**. The image is inserted into the document.

**Example 2 - Operations with Arguments - Report from Database Operation**

In this example, an operation is created that connects to a relational database and executes an SQL statement. The result should be inserted in the edited XML document as a table. To make the operation fully configurable, it will have arguments for the **database connection string**, the **user name**, the **password** and the **SQL expression**.

1. Set up a sample project following [this set of instructions](#). The framework project is **oxygen-sample-framework**.
2. Create the class `simple.documentation.framework.QueryDatabaseOperation`. This class must implement the `ro.sync.ecss.extensions.api.AuthorOperation` interface.
import ro.sync.ecss.extensions.api.ArgumentDescriptor;
import ro.sync.ecss.extensions.api.ArgumentsMap;
import ro.sync.ecss.extensions.api.AuthorAccess;
import ro.sync.ecss.extensions.api.AuthorOperation;
import ro.sync.ecss.extensions.api.AuthorOperationException;

public class QueryDatabaseOperation implements AuthorOperation {

    private static final String ARG_JDBC_DRIVER = "jdbc_driver";
    private static final String ARG_USER = "user";
    private static final String ARG_PASSWORD = "password";
    private static final String ARG_SQL = "sql";
    private static final String ARG_CONNECTION = "connection";

    public ArgumentDescriptor[] getArguments() {
        ArgumentDescriptor args[] = new ArgumentDescriptor[] {
            new ArgumentDescriptor(
                ARG_JDBC_DRIVER,
                ArgumentDescriptor.TYPE_STRING,
                "The name of the Java class that is the JDBC driver.") ,
            new ArgumentDescriptor(
                ARG_CONNECTION,
                ArgumentDescriptor.TYPE_STRING,
                "The database URL connection string.") ,
            new ArgumentDescriptor(
                ARG_USER,
                ArgumentDescriptor.TYPE_STRING,
                "The name of the database user.") ,
            new ArgumentDescriptor(
                ARG_PASSWORD,
                ArgumentDescriptor.TYPE_STRING,
                "The database password.") ,
            new ArgumentDescriptor(
                ARG_SQL,
                ArgumentDescriptor.TYPE_STRING,
                "The SQL statement to be executed.")
        };
        return args;
    }
}
These names, types and descriptions will be listed in the **Arguments** table when the operation is configured.

5. When the operation is invoked, the implementation of the `doOperation` method extracts the arguments, forwards them to the method that connects to the database and generates the XML fragment. The XML fragment is then inserted at the cursor position.

```java
public void doOperation(AuthorAccess authorAccess, ArgumentsMap map) throws IllegalArgumentException, AuthorOperationException {
    // Collects the arguments.
    String jdbcDriver = (String)map.getArgumentValue(ARG_JDBC_DRIVER);
    String connection = (String)map.getArgumentValue(ARG_CONNECTION);
    String user = (String)map.getArgumentValue(ARG_USER);
    String password = (String)map.getArgumentValue(ARG_PASSWORD);
    String sql = (String)map.getArgumentValue(ARG_SQL);

    int caretPosition = authorAccess.getCaretOffset();
    try {
        authorAccess.getDocumentController().insertXMLFragment(
            getFragment(jdbcDriver, connection, user, password, sql), caretPosition);
    } catch (SQLException e) {
        throw new AuthorOperationException(
            "The operation failed due to the following database error: 
            + e.getMessage(), e);
    } catch (ClassNotFoundException e) {
        throw new AuthorOperationException(
            "The JDBC database driver was not found. Tried to load '" 
            + jdbcDriver + '"', e);
    }
}
```

6. The `getFragment` method loads the JDBC driver, connects to the database and extracts the data. The result is a `<table>` element from the `http://www.oxygenxml.com/sample/documentation` namespace. The `<header>` element contains the names of the SQL columns. All the text from the XML fragment is escaped. This means that the '<' and '&' characters are replaced with the '&lt;' and '&amp;' character entities to ensure that the fragment is well-formed.

```java
private String getFragment(String jdbcDriver, String connectionURL, String user,
    String password, String sql) throws SQLException, ClassNotFoundException {
    Properties pr = new Properties();
```
pr.put("characterEncoding", "UTF8");
pr.put("useUnicode", "TRUE");
pr.put("user", user);
pr.put("password", password);

    // Loads the database driver.
    Class.forName(jdbcDriver);
    // Opens the connection
    Connection connection = DriverManager.getConnection(connectionURL, pr);
    java.sql.Statement statement = connection.createStatement();
    ResultSet resultSet = statement.executeQuery(sql);

    StringBuffer fragmentBuffer = new StringBuffer();
    fragmentBuffer.append(
        "<table xmlns=" +
        "'http://www.oxygenxml.com/sample/documentation'>");

    //
    // Creates the table header.
    //
    fragmentBuffer.append("<header>");
    ResultSetMetaData metaData = resultSet.getMetaData();
    int columnCount = metaData.getColumnCount();
    for (int i = 1; i <= columnCount; i++) {
        fragmentBuffer.append("<td>");
        fragmentBuffer.append(xmlEscape(metaData.getColumnName(i)));
        fragmentBuffer.append("</td>");
    }
    fragmentBuffer.append("</header>");

    //
    // Creates the table content.
    //
    while (resultSet.next()) {
        fragmentBuffer.append("<tr>");
        for (int i = 1; i <= columnCount; i++) {
            fragmentBuffer.append("<td>");
            fragmentBuffer.append(xmlEscape(resultSet.getObject(i)));
            fragmentBuffer.append("</td>");
        }
        fragmentBuffer.append("</tr>");
    }
fragmentBuffer.append("</table>");

// Cleanup
resultSet.close();
statement.close();
connection.close();
return fragmentBuffer.toString();
}

Note:
The complete source code for framework customization examples can be found in the `oxygen-sample-framework` module of the Oxygen SDK, available as a Maven archetype on the Oxygen XML Editor Eclipse plugin website.

7. Package the compiled class into a JAR (on page 2655) file.
8. Copy the JAR file and the JDBC driver files into your custom framework directory (`{OXYGEN_INSTALL_DIR}/frameworks/{CUSTOM_FRAMEWORK_DIR}`).
9. Add the JARS to the class path. To do this, open the Document Type Association preferences page (on page 88), select SDF and click the Edit button. Select the Classpath tab in the lower part of the Document Type configuration dialog box (on page 90) and click the Add button. In the displayed dialog box, enter the location of the JAR file, relative to the Oxygen XML Editor Eclipse plugin frameworks folder.
10. Go to the Actions subtab. The action properties are:
   - Set ID to clients_report.
   - Set Name to Clients Report.
   - Set Menu access key to letter r.
   - Set Description to Connects to the database and collects the list of clients.
   - Set Toolbar icon to `${framework}/TableDB20.png` (the TableDB20.png icon is stored in the frameworks/sdf folder).
   - Leave empty the Menu icon.
   - Set shortcut key to Ctrl + Shift + C (Command + Shift + C on macOS).
11. The action will work only if the current element is a section. Set up the operation as follows:
   - Set XPath expression to:
     ```
     local-name()='section'
     ```
   - Use the Java operation defined earlier to set the Invoke operation field. Click the Choose button, then select `simple.documentation.framework.QueryDatabaseOperation`. Once selected, the list of arguments is displayed. In the figure below the first argument, `jdbc_driver`, represents the class name of the MySQL JDBC driver. The connection string has the URL syntax: `jdbc://<database_host>:<database_port>/<database_name>`.
The SQL expression used in the example follows, but it can be any valid SELECT expression that can be applied to the database:

```
SELECT userID, email FROM users
```

12. Add the action to the toolbar, using the **Toolbar** panel.

**Figure 533. Java Operation Arguments Setup**

To test the action, open or create an XML file and place the cursor at a valid location. Then click the **Create Report** button from the toolbar. You can see below the toolbar with the action button and sample table inserted by the **Clients Report** action.
Handling Author Mode Action Events

The `AuthorActionEventHandler` extension point allows you to handle certain Author mode actions in a special way. For example, a specific use-case would be if you want to insert new lines when you press `Enter` instead of it opening the `Content Completion Assistant (on page 2653)`.

How to Implement an `AuthorActionEventHandler`

To implement your own `AuthorActionEventHandler`, follow this procedure:

1. Implement the `ro.sync.ecss.extensions.api.AuthorActionEventHandler` interface.
2. To instruct Oxygen XML Editor Eclipse plugin to use this newly created implementation, use either of the following methods:
   a. If you have configured an extensions bundle (on page 2020), you can return the `AuthorActionEventHandler` implementation using the `ro.sync.ecss.extensions.api.ExtensionsBundle.getAuthorActionEventHandler()` method.
   b. Specify the `AuthorActionEventHandler` in the Author action event handler individual extension in the `Extensions` tab (on page 117) of the Document Type configuration dialog box (on page 90) for your particular document type.

Example

The following example illustrates the use-case mentioned in the introduction, that is an implementation for inserting a new line when the user presses `Enter` in Author mode. It uses the `canHandleEvent` method to make sure the insertion will be performed in an element that will preserve the `new-line` character. Then the `handleEvent` method inserts the new line at the current cursor position.
public class CustomAuthorActionEventHandler implements AuthorActionEventHandler {

    /**
     * @see ro.sync.ecss.extensions.api.AuthorActionEventHandler#canHandleEvent(AuthorAccess, AuthorActionEventType)
     */
    @Override
    public boolean canHandleEvent(AuthorAccess authorAccess, AuthorActionEventType type) {
        boolean canHandle = false;

        if (type == AuthorActionEventType.ENTER) {
            AuthorDocumentController documentController = authorAccess.getDocumentController();
            int caretOffset = authorAccess.getEditorAccess().getCaretOffset();
            try {
                AuthorNode nodeAtOffset = documentController.getNodeAtOffset(caretOffset);
                if (nodeAtOffset instanceof AuthorElement) {
                    AuthorElement elementAtOffset = (AuthorElement) nodeAtOffset;
                    AttrValue xmlSpace = elementAtOffset.getAttribute("xml:space");
                    if (xmlSpace != null && xmlSpace.getValue().equals("preserve")) {
                        canHandle = true;
                    }
                }
            } catch (BadLocationException ex) {
                if (logger.isDebugEnabled()) {
                    logger.error(ex.getMessage(), ex);
                }
            }
        }

        return canHandle;
    }

    /**
     * @see ro.sync.ecss.extensions.api.AuthorActionEventHandler#handleEvent(AuthorAccess, AuthorActionEventHandler.AuthorActionEventType)
     */
    @Override
    public boolean handleEvent(AuthorAccess authorAccess,
AuthorActionEventType eventType) {
    int caretOffset = authorAccess.getEditorAccess().getCaretOffset();
    // Insert a new line
    authorAccess.getDocumentController().insertText(caretOffset, "\n");
    return true;
}

/**
 * @see ro.sync.ecss.extensions.api.Extension#getDescription()
 */
@Override
public String getDescription() {
    return "Insert a new line";
}
}

Handling Schema-Aware Editing Events

The AuthorSchemaAwareEditingHandlerAdapter extension point allows you to handle certain Author mode actions in various ways. For example, implementing the AuthorSchemaAwareEditingHandlerAdapter makes it possible to handle events such as typing, the keyboard delete event at a given offset (using Delete or Backspace keys), delete element tags, delete selection, join elements, or paste fragment. It also makes it possible to improve solutions that are proposed by the paste mechanism in Oxygen XML Editor Eclipse plugin when pasting content (through the use of some specific methods (on page 2073)).

How to Implement an AuthorSchemaAwareEditingHandlerAdapter

For this handler to be called, the Schema-Aware Editing option (on page 154) must be set to On or Custom in the Schema-Aware preferences page (on page 154). The handler can either resolve a specific case, let the default implementation take place, or reject the edit entirely by throwing an InvalidEditException.

To implement your own AuthorSchemaAwareEditingHandlerAdapter, follow this procedure:

1. Implement the ro.sync.ecss.extensions.api.AuthorSchemaAwareEditingHandlerAdapter extension.
2. To instruct Oxygen XML Editor Eclipse plugin to use this newly created implementation, configure an extensions bundle (on page 2020) and return the AuthorSchemaAwareEditingHandlerAdapter implementation using the ro.sync.ecss.extensions.api.ExtensionsBundle.getAuthorSchemaAwareEditingHandlerAdapter() method.

Example

Typing events can be handled using the handleTyping method. For example, the AuthorSchemaAwareEditingHandler checks if the schema is not a learned one, was loaded successfully, and if
the Smart paste and drag and drop option (on page 155) is selected. If these conditions are met, the event will be handled.

```java
public class AuthorSchemaAwareEditingHandlerAdapter extends AuthorSchemaAwareEditingHandler {

/**
 * @see AuthorSchemaAwareEditingHandler#handleTyping(int, char, ro.sync.ecss.extensions.api.AuthorAccess)
 */
public boolean handleTyping(int offset, char ch, AuthorAccess authorAccess) throws InvalidEditException {
    boolean handleTyping = false;
    AuthorSchemaManager authorSchemaManager = authorAccess.getDocumentController().getAuthorSchemaManager();
    if (!authorSchemaManager.isLearnSchema() && !authorSchemaManager.hasLoadingErrors() &&
        authorSchemaManager.getAuthorSchemaAwareOptions().isEnableSmartTyping()) {
        try {
            AuthorDocumentFragment characterFragment =
            authorAccess.getDocumentController().createNewDocumentTextFragment(String.valueOf(ch));
            handleTyping = handleInsertionEvent
            (offset, new AuthorDocumentFragment[] {characterFragment}, authorAccess);
        } catch (AuthorOperationException e) {
            throw new InvalidEditException
            (e.getMessage(), "Invalid typing event: " + e.getMessage(), e, false);
        }
    } return handleTyping;
}
```

Note:
The complete source code for framework customization examples can be found in the oxygen-sample-framework module of the Oxygen SDK, available as a Maven archetype on the Oxygen XML Editor Eclipse plugin website.

Methods for Improving the Paste Mechanism

getAncestorDetectionOptions

When pasting content in Author mode, if the result causes the document to become invalid, Oxygen XML Editor Eclipse plugin will propose solutions to make it valid. As a possible solution, Oxygen XML Editor Eclipse plugin might surround the pasted content in a sequence of ancestor
elements. This `getAncestorDetectionOptions` method allows you to choose which parent elements might be a possible solution.

**canBeReplaced**

Allows you to improve solutions that might be proposed by the paste mechanism when pasting content in Oxygen XML Editor Eclipse plugin. For example, when pasting an element inside an empty element with the same name, this `canBeReplaced` method allows Oxygen XML Editor Eclipse plugin to replace the empty node rather than pasting it after or before the empty node. The callback could also reject this behavior if, for instance, the replacement node contains attributes.

**Related Information:**

*AuthorDocumentFragment Class*

**Handling When URLs or XHTML Fragments are Dropped or Pasted in Author Mode**

The `AuthorExternalObjectInsertionHandler` extension can be used to configure how URLs or XHTML fragments from external applications are handled when they are dropped or pasted in **Author** mode.

**How to Implement an **AuthorExternalObjectInsertionHandler****

To implement your own `AuthorExternalObjectInsertionHandler`, follow this procedure:

1. Implement the `ro.sync.ecss.extensions.api.AuthorExternalObjectInsertionHandler` interface.
2. To instruct Oxygen XML Editor Eclipse plugin to use this newly created implementation, use either of the following methods:
   a. If your framework is an extension of DITA, DocBook, TEI, or XHTML, you can specify the `AuthorExternalObjectInsertionHandler` in the **Author extAut extern o act Insertion handler** individual extension in the **Extensions** tab (on page 117) of the **Document Type** configuration dialog box (on page 90) for your particular document type.
   b. Otherwise, you can configure an extensions bundle (on page 2020), then return the `AuthorExternalObjectInsertionHandler` implementation using the `ro.sync.ecss.extensions.api.ExtensionsBundle.createAuthorExternalObjectInsertionHandler()` method.
3. You can use a stylesheet to convert the pasted XHTML to your own XML vocabulary by overwriting the following method:

   `ro.sync.ecss.extensions.api.AuthorExternalObjectInsertionHandler.getImporterStylesheetFileName(AuthorAccess)`

   and return the file name of the stylesheet that will be applied. The path to the importer stylesheet must also be added in the **Classpath** tab (on page 95) in the **Document Type** configuration dialog box (on page 90) for your particular document type.
Example

The following example illustrates an implementation for the DITA framework:

```java
/**
 * @see ro.sync.ecss.extensions.api.ExtensionsBundle#createExternalObjectInsertionHandler()
 */
@Override
public AuthorExternalObjectInsertionHandler createExternalObjectInsertionHandler() {
    return new DITAExternalObjectInsertionHandler();
}
```

```java
/**
 * @see ro.sync.ecss.extensions.api.AuthorExternalObjectInsertionHandler#getImporterStylesheetFileName(ro.sync.ecss.extensions.api.AuthorAccess)
 */
@Override
protected String getImporterStylesheetFileName(AuthorAccess authorAccess) {
    return "xhtml2ditaDriver.xsl";
}
```

Tip:

For XHTML fragments, there is another method that you could use to configure how they are handled when they are pasted in Author mode. For more information, see Customizing Smart Paste Support (on page 1977).

Presenting an Edit Properties Dialog Box for Actions in Author Mode

The EditPropertiesHandler extension point allows you to present a specialized dialog box when the action of double-clicking an element tag is intercepted in Author mode. For example, you could use it to present a dialog box that allows the user to editing the properties of an image.

How to Implement an EditPropertiesHandler

To implement your own EditPropertiesHandler, follow this procedure:

1. Implement the ro.sync.ecss.extensions.api.EditPropertiesHandler interface.
2. To instruct Oxygen XML Editor Eclipse plugin to use this newly created implementation, use either of the following methods:
a. If you have configured an extensions bundle (on page 2020), you can return the EditPropertiesHandler implementation using the ro.sync.ecss.extensions.api.ExtensionsBundle.createEditPropertiesHandler() method.

b. Specify the EditPropertiesHandler in the Author edit properties handler individual extension in the Extensions tab (on page 117) of the Document Type configuration dialog box (on page 90) for your particular document type.

Example

The following example illustrates an implementation for presenting a simple properties editing dialog box when a user double-clicks an `<image>` tag in Author mode (with tags displayed from the Tags display mode drop-down menu):

```java
public class CustomEditPropertiesHandler implements EditPropertiesHandler {

  /**
   * @see ro.sync.ecss.extensions.api.Extension#getDescription()
   */
  @Override
  public String getDescription() {
    return "Sample implementation that handles properties for a table element.";
  }

  /**
   * @see ro.sync.ecss.extensions.api.EditPropertiesHandler#canEditProperties
   */
  @Override
  public boolean canEditProperties(AuthorNode authorNode) {
    // If this node is an image element we can edit its properties.
    return "image".equals(authorNode.getDisplayName());
  }

  /**
   * @see ro.sync.ecss.extensions.api.EditPropertiesHandler#editProperties
   */
  @Override
  public void editProperties(AuthorNode authorNode, AuthorAccess authorAccess) {
    // If we receive this call then it surely an image.
    AuthorElement imageElement = (AuthorElement) authorNode;
    String currentValue = "";
    AttrValue altValue = imageElement.getAttribute("alt");
  }
}
```
```java
if (altValue != null) {
    currentValue = altValue.getValue();
}
String newValue = JOptionPane.showInputDialog(
    (Component) authorAccess.getWorkspaceAccess().getParentFrame(),
    "Alternate text",
    currentValue);

if (newValue != null) {
    authorAccess.getDocumentController().setAttribute
    ("alt", new AttrValue(newValue), imageElement); 
}
}
```

**Example result:** If a user were to double-click an `<image>` tag icon in Author mode, the following dialog box would be displayed that allows the user to edit the alternate text property for the image:

![Input dialog box](image)

**Sharing a Framework**

You can create a custom framework by extending a built-in document type (on page 1919) (such as DITA or DocBook) using the Document Type Association preferences page (on page 88), make modifications to it, and then share the extension with your team.

**Sharing the Extended Framework**

There are several ways that you can share the extended custom framework (on page 1919) with others:

- Distribute the extended framework along with a project by following these steps:
  1. In a location where you have full write access, create a folder for your project.
  2. Go to the Project Explorer view (on page 268) and create a project. Save it in the folder you created in step 1.
  3. Create a custom framework by extending an existing one (on page 1919), if you have not already done so, and copy the custom framework directory to the folder you created in step 1. Make sure your custom framework directory includes any resources that are referenced in your framework (CSS files, new document templates, schemas used for validation, catalogs, etc.).
  4. Go to Options > Preferences > Document Type Association > Locations (on page 90).
5. In the **Additional frameworks directories** list, add an entry using the \${pd} editor variable (on page 226) like this: \${pd}/custom_frameworks.

6. You can then share the new project directory with other users. For example, you can commit it to your version control system and have them update their working copy. When they open the customized project file in their **Project Explorer view** (on page 268), the new **framework** becomes available in the list of document types.

   - Distribute the directory of the extended **framework** (on page 1919) to the other members of your team. They will simply copy that directory to their /frameworks directory. The new **framework** will be available in their list of document types when Oxygen XML Editor Eclipse plugin starts.

To test the extended **framework**, the other members of your team can check the list of document types in the **Document Type Association preferences page** (on page 88) to see if the **framework** is present and if it appears before the built-in frameworks (meaning that it has higher priority).

### Basic Framework Customization Tutorial

This section contains topics meant to provide a general tutorial for customizing a **framework** (on page 2655). It includes information about creating a basic document type association, some basic customizations, testing the configuration, packaging and deploying the custom framework, and more.

---

**Tip:**

A sample framework customization package is available that you can dabble with and use to help you get started. It can be downloaded from: [https://www.oxygenxml.com/maven/com/oxygenxml/samples/oxygen-sample-framework/24.0.0.0/oxygen-sample-framework-24.0.0.0-package.zip](https://www.oxygenxml.com/maven/com/oxygenxml/samples/oxygen-sample-framework/24.0.0.0/oxygen-sample-framework-24.0.0.0-package.zip). The package includes a sample CSS file, XSL file, schema files, document templates, an XML catalog file, custom icons, and other resources.

---

### Framework Customization Overview

The most important elements of a document type customization are represented by an XML Schema to define the XML structure, the CSS to render the information and the XML instance template that links the first two together.

**XML Grammar**

To provide as-you-type validation and to compute valid insertion proposals, Oxygen XML Editor Eclipse plugin needs an XML grammar (XML Schema, DTD, or Relax NG) associated to the XML. The grammar specifies how the internal structure of the XML is defined. For information about associating a schema and how Oxygen XML Editor Eclipse plugin detects the schema, see **Associating a Schema to XML Documents** (on page 583).

Consider a use-case where several users are testing a system and must send report results to a content management system. The customization should provide a visual editor for this type of document. The following XML Schema, `test_report.xsd` defines a report with results of a testing session. The report
consists of a title, few lines describing the test suite that was run, and a list of test results (each with a name and a boolean value indicating if the test passed or failed).
CSS Stylesheet

A set of rules must be defined for describing how the XML document is to be rendered in Author mode. This is done using Cascading Style Sheets (CSS). CSS is a language used to describe how an HTML or XML document should be formatted by a browser. CSS is widely used in the majority of websites.

The elements from an XML document are displayed in the layout as a series of boxes. Some of the boxes contain text and may flow one after the other, from left to right. These are called inline boxes. There are also other types of boxes that flow one below the other (such as paragraphs). These are called block boxes.

For example, consider the way a traditional text editor arranges the text. A paragraph is a block, because it contains a vertical list of lines. The lines are also blocks. However, blocks that contain inline boxes arrange its children in a horizontal flow. That is why the paragraph lines are also blocks, while the traditional "bold" and "italic" sections are represented as inline boxes.

The CSS allows us to specify that some elements are displayed as tables. In CSS, a table is a complex structure and consists of rows and cells. The table element must have children that have a table-row style. Similarly, the row elements must contain elements with a table-cell style.

To make it easy to understand, the following section describes how each element from a schema is formatted using a CSS file. Note that this is just one of infinite possibilities for formatting the content.

```
report
   The root of a report document. It should be rendered as a box that contains all other elements. To achieve this, the display type is set to block. Additionally, some margins are set for it. The CSS rule that matches this element is:

   report{
      display:block;
      margin:1em;
   }
```

```
title
   The title of the report. Usually titles have a large font. The block display is used so that the subsequent elements will be placed below it, and its font is changed to double the size of the normal text.

   title {
      display:block;
   }
```
Contains several lines of text describing the report. The lines of text are displayed one below the other, so the description has the **block** display. Also, the background color is changed to make it standout.

```css
description {
  display: block;
  background-color: #EEEEFF;
  color: black;
}
```

A line of text in the description. A specific aspect is not defined and it just indicates that the display should be **block** style.

```css
line {
  display: block;
}
```

Defines important text from the description. Since it can be mixed with text, its display property must be set to **inline**. Also, the text is emphasized with **bold** to make it easier to spot.

```css
important {
  display: inline;
  font-weight: bold;
}
```

Displays the list of `test_names` and the results for each one. To make it easier to read, it is displayed as a **table**, with a green border and margins.

```css
results {
  display: table;
  margin: 2em;
  border: 1px solid green;
}
```

The results are displayed as a table so the entry is a row in the table. Thus, the display is **table-row**.
test_name, passed

The name of the individual test, and its result. They are cells in the results table with the display set to `table-cell`. Padding and a border are added to emphasize the table grid.

test_name, passed{
    display:table-cell;
    border:1px solid green;
    padding:20px;
}

passed{
    font-weight:bold;
}

The full content of the CSS file `test_report.css` is:

```css
report {
    display:block;
    margin:1em;
}

description {
    display:block;
    background-color:#EEEEFF;
    color:black;
}

line {
    display:block;
}

important {
    display:inline;
    font-weight:bold;
}

title {
    display:block;
}
```
Figure 535. Report Rendered in Author Mode

Automated test report

This is the report of the test automatically ran. Each test suite is ran at 20:00h each day. Please check the failed ones!

- Database connection test: true
- XSLT Transformation test: true
- DTD validation test: false
XML Instance Template

Based on the XML Schema and CSS file Oxygen XML Editor Eclipse plugin can help the content author in loading, editing, and validating the test reports. An XML document template must be created as a kind of skeleton that the users can use as a starting point for creating new test reports. The template must be generic enough and reference the XML Schema file and the CSS stylesheet.

This is an example:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<?xml-stylesheet type="text/css" href="test_report.css"?>
<report xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance" xsi:noNamespaceSchemaLocation="test_report.xsd">
  <title>Automated test report</title>
  <description>
    <line>This is the report of the test automatically ran. Each test suite is ran at 20:00h each day. Please <important>check</important> the failed ones!</line>
  </description>
  <results>
    <entry>
      <test_name>Database connection test</test_name>
      <passed>true</passed>
    </entry>
    <entry>
      <test_name>XSLT Transformation test</test_name>
      <passed>true</passed>
    </entry>
    <entry>
      <test_name>DTD validation test</test_name>
      <passed>false</passed>
    </entry>
  </results>
</report>
```

The processing instruction `xml-stylesheet` associates the CSS stylesheet to the XML file. The `href` pseudo attribute contains the URI reference to the stylesheet file. In the example, the CSS is in the same directory as the XML file.

The next step is to place the XSD file and the CSS file on a web server and modify the template to use the HTTP URLs, like this:
If you want to share the files with other team members, you could create an archive containing the files test_report.xml, test_report.css, and test_report.xsd and send it to the other users.

Creating and Configuring a Custom Framework

This basic tutorial is meant to provide an example of creating and configuring a custom document type (framework (on page 2655)). This basic tutorial offers examples for creating a custom schema, adjusting the authoring experience through custom CSS styling, and creating a custom action.

Step 1: Organize Framework Files

First, create a new folder for your customized framework (on page 2655). This folder will be used to store all files related to the documentation framework. The folder structure will look something like this:

```
oxygen
    frameworks
    sdf
    schema
    css
```

The frameworks directory is the container where all the Oxygen XML Editor Eclipse plugin framework customizations are located. Each subdirectory contains files related to a specific type of XML documents (schemas, catalogs, stylesheets, CSS stylesheets, etc.) Distributing a framework means delivering a framework directory.

It is assumed that you have the right to create files and folders inside the Oxygen XML Editor Eclipse plugin installation directory. If you do not have this right, you will have to install another copy of the program in a folder you have access to, the home directory for instance, or your desktop.

To test your framework distribution, copy it in the frameworks directory of the newly installed application and start Oxygen XML Editor Eclipse plugin by running the provided start-up script files.

You should copy the created schema files abs.xsd and sdf.xsd, sdf.xsd being the main schema, to the schema directory and the CSS file sdf.css to the css directory.
Step 2: Extend an Existing Framework

The easiest way to create a custom framework (on page 2655) (document type) is by extending an existing built-in framework, such as DITA or DocBook, and then making modifications to it.

1. Open the Preferences dialog box (on page 70) and go to Document Type Association > Locations (on page 90). Add the path to your custom framework directory in the Additional frameworks directories list and click OK or Apply to save your changes.

2. Go to the Document Type Association preferences page (on page 88) and select an existing framework configuration (for example, DocBook) and use the Extend button to create an extension for it.

   **Step Result:** This opens the Document Type Configuration dialog box (on page 90) where you can define the set of rules and settings for your custom framework.

3. Give the extension an appropriate name, select External for the Storage option, click the browsing button ( ) to specify the location of your custom framework directory.

4. Click OK to close the configuration dialog box and then OK or Apply to save your changes.

**Results:** You now have a fully functional framework that you can continue to customize.

Step 3: Create a Custom XML Schema

To illustrate an example of creating an XML Schema for a custom DocBook framework (on page 2655), suppose the documents are either articles or books, and composed of sections. The sections may contain <title>, <para>, <figure>, <table>, and other <section> elements. To complete the picture, each section includes a <def> element from another namespace.

The first schema file:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<xs:schema xmlns:xs="http://www.w3.org/2001/XMLSchema"

targetNamespace="http://www.oxygenxml.com/sample/documentation"
xmlns:doc="http://www.oxygenxml.com/sample/documentation"
xmlns:abs="http://www.oxygenxml.com/sample/documentation/abstracts"

elementFormDefault="qualified">

<xs:import namespace="http://www.oxygenxml.com/sample/documentation/abstracts"

schemaLocation="abs.xsd"/>
```

Next, the structure of the sections is defined. They all start with a `<title>`, then have the optional `<def>` element then either a sequence of other sections, or a mixture of paragraphs, images, and tables.

```
<xs:element name="book" type="doc:sectionType"/>
<xs:element name="article" type="doc:sectionType"/>
<xs:element name="section" type="doc:sectionType"/>

<xs:complexType name="sectionType">
  <xs:sequence>
    <xs:element name="title" type="xs:string"/>
    <xs:element ref="abs:def" minOccurs="0"/>
    <xs:choice>
      <xs:sequence>
        <xs:element ref="doc:section" maxOccurs="unbounded"/>
      </xs:sequence>
      <xs:choice maxOccurs="unbounded">
        <xs:element ref="doc:para"/>
        <xs:element ref="doc:image"/>
        <xs:element ref="doc:table"/>
      </xs:choice>
    </xs:choice>
  </xs:sequence>
</xs:complexType>
```

The paragraph contains text and other custom styling markup, such as bold (`<b>`) and italic (`<i>`) elements.

```
<xs:element name="para" type="doc:paragraphType"/>

<xs:complexType name="paragraphType" mixed="true">
  <xs:choice minOccurs="0" maxOccurs="unbounded">
    <xs:element name="emphasis"/>
    <xs:element name="i"/>
  </xs:choice>
</xs:complexType>
```

The `<image>` element has an attribute with a reference to the file containing image data.

```
<xs:element name="image">
  <xs:complexType>
    <xs:attribute name="href" type="xs:anyURI" use="required"/>
  </xs:complexType>
</xs:element>
```

The `<table>` element contains a header row and then a sequence of rows (`<tr>`) elements each of them containing the cells. Each cell has the same content as the paragraphs.
The `<def>` element is defined as a text only element in the imported schema `abs.xsd`:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<xs:schema xmlns:xs="http://www.w3.org/2001/XMLSchema"
    targetNamespace="http://www.oxygenxml.com/sample/documentation/abstracts">
  <xs:element name="def" type="xs:string"/>
</xs:schema>
```

Now the XML data structure will be styled.
Step 4: Associate the Schema to the Framework

In the bottom section of the Document Type configuration dialog box (on page 90), there are a series of tabs. The Schema tab refers to the schema that is used for validation of the documents that match the defined association rules.

Important:
If the document references a schema directly (for example, using a DOCTYPE declaration, xsi:schemaLocation attribute, or a Relax NG xml-model processing instruction), the schema defined in this Schema tab is not used for validation or content completion.

Schema Type

Select from the combo box the value XML Schema.

Schema URI

Enter the value of the schema location (for example, ${framework}/schema/sdf.xsd). Use the $(frameworks) editor variable (on page 225) in the schema URI path instead of a full path to be valid for multiple Oxygen XML Editor Eclipse plugin installations.

Important:
The $(frameworks) variable is expanded at the time of validation into the absolute location of the directory containing the framework (on page 2655).

Step 5: Create a Custom CSS

If you read the Framework Customization Overview (on page 2078) then you already have some basic knowledge about creating simple styles. The example document contains elements from various namespaces, so you need to use CSS Level 3 extensions (supported by the Author mode layout engine) to associate specific properties with that element.

Defining the General Layout

Now the basic layout of the rendered documents is created.

Elements that are stacked one on top of the other are: book, article, section, title, figure, table, image. These elements are marked as having block style for display. Elements that are placed one after the other in a flowing sequence are: b, i. These will have inline display.

```/* Vertical flow */
book,
section,
para,
title,
table,
image,```
Important:
Having block display children in an inline display parent results in Oxygen XML Editor Eclipse plugin changing the style of the parent to block display.

Styling an Element

The title of any section must be bold and smaller than the title of the parent section. To create this effect, a sequence of CSS rules must be created. The * operator matches any element, it can be used to match titles having progressive depths in the document.

```css
title{
    font-size: 2.4em;
    font-weight: bold;
}
* * title{
    font-size: 2.0em;
}
* * * title{
    font-size: 1.6em;
}
* * * * title{
    font-size: 1.2em;
}
```

It is useful to have before the title a constant text, indicating that it refers to a section. This text can include also the current section number. The :before and :after pseudo-elements will be used, plus the CSS counters.

First declare a counter named sect for each book or article. The counter is set to zero at the beginning of each such element:

```css
book,
article{
    counter-reset: sect;
}
```
The `sect` counter is incremented with each `section`, that is a direct child of a `book` or an `article` element.

```css
book > section,
article > section{
    counter-increment: sect;
}
```

The "static" text that will prefix the section title is composed of the constant "Section ", followed by the decimal value of the `sect` counter and a dot.

```css
book > section > title:before,
article > section > title:before{
    content: "Section " counter(sect) ".";
}
```

To make the documents easy to read, you add a margin to the sections. In this way the higher nesting level, the larger the left side indent. The margin is expressed relatively to the parent bounds:

```css
section{
    margin-left: 1em;
    margin-top: 1em;
}
```

Figure 536. A sample of nested sections and their titles.

In the above screenshot you can see a sample XML document rendered by the CSS stylesheet. The selection "avoids" the text that is generated by the CSS "content" property. This happens because the CSS generated text is not present in the XML document and is just a visual aid.
Styling Inline Elements

The "bold" style is obtained by using the `font-weight` CSS property with the value `bold`, while the "italic" style is specified by the `font-style` property:

```css
b {
  font-weight: bold;
}

i {
  font-style: italic;
}
```

Styling Images

The CSS 2.1 does not specify how an element can be rendered as an image. To overpass this limitation, Oxygen XML Editor Eclipse plugin supports a CSS Level 3 extension allowing to load image data from a URL. The URL of the image must be specified by one of the element attributes and it is resolved through the catalogs specified in Oxygen XML Editor Eclipse plugin.

```css
image{
  display: block;
  content: attr(href, url);
  margin-left: 2em;
}
```

The `image` element has the required `href` attribute of type `xs:anyURI`. The `href` attribute contains an image location so the rendered content is obtained by using the function:

```css
attr(href, url)
```

The first argument is the name of the attribute pointing to the image file. The second argument of the `attr` function specifies the type of the content. If the type has the `url` value, then Oxygen XML Editor Eclipse plugin identifies the content as being an image. If the type is missing, then the content will be the text representing the attribute value.

Oxygen XML Editor Eclipse plugin handles both absolute and relative specified URLs. If the image has an `absolute` URL location (for example: "http://www.oasis-open.org/images/standards/oasis_standard.jpg") then it is loaded directly from this location. If the image URL is `relative` specified to the XML document (for example: "images/my_screenshot.jpg") then the location is obtained by adding this value to the location of the edited XML document.

An image can also be referenced by the name of a DTD entity that specifies the location of the image file. For example, if the document declares an entity `graphic` that points to a JPEG image file:

```xml
<!ENTITY graphic SYSTEM "depo/keyboard_shortcut.jpg" NDATA JPEG>
```
and the image is referenced in the XML document by specifying the name of the entity as the value of an attribute:

```xml
<mediaobject>
  <imageobject>
    <imagedata entityref="graphic" scale="50"/>
  </imageobject>
</mediaobject>
```

The CSS should use the functions `url`, `attr` and `unparsed-entity-uri` for displaying the image in the Author mode:

```css
imagedata[entityref]{
  content: url(unparsed-entity-uri(attr(entityref)));}
```

To take into account the value of the `@width` attribute of the `imagedata` and use it for resizing the image, the CSS can define the following rule:

```css
imagedata[width]{
  width: attr(width, length);
}
```

**Figure 537. Samples of images in Author**

**Section: 3 Documentation frameworks**

One of the most important documentation frameworks is Docbook.

The other is the topic oriented DITA, promoted by OASIS.

**Step 6: Associate the Custom CSS to the Framework**

Once you have customized your framework through CSS styling rules, you then need to associate the custom CSS file (on page 96).
Step 7: Testing the Framework Customization

To test the new framework (on page 2655) customization, create an XML instance that conforms with the association rules that you specified in your framework customization. You will not specify an XML Schema location directly in the document, using an xsi:schemaLocation attribute. Instead, Oxygen XML Editor Eclipse plugin will detect its associated document type and use the specified schema.

```xml
<book xmlns="http://www.oxygenxml.com/sample/documentation"
      xmlns:abs="http://www.oxygenxml.com/sample/documentation/abstracts">

  <title>My Technical Book</title>
  <section>
    <title>XML</title>
    <abs:def>Extensible Markup Language</abs:def>
    <para>In this section of the book I will explain different XML applications.</para>
  </section>
</book>
```

When trying to validate the document there should be no errors. Now modify the title to title2. Validate again. This time there should be as error.

Invalid content was found starting with element 'title2'. One of '{"http://www.oxygenxml.com/sample/documentation":title}' is expected.

Undo the tag name change, go to Author mode, and Oxygen XML Editor Eclipse plugin should load the CSS from the document type association (on page 2654) and create a layout similar to this:

Figure 538. Example: Testing a Framework Customization
CSS Support in Author Mode

The visual Author editing mode can be customized by creating CSS files to define styles for the XML elements and other components. The Author editing mode supports most CSS 2.1 selectors, numerous CSS 2.1 properties, and some CSS 3 selectors. Also, Oxygen XML Editor Eclipse plugin has added some custom functions and properties that extend the W3C CSS specification and are useful for a wide range of use-cases for developers who customize Author mode through custom frameworks (on page 1919).

Resources

To see a visual demonstration of various advanced customization possibilities (including ideas for tailoring the editing experience using CSS), watch our Webinar: Working with DITA in Oxygen - Customizing the Editing Experience.

Associating a CSS with an XML Document

Associating a Stylesheet with an XML Document

The rendering of an XML document in the Author mode is driven by a CSS stylesheet that conforms to the version 2.1 of the CSS specification from the W3C consortium. Some CSS 3 features, such as namespaces and custom extensions, of the CSS specification are also supported.

There are several methods for associating a stylesheet (CSS) with an XML document:

- Insert the xml-stylesheet processing instruction with the @type attribute at the beginning of the XML document. The easiest way to do this is by using the Associate XSLT/CSS Stylesheet action that is available on the toolbar or in the XML menu.

  CSS example:

  ```xml
  <?xml-stylesheet type="text/css" href="test.css"?>
  ```

- Add a new CSS file to a framework (on page 2655) (document type). To do so, open the Preferences dialog box (on page 70) and go to Document Type Association. Edit the appropriate framework, open the Author tab, then the CSS subtab. Click the New button to add a new CSS file.

Note:

The built-in frameworks are read-only, so you need to Extend (on page 89) or Duplicate (on page 89) them to configure them as custom frameworks.

If a document has no CSS association or the referenced stylesheet files cannot be loaded, a default one is used. A warning message is also displayed at the beginning of the document, presenting the reason why the CSS cannot be loaded.
Figure 539. Document with no CSS association default rendering

![Image of document with no CSS association default rendering]

For information about associating a CSS to a framework (document type), see Configuring and Managing Multiple CSS Styles for a Framework (on page 1933).

Handling CSS Imports

When a CSS document contains imports to other CSS documents, the references are also passed through the XML Catalog (on page 2659) URI mappings to determine an indirect CSS referenced location.

Example: CSS Import

For example, if you can have a CSS import, such as:

```html
@import "http://host/path/to/location/custom.css";
```

and then add your own XML Catalog (on page 2659) file that maps the location to a custom CSS in the XML Catalog preferences page (on page 189):

```xml
<uri name="http://host/path/to/location/custom.css"
     uri="path/to/custom.css"/>
```

Adding a Custom Default CSS for Every XML Document

To add a custom CSS that is applied to every XML document, add a mapping in your XML Catalog (on page 2659) file that looks like this:

```xml
<uri name="http://www.oxygenxml.com/extensions/author/css/userCustom.css"
     uri="path/to/custom.css"/>
```
This extra mapped CSS location will be parsed every time the application processes the CSS stylesheets used to render the opened XML document in the visual **Author** editing mode. This allows your custom CSS to be used without the need to modify all other CSS stylesheets contributed in the document type configuration.

**Editor Variables in CSS Imports**

You can use various editor variables *(on page 218)* in CSS imports. When editing an XML document with an associated CSS in **Author** mode, the editor variables will be expanded and resolved.

**Example: Editor Variable in a CSS Import**

For example, the following editor variable:

```css
@import "${framework(DITA)}/custom.css";
```

is resolved in the DITA **framework** *(on page 2655)* folder where the *custom.css* is placed. In the **Document Type Association** preferences page *(on page 88)*, you can see a list of document type. The name for your particular document type needs to be passed as a parameter to the *framework()* function.

**Note:**

If you use editor variables like `${cfdu}` (Current File Directory URL), it will be expanded to the URL of the current CSS document that contains the imports rather than the XML document that references the CSS.

**Displaying Processing Instructions from Other XML Editors**

By default, some external processing instructions are hidden (for example, certain processing instructions used to store metadata in other XML editors). If you want them to be displayed (for example, to edit them), they must be associated with the current document using a CSS *(on page 2095)* like this:

```css
@namespace oxy "http://www.oxygenxml.com/extensions/author";
oxy|processing-instruction[Pub],
oxy|processing-instruction[PubTbl],
oxy|processing-instruction[xm-replace_text],
oxy|processing-instruction[xm-deletion_mark],
oxy|processing-instruction[xm-insertion_mark_start],
oxy|processing-instruction[xm-insertion_mark_end] {
  display:block !important;
}
```

**Specifying Media Types in the CSS**

The CSS stylesheets can specify how a document is presented on different types of media (on the screen, paper, etc.) You can specify that some of the selectors from your CSS should be taken into account only in the
Oxygen XML Editor Eclipse plugin Author mode and ignored in other media types. This can be accomplished by using the `oxygen` media type.

**Example: oxygen Media Type**

```css
b{
    font-weight:bold;
    display:inline;
}
@media oxygen{
b{
    text-decoration:underline;
}
}
```

This example results in the text being bold if the document is opened in a web browser that does not recognize `@media oxygen`, while the text is bold and underlined when opened in Oxygen XML Editor Eclipse plugin Author mode.

You can also use the `oxygen` media type to specify CSS selectors to be applied in certain operating systems or platforms by using the `os` and `platform` properties. For example, you can specify one set of style rules for displaying Oxygen XML Editor Eclipse plugin in Windows, and another set of style rules for macOS. The supported properties are as follows:

- **os** - The possible values are: `win`, `linux`, or `mac`.
- **platform** - The possible values are: `standalone`, `eclipse`, or `webapp`.

**Example: os and platform Properties**

```css
@media oxygen AND (os:"win") AND (platform:"standalone") {
p{
    content:"PPP";
}
}
```

**Related information**

@media Rule *(on page 2099)*

**CSS At-Rules**

Oxygen XML Editor Eclipse plugin supports some of the standard at-rules specified by CSS Level 2.1 and 3. The `@media` rule also include support for some style rules that are specific to Oxygen XML Editor Eclipse plugin.
@font-face At-Rule

Oxygen XML Editor Eclipse plugin allows you to use custom fonts in the Author mode by specifying them in the CSS using the @font-face media type. Only the src and font-family CSS properties can be used for this media type.

Example: @font-face Rule

```css
@font-face{
    font-family:"Baroque Script";
    /*The location of the loaded TTF font must be relative to the CSS*/
    src:url("BaroqueScript.ttf");
}
```

The specified font-family must match the name of the font declared in the .ttf file.

@media Rule

The @media rule allows you to set different style rules for multiple types of media in the same stylesheet. For example, you can set the font size to be different on the screen than on paper. Oxygen XML Editor Eclipse plugin supports several media types, allowing you to set the style rules for presenting a document on various media (on screen, paper, etc.)

Supported Media Types

- **screen** - The styles marked with this media type are used only for rendering a document on screen.
- **print** - The styles marked with this media type are used only for printing a document.
- **all** - The styles marked with this media type are used for rendering a document in all supported types of media.
- **oxygen** - The styles marked with this media type are used only for rendering a document in the Oxygen XML Editor Eclipse plugin Author mode. For more information, see Specifying Media Types in the CSS (on page 2097).
- **oxygen-dark-theme** - The styles marked with this media type are used only for rendering a document in the Oxygen XML Editor Eclipse plugin Author mode when a dark theme is used (for example, Graphite).
- **oxygen-high-contrast-black** - The styles marked with this media type are used only for rendering a document in the Oxygen XML Editor Eclipse plugin Author mode on a Windows High Contrast Theme with a black background.
- **oxygen-high-contrast-white** - The styles marked with this media type are used only for rendering a document in the Oxygen XML Editor Eclipse plugin Author mode on a Windows High Contrast Theme with a white background.

Example: @media Rule

```css
@media oxygen{
    b{
        text-decoration:underline;
    }
}
```
Supported Properties

Oxygen XML Editor Eclipse plugin also supports a few properties to set specific style rules that depend upon the size of the visible area in Author mode. These supported properties are as follows:

- **min-width** - The styles selected in this property are applied if the visible area in Author mode is equal to or greater than the specified value.
- **max-width** - The styles selected in this property are applied if the visible area in Author mode is less than or equal to the specified value.

**Example: min-width and max-width Properties**

```css
@media (min-width: 500px) {
  p {
    content: 'XXX';
  }
}
@media (max-width: 700px) {
  p:after {
    content: 'yyy';
  }
}
```

Specifying Media Types in the CSS *(on page 2097)*

Standard W3C CSS Supported Features

Oxygen XML Editor Eclipse plugin supports most of the CSS Level 3 selectors and most of the CSS Level 2.1 properties

Supported CSS Selectors

Tip:

CSS rules that match attributes are always more specific than element selectors. For more information, see [https://drafts.csswg.org/selectors-3/#specificity](https://drafts.csswg.org/selectors-3/#specificity).
The following table lists the CSS selectors that are supported in Oxygen XML Editor Eclipse plugin:

<table>
<thead>
<tr>
<th>Expression</th>
<th>Name</th>
<th>CSS Level</th>
<th>Description / Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>*</td>
<td>Universal selector</td>
<td>CSS Level 2</td>
<td>Matches any element</td>
</tr>
<tr>
<td>E</td>
<td>Type selector</td>
<td>CSS Level 2</td>
<td>Matches any ( E ) element (i.e. an element with the local name ( E ))</td>
</tr>
<tr>
<td>E F</td>
<td>Descendant selector</td>
<td>CSS Level 2</td>
<td>Matches any ( F ) element that is a descendant of an ( E ) element.</td>
</tr>
<tr>
<td>E &gt; F</td>
<td>Child selectors</td>
<td>CSS Level 2</td>
<td>Matches any ( F ) element that is a child of an element ( E ).</td>
</tr>
<tr>
<td>E:lang(c)</td>
<td>Language pseudo-class</td>
<td>CSS Level 2</td>
<td>Matches element of type ( E ) if it is in (human) language ( c ) (the document language specifies how language is determined).</td>
</tr>
<tr>
<td>E + F</td>
<td>Adjacent selector</td>
<td>CSS Level 2</td>
<td>Matches any ( F ) element immediately preceded by a sibling element ( E ).</td>
</tr>
<tr>
<td>E ~ F</td>
<td>General sibling selector</td>
<td>CSS Level 3</td>
<td>Matches any ( F ) element preceded by a sibling element ( E ).</td>
</tr>
<tr>
<td>E[foo]</td>
<td>Attribute selector</td>
<td>CSS Level 2</td>
<td>Matches any ( E ) element with the ( &quot;foo&quot; ) attribute set (whatever the value).</td>
</tr>
<tr>
<td>E[foo=&quot;warning&quot;]</td>
<td>Attribute selector with value</td>
<td>CSS Level 2</td>
<td>Matches any ( E ) element whose ( &quot;foo&quot; ) attribute value is exactly equal to ( &quot;warning&quot; ).</td>
</tr>
<tr>
<td>E[foo=&quot;warning&quot;]</td>
<td>Attribute selector containing value</td>
<td>CSS Level 2</td>
<td>Matches any ( E ) element whose ( &quot;foo&quot; ) attribute value is a list of space-separated values, one of which is exactly equal to ( &quot;warning&quot; ).</td>
</tr>
<tr>
<td>E[lang=&quot;en&quot;]</td>
<td>Attribute selector containing hyphen separated values</td>
<td>CSS Level 2</td>
<td>Matches any ( E ) element whose ( &quot;lang&quot; ) attribute has a hyphen-separated list of values beginning (from the left) with ( &quot;en&quot; ).</td>
</tr>
<tr>
<td>E:before and E:after</td>
<td>Pseudo-elements</td>
<td>CSS Level 2</td>
<td>The ( :before ) and ( :after ) pseudo-elements can be used to insert generated content before or after an element’s content.</td>
</tr>
<tr>
<td>Expression</td>
<td>Name</td>
<td>CSS Level</td>
<td>Description / Example</td>
</tr>
<tr>
<td>----------------</td>
<td>-----------------------------------</td>
<td>-----------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>E:first-child</td>
<td>The first-child pseudo-class</td>
<td>CSS Level 2</td>
<td>Matches element $E$ when $E$ is the first child of its parent.</td>
</tr>
<tr>
<td>E:not(s)</td>
<td>Negation pseudo-class</td>
<td>CSS Level 2</td>
<td>An E element that does not match simple selector s.</td>
</tr>
<tr>
<td>E:has</td>
<td>Relational pseudo-class</td>
<td>CSS Level 4</td>
<td>The :has() relational pseudo-class is a functional pseudo-class that takes a relative selector as an argument. For more information, see :has Relational Pseudo-Class (on page 2107).</td>
</tr>
<tr>
<td>E:hover</td>
<td>The hover pseudo-class</td>
<td>CSS Level 2</td>
<td>The :hover pseudo-class applies while the user designates an element with a pointing device, but does not necessarily activate it. When moving the pointing device over an element, all the parent elements up to the root are taken into account.</td>
</tr>
<tr>
<td>E:focus</td>
<td>The focus pseudo-class</td>
<td>CSS Level 2</td>
<td>The :focus pseudo-class applies while an element has the focus (accepts keyboard input).</td>
</tr>
<tr>
<td>E:focus-within</td>
<td>The generalized input focus pseudo-class</td>
<td>CSS Level 4</td>
<td>The :focus-within pseudo-class applies to elements that will have the :focus pseudo-class applied. Additionally, the ancestors of an element that matches :focus-within also match.</td>
</tr>
<tr>
<td>E:marker</td>
<td>The marker pseudo-class</td>
<td>CSS Level 4</td>
<td>The ::marker pseudo-element represents the automatically generated marker box of a list item.</td>
</tr>
<tr>
<td>E#myid</td>
<td>The ID selector</td>
<td>CSS Level 2</td>
<td>Matches any E element with ID equal to &quot;myid&quot;.</td>
</tr>
<tr>
<td>Expression</td>
<td>Name</td>
<td>CSS Level</td>
<td>Description / Example</td>
</tr>
<tr>
<td>---------------</td>
<td>-------------------------------------</td>
<td>-----------</td>
<td>---------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>E[att^=&quot;val&quot;]</td>
<td>Substring matching attribute selector</td>
<td>CSS Level 3</td>
<td>An E element whose att attribute value begins exactly with the string val.</td>
</tr>
<tr>
<td>E[att$=&quot;val&quot;]</td>
<td>Substring matching attribute selector</td>
<td>CSS Level 3</td>
<td>An E element whose att attribute value ends exactly with the string val.</td>
</tr>
<tr>
<td>E[att*=&quot;val&quot;]</td>
<td>Substring matching attribute selector</td>
<td>CSS Level 3</td>
<td>An E element whose att attribute value contains the substring val.</td>
</tr>
<tr>
<td>E:root</td>
<td>Root pseudo-class</td>
<td>CSS Level 3</td>
<td>Matches the root element of the document. In HTML, the root element is always the HTML element.</td>
</tr>
<tr>
<td>E:empty</td>
<td>Empty pseudo-class</td>
<td>CSS Level 3</td>
<td>An E element that has no text or child elements.</td>
</tr>
<tr>
<td>E:nth-child(n)</td>
<td>The nth-child pseudo-class</td>
<td>CSS Level 3</td>
<td>An E element, the nth child of its parent.</td>
</tr>
<tr>
<td>E:nth-last-child(n)</td>
<td>The nth-last-child pseudo-class</td>
<td>CSS Level 3</td>
<td>An E element, the nth child of its parent, counting from the last one.</td>
</tr>
<tr>
<td>E:nth-of-type(n)</td>
<td>The nth-of-type pseudo-class</td>
<td>CSS Level 3</td>
<td>An E element, the nth sibling of its type.</td>
</tr>
<tr>
<td>E:nth-last-of-type(n)</td>
<td>The nth-last-of-type pseudo-class</td>
<td>CSS Level 3</td>
<td>An E element, the nth sibling of its type, counting from the last one.</td>
</tr>
<tr>
<td>E:last-child</td>
<td>The last-child pseudo-class</td>
<td>CSS Level 3</td>
<td>An E element, last child of its parent.</td>
</tr>
<tr>
<td>E:first-of-type</td>
<td>The first-of-type pseudo-class</td>
<td>CSS Level 3</td>
<td>An E element, first sibling of its type.</td>
</tr>
<tr>
<td>E:last-of-type</td>
<td>The last-of-type pseudo-class</td>
<td>CSS Level 3</td>
<td>An E element, last sibling of its type.</td>
</tr>
</tbody>
</table>

**Important:**

Limitation: In Oxygen XML Editor Eclipse plugin the match is performed only taking into account the attributes with the exact name: "id".
**Expression** | **Name** | **CSS Level** | **Description / Example**
--- | --- | --- | ---
E:only-child | The only-child pseudo-class | CSS Level 3 | An E element, only child of its parent.
E:only-of-type | The only-of-type pseudo-class | CSS Level 3 | An E element, only sibling of its type.
ns|E | Element namespace selector | CSS Level 3 | An element that has the local name E and the namespace given by the prefix ns. The namespace prefix can be bound to a URI by the at-rule:
```html
@namespace ns "http://some_namespace_uri";
```
See Namespace Selector (on page 2104).

E!>F | The subject selector | CSS Level 4 (experimental) | An element that has the local name E and has a child F. See Subject Selector (on page 2105).

---

**Namespace Selector**

In the CSS 2.1 standard, the element selectors ignore the namespaces of the elements they are matching. Only the local name of the elements are considered in the selector matching process.

Oxygen XML Editor Eclipse plugin uses a different approach that is similar to the CSS Level 3 specification. If the element name from the CSS selector is not preceded by a namespace prefix it is considered to match an element with the same local name as the selector value and ANY namespace. Otherwise, the element must match both the local name and the namespace.

In CSS up to version 2.1, the name tokens from selectors match all elements from ANY namespace that have the same local name. Example:

```html
<x:b xmlns:x="ns_x"/>
<y:b xmlns:y="ns_y"/>
```

Are both matched by the rule:

```css
b {font-weight:bold}
```

Starting with CSS Level 3, you can create selectors that are namespace aware.

**Example: Defining prefixed and default namespaces**

Given the namespace declarations:
@namespace sync "http://sync.example.org";
@namespace "http://example.com/foo";

Then:

`sync|A`

Represents the name A in the `http://sync.example.org` namespace.

`*|B`

Represents the name B in ANY namespace, including NO NAMESPACE.

`C`

Represents the name C in ANY namespace, including NO NAMESPACE.

**Example: Defining prefixed namespaces combined with pseudo-elements**

To match the `<def>` element its namespace declares, bind it to the `abs` prefix and then write a CSS rule:

```css
@namespace abs "http://www.oxygenxml.com/sample/documentation/abstracts";
```

Then:

`abs|def`

Represents the name "def" in the `http://www.oxygenxml.com/sample/documentation/abstracts` namespace.

`abs|def:before`

Represents the :before pseudo-element of the "def" element from the `http://www.oxygenxml.com/sample/documentation/abstracts` namespace.

**Subject Selector**

Oxygen XML Editor Eclipse plugin supports the subject selector described in CSS Level 4 (currently a working draft at W3C [http://www.w3.org/TR/selectors4/]). This selector matches a structure of the document, but unlike a compound selector, the styling properties are applied to the subject element (the one marked with "!") instead of the last element from the path.

*The subject of the selector can be explicitly identified by appending an exclamation mark (!) to one of the compound selectors in a selector. Although the element structure that the selector represents is the same with or without the exclamation mark, indicating the subject in this way can change which compound selector represents the subject in that structure.*

**Example:**
A border will be drawn to the table elements that contain a caption, as direct child.

This is different from:

```css
table > caption {
    border: 1px solid red;
}
```

This draws a border around the caption.

**Taking Processing Instructions into Account in CSS Subject Selectors**

You can test for the existence of specific processing instructions (PI) in the child hierarchy of a subject selector.

For example:

```css
@namespace oxy "http://www.oxygenxml.com/extensions/author";

chapter! > oxy|processing-instruction[important][level="high"]{
    color:red;
}
```

This would change the color of a DocBook chapter to red if it contains the `important` processing instruction:

```xml
<chapter>
    <title>A title</title>
    <?important level='high'?><
</chapter>
```

**Descendant Selectors Limitation**

⚠️ **Important:**

The current implementation has a known limitation. The general descendant selectors are taken into account as direct child selectors. For example, the following two CSS selectors are considered equivalent:

- `a:has(b c)`
- `a:has(b>c)`
Oxygen XML Editor Eclipse plugin supports the CSS Level 4 subject selector (currently a working draft at W3C http://www.w3.org/TR/selectors4/), as described in Subject Selector (on page 2105). Oxygen XML Editor Eclipse plugin also supports the :has relational pseudo-class that has similar functionality and it can match an element by taking its child elements into account. For more information, see https://drafts.csswg.org/selectors-4/#relational.

You can create conditions that take into account the structure of the matching element.

**Example: has Pseudo Class**

```css
table:has( tbody > thead){
    border: 1px solid red;
}
```

This example will result in a border being drawn for the table elements that contain at least a `<thead>` element in the `<tbody>` element.

**Taking Processing Instructions into Account in CSS Subject Selectors**

You can test for the existence of specific processing instructions (pi) in the child hierarchy of a subject selector.

For example:

```css
@namespace oxy "http://www.oxygenxml.com/extensions/author";

chapter! > oxy|processing-instruction[important][level="high"]{
    color:red;
}
```

This would change the color of a DocBook chapter to red if it contains the `important` processing instruction:

```xml
<chapter>
    <title>A title</title>
    <!--important level='high'-->
</chapter>
```
Descendant Selectors Limitation

**Important:**
The current implementation has a known limitation. The general descendant selectors are taken into account as direct child selectors. For example, the following two CSS selectors are considered equivalent:

```
a:has(b c)
```
and:

```
a:has(b>c)
```

Supported CSS Properties

Oxygen XML Editor Eclipse plugin validates all CSS 2.1 properties, but does not render *aural* and *paged* categories properties in **Author** mode, as well as some of the values of the *visual* category that are listed below under the **Ignored Values** column. For the Oxygen XML Editor Eclipse plugin-specific (extension) CSS properties, see CSS Extensions (on page 2121).

<table>
<thead>
<tr>

**<length>-** Refers to distance measurements and is expressed in units such as mm, cm, in, em, rem, ex, pc, pt, px. For more information, see the W3 CSS Level 3 length type specifications.

**Related Information:**

CSS Extensions (on page 2121)
Transparent Colors

CSS3 supports RGBA colors. The RGBA declaration allows you to set opacity (via the Alpha channel) as part of the color value. A value of 0 corresponds to a completely transparent color, while a value of 1 corresponds to a completely opaque color. To specify a value, you can use either a real number between 0 and 1, or a percent.

Example: RGBA Color

```css
personnel:before {
  display:block;
  padding: 1em;
  font-size: 1.8em;
  content: "Employees";
  font-weight: bold;
  color: #EEEEEE;
  background-color: rgba(50, 50, 50, 0.6);
}
```

**attr() Function: Properties Values Collected from the Edited Document**

In CSS Level 2.1 you may collect attribute values and use them as content only for the pseudo-elements. For instance, the :before pseudo-element can be used to insert some content before an element. This is valid in CSS 2.1:

```css
title:before{
  content: "[Audience Level: " attr(audience) "]";
}
```

If the `<title>` element from the XML document is:

```xml
<title audience="Expert">Changing the Timing Belt</title>
```

Then the title will be displayed as:

```
[Audience Level: Expert] Changing the Timing Belt
```

In Oxygen XML Editor Eclipse plugin, the use of attr() function is available not only for the content property, but also for any other property. This is similar to the CSS Level 3 working draft: http://www.w3.org/TR/2006/WD-css3-values-20060919/#functional. The arguments of the function are:

```ruby
attr ( attribute_name , attribute_type , default_value )
```

- **attribute_name**
  
  The attribute name. This argument is required.

- **attribute_type**
The attribute type. This argument is optional. If it is missing, argument’s type is considered string. This argument indicates what is the meaning of the attribute value and helps to perform conversions of this value. Oxygen XML Editor Eclipse plugin accepts one of the following types:

**color**

The value represents a color. The attribute may specify a color in various formats. Oxygen XML Editor Eclipse plugin supports colors specified either by name (red, blue, green, etc.) or as an RGB hexadecimal value #FEEFF.

**url**

The value is a URL pointing to a media object. Oxygen XML Editor Eclipse plugin supports only images. The attribute value can be a complete URL, or a relative one to the XML document. Note that this URL is also resolved through the catalog resolver.

**integer**

The value must be interpreted as an integer.

**number**

The value must be interpreted as a float number.

**length**

The value must be interpreted as an integer.

**percentage**

The value must be interpreted relative to another value (length, size) expressed in percents.

**em**

The value must be interpreted as a size. 1 em is equal to the font-size of the relevant font.

**ex**

The value must be interpreted as a size. 1 ex is equal to the height of the character of the relevant font.

**px**

The value must be interpreted as a size expressed in pixels relative to the viewing device.

**mm**

The value must be interpreted as a size expressed in millimeters.

**cm**
The value must be interpreted as a size expressed in centimeters.

\textit{in}

The value must be interpreted as a size expressed in inches. 1 inch is equal to 2.54 centimeters.

\textit{pt}

The value must be interpreted as a size expressed in points. The points used by CSS2 are equal to 1/72th of an inch.

\textit{pc}

The value must be interpreted as a size expressed in picas. 1 pica is equal to 12 points.

\textit{default_value}

This argument specifies a value that is used by default if the attribute value is missing. This argument is optional.

\textbf{Example: \textit{attr} Function}

Consider the following XML instance:

```xml
<sample>
  <para bg_color="#AAAAFF">Blue paragraph.</para>
  <para bg_color="red">Red paragraph.</para>
  <para bg_color="red" font_size="2">Red paragraph with large font.</para>
  <para bg_color="#00AA00" font_size="0.8" space="4">Green paragraph with small font and margin.</para>
</sample>
```

The \textit{<para>} elements have \textit{@bg_color} attributes with RGB color values (such as \#AAAAFF). You can use the \textit{attr()} function to change the elements appearance in the editor based on the value of this attribute:

```
background-color:attr(bg_color, color);
```

The \textit{font_size} represents the font size in \textit{em} units. You can use this value to change the style of the element:

```
font-size:attr(font_size, em);
```

The complete CSS rule is:

```
para{
  display:block;
  background-color:attr(bg_color, color);
  font-size:attr(font_size, em);
  margin:attr(space, em);
}
```
CSS Level 3 target-counter() and target-counters() Functions

The CSS Level 3 functions target-counter and target-counters can be used as values for the content property to retrieve counter values and display information obtained from a target at the end of a link.

The target-counter Function

This function retrieves the value of the innermost counter with a given name.

```
target-counter ( <fragment> , <counter-name> [ , <counter-style> ] ? )
```

- **fragment**
  - The URI fragment pointing to the ID of the target element.

- **counter-name**
  - The name of the counter. This argument is required.

- **counter-style**
  - This optional argument can be used to format the result.

Example:

HTML:
The target-counters Function

This function fetches the value of all counters of a given name from the end of a link and formats them by inserting a given string between the value of each nested counter.

```
target-counter ( <fragment> , <counter-name> , <delimiter> [ , <counter-style> ] ? )
```

**fragment**

The URI fragment pointing to the ID of the target element.

**counter-name**

The name of the counter. This argument is required.

**delimiter**

The string to be inserted between the value of each nested counter. This argument is required.

**counter-style**

This optional argument can be used to format the result.

calc() Function

The `calc()` function allows mathematical expressions with addition (+), subtraction (-), multiplication (*), division (/) to be used as component values. Percentages are solved relative to the dimensions of the containing parent block. It can be used when length values are accepted:

```css
elem {
  width: calc(100% - 1em);
}
```

For more information, see: https://drafts.csswg.org/css-values-3/#calc-notation

Custom CSS Properties (CSS Variables)

`Custom properties` (also referred to as `CSS variables`) are properties defined by CSS authors that contain specific values to be reused throughout a document.

Complex websites have many CSS rules, often with a lot of repeated values. For example, the same color might be used in dozens of different places, requiring a global search-and-replace operation if that color needs to be changed. Custom properties allow a value to be stored in one place, then referenced in multiple other places. An additional benefit is semantic identifiers. For example, `--main-text-color` is easier to understand than `#00ff00`, especially if this same color is also used in other contexts.

`Custom properties` follow the same rules as other CSS properties, so you are able to define and use them at multiple levels, following standard CSS cascading and specificity rules.

Usage

A custom property name begins with a double hyphen (`--`) and its value that can be any valid CSS value. You use the custom property value by specifying your custom property name inside the `var()` function, in place of a regular property value:

**Defining a Custom Property**

```css
element {
  --main-bg-color: brown;
  background-color: var(--main-bg-color);
}
```

**Note:**

Custom property names are case sensitive: `--my-color` will be treated as a separate custom property from `--My-color`.

Inheritance of Custom Properties

If you define a custom property on an element, you will be able to access it on all of its descendents.
**Inheritance**

```
<one>
  <two>
    <three/>
    <four/>
  </two>
</one>
```

```
one {
  --color:green;
}

three {
  --color:red;
}

* {
  color: var(--color);
}
```

**Result:**

- `<one>` has the color green.
- `<two>` has the color green.
- `<three>` has the color red.
- `<four>` has the color green.

**Custom Properties Fallback Values**

The `var()` function has two arguments. The first argument is the name of the custom property to be substituted. The second argument (optional) is a fallback value, which is used as the substitution value when the referenced custom property is invalid or undefined.

**Specifying a Fallback Value**

```
one {
  --color: blue;
}
```

```
one {
  color: var(--color, var(--fallback-color, red));
}
```
Dependencies

A custom property can reference the value of another custom property through the \texttt{var()} function.

\textbf{A Custom Property Safely Using a Variable}

\begin{verbatim}
:root {
  --border-color: red;
  --main-border: 1px solid var(--border-color, green);
}

p {
  border: var(--main-border);
}
\end{verbatim}

\textbf{Combining Custom Variables with \texttt{calc()}}

\begin{verbatim}
:root {
  --foo: 10px;
  --bar: calc(var(--foo) + 10px);
}

p {
  font-size: var(--bar);
}
\end{verbatim}

\textbf{CAUTION:}

This can create cyclic dependencies where two or more custom properties each attempt to reference each other.

\textbf{An Invalid Situation of Variables Depending on Each Other}

\begin{verbatim}
:root {
  --color: var(--bg-color);
  --bg-color: var(--color);
}
\end{verbatim}

\textbf{CSS Extensions}

CSS stylesheets provide support for displaying documents. When editing non-standard documents, Oxygen XML Editor Eclipse plugin CSS extensions are useful.

Examples of how they can be used:

\begin{itemize}
  \item Property for marking \textit{foldable elements (on page 2655)} in large files.
  \item Enforcing a display mode for the XML tags, regardless of the current mode selected by the user.
\end{itemize}
- Constructing a URL from a relative path location.
- String processing functions.

**Built-in CSS Selectors**

When Oxygen XML Editor Eclipse plugin renders content in the **Author** mode, it adds built-in CSS selectors (in addition to the CSS stylesheets linked in the XML or specified in the document type associated to the XML document). These built-in CSS selectors are processed before all other CSS content, but they can be overwritten if the CSS developer wants to modify a default behavior.

**List of CSS Selector Contributed by Oxygen XML Editor Eclipse plugin**

    white-space: -oxy-trim-when-ws-only !important;
}

/*EXM-28827 SVG can contain more than one namespace in it*/
svg|svg * {
    display:none !important;
    white-space:normal !important;
}

mml|math{
    display:inline !important;
    white-space: -oxy-trim-when-ws-only !important;
}

mml|math mml|*{
    display:none !important;
    white-space: normal !important;
}

/*Text direction attributes*/
*[dir='rtl'] { direction:rtl; unicode-bidi:embed; }
*[dir='rlo'] { direction:rtl; unicode-bidi:bidi-override; }

*[dir='ltr'] { direction:ltr; unicode-bidi:embed; }
*[dir='lro'] { direction:ltr; unicode-bidi:bidi-override; }

@media oxygen-high-contrast-black, oxygen-dark-theme{
/*
* EXM-40349
*
* In DIFF these place holder PIs are not handled so we treat them as normal PIs with a bit of styling.
*
*/
oxy|processing-instruction[oxy-placeholder] {
    visibility: -oxy-collapse-text;
    -oxy-display-tags:none;
}

oxy|processing-instruction[oxy-placeholder]:before {
    background-color: rgba(192, 192, 192, 0.2) !important;
    color: rgba(0, 0, 0, 0.6) !important;
    font-weight:bold;
    /* When there isn't an associated CSS the NO_CSS rules hide the PIs. @see AuthorViewport.CSS_ERROR_END */
    display: -oxy-morph;
    content: attr(content) !important;
}

@media oxygen-high-contrast-black, oxygen-dark-theme{
    oxy|processing-instruction[oxy-placeholder]:before {
        background-color: rgba(0, 0, 0, 0.15) !important;
        color: rgb(156, 156, 156) !important;
    }
    /* ------------------------------------
    * built-in oXygen elements
    *
    */
    oxy|comment {
        color: #a2a2a2 !important;
        background-color: transparent !important;
    }
}
Example:

To show all entities in the Author mode as transparent, without a gray background, first define in your CSS after all imports the namespace:

```css
@namespace oxy "http://www.oxygenxml.com/extensions/author";
```

and then add the following selector:

```css
oxy|entity {
  background-color: inherit !important;
}
```

Additional CSS Selectors

Oxygen XML Editor Eclipse plugin provides support for selecting additional types of nodes. These custom selectors apply to: document, doctype, processing-instruction, comment, CDATA sections, entities, and reference sections. Processing-instructions are not displayed by default. To display them, open the Preferences dialog box (on page 70), go to Editor > Author, and select Show processing instructions.

Note:

The custom selectors are presented in the default CSS for Author mode and all of their properties are marked with the important flag. For this reason, you have to set the important flag on each property of the custom selectors from your CSS to be applicable.

For the custom selectors to work in your CSS stylesheets, declare the Author mode extensions namespace at the beginning of the stylesheet documents:

```css
@namespace oxy url('http://www.oxygenxml.com/extensions/author');
```

- **oxy|document** - The oxy|document selector matches the entire document:

  ```css
  oxy|document {
    display:block !important;
  }
  ```

- **oxy|doctype** - The following example changes the rendering of doctype sections:

  ```css
  oxy|doctype {
    display:block !important;
    color:blue !important;
  }
  ```
• **oxy|processing-instruction** - To match the processing instructions, you can use the `oxy|processing-instruction` selector:

```css
oxy|processing-instruction {
  display:block !important;
  color:purple !important;
  background-color:transparent !important;
}
```

A processing instruction usually has a target and one or more pseudo attributes:

```xml
<?target_name data="b"/>
```

You can match a processing instruction with a particular target from the CSS using the following construct:

```css
oxy|processing-instruction[target_name]
```

You can also match the processing instructions having a certain target and pseudo attribute value, such as:

```css
oxy|processing-instruction[target_name][data="b"]
```

• **oxy|comment** - The XML comments displayed in **Author** mode can be changed using the `oxy|comment` selector:

```css
oxy|comment {
  display:block !important;
  color:green !important;
  background-color:transparent !important;
}
```

• **oxy|cdata** - The `oxy|cdata` selector matches **CDATA** sections:

```css
oxy|cdata{
  display:block !important;
  color:gray !important;
  background-color:transparent !important;
}
```

• **oxy|entity** - The `oxy|entity` selector matches the entity content:

```css
oxy|entity {
  display:morph !important;
  editable:false !important;
  color:orange !important;
```
To match particular entities, use the `oxy|entity` selector in expressions such as:

```html
doxygen
oxy|entity[name='amp'],
doxy|entity[name='lt'],
doxy|entity[name='gt'],
doxy|entity[name='quot'],
doxy|entity[name='apos'],
doxy|entity[name='#']{
  -oxygen-display-tags: none;
}
```

- `oxy|reference` - The `references to entities`, `XInclude`, and DITA `@conref` and `@conkeyref` attributes are expanded by default in **Author** mode and the referenced content is displayed. The referenced resources are displayed inside the element or entity that references them.

  You can use the `reference` property to customize the way these references are rendered in **Author** mode:

```html
doxygen
oxy|reference {
  border:1px solid gray !important;
}
```

In the **Author** mode, content is highlighted when text contains comments (on page 414) and changes (if Track Changes (on page 414) was active when the content was modified).

If this content is referenced, the **Author** mode does not display the highlighted areas in the new context. If you want to mark the existence of the comments and changes, you can use the `oxy|reference[comments]`, `oxy|reference[changeTracking]`, and `oxy|reference[changeTracking][comments]` selectors.

**Note:**

Two artificial attributes (`comments` and `changeTracking`) are set on the reference node, containing information about the number of comments and tracked changes in the content.

- The following example represents the customization of the reference fragments that contain comments:

```html
doxygen
oxy|reference[comments]:before {
  content: "Comments: " attr(comments) !important;
}
```

- To match reference fragments based on the fact that they contain tracked changes inside, use the `oxy|reference[changeTracking]` selector:
Here is an example of how you can set a custom color for the reference containing both tracked changes and comments:

```
oxy|reference[changeTracking][comments]:before {
  content: "Change tracking: " attr(changeTracking) !important;
  content: " and comments: " attr(comments) !important;
}
```

Figure 540. Example: A Document Rendered Using these Rules

```
<![DOCTYPE SAMPLE [ !ENTITY ent "Some entity">
<!ENTITY % xinclude SYSTEM "http://www.docbook.org/xml/4.4/xinclude.mod" >
%xinclude;
]>
xml-stylesheet type="text/css" href="sample.css"

Some Text
Some entity
Comment
CDATA section
 sample1.xml reffered

Reffered text.

 sample1.xml reffered-with-comment
 Comments: 2
Reffered text with comments.

 sample1.xml reffered-with-track-changes
 Change tracking: 2
Reffered text with changes.

 sample1.xml reffered-with-comment and-track-changes
 Change tracking: 1 and comments: 1
Reffered text with comments and changes.
```

Additional CSS Properties

Oxygen XML Editor Eclipse plugin provides various additional CSS properties to extend the standard CSS properties.
Append Content Properties: -oxy-append-content / -oxy-prepend-content

Used to append specified content.

**-oxy-append-content Property**

This property appends the specified content to the content generated by other matching CSS rules of lesser specificity. Unlike the `content` property, where only the value from the rule with the greatest specificity is taken into account, the `-oxy-append-content` property adds content to that generated by the lesser specificity rules into a new compound content.

**Example:**

```css
element:before{
    content: "Hello";
}

element:before{
    -oxy-append-content: " World!";
}
```

The content shown before the `element` will be **Hello World!**.

**-oxy-prepend-content Property**

Prepends the specified content to the content generated by other matching CSS rules of lesser specificity. Unlike the `content` property, where only the value from the rule with the greatest specificity is taken into account, the `-oxy-prepend-content` prepends content to that generated by the lesser specificity rules into a new compound content.

**Example:**

```css
element:before{
    content: "Hello!";
}

element:before{
    -oxy-prepend-content: "said: ";
}

element:before{
    -oxy-prepend-content: "I ";
}
```

The content shown before the `element` will be **I said: Hello!**.

**Collapse Text: -oxy-collapse-text Property Value**

Used to collapse the content of an element.
Oxygen XML Editor Eclipse plugin allows you to set the value of the \texttt{visibility} property to \texttt{-oxy-collapse-text}, meaning that the content of that element is not rendered. If an element is marked as \texttt{-oxy-collapse-text} you are not able to position the cursor inside it and edit it. The purpose of \texttt{-oxy-collapse-text} is to make the text value of an element editable only through a form control.

\textbf{Example: visibility Property}

The text value of an XML element will be edited using a text field form control. In this case, the text content is not directly present in the \texttt{Author} visual editing mode:

\begin{verbatim}
title{
    \texttt{content: oxy_textfield(edit, '#text', columns, 40);
    \texttt{visibility: -oxy-collapse-text;}}
}
\end{verbatim}

\textbf{Cyrillic Counters: -oxy-lower-cyrillic Property Values}

Used to style lists with Cyrillic counters.

Oxygen XML Editor Eclipse plugin allows you to set the value of the \texttt{list-style-type} property to Cyrillic counters. For example, \texttt{-oxy-lower-cyrillic-ru}, \texttt{-oxy-lower-cyrillic-uk}, \texttt{-oxy-upper-cyrillic-ru} or \texttt{-oxy-upper-cyrillic-uk}, meaning that you can have Russian and Ukrainian counters.

\textbf{Example: Cyrillic Counters}

Counting list items with Cyrillic symbols:

\begin{verbatim}
li{
    \texttt{display: list-item;
    \texttt{list-style-type: -oxy-lower-cyrillic-ru;}}
}
\end{verbatim}

\textbf{Display Tag Markers: -oxy-display-tags Property}

Used to specify whether or not tag markers are displayed.

Oxygen XML Editor Eclipse plugin allows you to choose whether tag markers of an element should never be presented or the current display mode should be respected. This is especially useful when working with \texttt{:before} and \texttt{:after} pseudo-elements, in which case the element range is already visually defined so the tag markers are redundant.

The property is named \texttt{-oxy-display-tags}, with the following possible values:

- \texttt{none} - Tags markers will not be presented regardless of the current display mode \textit{(on page 370)}.
- \texttt{default} - The tag markers will be created depending on the current display mode \textit{(on page 370)}.
- \texttt{inherit} - The value of the property is inherited from an ancestor element.
-oxy-display-tags

Value: none | default | inherit
Initial: default
Applies to: all nodes (comments, elements, CDATA, etc.)
Inherited: false
Media: all

Example: -oxy-display-tags Property

In this example, the para element from DocBook uses a :before and :after element and its tag markers will not be visible.

```css
para:before{
  content: "[";
}
para:after{
  content: "]";
}
para{
  -oxy-display-tags: none;
  display:block;
  margin: 0.5em 0;
}
```

Editable: -oxy-editable Property

Used to inhibit editing the content of a particular element.

If you want to inhibit the editing of the content of a certain element, you can set the -oxy-editable CSS property to false (the deprecated editable property is also supported).

Floating Toolbar: -oxy-floating-toolbar Property

Used to display a configured floating toolbar in Author mode.

The -oxy-floating-toolbar property is used to configure and display a floating toolbar in Author mode. It accepts a space-separated list of the following functions:

- oxy_button
- oxy_buttonGroup
- oxy_textfield
- oxy_combobox
- oxy_label
Note:
The "|" text value can be used to add a separator between elements of the toolbar.

It must be used in conjunction with the -oxy-selected and -oxy-selection-inside pseudo-classes. The -oxy-selected pseudo-class is automatically set on an element that is fully selected and the -oxy-selection-inside pseudo-class is automatically set on an element that has a selection inside.

Example 1:

```html
p:-oxy-selection-inside {
  -oxy-floating-toolbar:
    oxy_button(actionID, 'bold')
    oxy_button(actionID, 'italic')
    oxy_button(actionID, 'underline')
}
```

This results in a floating toolbar that contains bold, italic, and underline actions presented in Author mode every time text inside a paragraph element is selected.

Example 2:

```html
p:-oxy-selected {
  -oxy-floating-toolbar:
    oxy_label(text, "Platform: ")
    oxy_combobox{
      edit, '@platform',
      editable, false,
      values, 'windows, mac, linux',
      labels, 'Windows, MacOS, Linux'
    }
}
```

This results in a floating toolbar that contains a Platform: label and a drop-down menu used to change the value of the @platform profiling attribute. This is presented in Author mode every time a paragraph element is fully selected.

Example 3:

```html
[conref]:-oxy-selected, [conkeyref]:-oxy-selected {
  -oxy-floating-toolbar:
    oxy_button(actionID, 'add_edit_content_reference')
    oxy_button(actionID, 'remove_content_reference')
    "|"
    oxy_button(actionID, 'conref.replace')
}
```
This results in a floating toolbar that contains Edit Content Reference, Remove Content Reference, and Replace Reference with Content actions presented in Author mode every time an element with a @conref or @conkeyref attribute is fully selected.

**Folding Elements: -oxy-foldable / -oxy-folded / -oxy-not-foldable-child**

Used to configure whether or not the content of an element can be expanded or collapsed.

Oxygen XML Editor Eclipse plugin allows you to declare some elements to be foldable (on page 2655). This is especially useful when working with large documents organized in logical blocks, editing a large DocBook article or book, for instance. Oxygen XML Editor Eclipse plugin marks the foldable content with a small blue triangle. When you hover with your mouse pointer over this marker, a dotted line borders the collapsible content. The following actions are available in the Folding submenu of the contextual menu:

- **Toggle Fold**
  Toggles the state of the current fold.

- **Collapse Other Folds**
  Folds all the elements except the current element.

- **Collapse Child Folds**
  Folds the elements indented with one level inside the current element.

- **Expand Child Folds (Ctrl + NumPad+ (Command + NumPad+ on macOS))**
  Unfolds all child elements of the currently selected element.

- **Expand All**
  Unfolds all elements in the current document.

**-oxy-foldable Property**

This property defines whether or not the content for an element can be folded by the user. To define that an element's content can be folded, use the -oxy-foldable:true property.

**-oxy-folded Property**

This property is used in conjunction with the -oxy-foldable property and it defines the elements that are folded by default. To define an element to be folded by default, use the -oxy-folded:true property.

**Note:**

Since the -oxy-folded property works in conjunction with the -oxy-foldable property, the -oxy-folded property is ignored if the -oxy-foldable property is not set on the same element.

**-oxy-not-foldable-child Property**

When collapsing an element, it is useful to keep some of its content visible (for example, a short description of the collapsed region). The -oxy-not-foldable-child property is used to identify the child element that is
kept visible. As its value, it accepts an element name or a list of comma-separated element names. The first occurrence of each child element specified in the list of element names will be identified as the not-foldable child and displayed. If the element is marked as foldable (-oxy-foldable:true;) but it does not have the -oxy-not-foldable-child property or none of the specified non-foldable children exist, then the element is still foldable. In this case, the element kept visible when folded will be the before pseudo-element.

**Example: Folding DocBook Elements**

All the elements below can have a `<title>` child element and are considered to be logical sections. You mark them as being foldable leaving the `<title>` element visible.

```xml
set,
book,
part,
reference,
chapter,
preface,
article,
sect1,
sect2,
sect3,
sect4,
section,
appendix,
figure,
example,
table {
  -oxy-foldable:true;
  -oxy-not-foldable-child: title;
}
```

**Note:**
The foldable, folded, and not-foldable-child properties are deprecated and the equivalent with the -oxy prefix should be used instead.

**Links: -oxy-link Property**

Used to specify that a particular element should be considered a link.

Oxygen XML Editor Eclipse plugin allows you to declare some elements to be links. This is especially useful when working with many documents that reference each other. The links allow for an easy way to get from one document to another. Clicking the link marker will open the referenced resource in an editor.
To define the element that should be considered a link, you must use the `oxy-link` property on the `:before` or `:after` pseudo-element. The value of the property indicates the location of the linked resource. Since links are usually indicated by the value of an attribute in most cases it will have a value similar to `attr(href)`.

**Example: DocBook Link Elements**

The following elements are defined to be links on the `:before` pseudo-element and their values are defined by the value of an attribute.

```css
/*[href]:before{
   -oxy-link:attr(href);
   content: "Click * attr(href) " for opening" ;
}

ulink[url]:before{
   -oxy-link:attr(url);
   content: "Click to open: " attr(url);
}

click[targetdoc]:before{
   -oxy-link: attr(targetdoc);
   content: "Click to open: " attr(targetdoc);
}
```

**Link Navigation: -oxy-link-activation-trigger Property**

Used to specify how hyperlinks are handled in Author mode.

The `-oxy-link-activation-trigger` property is used to specify when hyperlinks are clickable in Author mode. This is helpful for those who are used to the hyperlink activation procedure in other applications (for example, apps that use **Ctrl+Click** (**Command+Click** on macOS) to activate hyperlinks.

The possible values are:

- **click** - Hyperlinks are opened when a user mouse-clicks the link icon or text.
- **modifier-click** - Hyperlinks are opened when a user holds down **Ctrl** (**Command** on macOS) and mouse-clicks the link icon or text.
- **auto** - The hyperlink strategy is determined automatically, depending on the context.
- **inherit** - The value is inherited from the parent element.

**Morph Elements: -oxy-morph Property Value**

Used to specify that an element should be displayed inline.

Oxygen XML Editor Eclipse plugin allows you to specify that an element has an `-oxy-morph` display type (deprecated `morph` property is also supported), meaning that the element is inline (on page 2655) if all its children are inline.
Example: -oxy-morph Property Value

Suppose you have a wrapper XML element that allows users to set a number of attributes on all sub-elements. This element should have an inline (on page 2655) or block (on page 2652) behavior, depending on the behavior of its child elements:

```
wrapper{
  display:-oxy-morph;
}
```

Placeholders for Empty Elements: -oxy-placeholder-content Property

Used to configure placeholders for empty elements.

Oxygen XML Editor Eclipse plugin displays the element name as pseudo-content for empty elements if the Show placeholders for empty elements option (on page 137) is selected in the Author preferences page and there is no before or after content set in the CSS for this type of element. There are two CSS properties that can be used to control the placeholders (-oxy-placeholder-content and -oxy-show-placeholder).

- oxy-placeholder-content CSS Property

To control the displayed pseudo-content for empty elements, you can use the -oxy-placeholder-content CSS property.

The following example would change the <keyword> element to be displayed as key:

```
keyword{
  -oxy-placeholder-content:"key";
}
```

Note:

This CSS property accepts the ${{i18n(key)}} (on page 225) localization editor variable, as in the following example:

```
- oxy-placeholder-content:"${i18n(id)}";
```

- oxy-show-placeholder CSS Property

The -oxy-show-placeholder property allows you to decide whether or not the placeholder will be shown. The possible values are:

- **always** - Always display placeholders.
- **default** - Always display placeholders if before or after content is not set in the CSS.
- **inherit** - The placeholders are displayed according to the Show placeholders for empty elements option (on page 137) (if before and after content is not declared).
- **no** - Never display placeholders.
Note:
Deprecated properties show-placeholder and placeholder-content are also supported.

Related information
Using Placeholders in Document Templates (on page 254)

Style Elements: -oxy-style Property
Used to configure the style of particular elements.

Oxygen XML Editor Eclipse plugin allows you to specify the style for an XML element. This is helpful if you want to embed CSS styling to XML elements directly in the XML file you are editing without having to edit the CSS files that are normally attached to the XML files. The property should have an XPath function for the value.

Example: -oxy-style Property

The following code snippet should be added in the CSS file that renders the files for your framework customization:

```css
*: 
- oxy-style: attr(style);
```

Suppose you want to display the `<title>` elements in your XML document in the color red. You could add the following snippet directly in the XML document:

```xml
<title style="color:red;">My Memoirs</title>
```

Tip:
The `@style` attribute is supported by default in HTML5 documents.

Tags Color: -oxy-tags-color Property
Used to configure the background or foreground colors of tags.

By default, Oxygen XML Editor Eclipse plugin does not display element tags. You can use the Partial Tags button from the Author toolbar to control the amount of displayed markup (on page 370).

To configure the default background and foreground colors of the tags, open the Preferences dialog box (on page 70), go to Editor > Edit modes > Author, and set the desired colors in the Tags background color (on page 139) and Tags foreground color (on page 139) options.

If you want to be more specific and configure the colors using a CSS, the -oxy-tags-background-color and -oxy-tags-color properties allow you to control the background and foreground colors for any particular XML element.
Example:

```xml
para {
    -oxy-tags-color:white;
    -oxy-tags-background-color:green;
}
title {
    -oxy-tags-color:yellow;
    -oxy-tags-background-color:black;
}
```

Custom CSS Functions

Oxygen XML Editor Eclipse plugin provides a wide range of custom CSS extension functions that can be used to customize the visual Author editing mode.

Arithmetic Functions

Arithmetic Functions that are supported.

You can use any of the arithmetic functions implemented in the `java.lang.Math` class ([http://download.oracle.com/javase/6/docs/api/java/lang/Math.html](http://download.oracle.com/javase/6/docs/api/java/lang/Math.html)).

In addition, the following functions are available:

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>oxy_add (param1, ..., paramN, 'returnType')</code></td>
<td>Adds the values of all parameters from <code>param1</code> to <code>paramN</code>.</td>
</tr>
<tr>
<td><code>oxy_subtract (param1, param2, ..., paramN, 'returnType')</code></td>
<td>Subtracts the values of parameters <code>param2</code> to <code>paramN</code> from <code>param1</code>.</td>
</tr>
<tr>
<td><code>oxy_multiply (param1, ..., paramN, 'returnType')</code></td>
<td>Multiplies the values of parameters from <code>param1</code> to <code>paramN</code>.</td>
</tr>
<tr>
<td><code>oxy_divide (param1, param2, 'returnType')</code></td>
<td>Performs the division of <code>param1</code> to <code>param2</code>.</td>
</tr>
<tr>
<td><code>oxy_modulo (param1, param2, 'returnType')</code></td>
<td>Returns the reminder of the division of <code>param1</code> to <code>param2</code>.</td>
</tr>
</tbody>
</table>

Note:
The `returnType` can be `integer`, `number`, or any of the supported CSS measuring types.

Example: `oxy_multiply` Function

If you have an image with `width` and `height` specified on it, this will compute the number of pixels on it:
Actions: oxy_action() Function

This function allows you to define actions directly in the CSS, rather than referencing them from the associated framework.

The oxy_action() function is frequently used from the oxy_button() function (on page 2167) that provides a graphical button for invoking a custom action. The action is normally defined in the associated Document Type (framework configuration) but the oxy_action() function allows you to define it directly in the CSS instead of the framework configuration.

The arguments received by the oxy_action() function are a list of properties that define an action. The following properties are supported:

- **name** - The name of the action. It will be displayed as the label for the button or menu item.
- **description** (optional) - A short description with details about the result of the action.
- **icon** (optional) - A path relative to the CSS pointing to an image (the icon for the action). The path can point to resources that are packed in Oxygen XML Editor Eclipse plugin (oxygen.jar) by starting its value with / (for example, /images/Remove16.png). It can also be expressed using an editor variable (on page 218).
- **operation** - The name of the Java class implementing the ro.sync.ecss.extensions.api.AuthorOperation interface. There is also a variety of predefined operations (on page 1940) that can be used.

**Note:**
If the name of the operation specified in the CSS is not qualified (has no Java package name), then it is considered to be one of the built-in Oxygen XML Editor Eclipse plugin operations (on page 1940). If the class is not found in this package, then it will be loaded using the specified name.

- **arg-string** - All arguments with the arg- prefix are passed to the operation (the string that follows the arg- prefix is passed). The argument value supports editor variables (on page 218).
- **ID** - (optional) - The ID of the action from the framework. If this is specified, all others parameters are disregarded.

**Example: oxy_action function inside an oxy_button form control (on page 2167):**

```xml
oxy_button{
  action, oxy_action{
    name, 'Insert',
    description, 'Insert an element after the current one',
    icon, url('insert.png'),
    operation,
```
Example: oxy_action Function

You can also create a button form control directly from an oxy_action function:

```xml
oxy_action(
  name, 'Insert',
  description, 'Insert an element after the current one',
  operation, 'InsertFragmentOperation',
  arg-fragment, '<element>${caret}</element>',
  arg-insertLocation, '.',
  arg-insertPosition, 'After')
```

Tip:
A code template is available to make it easy to add the oxy_action function with the Content Completion Assistant (on page 2653) by pressing Ctrl + Space and select the oxy_action code template.

Related information
Button Form Control (on page 2167)

Action Lists: oxy_action_list() Function

This function allows you to define a sequential list of actions directly in the CSS, rather than referencing them from the associated framework.

The oxy_action_list() function is used from the oxy_buttonGroup() function (on page 2170) that provides a graphical group of buttons with multiple custom actions. These actions are normally defined in the associated Document Type (framework configuration) but the oxy_action_list() function allows you to define the actions directly in the CSS instead of the framework configuration.

The arguments received by the oxy_action_list() function are a list of actions (executed sequentially) that are defined with the oxy_action() function (on page 2143). The following properties are supported in the oxy_action() function:

- **name** - The name of the action. The name of the first defined action will be displayed as the label for the button or menu item.
- **description** (optional) - A short description with details about the result of the action. The description of the first defined action will be displayed in a tooltip.
• **icon** (optional) - A path relative to the CSS pointing to an image (the icon for the action). The path can point to resources that are packed in Oxygen XML Editor Eclipse plugin (.oxygen.jar) by starting its value with `/` (for example, `/images/Remove16.png`). It can also be expressed using an editor variable (on page 218).

• **operation** - The name of the Java class implementing the `ro.sync.ecss.extensions.api.AuthorOperation` interface. There is also a variety of predefined operations (on page 1940) that can be used.

Note:
If the name of the operation specified in the CSS is not qualified (has no Java package name), then it is considered to be one of the built-in Oxygen XML Editor Eclipse plugin operations (on page 1940). If the class is not found in this package, then it will be loaded using the specified name.

• **arg-<string>** - All arguments with the `arg-` prefix are passed to the operation (the string that follows the `arg-` prefix is passed). The argument value supports editor variables (on page 218).

• **ID** - (optional) - The ID of the action from the framework. If this is specified, all others parameters are disregarded.

**Example: oxy_action_list Function**

```css
p:after {
  content: oxy_buttonGroup(
    label, 'A group of actions',
    icon, url('http://www.oxygenxml.com/img/icn_oxy20.png'),
    actions,
    oxy_action_list{
      oxy_action{
        name, 'Insert a new paragraph',
        description, 'Insert an element after the current one',
        operation, 'InsertFragmentOperation',
        arg-fragment, '<p></p>',
        arg-insertLocation, '.',
        arg-insertPosition, 'After'
      },
      oxy_action{
        name, 'Delete',
        description, 'Deletes the current element',
        operation, 'DeleteElementOperation'
      }
    }
  }
}
```
Tip:
A code template is available to make it easy to add the `oxy_action_list` function with the *Content Completion Assistant (on page 2653)* by pressing `Ctrl + Space` and select the `.oxy_action_list` code template.

Related information
Actions: `oxy_action()` Function (on page 2143)
Button Group Form Control (on page 2170)

Attributes Concatenation: `oxy_attributes()` Function
This function concatenates the attributes for an element and returns the serialization.

Syntax:

```java
oxy_attributes();
```

Example: `oxy_attributes` Function

```java
element{
    content:oxy_attributes();
}
```

For instance, if you have the following XML fragment: `<element att1="x" xmlns:a="2" x=""/>`, the CSS function will display:

```
att1="x" xmlns:a="2" x=""
```

Base URL: `oxy_base-uri()` Function

This function evaluates the base URL in the context of the current node.

It does not have any arguments and takes into account the `xml:base` context of the current node. See the XML Base specification for more details.

Example: `oxy_base-uri` Function

Suppose you have some image references but you want to see other thumbnail images that reside in the same folder (in Author mode):

```java
image[href]{
    content:oxy_url(oxy_base-uri(), oxy_replace(attr(href),
        '.jpeg', 'Thumbnail.jpeg'));
}
```

Capitalization: `oxy_capitalize()` Function

This function capitalizes the first letter of the text received as argument.
Syntax:

```java
oxy_capitalize (text)
```

text

The text in which the first letter will be capitalized.

Example: `oxy_capitalize` Function

```css
*:before{
  content: oxy_capitalize(oxy_name()) "";
}
```

This would insert the capitalized qualified name as static text content before the element.

### Compound Actions: `oxy_compound_action()` Function

This function allows you to define multiple actions that will be executed sequentially.

The `oxy_compound_action()` function is used from the `oxy_button()` form control function (on page 2167) or the `oxy_buttonGroup()` form control function (on page 2170).

The arguments received by the `oxy_compound_action()` function are a list of actions (executed sequentially) that are defined with the `oxy_action()` function (on page 2143).

You can use three optional properties (name, description, icon) in the `oxy_compound_action()` function to provide labels for the compound action. If you do not specify these three properties, those same properties defined in the first `oxy_action` function will be used for the labels.

- **name** - The name of the action. It will be displayed as the label for the action. If you want to reuse the name of an action already defined in your framework, you can use the `oxy_getActionName` function.
- **description** - A short description with details about the result of the action. It will be displayed in a tooltip when hovering over the button linked to this action. If you want to reuse the description of an action already defined in your framework, you can use the `oxy_getActionDescription` function.
- **icon** - A path relative to the CSS pointing to an image (the icon for the action). The path can point to resources that are packed in Oxygen XML Editor Eclipse plugin (`oxygen.jar`) by starting its value with `/` (for example, `/images/Remove16.png`). It can also be expressed as an editor variable (on page 218). If you want to reuse the icon of an action already defined in your framework, you can use the `oxy_getActionIcon` function.

The `oxy_getActionName`, `oxy_getActionDescription`, and `oxy_getActionIcon` functions accept the following 2 parameters:
• **framework.defined.action.id** *(required)* - The ID of an action defined in the current framework that gets the name, description, or icon for that action.
• **fallback** *(optional)* - A fallback value in case the ID value provided in the `framework.defined.action.id` parameter is not found.

**Example: oxy_compound_action Function**

```xml
oxy_button(
    action,
    oxy_compound_action{
        name, oxy_getActionName('framework.id', 'Fallback'),
        description, 'Inserts a paragraph and uses form controls to edit its @audience attribute',
        icon, url('http://www.oxygenxml.com/img/icn_oxy20.png'),
        oxy_action(
            name, 'Insert',
            description, 'Insert an element after the current one',
            operation, 'ro.sync.ecss.extensions.commons.operations.InsertFragmentOperation',
            icon, url('insert.png'),
            arg-fragment, '<p audience=''></p>',
            arg-insertLocation, '.',
            arg-insertPosition, 'After'
        ),
        oxy_action(
            name, 'Activate edit mode',
            description, 'Sets a pseudo class that will activate a CSS rule that will present a
            text field form control for the @audience attribute',
            operation, 'SetPseudoClassOperation',
            arg-name, 'edit-mode-on',
            arg-elementLocation, '.'
        )
    ),
    showIcon, true
)
```

**Tip:**
A code template is available to make it easy to add the `oxy_compound_action` function with the **Content Completion Assistant** *(on page 2653)* by pressing Ctrl + Space and select the `oxy_action_list` code template.

**Related information**

Actions: `oxy_action()` Function *(on page 2143)*  
Button Form Control *(on page 2167)*
Concatenation: oxy_concat() Function

This function concatenates the received string arguments.

Syntax:

```
 oxy_concat (str_1, str_2)
```

str_1 ... str_n

The string arguments to be concatenated.

Example: oxy_concat Function

If an XML element has a `padding-left` attribute:

```
<p padding-left="20">...
```

and you want to add a padding before it with that specific amount specified in the attribute value:

```
*[padding-left]*{
  padding-left: oxy_concat(attr(padding-left), "px");
}
```

Get Text: oxy_getSomeText(text, length) Function

This function allows you to truncate a long string and to set a maximum number of displayed characters.

Syntax:

```
 oxy_getSomeText (text, length, endsWithPoints)
```

text

Displays the actual text.

length

Sets the maximum number of characters that are displayed.

endsWithPoints

Specifies if the truncated text ends with ellipsis.

Example: oxy_getSomeText Function

If an attribute value is very large, you can trim its content before it is displayed as static content:

```
*[longdesc]:before{
  content: oxy_getSomeText(attr(longdesc), 200);
}
```
Indexing: oxy_indexof() Function

This function is used to define searches.

The oxy_indexof() function has two signatures:

Syntax 1:

```
oxy_indexof(text, toFind)
```

Returns the index within text string of the first occurrence of the toFind substring.

- **text**
  Text to search in.

- **toFind**
  The searched substring.

Syntax 2:

```
oxy_indexof(text, toFind, fromOffset)
```

Returns the index within text string of the first occurrence of the toFind substring. The search starts from fromOffset index.

- **text**
  Text to search in.

- **toFind**
  The searched substring.

- **fromOffset**
  The index to start the search from.

Example: oxy_indexof Function

```
oxy_indexof('abcd', 'bc') returns 1.
oxy_indexof('abcdbc', 'bc', 2) returns 4.
```

If you only want to display part of an attribute value, for instance the part that comes before an Appendix string:

``` xml
image[longdesc] {
  content: oxy_substring(attr(longdesc), 0,
    oxy_indexof(attr(longdesc), "Appendix"));
}
```
Label: oxy_label() Function

This function can be used in conjunction with the CSS `content` property to change the style of generated text.

The arguments of the function are `property name - property value` pairs. The following properties are supported:

- **text** - This property specifies the built-in form control you are using.
- **width** - Specifies the width of the content area using relative (`em`, `ex`), absolute (`in`, `cm`, `mm`, `pt`, `pc`, `px`), and percentage (followed by the `%` character) length units. The `width` property takes precedence over the `columns` property (if the two are used together).
- **color** - Specifies the foreground color of the form control. If the value of the `color` property is `inherit`, the form control has the same color as the element that was used to insert it.
- **background-color** - Specifies the background color of the form control. If the value of the `background-color` property is `inherit`, the form control has the same color as the element that was used to insert it.
- **styles** - Specifies styles for the form control. The values of this property are a set of CSS properties:
  - `font-weight`, `font-size`, `font-style`, `font`
  - `text-align`, `text-decoration`
  - `width`
  - `color`, `background-color`
  - `link` - For more information about this property, see the `link` property section (on page 2138).

```xml
<element>
  <content: oxy_label(text, "Label Text", styles, "font-size:2em;color:red;link:attr(href);")>
</element>
```

Instead of using the values of the `styles` property individually, you can define them in a CSS file as in the following example:

```css
* {
  width: 40%;
  text-align: center;
}
```

Then refer that file with an `@import` directive, as follows:

```xml
<elem>
  <content: oxy_label(text, 'my_label', styles, "@import 'labels.css';")>
</elem>
```

**CAUTION:**

Extensive use of the `styles` property may lead to performance issues.
If the text from an `oxy_label()` function contains new lines, for example `oxy_label(text, 'LINE1\A LINE2', width, 100px)`, the text is split in two. Each of the two new lines has the specified width of 100 pixels.

**Note:**
The text is split after \A, which represents a new line character.

You can use the `oxy_label()` function together with a built-in form control (on page 2162) function to create a form control based layouts.

**Example: oxy_label Function**

An example of a use case is if you have multiple attributes on a single element and you want use form controls on separate lines and style them differently. Consider the following CSS rule:

```css
.person:before {
    content: "Name:*" oxy_textfield(edit, '@name', columns, 20)
            "\A Address:" oxy_textfield(edit, '@address', columns, 20)
}
```

Suppose you only want the Name label to be set to bold, while you want both labels aligned to look like a table (the first column with labels and the second with a text field). To achieve this, you can use the `oxy_label()` to style each label differently.

```css
.person:before {
    content: oxy_label(text, "Name:*", styles, "font-weight:bold;width:200px")
            oxy_textfield(edit, '@name', columns, 20) "\A *
            oxy_label(text, "Address:" , styles, "width:200px")
            oxy_textfield(edit, '@address', columns, 20)
}
```

**Tip:**
A code template is available to make it easy to add the `oxy_label` function with the Content Completion Assistant (on page 2653) by pressing Ctrl + Space and select the `oxy_label` code template.

**Last Occurrence: oxy_lastindexOf() Function**

This function is used to define last occurrence searches.

The `oxy_lastindexOf()` function has two signatures:

**Syntax 1:**

```javascript
oxy_lastindexOf(text, toFind)
```

Returns the index within `text` string of the rightmost occurrence of the `toFind` substring.
text

Text to search in.

toFind

The searched substring.

Syntax 2:

```
oxy_lastindexof (text, toFind, fromOffset)
```

The search starts from `fromOffset` index. Returns the index within `text` string of the last occurrence of the `toFind` substring, searching backwards starting from the `fromOffset` index.

text

Text to search in.

toFind

The searched substring.

fromOffset

The index to start the search backwards from.

Example: `oxy_lastindexof` Function

```
oxy_lastindexof('abcdbc', 'bc') returns 4.
oxy_lastindexof('abcdbccdbc', 'bc', 2) returns 1.
```

If you only want to display part of an attribute value, for instance the part that comes before an Appendix string:

```xml
image[longdesc] {
  content: oxy_substring(attr(longdesc), 0,
    oxy_lastindexof(attr(longdesc), "Appendix"));
}
```

Link Text: `oxy_link-text()` Function

You can use this function on the CSS `content` property to obtain a text description from the source of a reference.

By default, the `oxy_link-text()` function resolves DITA and DocBook references. For further details about how you can also extend this functionality to other frameworks (on page 2655), go to Configuring an Extensions Bundle (on page 2020).

DITA Support

For DITA, the `oxy_link-text()` function resolves the `<xref>` element and the elements that have a `@keyref` attribute. The text description is the same as the one presented in the final output for those elements. If you
use this function for a `<topicref>` element that has the `@navtitle` and `@locktitle` attributes set, the function returns the value of the `@navtitle` attribute.

**DocBook Support**

For DocBook, the `oxy_link-text()` function resolves the `<xref>` element that defines a link in the same document. The text description is the same as the one presented in the final output for those elements.

**Example: `oxy_link-text` Function**

For the following XML and associated CSS fragments the `oxy_link-text()` function is resolved to the value of the `@xreflabel` attribute.

```xml
<para><code id="para.id" xreflabel="The reference label">my code</code></para>
<para><xref linkend="para.id"/></para>
xref {
    content: oxy_link-text();
}
```

If the text from the target cannot be extracted (for instance, if the `@href` is not valid), you can use an optional argument to display fallback text.

```css
/*[class="map/topicref"]:before{
    content: oxy_link-text("Cannot find the topic reference");
    link: attr(href);
}
```

**Local Name: `oxy_local-name()` Function**

This function evaluates the local name of the current node.

It does not have any arguments.

**Example: `oxy_local-name` Function**

To insert the local name as static text content before the element, use this CSS selector:

```css
*::before{
    content: oxy_local-name() ": ";
}
```

**Lowercase: `oxy_lowercase()` Function**

This function transforms the text received as argument to lower case.

**Syntax:**

```xml
oxy_lowercase( text )
```
text

The text to be lower cased.

**Example: oxy_lowercase Function**

To insert a lower-cased qualified name as static text content before the element, use this CSS selector:

```
*:before{
    content: oxy_lowercase(oxy_name()) " : ";
}
```

**Name: oxy_name() Function**

This function evaluates the qualified name of the current node.

It does not have any arguments.

**Example: oxy_name Function**

To insert a qualified name as static text content before the element, use this CSS selector:

```
*:before{
    content: oxy_name() " : ";
}
```

**Parent URL: oxy_parent-url() Function**

This function evaluates the parent URL of a URL received as string.

**Syntax:**

```
oxy_parent-url ( URL )
```

**URL**

The URL as string.

**Replace: oxy_replace() Function**

This function is used to replace a string of text.

The `oxy_replace()` function has two signatures:

**Syntax 1:**

```
oxy_replace ( text , target , replacement )
```

This function replaces each substring of the text that matches the literal target string with the specified literal replacement string.
The text in which the replace will occur.

The target string to be replaced.

The string replacement.

**Example:** Suppose that you have image references but you want to see other thumbnail images that reside in the same folder in the visual Author editing mode:

```html
image[href]{
    content: oxy_url(oxy_base-uri(), oxy_replace(attr(href), 
    '.jpeg', 'Thumbnail.jpeg'));
}
```

**Syntax 2:**

```javascript
oxy_replace(text, target, replacement, isRegExp)
```

This function replaces each substring of the text that matches the target string with the specified replacement string.

The text in which the replace will occur.

The target string to be replaced.

The string replacement.

If true the target and replacement arguments are considered regular expressions, if false they are considered literal strings.

**Example:** Suppose that you want to use a regular expression to replace all space sequences with an underscore:

```html
image[title]{
    content: oxy_replace(attr(title), '\s+', '_', true)
}
```

**Substring of Text: oxy_substring() Function**

This function is used to return a string of text.
The `oxy_substring()` function has two signatures:

**Syntax 1:**

```xml
oxy_substring(text, startOffset)
```

Returns a new string that is a substring of the original `text` string. It begins with the character at the specified index and extends to the end of `text` string.

- `text`
  - The original string.
- `startOffset`
  - The beginning index, inclusive

**Syntax 2:**

```xml
substring(text, startOffset, endOffset)
```

Returns a new string that is a substring of the original `text` string. The substring begins at the specified `startOffset` and extends to the character at index `endOffset` - 1.

- `text`
  - The original string.
- `startOffset`
  - The beginning index, inclusive.
- `endOffset`
  - The ending index, exclusive.

**Example: oxy_substring Function**

- `oxy_substring('abcd', 1)` returns the string 'bcd'.
- `oxy_substring('abcd', 4)` returns an empty string.
- `oxy_substring('abcd', 1, 3)` returns the string 'bc'.

If you only want to display part of an attribute value, for instance the part that comes before an `Appendix` string:

```xml
image[longdesc]{
    content: oxy_substring(attr(longdesc), 0,
        oxy_indexof(attr(longdesc), "Appendix"));
}
```
Unescape URL Value: oxy_unescapeURLValue(string) Function
This function returns the unescaped value of a URL-like string given as a parameter.

For example, if the value contains %20 it will be converted to a simple space character.

Example: oxy_unescapeURLValue Function

```
oxy_unescapeURLValue("http://www.example.com/a%20simple%20example.html") returns the following value:
http://www.example.com/a simple example.html
```

Unparsed Entity URI: oxy_unparsed-entity-uri() Function
This function returns the URI value of an unparsed entity name.

Syntax:

```
 oxy_unparsed-entity-uri ( unparsedEntityName )
```

unparsedEntityName
The name of an unparsed entity defined in the DTD.

This function can be useful to display images that are referenced with unparsed entity names.

Example: oxy_unparsed-entity-uri Function

CSS for displaying the image in Author for an imagedata with entityref to an unparsed entity:

```
imagedata[entityref]{
  content: oxy_url(oxy_unparsed-entity-uri(attr(entityref)));
}
```

Uppercase: oxy_uppercase() Function
This function transforms the text received as argument to upper case.

Syntax:

```
 oxy_uppercase ( text )
```

text
The text to be capitalized.

Example: oxy_uppercase Function

To insert the upper-cased qualified name as static text content before the element, use this CSS selector:
**URL: oxy_url() Function**

This function extends the standard CSS `url()` function by allowing you to specify additional relative path components (parameters `loc_1` to `loc_n`).

Oxygen XML Editor Eclipse plugin uses all these parameters to construct an absolute location. Note that any of the parameters that are passed to the function can be either relative or absolute locations. These locations can be expressed as String objects, functions, or editor variables (on page 218) (built-in or custom).

**Syntax:**

``` oxy_url(base_location, loc_1, loc_2) ```

**base_location**

String representing the base location. If not absolute, will be solved relative to the CSS file URL.

**loc_1 ... loc_n (optional)**

Strings representing relative location path components.

**Examples: oxy_url Function**

The following function receives String objects as input parameters:

and returns:

`'http://www.oxygenxml.com/dir1/dir4/dir5/test.xml'`

The following function receives the result of the evaluation of two other functions as parameters (for instance, this is useful if you have image references and you want to see thumbnail images stored in the same folder):

``` image[href]{
    content:oxy_url(oxy_base-uri(), oxy_replace(attr(href), 
        '.jpeg', 'Thumbnail.jpeg'));
}
```  

The following function uses an editor variable (on page 218) as the first parameter to point to the Oxygen XML Editor Eclipse plugin installation location:
XPath: oxy_xpath() Function

This function is used to evaluate XPath expressions.

Syntax:

```
oxy_xpath (XPathExpression [, processChangeMarkers, value ] [, evaluate, value ])
```

It evaluates the given XPath 3.1 expression using the latest Saxon XSLT processor bundled with the application and returns the result. XPath expressions that depend on the cursor location can be successfully evaluated only when the cursor is located in the actual XML content.

The parameters of the function are as follows:

- A required `expression` parameter, which is the XPath expression to be evaluated.
- An optional `processChangeMarkers` parameter, followed by its value, which can be either `true` or `false` (default value). When you set the parameter to `true`, the function returns the resulting text with all the change markers accepted (delete changes are removed and insert changes are preserved).
- An optional `evaluate` parameter, followed by its value, which can be one of the following:
  - `dynamic` - Evaluates the XPath each time there is a change in the document. This is the default evaluation value.
  - `dynamic-once` - Separately evaluates the XPath for each node that matches the CSS selector. It will not re-evaluate the expression when changes are made to other nodes in the document. This will lead to improved performance, but the displayed content may not be updated to reflect the actual document content.
  - `static` - If the same XPath is evaluated on several nodes, the result for the first evaluation will be used for all other matches. Use this only if the XPath does not contain a relationship with the node on which the CSS property is evaluated. This will lead to improved performance, but the static displayed content may not be updated to reflect the actual document content.

**Important:**

If the edited XML document is large, using dynamic XPath evaluation may induce performance issues while editing the content.
When XPath expressions are evaluated, the entities and `<xi:include>` elements are replaced with the actual content that is referenced. For example, consider the following code snippet:

```xml
<article>
  <xi:include href="section1.xml" xmlns:xi="http://www.w3.org/2001/XInclude"/>
</article>
```

where `section1.xml` contains the following content:

```xml
<section>
  <p>Referenced content</p>
</section>
```

The XPath expression will be executed over the actual content in the `section1.xml` file.

**Example: oxy_xpath Function**

The following example counts the number of words from a paragraph (including tracked changes (on page 2659)) and displays the result in front of it:

```xml
para:before{
  content:
  concat("|Number of words: ",
       oxy_xpath(
           "count(tokenize(normalize-space(string-join(text(), ' ')), ' '))",
           processChangeMarkers,
           true),
           " | ");
}
```

The `oxy_xpath()` function supports **editor variables (on page 218)**, as in the following example:

```xml
* {
  content:
  oxy_concat("Result: ",
       oxy_xpath('count(collection("${cfdu}/?select=*.xml"))'))
};
```

You can split the XPath expression on multiple lines by adding a backslash before each new line:

```xml
* {
  content: oxy_xpath('count(\
          collection(\n            "${cfdu}/?select=*.xml"))')
}
Form Controls

Oxygen XML Editor Eclipse plugin provides a variety of built-in form controls that allow users to interact with documents with familiar user interface objects. These form controls are defined in CSS stylesheets that are used to render Author mode. For customization purposes, Oxygen XML Editor Eclipse plugin also supports custom form controls in Java (on page 2193).

How to Add a Built-in Form Control in Author Mode

Form controls can be added by defining them in the CSS associated with the XML document.

1. Create a custom CSS file.
2. Define the form control in the CSS using its dedicated CSS function. For example, to add a date picker form control (on page 2178), its dedicated function is oxy_datePicker.
3. Associate the CSS file with the XML document in one of the following ways:
   ◦ If you have a framework (document type) already created for this XML vocabulary, create a CSS in the framework directory and associate the CSS with the framework (on page 1933). This approach is recommended if you intend on sharing the customization with others.
   ◦ If you do not have a framework, you can associate the CSS to the XML document through a Processing Instruction (on page 2095).

Resources

For more information about form controls, watch our video demonstration:

https://www.youtube.com/embed/-WY3wzkMSLM

Audio File Player Form Control

The oxy_audio built-in form control is used for providing a mechanism to play audio clips.

The oxy_audio form control supports the following properties:

- **href** - The absolute or relative location of a resource. This property is mandatory. Relative values are resolved relative to the CSS. If you have media resources relative to the XML document, you can specify their paths like this:

  ```
  oxy_audio(href, oxy_url(oxy_base-uri(), 'ex.mp3')), width, 400px
  ```

- **width** - Specifies the width of the content area using relative (em, ex), absolute (in, cm, mm, pt, pc, px), and percentage (followed by the % character) length units.

Example: oxy_audio Form Control

```json
object {
    content:
        oxy_audio({
            href, 'resources/audio.mp3',
        })
```
Tip:
To insert a sample of the oxy_audio form control in a CSS file, invoke the Content Completion Assistant (on page 2653) by pressing Ctrl + Space and select the oxy_audio Code template.

To see more detailed examples and more information about how form controls work in Oxygen XML Editor Eclipse plugin, see the sample files in the following directory:

[OXYGEN_INSTALL_DIR]/samples/form-controls.

Custom CSS Functions (on page 2142)
URL: oxy_url() Function (on page 2159)

Browser Form Control

The oxy_browser built-in form control is used for providing a mechanism to integrate HTML frames or interact with SVG documents directly in the Author mode editor. It can also be used to load HTML that executes JavaScript and from that JavaScript you can access the Oxygen XML Editor Eclipse plugin workspace.

The oxy_browser form control supports the following properties:

- **href** - The absolute or relative location of a resource. This property is mandatory. Relative values are resolved relative to the CSS. If you have media resources relative to the XML document, you can specify their paths like this:

  oxy_browser(href, oxy_url(oxy_base-uri(), 'ex.svg'), width, 50%, height, 50%)

- **width** - Specifies the width of the content area using relative (em, ex), absolute (in, cm, mm, pt, pc, px), and percentage (followed by the % character) length units.

- **height** - Specifies the height of the form control area using relative (em, ex), absolute (in, cm, mm, pt, pc, px), and percentage (followed by the % character) length units.

**Example: oxy_browser Form Control**

```java
object {
    content:
    oxy_browser{
        href, 'http://example.page',
```
Interacting with the Oxygen XML Editor Eclipse plugin Workspace

The oxy_browser form control also provides the possibility of creating custom form control without having to use the Java-based API. You can use the oxy_browser form control to load HTML that executes JavaScript. In the JavaScript, you can use some predefined global variables that provide a gateway between the JavaScript and the Oxygen XML Editor Eclipse plugin Java API. This allows you to perform changes in the document, open resources, and more, solely from the JavaScript.

Important:
This will only work if the loaded HTML is located inside a framework or plugin directory (on page 90), such as: [OXYGEN_INSTALL_DIR]/frameworks/ or [OXYGEN_INSTALL_DIR]/plugins/.

The following global variables can be used:

- authorAccess - This object is an instance of ro.sync.ecss.extensions.api.AuthorAccess.
- contextElement - An instance of ro.sync.ecss.extensions.api.node.AuthorNode. The form control is added over this node.
- fcArguments - A java.util.Map implementation with the properties (name and value pairs) passed on the form control function.
- apiHelper - A helper object for creating Java objects. It allows you to create Java objects from within the JavaScript code. These objects can then be passed to the Java methods as in the following example:

```javascript
var newAttrValue = apiHelper.newInstance(
    "ro.sync.ecss.extensions.api.node.AttrValue",
    ["normalizedValue", "rawValue", true]);
authorAccess.getDocumentController().setAttribute(
    "counter", newAttrValue, contextElement);
...
```
You can also specify the constructor signature:

```javascript
var newAttrValue = apiHelper.newInstance(
    "ro.sync.ecss.extensions.api.node.AttrValue
    (java.lang.String, java.lang.String, boolean)",
    ["normalizedValue", "rawValue", true]);
authorAccess.getDocumentController().setAttribute(
    "counter", newAttrValue, contextElement);
```

For more information, open the `form-controls.xml` file in the `[OXYGEN_INSTALL_DIR]/samples/form-controls` directory and go to section 11.1 - Interacting with the Oxygen Workspace.

⚠️ Warning:

On macOS, you need to use asynchronous calls to the API, due to the following JDK bug: [https://bugs.openjdk.java.net/browse/JDK-8087465](https://bugs.openjdk.java.net/browse/JDK-8087465). By default, the API is called synchronously, but you can change this behavior for each API object by calling two methods: `sync()` and `async()`.

```javascript
// By default, the methods are invoke synchronously.
var ctrl = authorAccess.getDocumentController();
try {
    // On Mac, methods that change the document must be executed asynchronously.
    ctrl.async();
    ctrl.setAttribute("counter", newAttrValue, contextElement);
} finally {
    ctrl.sync();
}
```

Listening for Changes in the Document

If the form control presents some information from the document (for example, the value of an attribute), then it needs to be notified on changes in the document so that it can update that information. To do this, follow these steps:

1. In the JavaScript, the `bridgeReady()` method is invoked as soon as the form control is loaded and the API bridge is installed. This is where you can add a listener:

```javascript
function bridgeReady () {
    // We declare a member function for each method of the
    // ro.sync.ecss.extensions.api.AuthorListener interface (same function signature)
    var handler = {
        attributeChanged : function(event) {
            var node = event.getOwnerAuthorNode();
            var attrName = event.getAttributeName();
        }
    }
```

if (node.equals(contextElement) && attrName === "counter") {
  init();
}

var ctrl = authorAccess.getDocumentController();

// Add the proxy listener.
ctrl.addAuthorListener(authorDocumentListener);

2. Since a listener was added on the document, it is important to remove it once the form control is not used anymore. When a form control is discarded, the dispose() JavaScript function is invoked, so if you have any cleanup to do, make sure you define a function with this name and remove any previously created listeners in it.

/**
 * The form control will not be used anymore. Clean up.
 */
function dispose() {
  // Dispose all added listeners.
  var ctrl = authorAccess.getDocumentController();
  ctrl.removeAuthorListener(authorDocumentListener);
}

---

**Debugging JavaScript Used for Custom Form Controls**

If you encounter unexpected results when using the method described above (on page 2164), you can debug the script by using the following guidelines:

- Calls to `alert("message.to.present")` or `console.log("message.to.present")` will be presented in the Results panel (on page 334).
- You can install the Firebug extension by executing the following script:
```javascript
function installFB() {
    if (!document.getElementById('FirebugLite')) {
        var E = document.createElementNS && document.documentElement.namespaceURI;
        if (E) E = document.createElementNS(E, 'script');
        E.setAttribute('id', 'FirebugLite');
        E.setAttribute('src', 'https://getfirebug.com/' + 'firebug-lite.js' + '#startOpened');
        E.setAttribute('FirebugLite', '4');
        (document.getElementsByTagName('head')[0] || document.getElementsByTagName('body')[0]).appendChild(E);
        E = new Image;
        E.setAttribute('src', 'https://getfirebug.com/' + '#startOpened');
    }
}
```

**Note:** To force the **Browser Form Control** to reload after making changes to the JavaScript file, you need to use the **Reload page** action from the form control's contextual menu.

**Button Form Control**

The **oxy_button** built-in form control is used for graphical user interface objects that invoke a custom **Author** mode action (defined in the associated Document Type) referencing it by its ID, or directly in the CSS.

The **oxy_button** form control supports the following properties:
• **fontInherit** - This value specifies whether or not the form control inherits its font from its parent element. The values of this property can be `true` or `false` (default value). To make the form control inherit its font from its parent element, set the `fontInherit` property to `true`.

• **color** - Specifies the foreground color of the form control. If the value of the `color` property is `inherit`, the form control has the same color as the element that was used to insert it.

• **visible** - Specifies whether or not the form control is visible. The possible values of this property are `true` (default value) and `false`.

• **transparent** - Flattens the aspect of the button form control, removing its border and background. The values of this property can be `true` or `false` (default value).

• **showText** - Specifies if the action text should be displayed on the button form control. If this property is missing then the button displays the icon only if it is available, or the text if the icon is not available. The values of this property can be `true` or `false`.

```xml
element {
  content: oxy_button(actionID, 'remove.attribute', showText, true);
}
```

• **showIcon** - Specifies if the action icon should be displayed on the button form control. If this property is missing then the button displays the icon only if it is available, or the text if the icon is not available. The values of this property can be `true` or `false`.

```xml
element {
  content: oxy_button(actionID, 'remove.attribute', showIcon, true);
}
```

• **enableInReadOnlyContext** - To enable button form controls (on page 2167) or groups of buttons form controls (on page 2170), this property needs to be set to `true`. This property can be used to specify areas as read-only (by setting the `-oxy-editable` property to `false`). This is useful when you want to use an action that does not modify the context.

• **hoverPseudoclassName** - Allows you to change the way an element is rendered when you hover over a form control. The value is the name of a CSS pseudo-class. When you hover over the form control, the specified pseudo-class will be set on the element that contains the form control.

```xml
p:before {
  content: oxy_button(hoverPseudoclassName, 'showBorder')
}
p:showBorder {
  border: 1px solid red;
}
```

• **actionContext** - Specifies the context that the action associated with the form control is executed. Its possible values are `element` (default value) and `caret`. If you select the `element` value, the context is the element that holds the form control. If you select the `caret` value, the action is invoked at the cursor location. If the cursor is not inside the element that holds the form control, the `element` value is selected automatically.
• **actionID** - The ID of the action, specified in the *document type association (on page 98)*, that is invoked when you click the button.

**Note:**
> The element that contains the form control represents the context where the action is invoked.

• **action** - Defines an action directly, rather than using the **actionID** parameter to reference an action from the *document type association (on page 98)*. This property is defined using the *oxy_action function (on page 2143)*.

**Tip:**
> You can also create a button form control directly from an *oxy_action function (on page 2144)*.

```xml
oxy_button(action, oxy_action{
    name, 'Insert',
    description, 'Insert an element after the current one',
    icon, url('insert.png'),
    operation, 'InsertFragmentOperation',
    arg-fragment, '<element>${caret}</element>',
    arg-insertLocation, '.',
    arg-insertPosition, 'After'
})
```

**Tip:**
> To execute multiple actions sequentially, you can use the *oxy_compound_action function (on page 2147)*.

**Example: oxy_button Form Control**

```css
button:before {
    content: "Label:
    oxy_button{
        /* This action is declared in the document type
        associated with the XML document. */
        actionID, "insert.popupWithMultipleSelection";
    }
```

**Tip:**
> To insert a sample of the oxy_button form control in a CSS file, invoke the *Content Completion Assistant (on page 2653)* by pressing Ctrl + Space and select the *oxy_button code template*. Also, an *oxy_button_in_place_action code template* is available that inserts an *oxy_button function that includes an action parameter*. 
To see more detailed examples and more information about how form controls work in Oxygen XML Editor Eclipse plugin, see the sample files in the following directory:

`{OXYGEN_INSTALL_DIR}/samples/form-controls`.

- Custom CSS Functions (on page 2142)
- Actions:oxy_action() Function (on page 2143)

**Button Group Form Control**

The `oxy_buttonGroup` built-in form control is used for a graphical user interface group of buttons that invokes one of several custom Author mode actions (defined in the associated Document Type) referencing it by its ID, or directly in the CSS.

The `oxy_buttonGroup` form control supports the following properties:

- **label** - Specifies the label to be displayed on the button. This label can be translated using the `{$i18n()}` editor variable (on page 225).
- **icon** - The path to the icon to be displayed on the button.
- **visible** - Specifies whether or not the form control is visible. The possible values of this property are `true` (default value) and `false`.
- **tooltip** - Specifies a tooltip to be displayed when you hover over the form control.
- **transparent** - Makes the button transparent without any borders or background colors. The values of this property can be `true` or `false`.
- **fontInherit** - This value specifies whether or not the form control inherits its font from its parent element. The values of this property can be `true` or `false` (default value). To make the form control inherit its font from its parent element, set the `fontInherit` property to `true`.
- **enableInReadOnlyContext** - To enable button form controls (on page 2167) or groups of buttons form controls (on page 2170), this property needs to be set to `true`. This property can be used to specify areas as `read-only` (by setting the `oxy-editable` property to `false`). This is useful when you want to use an action that does not modify the context.
- **hoverPseudoclassName** - Allows you to change the way an element is rendered when you hover over a form control. The value is the name of a CSS pseudo-class. When you hover over the form control, the specified pseudo-class will be set on the element that contains the form control.

```css
p:before {
  content: oxy_buttonGroup(hoverPseudoclassName, 'showBorder')
}
```
• **actionIDs** - The IDs of the actions that will be presented in the group of buttons.

• **actionID** - The ID of the action, specified in the document type association (on page 98), that is invoked when you click the button.

---

**Note:**
The element that contains the form control represents the context where the action is invoked.

---

• **actions** - Defines a sequential list of actions directly, rather than using the actionID parameter to reference actions from the document type association (on page 98). This property is defined using the oxy_action_list function (on page 2144).

```xml
oxy_buttonGroup(
  label, 'A group of actions',
  icon, url('http://www.oxygenxml.com/img/icn_oxy20.png'),
  actions,
  oxy_action_list(
    oxy_action(
      name, 'Insert',
      description, 'Insert an element after the current one',
      operation, 'InsertFragmentOperation',
      arg-fragment, '<element></element>',
      arg-insertLocation, '.',
      arg-insertPosition, 'After'
    ),
    oxy_action(
      name, 'Delete',
      description, 'Deletes the current element',
      operation, 'DeleteElementOperation'
    )
  )
)
```

---

**Tip:**
To execute multiple actions sequentially, you can use the oxy_compound_action function (on page 2147) in the oxy_action_list function (on page 2144).

```xml
p:before {
  content:
    oxy_buttonGroup(
      label, 'A group of actions',
    )
}```
icon, url('http://www.oxygenxml.com/img/icnoxy20.png'),
actions,

oxy_action_list{
  oxy_compound_action{
    name, oxy_getActionName('framework.id', 'Fallback'),
    description, 'Inserts a paragraph and uses form controls to edit its @audience attribute',
    icon, url('http://www.oxygenxml.com/img/icnoxy20.png'),
    oxy_action{
      name, 'Insert',
      description, 'Insert an element after the current one',
      operation, 'ro.sync.ecss.extensions.commons.operations.InsertFragmentOperation',
      icon, url('insert.png'),
      arg_fragment, "<p audience=''></p>",
      arg_insertLocation, '.',
      arg_insertPosition, 'After'
    },
    oxy_action{
      name, 'Activate edit mode',
      description, 'Sets a pseudo class that will activate a CSS rule that will present a text field form control for the @audience attribute',
      operation, 'SetPseudoClassOperation',
      arg_name, 'edit-mode-on',
      arg_elementLocation, '.'
    }
  },
  oxy_action{
    name, 'Delete',
    description, 'Deletes the current element',
    operation, 'DeleteElementOperation'
  }
}

• **actionContext** - Specifies the context that the action associated with the form control is executed. Its possible values are element (default value) and caret. If you select the element value, the context is the element that holds the form control. If you select the caret value, the action is invoked at the cursor.
location. If the cursor is not inside the element that holds the form control, the element value is selected automatically.

- **actionStyle** - Specifies what to display for an action in the form control. The values of this property can be `text` (default value), `icon`, or `both`.

**Example: oxy_buttonGroup Form Control**

```css
buttonGroup:before {
  content:
  oxy_label(text, "Button Group:", width, 150px, text-align, left)
  oxy_buttonGroup(
    label, 'A group of actions',
    /* The action IDs are declared in the document type associated with the XML document. */
    actionIDs,
    "insert.popupWithMultipleSelection,insert.popupWithSingleSelection",
    actionStyle, "both" );
}
```

**Tip:**
To insert a sample of the `oxy_buttonGroup` form control in a CSS file, invoke the **Content Completion Assistant (on page 2653)** by pressing Ctrl + Space and select the `oxy_buttonGroup` code template. Also, an `oxy_buttonGroup_in_place_action` code template is available that inserts an `oxy_buttonGroup` function that includes an `oxy_action_list` function.

To see more detailed examples and more information about how form controls work in Oxygen XML Editor Eclipse plugin, see the sample files in the following directory: `{OXYGEN_INSTALL_DIR}/samples/form-controls`.

https://www.youtube.com/embed/-WY3wzkMSLM

**Related information**

- Custom CSS Functions (on page 2142)
- Actions: `oxy_action()` Function (on page 2143)
- Action Lists: `oxy_action_list()` Function (on page 2144)
- Compound Actions: `oxy_compound_action()` Function (on page 2147)
- Label: `oxy_label()` Function (on page 2151)
The **oxy_checkbox** built-in form control is used for a graphical user interface box that you can click to enable or disable an option. A single checkbox or multiple checkboxes can be used to present and edit the value on an attribute or element.

The **oxy_checkbox** form control supports the following properties:

- **edit** - Lets you edit the value of an attribute, the text content of an element, or Processing Instructions (PI). This property can have the following values:
  - @attribute_name - The name of the attribute whose value is being edited. If the attribute is in a namespace, the value of the property must be a **QName** (on page 2657) and the CSS must have a namespace declaration for the prefix.
  - #text - Specifies that the presented/edited value is the simple text value of an element.

  **Note:** You can set the value of the **visibility** property to **-oxy-collapse-text** (on page 2133) to render the text only in the form control that the **oxy_editor** function specifies.

- **resultSeparator** - If multiple check-boxes are used, the separator is used to compose the final result. If not specified, the **space** character is used.
- **tooltips** - Associates tooltips to each value in the **values** property. The value of this property is a list of tooltip messages separated by commas. If you want the tooltip to display a comma, use the **${comma}** variable (on page 224).
- **visible** - Specifies whether or not the form control is visible. The possible values of this property are **true** (default value) and **false**.
- **values** - Specifies the values that are committed when the check-boxes are selected. If these values are not specified in the CSS, they are collected from the associated XML Schema.

  **Note:** Typically, when you use a comma in the values of a form control, the content that follows a comma is considered a new value. If you want to include a comma in the values, precede the comma with two backslashes. For example, **(values, '1\, 2\, 3, 4, edit, false)** will display a form control that has **1, 2, 3** for the first value and **4** for the second value.

- **fontInherit** - This value specifies whether or not the form control inherits its font from its parent element. The values of this property can be **true** or **false** (default value). To make the form control inherit its font from its parent element, set the **fontInherit** property to **true**.
- **uncheckedValues** - Specifies the values that are committed when check-boxes are not selected.
- **labels** - This property must have the same number of items as the **values** property. Each item provides a literal description of the items listed in the **values** property. These labels can be translated using the **$\{i18n\}** editor variable (on page 225). If this property is not specified, the **values** property is used as the label.
- **columns** - Controls the layout of the form control. The check boxes will be grouped in a number of columns equal to the given value.
- **hoverPseudoclassName** - Allows you to change the way an element is rendered when you hover over a form control. The value is the name of a CSS pseudo-class. When you hover over the form control, the specified pseudo-class will be set on the element that contains the form control.

```css
p:before {
    content: oxy_checkbox(hoverPseudoclassName, 'showBorder')
}
p:showBorder {
    border: 1px solid red;
}
```

**Example: Single oxy checkbox Form Control**

```css
checkBox[attribute]:before {
    content: "A check box editor that edits a two valued attribute (On/Off)
    The values are specified in the CSS:"
    oxy_checkbox{
        edit, "@attribute",
        values, "On",
        uncheckedValues, "Off",
        labels, "On/Off";
    }
}
```

**Example: Multiple oxy checkbox Form Controls**

```css
multipleCheckBox[attribute]:before {
    content: "Multiple checkboxes editor that edits an attribute value.
    Depending whether the check-box is selected,
    a different value is committed:"
    oxy_checkbox{
        edit, "@attribute",
        values, "true, yes, on",
        uncheckedValues, "false, no, off",
        resultSeparator, ",",
        labels, "Present, Working, Started";
    }
}
```

**Tip:**
To insert a sample of the oxy_checkbox form control in a CSS file, invoke the Content Completion Assistant (on page 2653) by pressing **Ctrl + Space** and select the oxy_checkbox code template.
To see more detailed examples and more information about how form controls work in Oxygen XML Editor Eclipse plugin, see the sample files in the following directory:

Related information

Custom CSS Functions (on page 2142)
Collapse Text: -oxy-collapse-text Property Value (on page 2133)

**Combo Box Form Control**

The `oxy_combobox` built-in form control is used for providing a graphical user interface object that is a drop-down menu of proposed values. This form control can also be used for a combination of a drop-down menu and an editable single-line text field.

The `oxy_combobox` form control supports the following properties:

- **edit** - Lets you edit the value of an attribute, the text content of an element, or Processing Instructions (PI). This property can have the following values:
  - `@attribute_name` - The name of the attribute whose value is being edited. If the attribute is in a namespace, the value of the property must be a `QName (on page 2657)` and the CSS must have a namespace declaration for the prefix.
  - `#text` - Specifies that the presented/edited value is the simple text value of an element.

  **Note:**
  You can set the value of the `visibility` property to `-oxy-collapse-text. (on page 2133)` to render the text only in the form control that the `oxy_editor` function specifies.

- **columns** - Controls the width of the form control. The unit size is the width of the `w` character.
- **width** - Specifies the width of the content area using relative (`em, ex`), absolute (`in, cm, mm, pt, pc, px`), and percentage (followed by the `%` character) length units. The `width` property takes precedence over the `columns` property (if the two are used together).
- **visible** - Specifies whether or not the form control is visible. The possible values of this property are `true` (default value) and `false`.
- **editable** - This property accepts the `true` and `false` values. In addition to a drop-down menu, the `true` value also generates an editable text field box that allows you to insert other values than the proposed ones. The `false` value generates a drop-down menu that only accepts the proposed values.
• **tooltips** - Associates tooltips to each value in the `values` property. The value of this property is a list of tooltip messages separated by commas. If you want the tooltip to display a comma, use the `${comma}` variable (on page 224).

• **values** - Specifies the values that populate the list of proposals. If these values are not specified in the CSS, they are collected from the associated XML Schema.

Note:
Typically, when you use a comma in the values of a form control, the content that follows a comma is considered a new value. If you want to include a comma in the values, precede the comma with two backslashes. For example, `(values, '1\, 2\, 3, 4, edit, false)` will display a form control that has `1, 2, 3` for the first value and `4` for the second value.

• **fontInherit** - This value specifies whether or not the form control inherits its font from its parent element. The values of this property can be `true` or `false` (default value). To make the form control inherit its font from its parent element, set the `fontInherit` property to `true`.

• **labels** - This property must have the same number of items as the `values` property. Each item provides a literal description of the items listed in the `values` property. These labels can be translated using the `$\{i18n()\}` editor variable (on page 225).

Note:
This property is only available for read-only combo boxes (the `editable` property is set to `false`).

• **color** - Specifies the foreground color of the form control. If the value of the `color` property is `inherit`, the form control has the same color as the element that was used to insert it.

• **hoverPseudoclassName** - Allows you to change the way an element is rendered when you hover over a form control. The value is the name of a CSS pseudo-class. When you hover over the form control, the specified pseudo-class will be set on the element that contains the form control.

```css
p:before {
  content: oxy_combobox(hoverPseudoclassName, 'showBorder')
}
p:showBorder {
  border: 1px solid red;
}
```

• **canRemoveValue** - If the value is set to `true` and the combo box is not editable, then a new `<Empty>` value is added in that combo box. This clears or removes the value being edited, depending on if it edits an element or an attribute.

• **onChange** - Can be used to invoke an action when the value of the combo box changes. The action can be created in the CSS using the `oxy_action()` function (on page 2143) or referenced from the framework (on page 2655) by its ID. After the action is executed, the cursor remains in the combo box. Note that this property does not support actions defined by JavaScript code.
Example: oxy_combobox Form Control

This example uses a combo box form control to edit an attribute value. Each time the value changes, it triggers an action that inserts an element into the attribute's parent element.

```css
comboBox:before {
  content: "A combo box that edits an attribute value. The possible values are provided from CSS:
  oxy_combobox{
    edit, "@attribute",
    editable, false,
    values, "value1, value2, value3",
    labels, "Value no1, Value no2, Value no3",
    onChange, oxy_action{
      name, 'Insert',
      operation, 'XQueryUpdateOperation',
      arg-script, 'insert node <product>{xs:string(@attribute)}</product>
        as last into .'});
}
```

Tip:
To insert a sample of the oxy_combobox form control in a CSS file, invoke the Content Completion Assistant (on page 2653) by pressing Ctrl + Space and select the oxy_combobox code template.

To see more detailed examples and more information about how form controls work in Oxygen XML Editor Eclipse plugin, see the sample files in the following directory:

```
{OXYGEN_INSTALL_DIR}/samples/form-controls
```

Date Picker Form Control

The oxy_datePicker built-in form control is used for offering a text field with a calendar browser that allows the user to choose a certain date in a specified format.

The oxy_datePicker form control supports the following properties:
**edit** - Lets you edit the value of an attribute, the text content of an element, or Processing Instructions (PI). This property can have the following values:

- **@attribute_name** - The name of the attribute whose value is being edited. If the attribute is in a namespace, the value of the property must be a QName (on page 2657) and the CSS must have a namespace declaration for the prefix.
- **#text** - Specifies that the presented/edited value is the simple text value of an element.

**Note:**
You can set the value of the visibility property to -oxy-collapse-text (on page 2133) to render the text only in the form control that the oxy_editor function specifies.

**columns** - Controls the width of the form control. The unit size is the width of the w character.

**width** - Specifies the width of the content area using relative (em, ex), absolute (in, cm, mm, pt, pc, px), and percentage (followed by the % character) length units. The width property takes precedence over the columns property (if the two are used together).

**color** - Specifies the foreground color of the form control. If the value of the color property is inherit, the form control has the same color as the element that was used to insert it.

**fontInherit** - This value specifies whether or not the form control inherits its font from its parent element. The values of this property can be true or false (default value). To make the form control inherit its font from its parent element, set the fontInherit property to true.

**format** - This property specifies the format of the inserted date, if a specific format is not detected from the associated document schema. The pattern value must be a valid Java date (or date-time) format. If this property is missing, the format of the date is determined from the associated schema.

**visible** - Specifies whether or not the form control is visible. The possible values of this property are true (default value) and false.

**validateInput** - Specifies if the form control is validated. If you introduce a date that does not respect the format, the datePicker form control is rendered with a red foreground. By default, the input is validated. To disable the validation, set this property to false.

**hoverPseudoclassName** - Allows you to change the way an element is rendered when you hover over a form control. The value is the name of a CSS pseudo-class. When you hover over the form control, the specified pseudo-class will be set on the element that contains the form control.

```css
p:before {
  content: oxy_datePicker(edit, "@attribute", hoverPseudoclassName, 'showBorder')
}
p:showBorder {
  border: 1px solid red;
}
```

**Example: oxy_datePicker Form Control**

```xml
date {
  content:
    oxy_label(text, "Date time attribute with")
}
```
Tip:

To insert a sample of the oxy_datePicker form control in a CSS file, invoke the Content Completion Assistant (on page 2653) by pressing Ctrl + Space and select the oxy_datePicker Code template.

To see more detailed examples and more information about how form controls work in Oxygen XML Editor Eclipse plugin, see the sample files in the following directory:

\[OXYGEN_INSTALL_DIR\]/samples/form-controls.

Custom CSS Functions (on page 2142)
Label: oxy_label() Function (on page 2151)

HTML Content Form Control

The oxy_htmlContent built-in form control is used for rendering HTML content. This HTML content is displayed as a graphical element shaped as a box. The shape of the box is determined by a given width and the height is computed based upon the length of the text.

The oxy_htmlContent form control supports the following properties:

- **href** - The absolute or relative location of a resource. The resource needs to be a well-formed HTML file.
- **id** - The unique identifier of an item. This is a <div> element that has a unique @id and is a child of the <body> element. The <div> element is the container of the HTML content to be rendered by the form control.
- **content** - An alternative to the @href and @id pair of elements. It provides the HTML content that will be displayed in the form control.
- **width** - Specifies the width of the content area using relative (em, ex), absolute (in, cm, mm, pt, pc, px), and percentage (followed by the % character) length units. The width property takes precedence over the columns property (if the two are used together).
**hoverPseudoclassName** - Allows you to change the way an element is rendered when you hover over a form control. The value is the name of a CSS pseudo-class. When you hover over the form control, the specified pseudo-class will be set on the element that contains the form control.

```css
p:before {
  content: oxy_htmlContent(hoverPseudoclassName, 'showBorder')
}
p:showBorder {
  border: 1px solid red;
}
```

You can customize the style of the content using CSS that is either referenced by the file identified by the `href` property or is defined inline. If you change the HTML content or CSS and you want your changes to be reflected in the XML that renders the form control, then you need to refresh the XML file. If the HTML does not have an associated style, then a default text and background color will be applied.

**Example: oxy_htmlContent Form Control**

In the following example, the form control collects the content from the `p_description` element found in the `descriptions.html` file. The box is 400 pixels wide and is displayed before a paragraph identified by the `@intro_id` attribute value.

```css
p#intro_id:before {
  content:
    oxy_htmlContent {
      href, "descriptions.html",
      id, "p_description",
      width, 400px);
}
```

An alternative example, using the `content` property:

```css
p#intro_id:before {
  content:
    oxy_htmlContent {
      content, "<div style='font-weight:bold;'>My content</div>",
      width, 400px);
}
```

**Note:**

Anchor HTML elements are displayed but the links are inactive.

**Tip:**

To insert a sample of the oxy_htmlContent form control in a CSS file, invoke the Content Completion Assistant (on page 2653) by pressing Ctrl + Space and select the oxy_htmlContent code template.
To see more detailed examples and more information about how form controls work in Oxygen XML Editor Eclipse plugin, see the sample files in the following directory:

\{OXYGEN_INSTALL_DIR\}/samples/form-controls.

Related information

Custom CSS Functions (on page 2142)

Pop-up Form Control

The oxy_popup built-in form control is used to offer a contextual menu that provides quick access to various actions. A pop-up form control can display single or multiple selections.

The oxy_popup form control supports the following properties:

- **color** - Specifies the foreground color of the form control. If the value of the color property is inherit, the form control has the same color as the element that was used to insert it.

  **Note:**

  This property is used for rendering in the Author mode.

- **columns** - Controls the width of the form control. The unit size is the width of the w character. This property is used for the visual representation of the form control.

- **edit** - Lets you edit the value of an attribute, the text content of an element, or Processing Instructions (PI). This property can have the following values:

  - **@attribute_name** - The name of the attribute whose value is being edited. If the attribute is in a namespace, the value of the property must be a QName (on page 2657) and the CSS must have a namespace declaration for the prefix.
  - **#text** - Specifies that the presented/edited value is the simple text value of an element.

  **Note:**

  You can set the value of the visibility property to oxy-collapse-text (on page 2133) to render the text only in the form control that the oxy_editor function specifies.

- **editorSort** - Specifies the sorting of the values displayed after clicking the popup control (for example, clicking a drop-down arrow button). The possible values of this property are ascending and descending.
• **fontInherit** - This value specifies whether or not the form control inherits its font from its parent element. The values of this property can be true or false (default value). To make the form control inherit its font from its parent element, set the fontInherit property to true.

• **hoverPseudoclassName** - Allows you to change the way an element is rendered when you hover over a form control. The value is the name of a CSS pseudo-class. When you hover over the form control, the specified pseudo-class will be set on the element that contains the form control.

```css
p:before {
    content: oxy_popup(hoverPseudoclassName, 'showBorder')
}
p:showBorder {
    border: 1px solid red;
}
```

• **labels** - Specifies the label associated with each entry used for presentation. If this property is not specified, the values property is used instead.

• **rendererSeparator** - Defines a separator used when multiple values are rendered. If not specified, the value of the resultSeparator property is used.

• **rendererSort** - Specifies the sorting of the values (labels) displayed on the form control before clicking the popup control. The possible values of this property are ascending and descending.

• **resultSeparator** - If multiple check-boxes are used, the separator is used to compose the final result. If not specified, the space character is used.

  **Note:**
  The value of the resultSeparator property cannot exceed one character.

• **rows** - This property specifies the number of rows that the form control presents.

  **Note:**
  If the value of the rows property is not specified, the default value of 12 is used.

• **selectionMode** - Specifies whether the form control allows the selection of a single value or multiple values. The predefined values of this property are single (default value) and multiple.

• **sort** - Specifies the default sorting of the form control values (the values displayed before and after clicking the popup control). However, the editorSort and rendererSort properties have a higher priority. The possible values of this property are ascending and descending.

• **tooltip** - Specifies a tooltip to be displayed when you hover over the form control.

• **tooltips** - Associates tooltips to each value in the values property. The value of this property is a list of tooltip messages separated by commas. If you want the tooltip to display a comma, use the $[comma]$ variable (on page 224).

**Example:**
**values** - Specifies the values that populate the list of proposals. If these values are not specified in the CSS, they are collected from the associated XML Schema.

**Note:**
Typically, when you use a comma in the values of a form control, the content that follows a comma is considered a new value. If you want to include a comma in the values, precede the comma with two backslashes. For example, `(values, '1\, 2\, 3, 4, edit, false)` will display a form control that has 1, 2, 3 for the first value and 4 for the second value.

**visible** - Specifies whether or not the form control is visible. The possible values of this property are `true` (default value) and `false`.

**width** - Specifies the width of the content area using relative (`em`, `ex`), absolute (`in`, `cm`, `mm`, `pt`, `pc`, `px`), and percentage (followed by the `%` character) length units. The `width` property takes precedence over the `columns` property (if the two are used together).

**Example: oxy_popup Form Control**

```
link:before{
  content: oxy_popup(
    edit, '@href',
    values, "Spring, Summer, Autumn, Winter",
    tooltips, "Iris${comma}Snowdrop, Gardenia${comma}Liliac,
    Chrysanthemum${comma}Salvia, Gerbera",
    selectionMode, single);
}
```

```
values - Specifies the values that populate the list of proposals. If these values are not specified in the CSS, they are collected from the associated XML Schema.

• values - Specifies the values that populate the list of proposals. If these values are not specified in the CSS, they are collected from the associated XML Schema.

• visible - Specifies whether or not the form control is visible. The possible values of this property are `true` (default value) and `false`.

• width - Specifies the width of the content area using relative (`em`, `ex`), absolute (`in`, `cm`, `mm`, `pt`, `pc`, `px`), and percentage (followed by the `%` character) length units. The `width` property takes precedence over the `columns` property (if the two are used together).

**Example: oxy_popup Form Control**

```
link:before{
  content: oxy_popup(
    edit, '@href',
    values, "Spring, Summer, Autumn, Winter",
    tooltips, "Iris${comma}Snowdrop, Gardenia${comma}Liliac,
    Chrysanthemum${comma}Salvia, Gerbera",
    selectionMode, single);
}
```

```
values - Specifies the values that populate the list of proposals. If these values are not specified in the CSS, they are collected from the associated XML Schema.

• values - Specifies the values that populate the list of proposals. If these values are not specified in the CSS, they are collected from the associated XML Schema.

• visible - Specifies whether or not the form control is visible. The possible values of this property are `true` (default value) and `false`.

• width - Specifies the width of the content area using relative (`em`, `ex`), absolute (`in`, `cm`, `mm`, `pt`, `pc`, `px`), and percentage (followed by the `%` character) length units. The `width` property takes precedence over the `columns` property (if the two are used together).

**Example: oxy_popup Form Control**

```
link:before{
  content: oxy_popup(
    edit, '@href',
    values, "Spring, Summer, Autumn, Winter",
    tooltips, "Iris${comma}Snowdrop, Gardenia${comma}Liliac,
    Chrysanthemum${comma}Salvia, Gerbera",
    selectionMode, single);
}
```
Tip:
To insert a sample of the oxy_popup form control in a CSS file, invoke the Content Completion Assistant (on page 2653) by pressing Ctrl + Space and select the oxy_popup code template.

To see more detailed examples and more information about how form controls work in Oxygen XML Editor Eclipse plugin, see the sample files in the following directory: [OXYGEN_INSTALL_DIR]/samples/form-controls.

Text Area Form Control
The oxy_textArea built-in form control is used for entering multiple lines of text in a graphical user interface box. A text area may include optional syntax highlight capabilities to present the form control.

The oxy_textArea form control supports the following properties:

- **edit** - Lets you edit the value of an attribute, the text content of an element, or Processing Instructions (PI). This property can have the following values:
  - @attribute_name - The name of the attribute whose value is being edited. If the attribute is in a namespace, the value of the property must be a QName (on page 2657) and the CSS must have a namespace declaration for the prefix.
  - #text - Specifies that the presented/edited value is the simple text value of an element.

  **Note:**
  You can set the value of the visibility property to -oxy-collapse-text (on page 2133) to render the text only in the form control that the oxy_editor function specifies.

  - #content - This parameter is useful when an element has mixed or element-only content and you want to edit its content inside a text area form control.

For example, if you have the following XML content:

```xml
<codeblock outputclass="language-xml">START_TEXT<ph>phase</ph><apiname><text>API</text></apiname></codeblock>
```

and your CSS includes the following snippet:
then the text area form control will edit the following fragment:

```
<ph>phase</ph><apiname><text>API</text></apiname>
```

**Note:** When the value of the `edit` property is `#content`, the text area form control will also offer content completion proposals.

- **columns** - Controls the width of the form control. The unit size is the width of the \texttt{w} character.
- **width** - Specifies the width of the content area using relative (\texttt{em}, \texttt{ex}), absolute (\texttt{in}, \texttt{cm}, \texttt{mm}, \texttt{pt}, \texttt{pc}, \texttt{px}), and percentage (followed by the \texttt{\%} character) length units. The `width` property takes precedence over the `columns` property (if the two are used together).
- **fontInherit** - This value specifies whether or not the form control inherits its font from its parent element. The values of this property can be `true` or `false` (default value). To make the form control inherit its font from its parent element, set the `fontInherit` property to `true`.
- **visible** - Specifies whether or not the form control is visible. The possible values of this property are `true` (default value) and `false`.
- **rows** - This property specifies the number of rows that the form control presents. If the form control has more lines, you can scroll and see them all.
- **contentType** - Specifies the type of content that the form control will format with syntax highlighting.
  The following values are supported: `text/batch; text/c; text/cc; text/css; text/dtd; text/html; text/java; text/javascript; text/json; text/markdown; text/nvdl; text/perl; text/plain; text/php; text/properties; text/python; text/rnc; text/rng; text/sch; text/shell; text/sql; text/wsdl; text/xml; text/xpath; text/xproc; text/xquery; text/xsd; text/xsl; text/yaml`.
- **indentOnTab** - Specifies the behavior of the Tab key. If the value of this property is set to `true` (default value), the Tab key inserts characters. If it is set to `false`, Tab is used for navigation, jumping to the next editable position in the document.
- **white-space** - CSS property that influences the value that you edit, as well as the form control size:
  - **pre** - The whitespaces and new lines of the value are preserved and edited. If the `rows` and `columns` properties are not specifies, the form control calculates its size on its own so that all the text is visible.
  - **pre-wrap** - The long lines are wrapped to avoid horizontal scrolling.
Note:
The `rows` and `columns` properties must be specified. If these are not specified, the form control considers the value to be `pre`.

- **normal** - The white spaces and new lines are normalized.

- **hoverPseudoclassName** - Allows you to change the way an element is rendered when you hover over a form control. The value is the name of a CSS pseudo-class. When you hover over the form control, the specified pseudo-class will be set on the element that contains the form control.

```javascript
p:before {
    content: oxy_textArea(hoverPseudoclassName, 'showBorder')
}
p:showBorder {
    border: 1px solid red;
}
```

**Example: oxy_textArea Form Control**

The following example presents a text area with CSS syntax highlighting that calculates its own dimension, and a second one with XML syntax highlighting with defined dimension.

```javascript
textArea {
    visibility: -oxy-collapse-text;
    white-space: pre;
}
textArea[language="CSS"]:before {
    content: oxy_textArea{
        edit, '#text',
        contentType, 'text/css'};
}
textArea[language="XML"]:before {
    content: oxy_textArea{
        edit, '#text',
        contentType, 'text/xml',
        rows, 10,
        columns, 30};
}
```

**Tip:**
To insert a sample of the `oxy_textArea` form control in a CSS file, invoke the Content Completion Assistant (on page 2653) by pressing **Ctrl + Space** and select the `oxy_textArea` code template.
To see more detailed examples and more information about how form controls work in Oxygen XML Editor Eclipse plugin, see the sample files in the following directory:

\[\text{OXYGEN\_INSTALL\_DIR}/samples/form-controls.\]

## Text Field Form Control

The \textit{oxy\_textfield} built-in form control is used for entering a single line of text in a graphical user interface box. A text field may include optional content completion capabilities, used to present and edit the value of an attribute or an element.

The \textit{oxy\_textfield} form control supports the following properties:

- **edit** - Lets you edit the value of an attribute, the text content of an element, or Processing Instructions (PI). This property can have the following values:
  - @\textit{attribute\_name} - The name of the attribute whose value is being edited. If the attribute is in a namespace, the value of the property must be a \textit{QName} (on page 2657) and the CSS must have a namespace declaration for the prefix.
  - #\textit{text} - Specifies that the presented/edited value is the simple text value of an element.

  **Note:**
  You can set the value of the \textit{visibility} property to -oxy-collapse-text (on page 2133) to render the text only in the form control that the \textit{oxy\_editor} function specifies.

- **columns** - Controls the width of the form control. The unit size is the width of the \textit{w} character.
- **width** - Specifies the width of the content area using relative (\textit{em}, \textit{ex}), absolute (\textit{in}, \textit{cm}, \textit{mm}, \textit{pt}, \textit{pc}, \textit{px}), and percentage (followed by the \textit{%} character) length units. The \textit{width} property takes precedence over the \textit{columns} property (if the two are used together).
- **fontInherit** - This value specifies whether or not the form control inherits its font from its parent element. The values of this property can be \textit{true} or \textit{false} (default value). To make the form control inherit its font from its parent element, set the \textit{fontInherit} property to \textit{true}.
- **visible** - Specifies whether or not the form control is visible. The possible values of this property are \textit{true} (default value) and \textit{false}.
- **values** - Specifies the values that populate the list of proposals. If these values are not specified in the CSS, they are collected from the associated XML Schema.
• **tooltips** - Associates tooltips to each value in the `values` property. The value of this property is a list of tooltip messages separated by commas. If you want the tooltip to display a comma, use the `$[comma]` variable (on page 224).

• **tooltip** - Specifies a tooltip to be displayed when you hover over the form control.

• **color** - Specifies the foreground color of the form control. If the value of the `color` property is `inherit`, the form control has the same color as the element that was used to insert it.

• **hasMultipleValues** - Specifies if the text field allows multiple values separated by spaces or just a single value.

**Note:**
If the value is `false`, the **Content Completion Assistant** (on page 2653) considers the entire text as the prefix for its proposals. If the value is `true` (the default value), the space is the delimiter for the values and thus it is not included in the prefix (the prefix will be whatever comes after the space).

For example, suppose the possible values for your text field are: value a, value b, and other values. If the `hasMultipleValues` property is set to `true` and the user enters `value *` (notice the space character after `value`) in the text field, the **Content Completion Assistant** will suggest all three values because the prefix is whatever comes after the space, and in this case the user did not enter anything after the space. If the `hasMultipleValues` property was set to `false`, the **Content Completion Assistant** would only suggest value a and value b because the space is considered part of the prefix.

• **hoverPseudoclassName** - Allows you to change the way an element is rendered when you hover over a form control. The value is the name of a CSS pseudo-class. When you hover over the form control, the specified pseudo-class will be set on the element that contains the form control.

```css
p:before {
  content: oxy_textfield(hoverPseudoclassName, 'showBorder')
}
p:showBorder {
  border: 1px solid red;
}
```

**Example: oxy_textfield Form Control**

```javascript
element {
  content: "Label: ")
  oxy_textfield(
    edit, "$my_attr",
    values, "value1, value2",
    color, "red",
    columns, 40);
}
```
Tip:

To insert a sample of the oxy_textfield form control in a CSS file, invoke the Content Completion Assistant (on page 2653) by pressing Ctrl + Space and select the oxy_textfield code template.

To see more detailed examples and more information about how form controls work in Oxygen XML Editor Eclipse plugin, see the sample files in the following directory:

{OXYGEN_INSTALL_DIR}/samples/form-controls.

URL Chooser Form Control

The oxy_urlChooser built-in form control is used for a dialog box that allows you to select the location of local or remote resources. The inserted reference is made relative to the URL of the currently open editor.

The oxy_urlChooser editor supports the following properties:

- **edit** - Lets you edit the value of an attribute, the text content of an element, or Processing Instructions (PI). This property can have the following values:
  - @attribute_name - The name of the attribute whose value is being edited. If the attribute is in a namespace, the value of the property must be a QName (on page 2657) and the CSS must have a namespace declaration for the prefix.
  - #text - Specifies that the presented/edited value is the simple text value of an element.

Note:

You can set the value of the visibility property to -oxy-collapse-text (on page 2133) to render the text only in the form control that the oxy_editor function specifies.

- **columns** - Controls the width of the form control. The unit size is the width of the w character.
- **width** - Specifies the width of the content area using relative (em, ex), absolute (in, cm, mm, pt, pc, px), and percentage (followed by the % character) length units. The width property takes precedence over the columns property (if the two are used together).
- **color** - Specifies the foreground color of the form control. If the value of the color property is inherit, the form control has the same color as the element that was used to insert it.
• **visible** - Specifies whether or not the form control is visible. The possible values of this property are `true` (default value) and `false`.

• **fontInherit** - This value specifies whether or not the form control inherits its font from its parent element. The values of this property can be `true` or `false` (default value). To make the form control inherit its font from its parent element, set the `fontInherit` property to `true`.

• **fileFilter** - string value that holds comma-separated file extensions. The URL chooser uses these extensions to filter the displayed files. A value such as `"jpg,png,gif"` is mapped to three filters that will display all `jpg`, `png`, and `gif` files respectively.

• **hoverPseudoclassName** - Allows you to change the way an element is rendered when you hover over a form control. The value is the name of a CSS pseudo-class. When you hover over the form control, the specified pseudo-class will be set on the element that contains the form control.

```css
p:before {
  content: oxy_urlChooser(hoverPseudoclassName, 'showBorder')
}
p:showBorder {
  border: 1px solid red;
}
```

**Example: oxy_urlChooser Form Control**

```css
urlChooser[file]:before {
  content: "A URL chooser editor that allows browsing for a URL. The selected URL is made relative to the currently edited file:" oxy_urlChooser(
    edit, "$file",
    columns 25)
}
```

**Tip:**
To insert a sample of the `oxy_urlChooser` form control in a CSS file, invoke the **Content Completion Assistant (on page 2653)** by pressing `Ctrl + Space` and select the `oxy_urlChooser Code template`.

To see more detailed examples and more information about how form controls work in Oxygen XML Editor Eclipse plugin, see the sample files in the following directory:

`[OXYGEN_INSTALL_DIR]/samples/form-controls`.

https://www.youtube.com/embed/-WY3wzkMSLM
Video Player Form Control

The \texttt{oxy\_video} built-in form control is used for providing a mechanism to play videos.

The \texttt{oxy\_video} form control supports the following properties:

- \texttt{href} - The absolute or relative location of a resource. This property is mandatory. Relative values are resolved relative to the CSS. If you have media resources relative to the XML document, you can specify their paths like this:

\begin{verbatim}
oxy_video(href, oxy_url(oxy_base-uri(), 'ex.mp4'), width, 400px, height, 300px)
\end{verbatim}

- \texttt{width} - Specifies the width of the content area using relative (\texttt{em}, \texttt{ex}), absolute (\texttt{in}, \texttt{cm}, \texttt{mm}, \texttt{pt}, \texttt{pc}, \texttt{px}), and percentage (followed by the \texttt{%} character) length units.

- \texttt{height} - Specifies the height of the form control area using relative (\texttt{em}, \texttt{ex}), absolute (\texttt{in}, \texttt{cm}, \texttt{mm}, \texttt{pt}, \texttt{pc}, \texttt{px}), and percentage (followed by the \texttt{%} character) length units.

\textbf{Example: oxy\_video Form Control}

\begin{verbatim}
object {
  content:
    oxy_video(
      href, 'resources/video.mp4',
      width, 400px,
      height, 300px),
}
\end{verbatim}

\textbf{Tip:}

To insert a sample of the \texttt{oxy\_video} form control in a CSS file, invoke the \textit{Content Completion Assistant (on page 2653)} by pressing \texttt{Ctrl + Space} and select the \texttt{oxy\_video} code template.

To see more detailed examples and more information about how form controls work in Oxygen XML Editor Eclipse plugin, see the sample files in the following directory:

[\texttt{OXYGEN\_INSTALL\_DIR}/samples/form-controls].

\textbf{Resources}

For more information about form controls, watch our video demonstration:

https://www.youtube.com/embed/-WY3wzkMSLM
Implementing Custom Form Controls

If the built-in form controls are not sufficient for your needs, you can implement custom form controls in Java.

Custom Form Controls Implementation

You can specify custom form controls using the following properties:

- `rendererClassName` - The name of the class that draws the edited value. It must be an implementation of `ro.sync.ecss.extensions.api.editor.InplaceRenderer`. The renderer has to be a SWING implementation and can be used both in the standalone and Eclipse distributions.
- `swingEditorClassName` - You can use this property for the standalone (Swing-based) distribution to specify the name of the class used for editing. It is a Swing implementation of `ro.sync.ecss.extensions.api.editor.InplaceEditor`.
- `swtEditorClassName` - You can use this property for the Eclipse plugin distribution to specify the name of the class used for editing. It is a SWT implementation of the `ro.sync.ecss.extensions.api.editor.InplaceEditor`.

**Note:**

If the custom form control is intended to work in the Oxygen XML Editor Eclipse plugin standalone distribution, the declaration of `swtEditorClassName` is not required. The `renderer` (the class that draws the value) has different properties from the `editor` (the class that edits the value) because you can present a value in one way and edit it in another.

- `classpath` - You can use this property to specify the location of the classes used for a custom form control. The value of the `classpath` property is an enumeration of URLs separated by comma.
- `edit` - If your form control edits the value of an attribute or the text value of an element, you can use the `@attribute_name` and `#text` predefined values and Oxygen XML Editor Eclipse plugin will perform the commit logic by itself. You can use the `custom` value to perform the commit logic yourself.
- `ecHeavyFormControlClassName` - This type of form control is effectively present at all times at its allocated bounds. This is useful if you need a form control that renders dynamic or interactive SVG documents (for example, if you have an SVG document that displays tooltips when hovering over certain areas).

The value of this property is a class name that must implement the `ro.sync.ecss.extensions.api.editor.InplaceHeavyEditor` method. The JAR (on page 2655) that contains this implementation can either be added in the Classpath tab in the Document Type Configuration dialog box (on page 95) for your particular framework (on page 2655) or specified with the `classpath` property (on page 2193).
Example: Java Code

The following is a sample Java code for implementing a custom combo box form control that inserts an XML element in the content when the editing stops:

```java
public class ComboBoxEditor extends AbstractInplaceEditor {
    /**
     * @see ro.sync.ecss.extensions.api.editor.InplaceEditor#stopEditing()
     */
    @Override
    public void stopEditing() {
        Runnable customCommit = new Runnable() {
            @Override
            public void run() {
                AuthorDocumentController documentController =
                    context.getAuthorAccess().getDocumentController();
                documentController.insertXMLFragment("<custom/>", offset);
            }
        };
        EditingEvent event = new EditingEvent(customCommit, true);
        fireEditingStopped(event);
    }
}
```

The custom form controls can use any of the predefined properties of the built-in form controls (on page 2162), as well as specified custom properties.

Example: CSS

The following is an example of how to specify a custom form control in the CSS:

```css
myElement {
    content: oxy_editor(
        rendererClassName, "com.custom.editors.CustomRenderer",
        swingEditorClassName, "com.custom.editors.SwingCustomEditor",
       .swtEditorClassName, "com.custom.editors.SwtCustomEditor",
        edit, "@my_attr",
        customProperty1, "customValue1",
        customProperty2, "customValue2"
    )
}
```

How to Implement Custom Form Controls

To implement a custom form control, follow these steps:
1. Download the Oxygen XML Editor Eclipse plugin SDK at: https://www.oxygenxml.com/oxygen_sdk.html.

2. Implement the custom form control by extending `ro.sync.ecss.extensions.api.editor.InplaceEditorRendererAdapter`. You could also use `ro.sync.ecss.extensions.api.editor.AbstractInplaceEditor`, which offers some default implementations and listeners management.

3. Pack the previous implementation in a Java **JAR (on page 2655)** library.

4. Copy the **JAR** library to the **[OXYGEN_INSTALL_DIR]/frameworks/[FRAMEWORK_DIR]** directory.

5. In Oxygen XML Editor Eclipse plugin, open the **Preferences** dialog box (on page 70), go to **Document Type Association**, edit the appropriate **framework**, and add the **JAR** library in the **Classpath** tab.

6. Specify the custom form control in your CSS, as described above.

**Tip:**
To see more detailed examples and more information about how form controls work in Oxygen XML Editor Eclipse plugin, see the sample files in the following directory:

```
[OXYGEN_INSTALL_DIR]/samples/form-controls.
```

**Resources**

For more information about form controls, watch our video demonstration:

https://www.youtube.com/embed/-WY3wzkMSLM

**Editing Processing Instructions Using a Form Control**

Oxygen XML Editor Eclipse plugin allows you to edit **processing instructions**, **comments**, and **CDATA** by using CSS extensions.

**Note:**
You can edit both the content and the attribute value from a **processing instruction**.

**Example: Editing an Attribute from a Processing Instruction**

**PI content:**

```xml
<?pi_target attr="val"?>
```

**CSS:**

```css
@namespace oxy "http://www.oxygenxml.com/extensions/author";

oxy|processing-instruction:before {
    display:inline;
    content: "EDIT attribute: " oxy_textfield(edit, '@attr', columns, 15);
    visibility:visible;
```
Custom CSS Pseudo-classes

You can set your custom CSS pseudo-classes on the nodes from the `AuthorDocument` model. These are similar to the normal XML attributes, with the important difference that they are not serialized, and by changing them, the document does not create undo and redo edits (the document is considered unmodified). You can use custom pseudo-classes for changing the style of an element (and its children) without altering the document.

In Oxygen XML Editor Eclipse plugin they are used to hide/show the `colspec` elements from CALS tables. To take a look at the implementation, see:

1. `{OXYGEN_INSTALL_DIR}/frameworks/docbook/css/cals_table.css` (Search for `-oxy-visible-colspecs`)
2. The definition of action `table.toggle.colspec` from the DocBook framework (on page 2655) makes use of the pre-defined `TogglePseudoClassOperation Author` mode operation.

Here are some examples:

**Example: Controlling the visibility of a section using a pseudo-class**

You can use a non standard (custom) pseudo-class to impose a style change on a specific element. For instance, you can have CSS styles matching the custom pseudo-class `access-control-user`, like the one below:

```css
section {
    display:none;
}
section:access-control-user {
    display:block;
}
```

By setting the pseudo-class `access-control-user`, the element section will become visible by matching the second CSS selector.

**Example: Coloring the elements at the current cursor location**
You could create an `AuthorCaretListener` that sets the `caret-visited` pseudo-class to the element at the cursor location. The effect will be that all the elements traversed by the cursor become red.

```html
*:caret-visited {
  color:red;
}
```

The API that you can use from the `CaretListener`:

- `ro.sync.ecss.extensions.api.AuthorDocumentController#setPseudoClass(java.lang.String, ro.sync.ecss.extensions.api.node.AuthorElement)`
- `ro.sync.ecss.extensions.api.AuthorDocumentController#removePseudoClass(java.lang.String, ro.sync.ecss.extensions.api.node.AuthorElement)`

**Predefined Pseudo-Class Author Mode Operations**

Pre-defined `Author` mode operations can be used directly in your `framework` to work with custom pseudo-classes:

1. `TogglePseudoClassOperation`
2. `SetPseudoClassOperation`
3. `RemovePseudoClassOperation`

**Using the :before(n) and :after(n) CSS Pseudo-Elements**

Although not standard, this extension may be useful if you want to style sections by adding multiple levels of static content. To add static content to an element, you would normally use a :before or :after pseudo-element.

This example adds static text before the title ("Chapter 1", "Chapter 2", etc.):

```css
elements h1:before {
  content: "Chapter " counter(chapter) ".";
  color: blue;
}
```

All of this is styled with the same color (blue in this example). Using standard CSS, it is impossible to style specific aspects of it (for example, just the chapter number with a larger font and with red). However, you can do it using multiple :before(n) or :after(n) pseudo-elements:

```css
elements h1:before(3) {
  content: "Chapter ";
  color: blue;
}
elements h1:before(2) {
  content: counter(chapter);
  color: red;
}
```
font-size: large;
}

h1:before(1) {
  content: ".";
  color: blue;
}

Notes:

- The bigger the level, the more distant the pseudo-element is.
- Level 1 corresponds to normal :before or :after pseudo-elements.

Debugging CSS Stylesheets

To assist you with debugging and customizing CSS stylesheets the Author mode includes a CSS Inspector view (on page 412) to examine the CSS rules that match the currently selected element.

This tool is similar to the Inspect Element development tool that is found in most browsers. The CSS Inspector view allows you to see how the CSS rules are applied and the properties defined. Each rule that is displayed in this view includes a link to the line in the CSS file that defines the styles for the element that matches the rule. You can use the link to open the appropriate CSS file and edit the style rules. Once you have found the rule you want to edit, you can click the link in the top-right corner of that rule to open the CSS file in the editor.

Figure 541. CSS Inspector View

There are two ways to open the CSS Inspector view:

1. Select CSS Inspector from the Window > Show View menu.
2. Select the Inspect Styles action from the contextual menu in Author mode.

Related Information:

CSS Inspector View (on page 412)

Extension Points for the Oxygen Eclipse Plugin

The Oxygen XML Editor Eclipse plugin includes a number of extension (on page 2657) points, which can be implemented by other Eclipse plugins (on page 2657) that depend on it. All of them are listed in the plugin.xml file, along with samples of usage code. The following is a list with short descriptions for some of the most useful extension points:

Extension point: **ditaKeyDefinitionManager**

It can be used to provide an external keys manager, responsible of providing DITA keys that are then used for editing and resolving referenced content. Its EXSD schema can be found in: OXYGEN_PLUGIN_DIR/exsd-schema/ditaKeyDefinitionManager.exsd.

Extension point: **actionBarContributorCustomizer**

A very useful extension point that can add or remove actions from various menus, contextual menus, and toolbars that are contributed by the Oxygen XML Editor Eclipse plugin. Its EXSD schema can be found in: OXYGEN_PLUGIN_DIR/exsd-schema/actionBarContributorCustomizer.exsd.

Extension point: **customEditorInputCreator**

Use this extension point to create your custom editor input for a certain resource that will be opened by the Oxygen XML Editor Eclipse plugin when clicking links. Its EXSD schema can be found in: OXYGEN_PLUGIN_DIR/exsd-schema/customEditorInputCreator.exsd.

Extension point: **editorAdapterContributor**

When an adapter is requested to the open XML editor you can provide your custom adapter from your external plugin. Its EXSD schema can be found in: OXYGEN_PLUGIN_DIR/exsd-schema/editorAdapterContributor.exsd.

Extension point: **extensionsBundleContributor**

Use this extension point to provide your own ExtensionsBundle implementation for a certain open XML resource. Its EXSD schema can be found in: OXYGEN_PLUGIN_DIR/exsd-schema/extensionsBundleContributor.exsd.

Extension point: **stylesFilterContributor**

Use this extension point to provide your own StylesFilter implementation for special visual rendering when an XML resource is opened in the Author editing mode. Its EXSD schema can be found in: OXYGEN_PLUGIN_DIR/exsd-schema/stylesFilterContributor.exsd.
Extension point: **XMLRefactoringContributor**

Contributes a folder that contains the additional XML Refactoring operation descriptor files and XQuery scripts that can be used by the batch XML refactoring actions. Its EXSD schema can be found in: `OXYGEN_PLUGIN_DIR/exsd-schema/xmlRefactoringContributor.exsd`.

Extension point: **workspaceAccessPlugin**

Use this extension point to be notified when Oxygen XML Editor Eclipse plugin has started. Its EXSD schema can be found in: `OXYGEN_PLUGIN_DIR/exsd-schema/exsd-schema/workspaceAccessExtension.exsd`.

Extension point: **AuthorStylesheet**

Use this extension point to provide a stylesheet layer that will be used when rendering any XML document in **Author** mode. Its EXSD schema can be found in: `OXYGEN_PLUGIN_DIR/exsd-schema/authorStylesheetContributor.exsd`.

---

**How to Use a Custom View with the Oxygen XML Editor Eclipse plugin Distribution**

**Question**

Is it possible to create a custom view in Eclipse that can insert certain XML fragments in the documents opened with the Oxygen XML Editor Eclipse plugin?

**Answer**

Here you can find more information about the Eclipse part of the Oxygen SDK:

[https://www.oxygenxml.com/oxygen_sdk.html#oXygen_Eclipse_plugin](https://www.oxygenxml.com/oxygen_sdk.html#oXygen_Eclipse_plugin)

Use the provided Oxygen XML Editor Eclipse plugin sample project as a starting point. From any custom view/component you can have singleton access to the using the `ro.sync.exml.workspace.api.PluginWorkspaceProvider.getPluginWorkspace()` API.

The Java code for inserting a certain XML fragment in the currently open editor (either in the **Text** or **Author** editing modes) would look like this:

```java
WSEditor currentEditorAccess = PluginWorkspaceProvider.getPluginWorkspace().
    getCurrentEditorAccess(PluginWorkspace.MAIN_EDITING_AREA);

if(currentEditorAccess.getCurrentPage() instanceof WSXMLTextEditorPage) {
    //Editor opened in Text page
    WSXMLTextEditorPage tp = (WSXMLTextEditorPage) currentEditorAccess.getCurrentPage();

    //You can access an API to insert text in the XML content

    // tp.getDocument().insertString(tp.getCaretOffset(), "<testTag/>", null);
```
// This is the internal StyledText implementation

// tp.getTextComponent()

// You can use this XPath API to find the range of an XML element.
// tp.findElementByXPath(xpathExpression)

} else if (currentEditorAccess.getCurrentPage() instanceof WSAuthorEditorPage) {
    // Editor opened in Author page
    //
    try {
        WSAuthorEditorPage authPage = (WSAuthorEditorPage) currentEditorAccess.getCurrentPage();

        // Then you can do stuff like this to insert XML at the cursor position
        authPage.getDocumentController().insertXMLFragment("<testTag/>", authPage.getCaretOffset());
    }

    catch (AuthorOperationException e) {
        // TODO Auto-generated catch block
        e.printStackTrace();
    }

    //

}
19. Tools

Oxygen XML Editor Eclipse plugin includes a variety of helpful tools to help you accomplish XML-related tasks. This section presents many of those tools. These tools are available in the Tools menu and some of them can be launched through keyboard shortcuts or command-line scripts.

Refactoring XML Documents

In the life cycle of XML documents there are instances when the XML structure needs to be changed to accommodate various needs. For example, when an associated schema is updated, an attribute may have been removed, or a new element added to the structure.

These types of situations cannot be resolved with a traditional Find/Replace tool, even if the tool accepts regular expressions. The problem becomes even more complicated if an XML document is computed or referenced from multiple modules, since multiple resources need to be changed.

To assist you with these types of refactoring tasks, Oxygen XML Editor Eclipse plugin includes a specialized XML Refactoring tool that helps you manage the structure of your XML documents.

XML Refactoring Tool

The XML Refactoring tool is presented in the form of an easy to use wizard that is designed to reduce the time and effort required to perform various structure management tasks. For example, you can insert, delete, or rename an attribute in all instances of a particular element that is found in all documents within your project.

To access the tool, select the XML Refactoring action from one of the following locations:

- The XML Tools menu.
- The Refactoring submenu from the contextual menu in the Project Explorer view (on page 268).
- The Refactoring submenu from the contextual menu in the DITA Maps Manager view (on page 2315).

Note:
The built-in refactoring operations are also available from the Refactoring submenu in the contextual menu of Author or Text mode. This is useful because by selecting the operations from the contextual menu, Oxygen XML Editor Eclipse plugin considers the editing context to skip directly to the wizard page of the appropriate operation and to help you by preconfiguring some of the parameter values. For your convenience, the last 5 operations that were finished (on page 2205) or previewed (on page 2205) also appear in the Refactoring submenu of the contextual menu in the DITA Maps Manager.
XML Refactoring Wizard

The XML Refactoring tool includes the following wizard pages:

**Refactoring operations**

The first wizard page presents the available operations, grouped by category. To search for an operation, you can use the filter text box at the top of the page.

**Figure 542. XML Refactoring Wizard**

![XML Refactoring Wizard](image)

**Configure Operation Parameters**

The next wizard page allows you to specify the parameters for the refactoring operation. The parameters are specific to the type of refactoring operation that is being performed. For example, to delete an attribute you need to specify the parent element and the qualified name of the attribute to be removed.
Scope and Filters

The last wizard page allows you to select the set of files that represent the input of the operation.

Scope section

You can specify the scope for the operation by selecting from predefined resource sets or you can define your own set of resources by creating a working set (on page 2659) (select Working sets and click the Choose button to the right). If you select Project, all files attached to the current project will be used for the scope of the operation. If you select Current DITA Map hierarchy, the current DITA map
that is open in the DITA Maps Manager along with all of its referenced topics and submaps (and topics referenced in those submaps) are used for the scope.

Filters

The Filters section includes the following options:

- **Include files** - Allows you to filter the selected resources by using a file pattern. For example, to restrict the operation to only analyze build files you could use `build*.xml` for the file pattern.

- **Restrict only to known XML file types** - When selected, only resources with a known XML file type will be affected by the operation.

Preview

You can use the Preview button to open a comparison panel where you can review all the changes that will be made by the refactoring operation before applying the changes.

Finish

After clicking the Finish button, the operation will be processed and Oxygen XML Editor Eclipse plugin provides no automatic means for reverting the operations. Any Undo action will only revert changes on the current document.

Troubleshooting:

If an operation fails, a notification will be displayed in the Results panel with some information about the error. For example, if the operation was invoked on a read-only resource, the error will indicate that a read-only file cannot be converted.

Tip:

If an operation takes longer than expected you can use the Stop button in the progress bar to cancel the operation.

Restriction:

XML refactoring operations cannot preserve CDATA sections. If your document contains XML CDATA sections, the refactoring operations will convert them to plain text nodes.

Built-in Refactoring Operations

The XML Refactoring tool includes a variety of built-in operations that can be used for common refactoring tasks. They are grouped by category in the Refactoring operations wizard page. You can also access the operations from the Refactoring submenu in the contextual menu of Author or Text mode. The operations are also grouped by category in this submenu. When selecting the operations from the contextual menu, Oxygen XML Editor Eclipse plugin considers the editing context to get the names and namespaces of the current
element or attribute, and uses this information to preconfigure some of the parameter values for the selected refactoring operation.

**Tip:**
Each operation includes a link in the lower part of the wizard that opens the [XML / XSLT-XQuery / XPath](#) preferences page where you can configure XPath options and declare namespace prefixes.

The following built-in operations are available:

**Refactoring Operations for Attributes**

**Add/Change attribute**

Use this operation to change the value of an attribute or insert a new one. This operation allows you to specify the following parameters:

- **Parent element section**
  - **Element**
    - The parent element of the attribute to be changed, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.

- **Attribute section**
  - **Local name**
    - The local name of the affected attribute.
  - **Namespace**
    - The namespace of the affected attribute.
  - **Value**
    - The value for the affected attribute.

- **Options section**
  You can choose between one of the following options for the **Operation mode**:

  - **Add the attribute in the parent elements where it is missing**
    - Adds the attribute to all instances of the specified parent element.
  
  - **Change the value in the parent elements where the attribute already exists**
    - Replaces the value of the already existing attribute in all instance of the specified parent element.

  - **Both**
    - Adds the attributes to the instances where it is missing and replaces the value in instances where the attribute already exists.
Convert attribute to element

Use this operation to convert a specified attribute to an element. This operation allows you to specify the following parameters:

**Parent element section**

**Element**

The parent element of the attribute to be converted, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.

**Attribute section**

**Local name**

The local name of the affected attribute.

**Namespace**

The namespace of the affected attribute.

**New element section**

**Local name**

The local name of the new element.

**Namespace**

The namespace of the new element.

Delete attribute

Use this operation to remove one or more attributes. This operation requires you to specify the following parameters:

**Element**

The parent element of the attribute to be deleted, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.

**Attribute**

The name of the attribute to be deleted.

Rename attribute

Use this operation to rename an attribute. This operation requires you to specify the following parameters:

**Element**

The parent element of the attribute to be renamed, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.
Attribute

The name of the attribute to be renamed.

New local name

The new local name of the attribute.

Replace in attribute value

Use this operation to search for a text fragment inside an attribute value and change the fragment to a new value. This operation allows you to specify the following parameters:

Target attribute section

Element

The parent element of the attribute to be modified, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.

Attribute

The name of the attribute to be modified.

Find / Replace section

Find

The text fragments to find. You can use Perl-like regular expressions.

Replace with

The text fragment to replace the target with. This parameter can bind regular expression capturing groups ($1, $2, etc.) from the find pattern.

Refactoring Operations for Comments

Delete comments

Use this operation to delete comments from one or more elements. This operation requires you specify the following parameter:

Element

The target element (or elements) that will have comments deleted, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.

Note:

Comments that are outside the root element will not be deleted because the serializer preserves the content before and after the root.
Refactoring Operations for DITA Topics

Change topic ID to file name

Use this operation to change the ID of a topic to be the same as its file name.

Convert CALS tables to simple tables

Use this operation to convert DITA CALS tables to simple tables.

Convert DITA 1.3 Maps and Topics to DITA 2.0

Use this operation to convert topics and maps that adhere to the DITA 1.3 standard to the DITA 2.0 standard.

- Changes DOCTYPE declarations and XML Schema/Relax NG schema references.
- DITA Map changes:
  - Removes the `@lockmeta` attribute.
  - Removes the `<topicset>` and `<topicsetref>` elements.
  - Removes the `<anchor>` and `<anchorref>` elements and the `@anchorref` attribute.
  - Migrates the `<navtitle>` attribute as a `<navtitle>` element.
  - Migrates the `@title` attribute as a `<title>` element.
  - Converts the `@copy-to` attribute to a `<resourceid>` element.
  - Replaces the `@print` attribute with an `@deliveryTarget` attribute.
  - Converts topicmeta `<linktext>` to `<linktitle>`.
  - Removed `<hasInstance>`, `<hasKind>`, `<hasNarrower>`, `<hasPart>`, `<hasRelated>`, and `<relatedSubjects>` from subject scheme relationship tables in subject scheme, including `<subjectRelTable>`, `<subjectRelHeader>`, `<subjectRel>`, and `<subjectRole>`.
- DITA task changes:
  - Converts the `<substep>` element to a `<step>` element.
  - Converts the `<substeps>` element to a `<steps>` element.
- DITA topic changes:
  - Removes the `@type` attribute with the value `fastpath`.
  - Converts the `@alt` attribute to an `<alt>` element.
  - Replaces the `<index-sort-as>` element with a `<sort-as>` element.
  - Removes the `<itemgroup>` element.
  - Moves the contents of the `<titlealts>` element inside the `<prolog>`.
  - Removes the `@domains` attribute.
  - Renames `<sectiondiv>` to `<div>`.
  - Remove `@query` attribute from `<link>` element.
  - Remove `@specentry` attribute from `<stentry>` element.
  - Remove the `@spectitle` attribute.

Convert conrefs to conkeyrefs
Use this operation to convert \texttt{@conref} attributes to \texttt{@conkeyref} attributes. For more information and instructions for using this operation, see Converting Conrefs to Conkeyrefs (on page 2463).

**Convert Nested Topics to New Topics (Available from the contextual menu of editable maps/nodes in the DITA Maps Manager (on page 2315))**

Use this operation on topics that contain nested \texttt{<topic>} elements to convert each nested topic to a new topic. Also, the new topics are added in the DITA Maps Manager as the first child topics of the original topic.

**Convert Sections to New Topics (Available from the contextual menu of editable maps/nodes in the DITA Maps Manager (on page 2315))**

Use this operation on topics that contain multiple sections to convert each section to a new topic. Also, the new topics are added in the DITA Maps Manager as the first child topics of the original topic.

**Convert simple tables to CALS tables**

Use this operation to convert DITA simple tables to CALS tables.

**Convert to Concept**

Use this operation to convert a DITA topic (of any type) to a DITA Concept topic type (for example, Topic to Concept). For more information, see Converting DITA Topics to Another Type (on page 2389).

**Convert to General Task**

Use this operation to convert a DITA topic (of any type) to a DITA General Task topic type (for example, Task to General Task). For more information, see Converting DITA Topics to Another Type (on page 2389).

**Convert to Reference**

Use this operation to convert a DITA topic (of any type) to a DITA Reference topic type (for example, Topic to Reference). For more information, see Converting DITA Topics to Another Type (on page 2389).

**Convert to Task**

Use this operation to convert a DITA topic (of any type) to a DITA Task topic type (for example, Topic to Task). For more information, see Converting DITA Topics to Another Type (on page 2389).

**Convert to Topic**

Use this operation to convert a DITA topic (of any type) to a DITA Topic (for example, Task to Topic). For more information, see Converting DITA Topics to Another Type (on page 2389).

**Convert to Troubleshooting**

Use this operation to convert a DITA topic (of any type) to a DITA Troubleshooting topic type (for example, Topic to Troubleshooting). For more information, see Converting DITA Topics to Another Type (on page 2389).
Rename Key

Use this operation to rename a key. It also updates all references to it.

Note:
It does not work on DITA 1.3 key scopes.

Generate IDs

Use this operation to automatically generate unique IDs for elements.

Scope and Filters:

All of the DITA refactoring actions allow you to choose a scope for the operation and some filters:

Scope

Select from a variety of options to define the scope that will have resources affected by the operation. For example, you can choose to affect all resources in the Project, All opened files, Current DITA map hierarchy, or just the Current file.

Filters section

Include files

Specifies files to be excluded from the operation. You can specify multiple files by separating them with commas and the patterns can include wildcards (such as * or ?).

Restrict to known XML file types only

Excludes non-XML file types from the operation.

Refactoring Operations for DITA Maps

Convert DITA Bookmap to Map

Convert a DITA bookmap to a DITA map.

Convert DITA Map to Bookmap

Convert a DITA map to a DITA bookmap.

Change or remove profiling attribute value

Change or remove a value from a DITA profiling attribute. A profiling attribute can have multiple values, separated by spaces (e.g. for platform="windows redhat", you can change the current redhat value to linux). Select the name of the profiling attribute, the current value to replace, and the new value. If the new value is left empty, the current value is removed from the profiling attribute. The new value is modified and reflected in DITA maps, DITA topics, and DITAVAL files.

Define keys for all topic references

This refactoring action is useful for converting links inside a DITA project from direct to indirect key-based addressing. When applied on DITA resources from your project (DITA maps and
topics), this refactoring action defines keys for all of a DITA map's topic references based on the referenced file name and converts each direct reference to a key reference in each DITA topic. If a topic references already has keys defined, the action does not define new ones. Inside the DITA topics, whenever there is a link element (<xref> or <link>) with a direct reference to another DITA topic or an element with a @conref, the action attempts to convert them to indirect key-based addressing. The refactoring action may introduce linking errors or create duplicate keys so it is advised to run the Validate and check for completeness action from the DITA Maps Manager toolbar to manually fix those problems. You can enable the Report duplicate keys checkbox to also report any keys that are defined more than once.

**Scope and Filters:**

All of the DITA refactoring actions allow you to choose a scope for the operation and some filters:

**Scope**

Select from a variety of options to define the scope that will have resources affected by the operation. For example, you can choose to affect all resources in the **Project, All opened files, Current DITA map hierarchy**, or just the **Current file**.

**Filters section**

**Include files**

Specifies files to be excluded from the operation. You can specify multiple files by separating them with commas and the patterns can include wildcards (such as * or ?).

**Restrict to known XML file types only**

Excludes non-XML file types from the operation.

**Refactoring Operations for Elements**

**Delete element**

Use this operation to delete elements. This operation requires you to specify the following parameter:

**Element**

The target element to be deleted, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.

**Delete element content**

Use this operation to delete the content of elements. This operation requires you to specify the following parameter:

**Element**
The target element whose content is to be deleted, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.

**Insert element**

Use this operation to insert new elements. This operation allows you to specify the following parameters:

**Element section**

**Local name**

The local name of the element to be inserted.

**Namespace**

The namespace of the element to be inserted.

**Location section**

**XPath**

An XPath expression that identifies an existing element to which the new element is relative, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.

**Position**

The position where the new element will be inserted, in relation to the specified existing element. The possible selections in the drop-down menu are: After, Before, First child, or Last child.

**Rename element**

Use this operation to rename elements. This operation requires you to specify the following parameters:

**Target elements (XPath)**

The target elements to be renamed, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.

**New local name**

The new local name of the element.

**Unwrap element**

Use this operation to remove the surrounding tags of elements, while keeping the content unchanged. This operation requires you to specify the following parameter:

**Target elements (XPath)**
The target elements whose surrounding tags will be removed, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.

Wrap element

Use this operation to surround elements with element tags. This operation allows you to specify the following parameters:

Target elements (XPath)

The target elements to be surrounded with tags, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.

Wrapper element section

Local name

The local name of the Wrapper element.

Namespace

The namespace of the Wrapper element.

Wrap element content

Use this operation to surround the content of elements with element tags. This operation allows you to specify the following parameters:

Target elements (XPath)

The target elements whose content will be surrounded with tags, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.

Wrapper element section

Local name

The local name of the Wrapper element that will surround the content of the target.

Namespace

The namespace of the Wrapper element that will surround the content of the target.

Refactoring Operations for Fragments

Insert XML fragment

Use this operation to insert an XML fragment. This operation allows you to specify the following:

XML Fragment
The XML fragment to be inserted.

Location section

XPath

An XPath expression that identifies an existing element to which the inserted fragment is relative, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.

Position

The position where the fragment will be inserted, in relation to the specified existing element. The possible selections in the drop-down menu are: After, Before, First child, or Last child.

Replace element content with XML fragment

Use this operation to replace the content of elements with an XML fragment. This operation allows you to specify the following parameters:

Target elements (XPath)

The target elements whose content will be replaced, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.

XML Fragment

The XML fragment with which to replace the content of the target element.

Replace element with XML fragment

Use this operation to replace elements with an XML fragment. This operation allows you to specify the following parameters:

Target elements (XPath)

The target elements to be replaced, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.

XML Fragment

The XML fragment with which to replace the target element.

Refactoring Operations for JATSKit

Add BITS DOCTYPE - NLM/NCBI Book Interchange 2.0

Use this operation to add an NLM 'BITS' 2.0 DOCTYPE declaration.

Add Blue DOCTYPE - NISO JATS Publishing 1.1

Use this operation to add a JATS 'Blue' 1.1 DOCTYPE declaration.
Normalize IDs

Use this operation to normalize assigned IDs and assigned IDs to elements that are missing them.

All of these JATSKit refactoring actions allow you to choose a scope for the operation and some filters:

Scope

Select from a variety of options to define the scope for the resources that will be affected by the operation. For example, you can choose to affect all resources in the Project, All opened files, or just the Current file.

Filters section

Include files

Specifies files to be excluded from the operation. You can specify multiple files by separating them with commas and the patterns can include wildcards (such as * or ?).

Restrict to known XML file types only

Excludes non-XML file types from the operation.

Refactoring Operations for Processing Instructions

Accept all tracked changes, remove all Oxygen-specific comments and highlights

Use this operation to accept all application-specific tracked changes (from elements and attributes) or remove all application-specific comments or highlights. There are several options to choose from:

Accept all tracked changes

Accepts all application-specific tracked changes (from elements and attributes).

Remove comments

Removes all application-specific comments.

Remove highlights

Removes all application-specific highlights.

Delete processing instructions

Use this operation to delete all processing instructions that have a certain target name from the processed documents. This operation requires you to specify the following parameter:

Processing instruction target

The target name of the processing instructions to delete.
Note:
Processing instructions that are outside the root element are not deleted because the serializer preserves the content before and after the root.

Refactoring Operations for Publishing Template

These operations are for those who use Oxygen Publishing Templates for WebHelp Responsive output customization.

Migrate HTML Page Layout Files to v21

Use this operation to convert custom HTML page layout files (on page 1359) that are included in a custom Publishing Template that was created in Oxygen XML Editor Eclipse plugin version 20.0 or 20.1 so that they will be compatible with Oxygen XML Editor Eclipse plugin version 21.0.

Migrate HTML Page Layout Files to v22

Use this operation to convert custom HTML page layout files (on page 1359) that are included in a custom Publishing Template that was created in Oxygen XML Editor Eclipse plugin versions 20.0 - 21.1 so that they will be compatible with Oxygen XML Editor Eclipse plugin version 22.0.

Update HTML Pages

Attention:
This operation is only used by Oxygen XML Editor Eclipse plugin and should not be used manually.

Additional Notes:

• There are some operations that allow `<ANY>` for the local name and namespace parameters. This value can be used to select an element or attribute regardless of its local name or namespace. Also, the `<NO_NAMESPACE>` value can be used to select nodes that do not belong to a namespace.

• Some operations have parameters that accept XPath expressions to match elements or attributes. In these XPath expressions you can only use the prefixes declared in the Options > Preferences > XML > XSLT-XQUERY > XPath (on page 203) page. This preferences page can be easily opened by clicking the link in the note (Each prefix used in an XPath expression must be declared in the Default prefix-namespace mappings section) at the bottom of the Configure Operation Parameters wizard page.

Custom Refactoring Operations

While Oxygen XML Editor Eclipse plugin includes a variety of built-in XML refactoring operations to help you accomplish particular tasks, you can also create custom operations according to your specific needs. For
example, you could create a custom refactoring operation to convert an attribute to an element and insert the element as the first child of the parent element.

An XML Refactoring operation is defined as a pair of resources:

- An XQuery Update script or XSLT stylesheet that Oxygen XML Editor Eclipse plugin will run to refactor the XML files.
- An XML Operation Descriptor file that contains information about the operation (such as the name, description, and parameters).

**Figure 545. Diagram of an XML Refactoring Operation**

All the defined custom operations are loaded by the XML Refactoring Tool and presented in the Refactoring Operations wizard page (on page 608), along with the built-in operations.

After the user chooses an operation and specifies its parameters, Oxygen XML Editor Eclipse plugin processes an XQuery Update or XSLT transformation over the input file. This transformation is executed in a **safe mode**, which implies the following:

- When loading the document:
  - The **XInclude** mechanism is disabled. This means that the resources included by using XInclude will not be visible in the transformation.
  - The DTD entities will be processed without being expanded.
  - The associated DTD will be not loaded, so the default attributes declared in the DTD will not be visible in the transformation.
• When saving the updated XML document:
  ◦ The DOCTYPE will be preserved.

  ![Note:]
  This can be changed using Saxon extension functions in XSLT (on page 640).

  ◦ The DTD entities will be preserved as they are in the original document when the document is saved.
  ◦ The attribute values will be kept in their original form without being normalized.
  ◦ The spaces between attributes are preserved. Basically, the spaces are lost by a regular XML serialization since they are not considered important.

The result of this transformation overrides the initial input file.

  ![Note:]
  To achieve some of the previous goals, the XML Refactoring mechanism adds several attributes that are interpreted internally. The attributes belong to the http://www.oxygenxml.com/ns/xmlRefactoring/additional_attributes namespace. These attributes should not be taken into account when processing the input XML document since they are discarded when the transformed document is serialized.

  ![Restriction:]
  Comments or processing instructions that are in any node before or after the root element cannot be modified by an XML Refactoring operation. In other words, XML Refactoring operations can only be applied on the root element and the nodes inside it. However, as a work around to this limitation, you can use Saxon extension functions and the XSLT stylesheet method (on page 640) to implement the new custom XML refactoring operation.

Creating a Custom Refactoring Operation

To create a custom refactoring operation, follow these steps:

1. Create an XQuery Update script (on page 630) or XSLT stylesheet file (on page 635).
2. Create an XML refactoring operation descriptor file, that references the above script, as explained in these sections: Example descriptor file for an XQuery Update script (on page 633) or Example descriptor file for an XSLT stylesheet (on page 638).
3. Store both files in one of the locations that Oxygen XML Editor Eclipse plugin (on page 642) scans when loading the custom operations.

  **Result:** Once you run the XML Refactoring tool again, the custom operation appears in the Refactoring Operations wizard page (on page 608).
Custom Refactoring Script

The first step in creating a custom refactoring operation is to create an XQuery Update script (on page 630) or XSLT stylesheet (on page 635) that is needed to process the refactoring operations. The easiest way to create this script file is to use the New document wizard to create a new XQuery or XSLT file and you can use the XQuery method example (on page 630) or XSLT method example (on page 635) to help you with the content.

There are cases when it is necessary to add parameters in the XQuery script (on page 630) or XSLT stylesheet (on page 635). For instance, if you want to rename an element, you may want to declare an external parameter associated with the name of the element to be renamed. To allow you to specify the value for these parameters, they need to be declared in the refactoring operation descriptor file that is associated with this operation.

Note:
The XQuery Update processing is disabled by default in Oxygen XML Editor Eclipse plugin. Thus, if you want to create or edit an XQuery Update script you have to enable this mechanism by creating an XQuery transformation scenario (on page 1272) and choose Saxon EE as the transformation engine. Also, you need to make sure the Enable XQuery update option is selected in the Saxon processor advanced options (on page 1223).

Note:
If you are using an XSLT file, XPath expressions that are passed as parameters will automatically be rewritten to conform with the mapping of the namespace prefixes declared in the XML /XSLT- XQuery / XPath preferences page (on page 203).

The next step in creating a custom refactoring operation is to create an XML Refactoring Operation Descriptor file contains the path to the XQuery Update script (on page 633) or XSLT stylesheet (on page 638).

Related Information:
XQuery Update Script for Creating a Custom Operation (on page 630)
XSLT Stylesheet for Creating a Custom Operation (on page 635)

Custom Refactoring Operation Descriptor File

The second step in creating a custom refactoring operation is to create an operation descriptor file. The easiest way to do this is to use the New document wizard and choose the XML Refactoring Operation Descriptor template.
Introduction to the Descriptor File

This descriptor file root element specifies required attributes to define the operation @name, @description, and @id which are necessarily when loading an XML Refactoring operation. It also contains the path to the XQuery Update script (on page 630) or XSLT stylesheet (on page 635) that is associated with the particular operation through the <script> element.

The optional @filesFilter attribute can be specified to filter the resources by using a file pattern or list of file patterns separated by a comma (for example: filesFilter="*.dita, *.xml"). When set, its value is automatically populated in the Include files field within the Scope and Filters wizard page (on page 610) as a default value.

You can specify a category for your custom operations to logically group certain operations. The <category> element is optional and if it is not included in the descriptor file, the default name of the category for the custom operations is Other operations.

The descriptor file is edited and validated against the following schema: frameworks/xml_refactoring/operation_descriptor.xsd.

Declaring Parameters in the Descriptor File

If the XQuery Update script or XSLT stylesheet includes parameters, they should be declared in the parameters section of the descriptor file. All the parameters specified in this section of the descriptor file will be displayed in the XML Refactoring tool within the Configure Operation Parameters wizard page (on page 608) for that particular operation.

The value of the first <description> element in the <parameters> section will be displayed at the top of the Configure Operation Parameters wizard page (on page 608).

To declare a parameter, specify the following information:

- **label** - This value is displayed in the user interface for the parameter.
- **name** - The parameter name used in the XQuery Update script or XSLT stylesheet and it should be the same as the one declared in the script.
- **type** - Defines the type of the parameter and how it will be rendered. There are several types available:
  - TEXT - Generic type used to specify a simple text fragment.
  - XPATH - Type of parameter whose value is an XPATH expression. For this type of parameter, Oxygen XML Editor Eclipse plugin will use a text input with corresponding content completion and syntax highlighting.

**Note:**
The value of this parameter is transferred as plain text to the XQuery Update or XSLT transformation without being evaluated. You should evaluate the XPath expression inside the XQuery Update script or XSLT stylesheet. For example, you could use the saxon:evaluate Saxon extension function.
Note:
A relative XPath expression is converted to an absolute XPath expression by adding `//` before it (`//XPathExp`). This conversion is done before transferring the XPath expression to the XML refactoring engine.

Note:
When writing XPath expressions, you can only use prefixes declared in the Options > Preferences > XML > XSLT-XQuery > XPath (on page 203) options page.

- **NAMESPACE** - Used for editing namespace values.
- **REG_EXP_FIND** - Used when you want to match a certain text by using Perl-like regular expressions.
- **REG_EXP_REPLACE** - Used along with **REG_EXP_FIND** to specify the replacement string.
- **XML_FRAGMENT** - This type is used when you want to specify an XML fragment. For this type, Oxygen XML Editor Eclipse plugin will display a text area specialized for inserting XML documents.
- **NC_NAME** - The parameter for `NC_NAME` values. It is useful when you want to specify the local part of a QName (on page 2657) for an element or attribute.
- **BOOLEAN** - Used to edit boolean parameters.
- **TEXT_CHOICE** - It is useful for parameters whose value should be from a list of possible values. Oxygen XML Editor Eclipse plugin renders each possible value as a radio button option.

  - **optional** - Specifies whether the parameter is optional or required. For optional parameters, the end user is not required to fill in a value in the XML refactoring wizard.
  - **description** - The description of the parameter. It is used by the application to display a tooltip when you hover over the parameter.
  - **possibleValues** - Contains the list with possible values for the parameter and you can specify the default value, as in the following example:

```xml
<possibleValues onlyPossibleValuesAllowed="true">
  <value name="before">Before</value>
  <value name="after" default="true">After</value>
  <value name="firstChild">First child</value>
  <value name="lastChild">Last child</value>
</possibleValues>
```

On a `<value>`, you can specify the `@default` attribute with the value `true` to mark it as the default presented value in the XML refactoring wizard. The text specified inside the `<value>` element is displayed as placeholder default text in the text entry box. If the dialog box is accepted with the placeholder text in place, the `@name` attribute value is passed to the refactoring script. Example:

```xml
<value name="my-actual-default-value" default="true">[default displayed]</value>
```
**Specialized Parameters to Match Elements or Attributes**

If you want to match elements or attributes, you can use some specialized parameters, in which case Oxygen XML Editor Eclipse plugin will propose all declared elements or attributes based on the schema associated with the currently edited file. The following specialized parameters are supported:

**elementLocation**

This parameter is used to match elements. For this type of parameter, the application displays a text field where you can enter the element name or an XPath expression. The text from the `@label` attribute is displayed in the application as the label of the text field. The `@name` attribute is used to specify the name of the parameter from the XQuery Update script or XSLT stylesheet. If the value of the `@useCurrentContext` attribute is set to `true`, the element name from the cursor position is used as proposed values for this parameter.

Example of an `<elementLocation>`:

```
<elementLocation name="elem_loc" useCurrentContext="false">
  <element label="Element location">
    <description>Element location description.</description>
  </element>
</elementLocation>
```

**attributeLocation**

This parameter is used to match attributes. For this type of parameter, the application displays two text fields where you can enter the parent element name and the attribute name (both text fields accept XPath expressions for a finer match). The text from the `@label` attributes is displayed in the application as the label of the associated text fields. The `@name` attribute is used to specify the name of the parameter from the XQuery Update script or XSLT stylesheet. The value of this parameter is an XPath expression that is computed by using the values of the expression from the `element` and `attribute` text fields. For example, if `section` is entered for the element and a `title` is entered for the attribute, the XPath expression would be computed as `//section/@title`. If the value of the `useCurrentContext` attribute is set to `true`, the element and attribute name from the cursor position is used as proposed values for the operation parameters.

Example of an `<attributeLocation>`:

```
<attributeLocation name="attr_xpath" useCurrentContext="true">
  <element label="Element path">
    <description>Element path description.</description>
  </element>
  <attribute label="Attribute">
    <description>Attribute path description.</description>
  </attribute>
</attributeLocation>
```
**elementParameter**

This parameter is used to specify elements by local name and namespace. For this type of parameter, the application displays two combo boxes with elements and namespaces collected from the associated schema of the currently edited file. The text from the `@label` attribute is displayed in the application as label of the associated combo. The `@name` attribute is used to specify the name of the parameter from the XQuery Update script or XSLT stylesheet. If you specify the `@allowsAny` attribute, the application will propose `<ANY>` as a possible value for the **Name** and **Namespace** combo boxes. You can also use the `@useCurrentContext` attribute and if its value is set to `true`, the element name and namespace from the cursor position is used as proposed values for the operation parameters.

Example of an `<elementParameter>`:

```xml
<elementParameter id="elemID" useCurrentContext="true">
  <localName label="Name" name="element_localName" allowsAny="true">
    <description>Local name of the parent element.</description>
  </localName>
  <namespace label="Namespace" name="element_namespace" allowsAny="true">
    <description>Local name of the parent element</description>
  </namespace>
</elementParameter>
```

**attributeParameter**

This parameter is used to specify attributes by local name and namespace. For this type of parameter, the application displays two combo boxes with attributes and their namespaces collected from the associated schema of the currently edited file. The text from the `@label` attribute is displayed in the application as the label of the associated combo box. You can also use the `@useCurrentContext` attribute and if its value is set to `true`, the attribute name and namespace from the cursor position is used as proposed values for the operation parameters.

**Note:**

An `<attributeParameter>` is dependant upon an `<elementParameter>`. The list of attributes and namespaces are computed based on the selection in the `elementParameter` combo boxes.

Example of an `<attributeParameter>`:

```xml
<attributeParameter dependsOn="elemID" useCurrentContext="true">
  <localName label="Name" name="attribute_localName">
    <description>The name of the attribute to be converted.</description>
  </localName>
  <namespace label="Namespace" name="attribute_namespace" allowsAny="true">
    <description>Namespace of the attribute to be converted.</description>
  </namespace>
</attributeParameter>
```
Grouping Parameters in the Descriptor File

You can use `<section>` elements to group related parameters in the descriptor file:

```xml
<section label="Parent element">
  <elementParameter id="elemID">
    <localName label="Name" name="element_localName" allowsAny="true">
      <description>Local name of the parent element.</description>
    </localName>
    <namespace label="Namespace" name="element_namespace" allowsAny="true">
      <description>Local name of the parent element</description>
    </namespace>
  </elementParameter>
</section>
```

Note:
All built-in operations are loaded from the `{OXYGEN_INSTALL_DIR}/refactoring` folder.

XSLT Stylesheet for Creating a Custom Operation

To demonstrate creating a custom operation, suppose that you have a task where you need to convert an attribute into an element and insert it inside another element. A specific example would be if you have a project with a variety of `<image>` elements where a deprecated `@alt` attribute was used for the description and you want to convert all instances of that attribute into an element with the same name and insert it as the first child of the `<image>` element.

Thus, the task is to convert this attribute into an element with the same name and insert it as the first child of the image element.
An XSLT stylesheets can be used to implement the new custom XML refactoring operation. The second requirement is an XML Refactoring operation descriptor file (on page 2228) that contains the path to the XSLT stylesheet.

**Example of an XSLT Script for Creating a Custom Operation to Convert an Attribute to an Element**

The XSLT stylesheet does the following:

- Iterates over all elements from the document that have the specified local name and namespace.
- Finds the attribute that will be converted to an element.
- Adds the new element as the first child of the parent element.

```xml
<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
    xmlns:xs="http://www.w3.org/2001/XMLSchema"
    exclude-result-prefixes="xs"
    xmlns:xr="http://www.oxygenxml.com/ns/xmlRefactoring"
    version="2.0">

    <xsl:param name="element_localName" as="xs:string" required="yes"/>
    <xsl:param name="element_namespace" as="xs:string" required="yes"/>
    <xsl:param name="attribute_localName" as="xs:string" required="yes"/>
    <xsl:param name="attribute_namespace" as="xs:string" required="yes"/>
    <xsl:param name="new_element_localName" as="xs:string" required="yes"/>
```
<xsl:param name="new_element_namespace" as="xs:string" required="yes"/>

<xsl:template match="node() | @*">
  <xsl:copy>
    <xsl:apply-templates select="node() | @*"/>
  </xsl:copy>
</xsl:template>

<xsl:template match="/*[xr:check-local-name($element_localName, ., true())
  and
  xr:check-namespace-uri($element_namespace, .)]">
  <xsl:variable name="attributeToConvert"
    select="@*[xr:check-local-name($attribute_localName, ., true())
    and
    xr:check-namespace-uri($attribute_namespace, .)]"/>

  <xsl:choose>
    <xsl:when test="empty($attributeToConvert)">
      <xsl:copy>
        <xsl:apply-templates select="node() | @*"/>
      </xsl:copy>
    </xsl:when>
    <xsl:otherwise>
      <xsl:copy>
        <xsl:for-each select="@*[empty(. intersect $attributeToConvert)]">
          <xsl:copy-of select="."/>
        </xsl:for-each>
      </xsl:copy>
    </xsl:otherwise>
  </xsl:choose>

  <!-- The new element namespace -->
  <xsl:variable name="nsURI" as="xs:string">
    <xsl:choose>
      <xsl:when test="$new_element_namespace eq $xr:NO-NAMESPACE">
        <xsl:value-of select="''"/>
      </xsl:when>
      <xsl:otherwise>
        <xsl:value-of select="$new_element_namespace"/>
      </xsl:otherwise>
    </xsl:choose>
  </xsl:variable>

  <xsl:element name="{$new_element_localName}" namespace="{$nsURI}">
    <xsl:value-of select="$attributeToConvert"/>
  </xsl:element>
</xsl:template>

<xsl:apply-templates select="node()"/>
Note:
The XSLT stylesheet imports a module library that contains utility functions and variables. The location of this module is resolved via an XML Catalog (on page 2659) set in the XML Refactoring framework (on page 2655).

Example of an Operation Descriptor File That References the XSLT Stylesheet for Creating a Custom Operation to Convert an Attribute to an Element

After you have developed the XSLT stylesheet (for example, named `convert-attribute-to-element.xsl`), you have to create an XML Refactoring operation descriptor (for example, named `convert-attribute-to-element.xml`) that references the stylesheet and provides descriptions and possible values for its parameters. This descriptor is used by the application to load the operation details such as name, description, or parameters.

```xml
<?xml version="1.0" encoding="UTF-8"?>
<refactoringOperationDescriptor
    xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
    xmlns="http://www.oxygenxml.com/ns/xmlRefactoring"
    id="convert-attribute-to-element"
    name="Convert attribute to element">
    <description>Converts the specified attribute to an element. The new element will be inserted as first child of the attribute's parent element.</description>
    <script type="XSLT" href="convert-attribute-to-element.xsl"/>
    <parameters>
        <description>Specify the attribute to be converted to element.</description>
        <section label="Parent element">
            <elementParameter id="elemID">
                <localName label="Name" name="element_localName" allowsAny="true">
                    <description>Local name of the parent element.</description>
                </localName>
                <namespace label="Namespace" name="element_namespace" allowsAny="true">
                    <description>Local name of the parent element</description>
                </namespace>
            </elementParameter>
        </section>
    </parameters>
</refactoringOperationDescriptor>
```
<section label="Attribute">
  <attributeParameter dependsOn="elemID">
    <localName label="Name" name="attribute_localName">
      <description>Name of the attribute to be converted.</description>
    </localName>
    <namespace label="Namespace" name="attribute_namespace" allowsAny="true">
      <description>Namespace of the attribute to be converted.</description>
    </namespace>
  </attributeParameter>
</section>

<section label="New element">
  <elementParameter>
    <localName label="Name" name="new_element_localName">
      <description>The name of the new element.</description>
    </localName>
    <namespace label="Namespace" name="new_element_namespace">
      <description>The namespace of the new element.</description>
    </namespace>
  </elementParameter>
</section>

Note:
If you are using an XSLT file, the line with the <script> element would look like this:

```xml
<script type="XSLT" href="convert-attribute-to-element.xsl"/>
```

The code exemplified above and other refactoring examples can be found on the DITA Refactoring GitHub sample project.

Results

After you have created these files, copy them into a folder scanned by Oxygen XML Editor Eclipse plugin when it loads the custom operation (on page 642). When the XML Refactoring tool is started again, you will see the created operation.

Since various parameters can be specified, this custom operation can also be used for other similar tasks. The following image shows the parameters that can be specified in the example of the custom operation to convert an attribute to an element:
Using Saxon Extension Functions to Allow Custom Refactoring Operations to Read and Modify Content Outside the Root Node

One advantage to using an XSLT stylesheet is that there is limitation when using an XQuery Update script (on page 630) in that refactoring operations can only be performed on comments or processing instructions that are inside the root element. Thus, using the XQuery method, comments or processing instructions that are in any node before or after the root element cannot be modified by an XML Refactoring operation.

The XSLT stylesheet method offers a work-around to this limitation through the use of some Saxon extension functions.

To illustrate the use of these functions, consider the following sample XML file:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<!-- comment before root -->
<?pi before root ?>
<root>
  <child></child>
</root>
<!-- comment after root -->
<?pi after root ?>
```

The following Saxon extension functions can be used to read and modify content outside the root node:

Note: They belong to the http://www.oxygenxml.com/ns/xmlRefactoring/functions namespace.
• **get-content-after-root()** - Returns the content after root as `xs:string`.

For the XML above, the call of this function will return the following string value:

```xml
g <!-- comment after root -->
<pi after root ?>
```

• **set-content-after-root(xs:string)** - Updates the content that will be serialized in the refactored document after the root node.

The function call `set-content-after-root('<!-- Inserted comment -->')` will result in replacing the nodes after the root element with the comment passed as string argument. The XML document will be modified as follows:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<!-- comment before root -->
<?pi before root ?>
<root>
  <child/>
</root>
<!-- Inserted comment -->
```

• **get-content-before-root()** - Returns the content before root as `xs:string`.

For the XML above, the call of this function will return the following string value:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<!-- comment before root -->
<?pi before root ?>
```

• **set-content-before-root(xs:string)** - Updates the content that will be serialized in the refactored document after the root node.

The function call `set-content-before-root('<!-- Inserted comment -->')` will result in replacing the nodes before the root element with the comment passed as string argument. The XML document will be modified as follows:

```xml
<!-- Inserted comment -->
<root>
  <child/>
</root>
<!-- comment after root -->
<?pi after root ?>
```

**XSLT Example:**

To process content after the root node, the XSLT would look like this:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
xmns:xs="http://www.w3.org/2001/XMLSchema" exclude-result-prefixes="xs"
<xsl:template match="/">
  <!-- The comment content that will be inserted after the root element -->
  <xsl:variable name="commentAsText"><!-- COMMENT ADDED FROM XR OPERATION-->
  </xsl:variable>
  <!-- Retrieve the content after the root element as is -->
  <xsl:variable name="after-root-content" as="xs:string"
    select="xrf:get-content-after-root()"/>
  <xsl:variable name="processedContent"
    select="concat($after-root-content, $commentAsText)"/>
  <!-- Update the content after the root element -->
  <xsl:value-of select="xrf:set-content-after-root($processedContent)"/>
</xsl:template>

<xsl:template match="node() | @*">
  <xsl:copy>
    <xsl:apply-templates select="node() | @*"/>
  </xsl:copy>
</xsl:template>

<xsl:stylesheet xmlns:xrf="http://www.oxygenxml.com/ns/xmlRefactoring/functions" version="3.0">
  <xsl:template match="/">
    <!-- The comment content that will be inserted after the root element -->
    <xsl:variable name="commentAsText"><!-- COMMENT ADDED FROM XR OPERATION-->
    </xsl:variable>
    <!-- Retrieve the content after the root element as is -->
    <xsl:variable name="after-root-content" as="xs:string"
      select="xrf:get-content-after-root()"/>
    <xsl:variable name="processedContent"
      select="concat($after-root-content, $commentAsText)"/>
    <!-- Update the content after the root element -->
    <xsl:value-of select="xrf:set-content-after-root($processedContent)"/>
  </xsl:template>
</xsl:stylesheet>

Note:
The above XSLT retrieves the nodes after the root element as string, appends a new comment, and then sets back the updated content into the XML document.

Storing and Sharing Refactoring Operations
Oxygen XML Editor Eclipse plugin scans the following locations when looking for XML Refactoring operations to provide flexibility:

- A folder named refactoring, created inside the folder of the framework you are customizing. In the Classpath tab of the Document type configuration dialog box (on page 95), you need to add a reference to the refactoring folder specific for the framework.
- A folder that you specify in the Load additional refactoring operations from text box (on page 196) in the XML Refactoring preferences page (on page 196).
- The refactoring folder from the Oxygen XML Editor Eclipse plugin installation directory ([OXYGEN_INSTALL_DIR]/refactoring/).
Sharing Custom Refactoring Operations

The purpose of Oxygen XML Editor Eclipse plugin scanning multiple locations for the XML Refactoring operations is to provide more flexibility for developers who want to share the refactoring operations with the other team members. Depending on your particular use case, you can attach the custom refactoring operations to other resources, such as framework (on page 2655) or projects.

After storing custom operations, you can share them with other users by sharing the resources.

Localizing XML Refactoring Operations

Oxygen XML Editor Eclipse plugin includes localization support for the XML refactoring operations.

The translation keys for the built-in refactoring operations are located in 
{OXYGEN_INSTALL_DIR}/refactoring/i18n/translation.xml.

The localization support is also available for custom refactoring operations. The following information can be translated:

- The operation name, description, and category.
- The <description> of the <parameters> element.
- The label, description, and possibleValues for each parameter.

Translated refactoring information uses the following form:

${i18n(translation_key)}

Oxygen XML Editor Eclipse plugin scans the following locations to find the translation.xml files that are used to load the translation keys:

- A refactoring/i18n folder, created inside a directory that is associated to a customized framework.
- A i18n folder, created inside a directory that is associated to a customized framework.
- An i18n folder inside any specified folder. In this case, you need to open the Preferences dialog box (on page 70), go to XML > XML Refactoring, and specify the folder in the Load additional refactoring operations from text box.
- The refactoring/i18n folder from the Oxygen XML Editor Eclipse plugin installation directory (/OXYGEN_INSTALL_DIR)/refactoring/i18n).

Example: Refactoring Operation Descriptor File with i18n Support

```xml
<?xml version="1.0" encoding="UTF-8"?>

<refactoringOperationDescriptor
     xmlns="http://www.oxygenxml.com/ns/xmlRefactoring" id="remove_text_content"
     name="${i18n(Remove_text_content)}">
     <description>${i18n(Remove_text_content_description)}</description>
     <script type="XQUERY_UPDATE" href="remove_text_content.xq"/>
</refactoringOperationDescriptor>
```
Generating Sample XML Files

Oxygen XML Editor Eclipse plugin offers support to generate sample XML files both from XML schema 1.0 and XML schema 1.1, depending on the XML schema version set in XML Schema preferences page (on page 195).

To generate sample XML files from an XML Schema, use the Generate Sample XML Files action from the XML Tools menu. This action is also available in the contextual menu of the schema Design mode (on page 704). The action opens the Generate Sample XML Files dialog box that allows you to configure a variety of options for generating the files.

The Generate Sample XML Files dialog box contains three tabs with various configurable options. Default values for these options can be set in the Sample XML Files Generator preferences page (on page 187).

Schema Tab

The first set of options for the Generate Sample XML Files tool are found in the Schema tab.
This tab includes the following options:

**URL**

Specifies the URL of the Schema location. You can specify the path by using the text field, the history drop-down menu, or the browsing actions in the `Browse` drop-down list.

**Namespace**

Displays the namespace of the selected schema.

**Root Element**

After the schema is selected, this drop-down menu is populated with all root candidates gathered from the schema. Choose the root of the output XML documents.

**Output folder**

Path to the folder where the generated XML instances will be saved.

**Filename prefix and Extension**

You can specify the prefix and extension for the file name that will be generated. Generated file names have the following format: `prefixN.extension`, where `N` represents an incremental number from 0 up to the specified **Number of instances**.

**Number of instances**

The number of XML files to be generated.
Open first instance in editor

When selected, the first generated XML file is opened in the editor.

Namespaces section

You can specify the Default Namespace, as well as the prefixes for the namespaces.

Export settings

Use this button to save the current settings for future use.

Import settings

Use this button to load previously exported settings.

You can click OK at any point to generate the sample XML files.

Options Tab

The Options tab allows you to set specific options for namespaces and elements.

Figure 549. Generate Sample XML Files Dialog Box (Options Tab)

This tab includes the following options:
**Namespace / Element table**

Allows you to set a namespace for each element name that appears in an XML document instance. The following prefix-to-namespace associations are available:

- All elements from all namespaces (< ANY > - < ANY >). This is the default setting.
- All elements from a specific namespace.
- A specific element from a specific namespace.

**Settings subtab**

**Namespace**

Displays the namespace specified in the table at the top of the dialog box.

**Element**

Displays the element specified in the table at the top of the dialog box.

**Generate optional elements**

When selected, all elements are generated, including the optional ones (having the minOccurs attribute set to 0 in the schema).

**Generate optional attributes**

When selected, all attributes are generated, including the optional ones (having the use attribute set to optional in the schema).

**Values of elements and attributes**

Controls the content of generated attribute and element values. The following choices are available:

- **None** - No content is inserted.
- **Default** - Inserts a default value depending on the data type descriptor of the particular element or attribute. The default value can be either the data type name or an incremental name of the attribute or element (according to the global option from the Sample XML Files Generator preferences page). Note that type restrictions are ignored when this option is selected. For example, if an element is of a type that restricts an xs:string with the xs:maxLength facet to allow strings with a maximum length of 3, the XML instance generator tool may generate string element values longer than 3 characters.
- **Random** - Inserts a random value depending on the data type descriptor of the particular element or attribute.

⚠️ **Important:**

If all of the following are true, the Generate Sample XML Files tool outputs invalid values:
At least one of the restrictions is a regexp.

The value generated after applying the regexp does not match the restrictions imposed by one of the facets.

**Preferred number of repetitions**

Allows you to set the preferred number of repeating elements related to `minOccurs` and `maxOccurs` facets defined in the XML Schema.

- If the value set here is between `minOccurs` and `maxOccurs`, then that value is used.
- If the value set here is less than `minOccurs`, then the `minOccurs` value is used.
- If the value set here is greater than `maxOccurs`, then `maxOccurs` is used.

**Maximum recursion level**

If a recursion is found, this option controls the maximum allowed depth of the same element.

**Type alternative strategy**

Used for the `<xs:alternative>` element from XML Schema 1.1. The possible strategies are:

- **First** - The first valid alternative type is always used.
- **Random** - A random alternative type is used.

**Choice strategy**

Used for `<xs:choice>` or `<substitutionGroup>` elements. The possible strategies are:

- **First** - The first branch of `<xs:choice>` or the head element of `<substitutionGroup>` is always used.
- **Random** - A random branch of `<xs:choice>` or a substitute element or the head element of a `<substitutionGroup>` is used.

**Generate the other options as comments**

If selected, generates the other possible choices or substitutions (for `<xs:choice>` and `<substitutionGroup>`). These alternatives are generated inside comments groups so you can uncomment and use them later. Use this option with care (for example, on a restricted namespace and element) as it may generate large result files.

**Element values subtab**

Allows you to add values that are used to generate the content of elements. If there are multiple values, then the values are used in a random order.

**Attribute values subtab**
Allows you to add values that are used to generate the content of attributes. If there are multiple values, then the values are used in a random order.

**Export settings**

Use this button to save the current settings for future use.

**Import settings**

Use this button to load previously exported settings.

You can click **OK** at any point to generate the sample XML files.

**Advanced Tab**

The **Advanced** tab allows you to set some options regarding output values and performance.

**Figure 550. Generate Sample XML Files Dialog Box (Advanced Tab)**

![Generate Sample XML Files Dialog Box (Advanced Tab)](image)

This tab includes the following options:

**Use incremental attribute / element names as default**

If selected, the value of an element or attribute starts with the name of that element or attribute. For example, for an `<a>` element the generated values are: `a1, a2, a3`, and so on. If not selected, the value is the name of the type of that element / attribute (for example: `string, decimal, etc.`)

**Maximum length**

The maximum length of string values generated for elements and attributes.

**Discard optional elements after nested level**

The optional elements that exceed the specified nested level are discarded. This option is useful for limiting deeply nested element definitions that can quickly result in very large XML documents.

**Export settings**

Use this button to save the current settings for future use.

**Import settings**

Use this button to load previously exported settings.
Tip:
This function can be executed from an automated command-line script, for more details, see Scripting Oxygen (on page 2618).

Converting Schema to Another Schema Language

The Generate/Convert Schema tool allows you to convert a DTD or Relax NG (full or compact syntax) schema or a set of XML files to an equivalent XML Schema, DTD or Relax NG (full or compact syntax) schema. Where perfect equivalence is not possible due to limitations of the target language, Oxygen XML Editor Eclipse plugin generates an approximation of the source schema. Oxygen XML Editor Eclipse plugin uses the Trang multiple format converter to perform the actual schema conversions.

To use this tool, select the Generate/Convert Schema (Ctrl + Shift + BackSlash (Command + Shift + BackSlash on macOS)) action from the XML Tools menu. This action opens the Generate/Convert Schema dialog box that allows you to configure various options for conversion.

Figure 551. Generate/Convert Schema Dialog Box

The Generate/Convert Schema dialog box includes the following options:

Input section

Allows you to select the language of the source schema. If the conversion is based on a set of XML files, rather than just a single XML file, select the XML Documents option and use the file selector to add the XML files involved in the conversion.

Output section

Allows you to select the language of the target schema.
Options

You can choose the **Encoding**, the maximum **Line width**, and the **Indent size** (in number of spaces) for one level of indentation.

Output file

Specifies the path for the output file that will be generated.

Close dialog when finished

If you deselect this option, the dialog box will remain open after the conversion so that you can easily continue to convert more files.

Advanced options

If you select **XML 1.0 DTD** for the input, you can click this button to access more advance options to further fine-tune the conversion. The following advanced options are available:

**XML 1.0 DTD Input section**

These options apply to the source DTD:

- **xmlns** - Specifies the default namespace, that is the namespace used for unqualified element names.
- **attlist-define** - Specifies how to construct the name of the definition representing an attribute list declaration from the name of the element. The specified value must contain exactly one percent character. This percent character is replaced by the name of element (after colon replacement) and the result is used as the name of the definition.
- **colon-replacement** - Replaces colons in element names with the specified chars when constructing the names of definitions used to represent the element declarations and attribute list declarations in the DTD.
- **any-name** - Specifies the name of the definition generated for the content of elements declared in the DTD as having a content model of ANY.
- **element-define** - Specifies how to construct the name of the definition representing an element declaration from the name of the element. The specified value must contain exactly one percent character. This percent character is replaced by the name of element (after colon replacement) and the result is used as the name of the definition.
- **annotation-prefix** - Default values are represented using a @prefix:defaultValue annotation attribute where prefix is the specified value and is bound to http://relaxng.org/ns/compatibility/annotations/1.0 as defined by the RELAX NG DTD Compatibility Committee Specification. By default, the conversion engine will use a for prefix unless that conflicts with a prefix used in the DTD.
- **inline-attlist** - Instructs the application not to generate definitions for attribute list declarations, but instead move attributes declared in attribute
list declarations into the definitions generated for element declarations. This is the default behavior when the output language is XSD.

- **strict-any** - Preserves the exact semantics of ANY content models by using an explicit choice of references to all declared elements. By default, the conversion engine uses a wildcard that allows any element

- **generate-start** - Specifies whether or not the conversion engine should generate a start element. DTD's do not indicate what elements are allowed as document elements. The conversion engine assumes that all elements that are defined but never referenced are allowed as document elements.

- **xmlns mappings** table - Each row specifies the prefix used for a namespace in the input schema.

**W3C XML Schema Output section**

This section is available if you select W3C XML Schema for the output.

- **disable-abstract-elements** - Disables the use of abstract elements and substitution groups in the generated XML Schema. This can also be controlled using an annotation attribute.

- **any-process-contents** - One of the values: strict, lax, skip. Specifies the value for the @processContents attribute of any elements. The default is skip (corresponding to RELAX NG semantics) unless the input format is DTD, in which case the default is strict (corresponding to DTD semantics).

- **any-attribute-process-contents** - Specifies the value for the @processContents attribute of <anyAttribute> elements. The default is skip (corresponding to RELAX NG semantics).

**Converting Database to XML Schema**

Oxygen XML Editor Eclipse plugin includes a tool that allows you to create an XML Schema from the structure of a database.

To convert a database structure to an XML Schema, use the following procedure:

1. Select the Convert DB Structure to XML Schema action from the Tools menu.

   **Result:** The Convert DB Structure to XML Schema dialog box is opened and your current database connections are displayed in the Connections section.

2. If the database source is not listed, click the Configure Database Sources button to open the Data Sources preferences page (on page 74) where you can configure data sources and connections.

3. In the Format for generated schema section, select one of the following formats:
- **Flat schema** - A flat structure that resembles a tree-like view of the database without references to elements.

- **Hierarchical schema** - Display the table dependencies visually, in a type of tree view where dependent tables are shown as indented child elements in the content model. Select this option if you want to configure the database columns of the tables to be converted.

4. Click **Connect**.

**Result:** The database structure is listed in the **Select database tables** section according to the format you chose.

5. Select the database tables that you want to be included in the XML Schema.

6. If you selected **Hierarchical schema** for the format, you can configure the database columns.
   a. Select the database column you want to configure.
   b. In the **Criterion** section you can choose to convert the selected database column as an **Element**, **Attribute**, or to be **Skipped** in the resulting XML Schema.
   c. You can also change the name of the selected database column by changing it in the **Name** text field.

7. Click **Generate XML Schema**.

**Result:** The database structure is converted to an XML Schema and it is opened for viewing and editing.

### Compiling an XSL Stylesheet for Saxon

As of Saxon 12.3, it is possible to export a compiled form of a stylesheet as a JSON or XML file (called a **stylesheet export file** or SEF). Oxygen XML Editor Eclipse plugin includes a simple tool called **Compile XSL Stylesheet for Saxon** (found in the **XML Tools** menu) that does this for you.

### Use-Cases for a Stylesheet Export File (SEF)

- **Use Saxon-JS to run transformations in a browser** - A **stylesheet export file** (SEF) is needed if you want to use the Saxon-JS product to run transformations in a browser, as in the following example:

```xml
<script type="text/javascript" src="SaxonJS/SaxonJS.min.js"></script>

<script>
    window.onload = function () {
        SaxonJS.transform({
            stylesheetLocation: "books.sef",
            sourceLocation: "books.xml"
        });
    }
</script>
```

- **Use SEF to run transformations in Oxygen XML Editor Eclipse plugin** - You can also use a **stylesheet export file** (SEF) in Oxygen XML Editor Eclipse plugin to apply an XSLT transformation over an XML file.
This requires **Saxon-EE** or **Saxon-PE** versions of the Saxon product and you must select one of those two versions for the **Target** when you configure the SEF file *(on page 2245)*. When configuring the XSLT transformation, you will specify the SEF file in the **XSL URL** field *(on page 1202)*.

## Compiling an SEF File

The **Compile XSL Stylesheet for Saxon** tool can be found in the **XML Tools** menu and it compiles a specified stylesheet as a JSON or an XML file *(stylesheet export file)*.

If you choose **Saxon-JS** as the **Target** *(the type of Saxon product that the export file will be used with)*, then the compiled stylesheet will be a JSON file with a file extension of `.sef` by default.

If you choose **Saxon-EE**, **Saxon-PE**, or **Saxon-HE** for the **Target**, then the compiled stylesheet will be an XML file with a file extension of `.xsef` by default.

Selecting this tool opens the **Compile XSL Stylesheet for Saxon** dialog box that allows you to configure some options for conversion.

**Figure 552. Compile XSLT Stylesheet for Saxon Dialog Box**

![Compile XSL Stylesheet for Saxon Dialog Box](image)

This dialog box includes the following options:

**XSL URL**

Allows you to select URL of the source XSL stylesheet. You can specify the URL by using the text field, the history drop-down, or the browsing actions in the **Browse** drop-down list.

**Output file**

You can specify the path where the output file will be saved by entering it in the text field, using the **Insert Editor Variables** button, or using the browsing actions in the **Browse** drop-down list.
Open in Editor

Select this option to open the resulting stylesheet export file in the main Oxygen XML Editor Eclipse plugin editing pane.

Target

Allows you to select the type of Saxon product that the export file will be used with. You can choose Saxon-JS, Saxon-EE, Saxon-PE, or Saxon-HE.

Relocatable

Can be used to control the Saxon -relocate parameter. You can select this option to produce a relocatable export package (SEF) that can be deployed to a different location, with a different base URI.

Set the default namespace for unprefixed element names ("-ns")

Can be used to control the -ns: (uri | ##any | ##html5) Saxon parameter that defines the handling of unprefixed element names that appear as name tests in path expressions and match patterns in the stylesheet:

- The ##any value declares that unprefixed names are treated as a test on the local name of the element only. They will match regardless of namespace.
- The ##html5 value declares that an unprefixed element name will match either a name in the XHTML namespace or a name in no namespace. This option is primarily intended for use when generating stylesheets to run under Saxon-JS in the browser since the resulting behavior is close to that defined by the special rules in the HTML5 specification for XSLT and XPath running against an HTML5 DOM.
- You can also specify a valid URI by editing the value in the combo box. Specifying a URI sets the default namespace for elements and types (effectively a default value for xpath-default-namespace). Note that an explicit value for this attribute takes precedence.

Use a configuration file ("-config")

Select this option if you want to use a Saxon 12.3 configuration file that will be executed for the XSLT transformation and validation processes. You can specify the path to the configuration file by entering it in the URL field, or by using the Insert Editor Variables button, or using the browsing actions in the Browse drop-down list.

Compile

Use this button to generate the stylesheet export file according the options selected in this dialog box.
JSON Tools

Oxygen XML Editor Eclipse plugin includes some useful tools for converting between JSON, XML and YAML, converting XSD to JSON Schema, generating JSON instances or a JSON Schema, and OpenAPI (JSON and YAML) testing.

Generating Sample JSON Files from a JSON Schema

Oxygen XML Editor Eclipse plugin includes a tool for generating sample JSON files. To generate sample JSON files from a JSON Schema, select Generate Sample JSON Files from the XML Tools > JSON Tools menu. The action opens a dialog box where you can configure a variety of options for generating the files.

Figure 553. Generate Sample JSON Files Dialog Box

The Generate Sample JSON Files dialog box includes the following fields and options:

- **Schema URL**
  The URL of the Schema location. You can specify the path by using the text field, the history drop-down menu, or the browsing actions in the Browse drop-down list. The tool supports schemas with versions Draft 04, 06, 07, 2019-09, and 2020-12.

- **Associate schema in the document**
  If enabled, the specified schema will be associated with the generated files.

- **Output folder**
  Path to the folder where the generated JSON instances will be saved.

- **File name**
  The name of the instance(s) that will be generated. By default, instance.json is used.

- **Number of instances**
  
  The Generate Sample JSON Files dialog box includes the following fields and options:

- **Schema URL**
  The URL of the Schema location. You can specify the path by using the text field, the history drop-down menu, or the browsing actions in the Browse drop-down list. The tool supports schemas with versions Draft 04, 06, 07, 2019-09, and 2020-12.

- **Associate schema in the document**
  If enabled, the specified schema will be associated with the generated files.

- **Output folder**
  Path to the folder where the generated JSON instances will be saved.

- **File name**
  The name of the instance(s) that will be generated. By default, instance.json is used.
The desired number of JSON instances to be generated. When more than one instance is generated, the index of the instance will be added to its file name.

**Property value**

You can specify the way the values of the properties are generated. The following options are available:

- *None* - Assigns empty values for properties (a template file will be generated). This is the default value.
- *Default* - Assigns the name of the property as the value (for strings) or assigns the specified minimum value (for numbers).
- *Random* - Assigns random values according to schema restrictions.

**Generate optional properties**

If selected, the JSON instance will be generated with optional properties that are defined in the JSON schema. Otherwise, only the required properties will be generated.

**Generate additional content**

If selected, the JSON instance will be generated with additional properties that are defined in the JSON schema as `additionalProperties` and additional items that are defined as `additionalItems` (in the case of an Array).

**Choice strategy**

You can specify the way an instance will be generated from a schema that contains a `CombinedSchema` (with either `oneOf` or `anyOf`). The following options are available:

- *First* - The first defined schema in `oneOf` or `anyOf` will be used.
- *Random* - A random schema defined in `oneOf` or `anyOf` will be used.

**Recursion level**

This option controls the maximum allowed depth (must be a number), in case the selected schema contains recursive calls of `$ref` schemas referencing one another. By default, it is set to 1, meaning that the generation for the recursive calls will stop after the first iteration.

**Open first instance in editor**

If selected, the first generated instance is opened in the editor.

You can click **OK** at any point to generate the sample JSON files.

**Generating JSON Schema from a JSON File**

Oxygen XML Editor Eclipse plugin includes a tool for generating a sample JSON Schema from a JSON file. To generate a sample JSON Schema, select **Generate JSON Schema** from the **XML Tools > JSON Tools** menu. The action opens a dialog box where you can configure some options for generating the JSON Schema.
The **Generate JSON Schema** dialog box includes the following fields and options:

**JSON Document URL**

The URL of the JSON file. You can specify the path by using the text field, the history drop-down menu, or the browsing actions in the Browse drop-down list.

**Output JSON Schema**

The path to the folder where the generated JSON Schema will be saved.

**Open in Editor**

If selected, the generated JSON Schema is opened in the editor.

**JSON Schema version**

The version of the resulting JSON schema. The possible choices are: Draft 4, Draft 6, Draft 7, Draft 2019-09, and Draft 2020-12.

**Extract matching format for strings**

If selected, the generator will attempt to find a format that matches the string values from the JSON Document.

**Restrict additional content**

If selected, `additionalProperties` (for objects) and `additionalItems` (for arrays) will be set to `false` in the resulting schema. By default, these keys are not in the schema, meaning that providing additional content (according to the schema) is allowed.

**Add default values for simple types**

If selected, the `default` values (0 for number, "" for string, `false` for boolean) and `examples` for strings will be added.
Make all properties required

If selected, the generator will mark all the properties as required in the resulting schema.

You can click Generate at any point to generate the JSON Schema.

JSON to YAML Converter

Converting JSON to YAML in Oxygen

Oxygen XML Editor Eclipse plugin includes a useful and simple tool for converting JSON files to YAML. The JSON to YAML action for invoking the tool can be found in the XML Tools > JSON Tools menu.

To convert a JSON document to YAML, follow these steps:

1. Select the JSON to YAML action from the XML Tools > JSON Tools menu.

   The JSON to YAML dialog box is displayed:

   ![Figure 555. JSON to YAML Dialog Box](image)

2. Choose or enter the JSON URL for the document you want to convert.
3. Choose the path of the Output file that will contain the resulting YAML document.
4. [Optional] Select the Open in Editor option to open the resulting YAML document in the main editing pane.
5. Click the Convert button.

Result: The original JSON document is now converted to a YAML document.

Related Information:

YAML to JSON Converter (on page 886)

YAML to JSON Converter

Converting YAML to JSON in Oxygen

Oxygen XML Editor Eclipse plugin includes a useful and simple tool for converting YAML files to JSON. It even works on files that consist of multiple YAML documents, each separated by three dashes (---), in which case the conversion creates multiple JSON files with a number in the name.
The **YAML to JSON** action for invoking the tool can be found in the **XML Tools > JSON Tools** menu.

To convert a YAML document to JSON, follow these steps:

1. Select the **YAML to JSON** action from the **XML Tools > JSON Tools** menu.

   The **YAML to JSON** dialog box is displayed:

   ![YAML to JSON Dialog Box](image)

2. Choose or enter the **YAML URL** for the document you want to convert.

3. Choose the path of the **Output file** that will contain the resulting JSON document.

4. **[Optional]** Select the **Open in Editor** option to open the resulting JSON document in the main editing pane.

5. Click the **Convert** button.

**Result:** The original YAML document is now converted to a JSON document.

**Related Information:**

**JSON to XML Converter**

**Online JSON to XML Converter**

![Attention](image)

For a simple ONLINE tool for converting a single JSON file to XML, or vice versa, go to: [https://www.oxygenxml.com/xml_json_converter.html](https://www.oxygenxml.com/xml_json_converter.html).

**Converting JSON to XML in Oxygen**

Oxygen XML Editor Eclipse plugin includes a useful and simple tool for converting JSON files to XML. The **JSON to XML** action for invoking the tool can be found in the **XML Tools > JSON Tools** menu.

To convert a JSON document to XML, follow these steps:
1. Select the **JSON to XML** action from the **XML Tools > JSON Tools** menu.

The **JSON to XML** dialog box is displayed:

2. Choose or enter the **Input URL** of the JSON document.
3. Choose the path of the **Output file** that will contain the resulting XML document.
4. Select the **Open in Editor** option to open the resulting XML document in the main editing pane.
5. Click the **Convert** button.

**Result:** The original JSON document is now converted to an XML document.
Conversion Details

- If the JSON document has more than one property on the first level, the converted XML document will have an additional root element called `<JSON>`.

For example, the following JSON document:

```json
{
  "personnel": {
    "person": [
      {"name": "Boss"},
      {"name": "Worker"}
    ],
    "id": "personnel-id"
  }
}
```

it is converted to:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<JSON>
  <personnel>
    <person>
      <name>Boss</name>
    </person>
    <person>
      <name>Worker</name>
    </person>
  </personnel>
  <id>personnel-id</id>
</JSON>
```

- If the JSON document is an array, the converted XML document will have a root element called `<array>` and for each item within the array, another `<array>` is created.

```json
[
  {"name": "Boss"},
  {"name": "Worker"}
]
```

it is converted to:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<array>
  <array>
    <name>Boss</name>
  </array>
</array>
```
If the name of a JSON property contains characters that are not valid in XML element names (for example, $), then the invalid characters will be escaped as its hexadecimal equivalent in the converted XML.

```
{"$id": "personnel-id"}
```

is converted to:

```
<\_X24_id>personnel-id</\_X24_id>
```

⚠️ **Attention:**
For a simple ONLINE tool for converting a single XML file to JSON, or vice versa, go to: https://www.oxygenxml.com/xml_json_converter.html.

**Converting XML to JSON in Oxygen**

Oxygen XML Editor Eclipse plugin includes a useful and simple tool for converting XML files to JSON. The XML to JSON action for invoking the tool can be found in the XML Tools > JSON Tools menu.

To convert an XML document to JSON, follow these steps:

1. Select the XML to JSON action from the XML Tools > JSON Tools menu.

   **Step Result:** The XML to JSON dialog box is displayed:
2. Choose or enter the **Input URL** of the XML document.
3. Choose the path of the **Output file** that will contain the resulting JSON document.
4. Select how you want empty elements to be converted (default is **object**).
5. Select the **Open in Editor** option to open the resulting JSON document in the main editing pane.
6. Click the **Convert** button.

**Result:** The original XML document is now converted to a JSON document.
Conversion Details

- Some XML components are ignored (e.g. comments and processing instructions).

- If any elements contain attributes in the XML document, the attributes are converted to properties in the converted JSON document. If the XML document contains more than one element with the same name, they will be converted into an array of object in the converted JSON document.

For example, the following XML document:

```xml
<personnel>
  <person id="person.one">
    <name>Boss</name>
  </person>
  <person id="person.two">
    <name>Worker</name>
  </person>
</personnel>
```

it is converted to:

```json
{
  "personnel": {
    "person": [
      {
        "id": "person.one",
        "name": "Boss"
      },
      {
        "id": "person.two",
        "name": "Worker"
      }
    ]
  }
}
```

- If the XML document contains elements with mixed content (text plus elements), the converted JSON document will contain a 
  \texttt{#text} property with its value set as the text content. If there are multiple text nodes, the subsequent 
  \texttt{#text} properties will contain a number (e.g. \texttt{#text1}, \texttt{#text2}). If there are multiple elements with the same name, the first property will have the element name and the subsequent properties will contain a number (e.g. b, b\#1, b\#2).

```xml
<p>This <b>is</b> an <b>example</b>!</p>
```

is converted to:

```json
{
  "personnel": {
    "person": {
      "id": "person.one",
      "name": "Boss"
    },
    "id": "person.two",
    "name": "Worker"
  }
}
```
• If the XML document contains element names that contain hexadecimal codes (for example, if they were escaped during a JSON to XML conversion (on page 879)), it will be converted to the normal character value in the converted JSON document.

```xml
<_X24_id>personnel-id</_X24_id>
```

is converted to:

```json
{ "Sid": "personnel-id" }
```

**Related Information:**

JSON to XML Converter (on page 879)

**JSON Schema Converter**

Oxygen XML Editor Eclipse plugin includes a tool for converting an older version of a JSON schema (Draft 4, 6, or 7) to the latest versions (Draft 2019-09 or Draft 2020-12).

To convert a JSON schema, select **Convert JSON Schema** from the **XML Tools > JSON Tools** menu. The action opens a dialog box where you can configure some options for converting the JSON Schema.

**Figure 561. Convert JSON Schema Dialog Box**

The **Convert JSON Schema** dialog box includes the following fields and options:

**JSON Schema URL**
The URL of the JSON schema file. You can specify the path by using the text field, the history drop-down menu, or the browsing actions in the Browse drop-down list.

**Output JSON Schema**

The path to the folder where the converted JSON schema will be saved.

**Open in Editor**

If selected, the converted JSON schema is opened in the editor.

**JSON Schema version**

The version of the resulting JSON schema. The possible choices are: Draft 2019-09 or Draft 2020-12.

You can click Convert at any point to generate the JSON Schema.

**Conversion Notes**

- The $schema declaration is changed according to the selected JSON schema version.
- The definitions keyword is converted to $defs and all the references are updated.
- The dependencies keyword is split into dependentRequired and dependentSchemas.
- The items keyword (tuple array) is converted to prefixItems (Draft 2020-12).
- The additionalItems keyword is converted to items (Draft 2020-12, only if prefixItems is present).
- The exclusiveMinimum and exclusiveMaximum keywords with boolean values (Draft 4) are removed.
- The id keyword (Draft 4) is converted to $id.
- The $ref keyword wrapped into 1-item allOf is unwrapped because the latest versions allow processing $ref along with other keywords.

**Generate Documentation**

Oxygen XML Editor Eclipse plugin includes a tool for generating documentation for XSLT, XML Schema, XQuery, WSDL, JSON schema, and OpenAPI documents.

**Generating Documentation for an XML Schema**

Oxygen XML Editor Eclipse plugin can generate detailed documentation for the components of an XML Schema in HTML, PDF, DocBook, or other custom formats. You can select the components and the level of detail. The components are hyperlinked in both HTML and DocBook documents.

**Note:**

You can generate documentation for both XML Schema version 1.0 and 1.1.

To generate documentation for an XML Schema document, select XML Schema Documentation from the XML Tools > Generate Documentation menu or from the Generate XML Schema Documentation action from the contextual menu of the Project Explorer view (on page 268).
The **Schema URL** field of the dialog box must contain the full path to the XML Schema (XSD) file that will have documentation generated. The schema may be a local or a remote file. You can specify the path to the schema by entering it in the text field, or by using the **Insert Editor Variables** button or the options in the **Browse** drop-down menu.

**Output Tab**

The following options are available in the **Output** tab:

- **Format** - Allows you to choose between the following formats:
  - **HTML** - The documentation is generated in HTML output format *(on page 768).*
  - **PDF** - The documentation is generated in PDF output format *(on page 771).*
  - **DocBook** - The documentation is generated in DocBook output format *(on page 771).*
  - **DITA** - The documentation is generated in DITA output format *(on page 771).*
  - **Custom** - The documentation is generated in a custom output format *(on page 771)*, allowing you to control the output. Click the **Options** button to open a **Custom format options** dialog box where you can specify a custom stylesheet for creating the output. There is also an option to **Copy additional resources to the output folder** and you can select the path to the additional...
Resources that you want to copy. You can also choose to keep the intermediate XML files created during the documentation process by deselecting the Delete intermediate XML file option.

- **Output file** - You can specify the path of the output file by entering it in the text field, or by using the **Insert Editor Variables** button or the options in the **Browse** drop-down menu.

- **Split output into multiple files** - Instructs the application to split the output into multiple files. You can choose to split them by namespace, location, or component name.

- **Open in Browser/System Application** - Opens the result in the system application associated with the output file type. For DITA and DocBook documents, this option appears as **Open in Editor** and the result will be opened in Oxygen XML Editor Eclipse plugin (in the current editor).

  ![Note:]

  To set the browser or system application that will be used, go to **Window > Preferences > General > Web Browser** and specify it there. This will take precedence over the default system application settings.

- **Keep only the annotations with xml:lang set to** - The generated output will contain only the annotations with the `@xml:lang` attribute set to the selected language. If you choose a primary language code (for example, `en` for English), this includes all its possible variations (`en-us`, `en-uk`, etc.).

**Settings Tab**

When you generate documentation for an XML schema you can choose what components to include in the output and the details to be included in the documentation.
The **Settings** tab allows you to choose whether or not to include the following components: **Global elements**, **Global attributes**, **Local elements**, **Local attributes**, **Simple Types**, **Complex Types**, **Groups**, **Attribute Groups**, **Redefines**, **Referenced schemas**, **Include notations**.

You can choose whether or not to include the following other details:

- **Diagram** - Displays the diagram for each component. You can choose the image format (JPEG, PNG, SVG) to use for the diagram section. The generated diagrams are dependent on the options from the [Schema Design Properties (on page 160)](on_page_160).
- **Diagram annotations** - This option controls whether or not the annotations of the components presented in the diagram sections are included.
- **Namespace** - Displays the namespace for each component.
- **Location** - Displays the schema location for each component.
- **Type** - Displays the component type if it is not an anonymous one.
- **Type hierarchy** - Displays the types hierarchy.
- **Model** - Displays the model (sequence, choice, all) presented in BNF form. The separator characters that are used depend upon the information item used:
• **xs:all** - Its children will be separated by space characters.
• **xs:sequence** - Its children will be separated by comma characters.
• **xs:choice** - Its children will be separated by `/` characters.

- **Children** - Displays the list of component's children.
- **Instance** - Displays an XML instance generated based on each schema element.
- **Used by** - Displays the list of all the components that reference the current one. The list is sorted by component type and name.
- **Properties** - Displays some of the component's properties.
- **Facets** - Displays the facets for each simple type.
- **Identity constraints** - Displays the identity constraints for each element. For each constraint there are presented the name, type (unique, key, keyref), reference attribute, selector and field(s).
- **Attributes** - Displays the attributes for the component. For each attribute there are presented the name, type, fixed or default value, usage and annotation.
- **Asserts** - Displays the assert elements defined in a complex type. The test, XPath default namespace, and annotation are presented for each assert.
- **Annotations** - Displays the annotations for the component. If you choose **Escape XML Content**, the XML tags are present in the annotations.
- **Source** - Displays the text schema source for each component.
- **Generate index** - Displays an index with the components included in the documentation.
  - **Include local elements and attributes** - If selected, local elements and attributes are included in the documentation index.
  - **Include resource hierarchy** - Specifies whether or not the resource hierarchy for an XML Schema documentation is generated. It is deselected by default.

**Export settings** - Save the current settings in a settings file for further use (for example, if you need the exported settings file for generating the documentation from the command-line interface).

**Import settings** - Reloads the settings from the exported file.

**Generate** - Use this button to generate the XML Schema documentation.

**Tip:**
This function can be executed from an automated command-line script, for more details, see **Scripting Oxygen (on page 2618)**.

**Related Information:**
Customizing PDF or DocBook Output of Generated XML Schema Documentation (on page 772)

### Generating Documentation for an XSLT Stylesheet

You can use Oxygen XML Editor Eclipse plugin to generate detailed documentation in HTML format for the elements (top-level elements whose names are in the XSLT namespace) of an XSLT stylesheet. You can select what XSLT elements to include in the generated documentation and also the level of details to present for
each of them. The elements are hyperlinked. To generate documentation in a custom output format (on page 696), you can edit the XSLT stylesheet used to generate the documentation, or create your own stylesheet.

To open the XSLT Stylesheet Documentation dialog box, select XSLT Stylesheet Documentation from the XML Tools > Generate Documentation menu or from the Generate Stylesheet Documentation action from the contextual menu of the Project Explorer view (on page 268).

The XSL URL field of the dialog box must contain the full path to the XSL Stylesheet file you want to generate documentation for. The stylesheet may be a local or a remote file. You can specify the path to the stylesheet by entering it in the text field, or by using the Insert Editor Variables button or the options in the Browse drop-down menu.

**Output Tab**

The following options are available in the Output tab:

- **Format** - Allows you to choose between the following formats:
  - **HTML** - The documentation is generated in HTML output format (on page 694).
  - **Custom** - The documentation is generated in a custom output format (on page 696), allowing you to control the output. Click the Options button to open a Custom format options dialog box (on page 697) where you can specify a custom stylesheet for creating the output. There is also an option to Copy additional resources to the output folder and you can select the path to the additional Resources that you want to copy. You can also choose to keep the intermediate XML files created during the documentation process by deselected the Delete intermediate XML file option.
• **Output file** - You can specify the path of the output file by entering it in the text field, or by using the  
  Insert Editor Variables button or the options in the Browse drop-down menu.

• **Split output into multiple files** - Instructs the application to split the output into multiple files. For large 
  XSLT stylesheets, choosing another split criterion may generate smaller output files, providing faster 
  documentation browsing. You can choose to split them by namespace, location, or component name.

• **Open in Browser/System Application** - Opens the result in the system application associated with the 
  output file type.

---

Note:

To set the browser or system application that will be used, go to Window > Preferences > 
General > Web Browser and specify it there. This will take precedence over the default system 
application settings.

---

**Settings Tab**

When you generate documentation for an XSLT stylesheet you can choose what XSLT elements to include 
in the output (templates, functions, global parameters, global variables, attribute sets, character maps, keys, 
decimal formats, output formats, XSLT elements from referenced stylesheets) and the details to include in the 
documentation.

---

**Figure 565. Settings Tab of the XSLT Stylesheet Documentation Dialog Box**

The **Settings** tab allows you to choose whether or not to include the following components: **Templates**, 
**Functions**, **Global parameters**, **Global variables**, **Attribute sets**, **Character maps**, **Keys**, **Decimal formats**, 
**Output formats**, **Referenced stylesheets**.

You can choose whether or not to include the following other details:
• **Documentation** - Shows the documentation for each XSLT element. For HTML format, the user-defined data elements that are recognized and transformed in documentation blocks of the XSLT elements they precede, are the ones from the following schemas:
  ◦ Oxygen XML Editor Eclipse plugin built-in XSLT documentation schema.
  ◦ A subset of DocBook 5 elements. The recognized elements are: `section`, `sect1` to `sect5`, `emphasis`, `title`, `ulink`, `programlisting`, `para`, `orderedlist`, `itemizedlist`.
  ◦ A subset of DITA elements. The recognized elements are: `concept`, `topic`, `task`, `codeblock`, `p`, `b`, `i`, `ul`, `ol`, `pre`, `sl`, `sli`, `step`, `steps`, `li`, `title`, `xref`.
  ◦ Full XHTML 1.0 support.
  ◦ XSLStyle documentation environment. XSLStyle uses DocBook or DITA languages inside its own user-defined data elements. The supported DocBook and DITA elements are the ones mentioned above.
  ◦ DOXSL documentation [framework (on page 2655)](#). Supported elements are: `codefrag`, `description`, `para`, `docContent`, `documentation`, `parameter`, `function`, `docSchema`, `link`, `list`, `listitem`, `module`, `parameter`, `template`, `attribute-set`.

Other XSLT documentation blocks that are not recognized will just be serialized inside an HTML `pre` element. You can change this behavior by using a [custom format (on page 696)](#) instead of the built-in [HTML format (on page 694)](#) and providing your own XSLT stylesheets.

• **Use comments** - Controls whether or not the comments that precede an XSLT element is treated as documentation for the element they precede. Comments that precede or succeed the `xsl:stylesheet` element, are treated as documentation for the whole stylesheet. Note that comments that precede an import or include directive are not collected as documentation for the imported/included module. Also, comments from within the body of the XSLT elements are not collected at all.

• **Namespace** - Shows the namespace for named XSLT elements.

• **Location** - Shows the stylesheet location for each XSLT element.

• **Parameters** - Shows parameters of templates and functions.

• **References** - Shows the named XSLT elements that are referenced from within an element.

• **Used by** - Shows the list of all the XSLT elements that reference the current named element.

• **Supersedes** - Shows the list of all the XSLT elements that are superseded the current element.

• **Overriding** - Shows the list of all the XSLT elements that override the current element.

• **Return type** - Shows the return type of the function.

• **Source** - Shows the text stylesheet source for each XSLT element.

• **Import precedence** - Shows the computed import precedence as declared in the XSL transformation specifications.

• **Generate index** - Creates an index with all the XSLT elements included in the documentation.

**Export settings** - Save the current settings in a settings file for further use (for example, if you need the exported settings file for generating the documentation from the command-line interface).

**Import settings** - Reloads the settings from the exported file.

**Generate** - Use this button to generate the XSLT documentation.
Generating HTML Documentation for an XQuery Document

To generate HTML documentation for an XQuery document, use the XQuery Documentation dialog box. It is opened with the XQuery Documentation action that is available from the XML Tools > Generate Documentation menu or from the Generate XQuery Documentation action from the contextual menu of the Project Explorer view (on page 268).

The dialog box allows you to configure a set of parameters for the process of generating the HTML documentation.

The following options are available:
• **Input** - The full path to the XQuery file must be specified in one of the two fields in this section:
  ◦ **URL** - The URL of the file to be used for generating the documentation.
  ◦ **Folder** - The directory that contains the files to be used for generating the documentation. You can also specify the XQuery file extensions to be searched for in the specified directory.

• **Default function namespace** - Optional URI for the default namespace for the submitted XQuery.

• **Predefined function namespaces** - Optional, engine-dependent, predefined namespaces that the submitted XQuery refers to. They allow the conversion to generate annotation information to support the presentation component hypertext linking (only if the predefined modules have been loaded into the local xqDoc XML repository).

• **Open in Browser/System Application** - Select this option if you want the result to be opened in the system application associated with that file type.

**Note:**
To set the browser or system application that will be used, go to **Window > Preferences > General > Web Browser** and specify it there. This will take precedence over the default system application settings.

• **Output** - Allows you to specify where the generated documentation is saved on disk.

### Generating Documentation for WSDL Documents

You can use Oxygen XML Editor Eclipse plugin to generate detailed documentation for the components of a WSDL document in HTML format. You can select the WSDL components to include in your output and the level of details to present for each of them. Also, the components are hyperlinked. You can also generate the documentation in a custom output format (on page 822) by using a custom stylesheet.

**Note:**
The WSDL documentation includes the XML Schema components that belong to the internal or imported XML schemas.

To generate documentation for a WSDL document, select **WSDL Documentation** from the **XML Tools > Generate Documentation** menu or from the Generate **WSDL Documentation** action from the contextual menu of the **Project Explorer view** (on page 268).
Figure 567. WSDL Documentation Dialog Box

The **Input URL** field of the dialog box must contain the full path to the WSDL document that you want to generate documentation for. The WSDL document may be a local or a remote file. You can specify the path to the WSDL file by entering it in the text field, or by using the **Insert Editor Variables** button or the options in the **Browse** drop-down menu.

**Output Tab**

The following options are available in the **Output** tab:

- **Format** - Allows you to choose between the following formats:
  - **HTML** - The documentation is generated in [HTML output format](on page 820).
  - **Custom** - The documentation is generated in a [custom output format](on page 822), allowing you to control the output. Click the **Options** button to open a **Custom format options** dialog box where you can specify a custom stylesheet for creating the output. There is also an option to [Copy additional resources to the output folder](#) and you can select the path to the additional **Resources** that you want to copy. You can also choose to keep the intermediate XML files created during the documentation process by deselecting the **Delete intermediate XML file** option.

- **Output file** - You can specify the path of the output file by entering it in the text field, or by using the **Insert Editor Variables** button or the options in the **Browse** drop-down menu.

- **Split output into multiple files** - Instructs the application to split the output into multiple files. For large WSDL documents, choosing a different split criterion may generate smaller output files providing a faster documentation browsing. You can choose to split them by namespace, location, or component name.
• **Open in Browser/System Application** - Opens the result in the system application associated with the output file type.

**Note:**
To set the browser or system application that will be used, go to Window > Preferences > General > Web Browser and specify it there. This will take precedence over the default system application settings.

• **Keep only the annotations with xml:lang set to** - The generated output will contain only the annotations with the @xml:lang attribute set to the selected language. If you choose a primary language code (for example, en for English), this includes all its possible variations (en-us, en-uk, etc.).

**Setting Tab**

When you generate documentation for a WSDL document, you can choose what components to include in the output and the details to be included in the documentation.

![Settings Tab of the WSDL Documentation Dialog Box](image)

The Settings tab allows you to choose whether or not to include the following:

• **Components**
  - **Services** - Specifies whether or not the generated documentation includes the WSDL services.
  - **Bindings** - Specifies whether or not the generated documentation includes the WSDL bindings.
  - **Port Types** - Specifies whether or not the generated documentation includes the WSDL port types.
- **Messages** - Specifies whether or not the generated documentation includes the WSDL messages.
- **XML Schema Components** - Specifies whether or not the generated documentation includes the XML Schema components.
- **Only global elements and types** - Specifies whether or not the generated documentation includes only global elements and types.

**Component Details**
- **Namespace** - Presents the namespace information for WSDL or XML Schema components.
- **Location** - Presents the location information for each WSDL or XML Schema component.
- **Used by** - Presents the list of components that reference the current one.
- **Documentation** - Presents the component documentation. If you choose **Escape XML Content**, the XML tags are presented in the documentation.
- **Source** - Presents the XML fragment that defines the current component.
- **Instance** - Generates a sample XML instance for the current component.

**Note:**
This option applies to the XML Schema components only.

- **XML Schema Diagram** - Displays the diagram for each XML Schema component. You can choose the image format (JPEG, PNG, SVG) to use for the diagram section.
- **Diagram annotations** - Specifies whether or not the annotations of the components presented in the diagram sections are included.

**Generate index** - Displays an index with the components included in the documentation.
- **Include local elements and attributes** - If selected, local elements and attributes are included in the documentation index.
- **Include resource hierarchy** - Specifies whether or not the resource hierarchy for an XML Schema documentation is generated. It is deselected by default.

**Export settings** - Save the current settings in a settings file for further use (for example, if you need the exported settings file for generating the documentation from the command-line interface).

**Import settings** - Reloads the settings from the exported file.

**Generate** - Use this button to generate the WSDL documentation.

**Tip:**
This function can be executed from an automated command-line script, for more details, see Scripting Oxygen (on page 2618).
Canonicalizing Files

You can select the canonicalization (on page 2653) algorithm to be used for a document from the dialog box that is displayed by using the Canonicalize action that is available from the Source submenu when invoking the contextual menu in Text mode or from the XML Tools menu.

The Canonicalize dialog box allows you to set the following options:

- **Input URL** - Available if the Canonicalize action was selected from the XML Tools menu. It allows you to specify the location of the input file.
- **Exclusive** - If selected, the exclusive (uncommented) canonicalization (on page 2653) method is used.

**Note:**

Exclusive Canonicalization just copies the namespaces you are actually using (the ones that are a part of the XML syntax). It does not look into attribute values or element content, so the namespace declarations required to process these are not copied. This is useful if you have a signed XML document that you want to insert into other XML documents (or you need self-signed structures that support placement within various XML contexts), as it will ensure the signature is verified correctly each time.

- **Exclusive with comments** - If selected, the exclusive with comments canonicalization (on page 2653) method is used.
- **Inclusive** - If selected, the inclusive (uncommented) canonicalization (on page 2653) method is used.
Note:

_Inclusive Canonicalization_ copies all the declarations, even if they are defined outside of the scope of the signature, and all the declarations you might use will be unambiguously specified. Inclusive _Canonicalization_ is useful when it is less likely that the signed data will be inserted in other XML document and it is the safer method from the security standpoint because it requires no knowledge of the data that are to be secured to safely sign them. A problem may occur if the signed document is moved into another XML document that has other declarations because the Inclusive _Canonicalization_ will copy them and the signature will be invalid.

- **Inclusive with comments** - If selected, the inclusive with comments _canonicalization_ method is used.
- **XPath** - The XPath expression provides the fragments of the XML document to be signed.
- **Output** - Available if the _Canonicalize_ action was selected from the _XML Tools_ menu. It allows you to specify the output file path where the signed XML document will be saved.
- **Open in editor** - If selected, the output file will be opened in the editor.

Related Information:

Digital Signatures Overview (on page 644)

### Signing Files

You can select the type of signature to be used for documents from a signature settings dialog box. To open this dialog box, select the _Sign_ action from the _Source_ submenu when invoking the contextual menu in _Text_ mode or from the _XML Tools_ menu.
The following options are available:

**Note:**
If Oxygen XML Editor Eclipse plugin could not find a valid certificate, a link is provided at the top of the dialog box that opens the XML Signing Certificates preferences page (on page 197) where you can configure a valid certificate.

- **Input** - Available if the **Sign** action was selected from the XML Tools menu. Specifies the location of the input URL.
- **Transformation Options** - See the Digital Signature Overview (on page 644) section for more information about these options.
  - **None** - If selected, no canonicalization (on page 2653) algorithm is used.
  - **Exclusive** - If selected, the exclusive (uncommented) canonicalization (on page 2653) method is used.
Note:

**Exclusive Canonicalization** just copies the namespaces you are actually using (the ones that are a part of the XML syntax). It does not look into attribute values or element content, so the namespace declarations required to process these are not copied. This is useful if you have a signed XML document that you want to insert into other XML documents (or you need self-signed structures that support placement within various XML contexts), as it will ensure the signature is verified correctly each time.

- **Exclusive with comments** - If selected, the exclusive with comments [canonicalization (on page 2653)] method is used.
- **Inclusive** - If selected, the inclusive (uncommented) [canonicalization (on page 2653)] method is used.

Note:

**Inclusive Canonicalization** copies all the declarations, even if they are defined outside of the scope of the signature, and all the declarations you might use will be unambiguously specified. Inclusive **Canonicalization** is useful when it is less likely that the signed data will be inserted in other XML document and it is the safer method from the security standpoint because it requires no knowledge of the data that are to be secured to safely sign them. A problem may occur if the signed document is moved into another XML document that has other declarations because the Inclusive **Canonicalization** will copy them and the signature will be invalid.

- **Inclusive with comments** - If selected, the inclusive with comments [canonicalization (on page 2653)] method is used.

- **XPath** - The XPath expression provides the fragments of the XML document to be signed.
- **ID** - Provides ID of the XML element to be signed.
- **Envelope** - If selected, the **enveloped** signature is used. See the Digital Signature Overview [on page 644] for more information.
- **Detached** - If selected, the **detached** signature is used. See the Digital Signature Overview [on page 644] for more information.
- **Append KeyInfo** - If this option is selected, the `<ds:KeyInfo>` element will be added in the signed document.
- **Signature algorithm** - The algorithm used for signing the document. The following options are available: **RSA with SHA1**, **RSA with SHA256**, **RSA with SHA384**, and **RSA with SHA512**.
- **Output** - Available if the **Sign** action was selected from the XML Tools menu. Specifies the path of the output file where the signed XML document will be saved.
- **Open in editor** - If selected, the output file will be opened in Oxygen XML Editor Eclipse plugin.
Verifying Signature

You can verify the signature of a file by selecting the Verify Signature action from the Source submenu when invoking the contextual menu in Text mode or from the XML Tools menu. The Verify Signature dialog box then allows you to specify the location of the file whose signature is verified.

If the signature is valid, a dialog box displays the name of the signer. Otherwise, an error shows details about the problem.

WSDL SOAP Analyzer Tool

WSDL SOAP Analyzer is a tool that helps you test if the messages defined in a Web Service Descriptor (WSDL) are accepted by a Web Services server.

After you edit and validate your Web service descriptor against a mix of the XML Schemas for WSDL and SOAP, it is easy to check if the defined SOAP messages are accepted by the remote Web Services server by using the integrated WSDL SOAP Analyzer tool (available from the toolbar or WSDL menu).

Oxygen XML Editor Eclipse plugin provides two ways of testing, one for the currently edited WSDL document and another for the remote WSDL documents that are published on a web server. To open the WSDL SOAP Analyzer tool for the currently edited WSDL document do one of the following:

- Click the WSDL SOAP Analyzer toolbar button.
- Use the WSDL SOAP Analyzer action from the WSDL menu.
- Go to Open with > WSDL Editor in the contextual menu of the Project Explorer (on page 268) view.
This tool contains a SOAP analyzer and sender for Web Services Description Language file types. The analyzer fields are as follows:

- **Services** - The list of services defined by the WSDL file.
- **Ports** - The ports for the selected service.
- **Operations** - The list of available operations for the selected service.
- **Action URL** - The script that serves the operation.
- **SOAP Action** - Identifies the action performed by the script.
- **Version** - Choose between 1.1 and 1.2. The SOAP version is selected automatically depending on the selected port.
- **Request Editor** - It allows you to compose the web service request. When an action is selected, Oxygen XML Editor Eclipse plugin tries to generate as much content as possible for the SOAP request. The envelope of the SOAP request has the correct namespace for the selected SOAP version, that is http://schemas.xmlsoap.org/soap/envelope/ for SOAP 1.1 or http://www.w3.org/2003/05/soap-envelope for SOAP 1.2. Usually you just have to change a few values for the request to be valid. The *Content Completion Assistant (on page 2653)* is available for this editor and is driven by the schema that defines the type of the current message. While selecting various operations, Oxygen XML Editor Eclipse plugin remembers the modified request for each one. You can click the **Regenerate** button to overwrite your modifications for the current request with the initial generated content.
- **Attachments List** - You can define a list of file URLs to be attached to the request.
- **Response Area** - Initially it displays an auto generated server sample response so you can have an idea about how the response looks like. After pressing the **Send** button, it presents the message received from the server in response to the Web Service request. It may show also error messages. If the response message contains attachments, Oxygen XML Editor Eclipse plugin prompts you to save them, then tries to open them with the associated system application.
- **Errors List** - There may be situations where the WSDL file is respecting the WSDL XML Schema, but it fails to be valid (for example, in the case of a message that is defined by means of an element that
is not found in the types section of the WSDL). In such a case, the errors are listed here. This list is presented only when there are errors.

- **Send Button** - Executes the request. A status dialog box is displayed when Oxygen XML Editor Eclipse plugin is connecting to the server.

The testing of a WSDL file is straight-forward. Click the WSDL analysis button, then select the service, the port, and the operation. The editor generates the skeleton for the SOAP request. You can edit the request, eventually attach files to it and send it to the server. Watch the server response in the response area. You can find more details in the Testing Remote WSDL Files (on page 824) section.

**Note:**

SOAP requests and responses are automatically validated in the **WSDL SOAP Analyzer** using the XML Schemas specified in the WSDL file.

Once defined, a request derived from a Web Service descriptor can be saved with the **Save** button to a Web Service SOAP Call (WSSC) file for later reuse. In this way, you save time in configuring the URLs and parameters.

You can open the result of a Web Service call in an editor panel using the **Open** button.

**Testing Remote WSDL Files**

To open and test a remote WSDL file the steps are the following:

1. Go to **Window > Show View > Other > Oxygen XML Editor Eclipse plugin > WSDL SOAP Analyzer**.
2. Click the **Choose WSDL** button and enter the URL of the remote WSDL file.
3. Click the **OK** button.
   
   This will open the **WSDL SOAP Analyzer** tool (on page 822). In the **Saved SOAP Request** tab you can open directly a previously saved Web Service SOAP Call (WSSC) file, thus skipping the analysis phase.

**XML Schema Regular Expressions Builder Tool**

The XML Schema regular expressions builder allows you to test regular expressions on a fragment of text as they are applied to an XML instance document. Start the tool by selecting **XML Schema Regular Expressions Builder** from the **XML Tools** menu.
The dialog box contains the following:

**Regular expressions editor**

Allows you to edit the regular expression to be tested and used. Content completion is available and presents a list with all the predefined expressions. It is triggered by pressing `Ctrl + Space`.

**Error display area**

If the edited regular expression is incorrect, an error message will be displayed here. The message contains the description and the exact location of the error. Also, clicking the quick navigation button (←) highlights the error inside the regular expression.

**Category**

You can choose from several categories of predefined expressions. The selected category influences the displayed expressions in the **Available expressions** table.

**Available expressions**

This table includes the available regular expressions and a short description for each of them. The set of expressions depends on the category selected in the previous **Category** combo box. You can add an expression in the **Regular expressions editor** by double-clicking the expression.
row in the table. You will notice that in the case of **Character categories** and **Block names**, the expressions are also listed in complementary format.

**Evaluate expression on**

You can choose between two options:

- **Evaluate expression on each line** - The edited expression will be applied on each line in the Test area.
- **Evaluate expression on all text** - The edited expression will be applied on the whole text.

**Test**

A text editor that allows you to enter a text sample that will have the regular expression applied. All matches of the edited regular expression will be highlighted.

After editing and testing your regular expression you can insert it in the current editor. The **Insert** button will become active when an editor is opened in the background and there is an expression in the **Regular expressions editor**.

The regular expression builder cannot be used to insert regular expressions in the **Grid mode (on page 241)** or **schema Design mode (on page 242)**. Accordingly, the **Insert** button will be not available if the current document is edited in these modes.

**Note:**

Some regular expressions may indefinitely block the Java Regular Expressions engine. If the execution of the regular expression does not end in about five seconds, the application displays a dialog box that allows you to interrupt the operation.

**File Comparison Tool**

Oxygen XML Editor Eclipse plugin includes a file comparison tool that provides a mechanism for comparing two XML-related resources, as well as the possibility for a three-way comparison. You can compare files in a visual comparison mode or in a text-based comparison mode. The supported XML file types include XSL, XSD, DTD, XProc, WSDL, RNG, and XSpec, as well as HTML documents.

**How to Start a File Comparison**

There are various ways to automatically start the file comparison, but the most common ways are:

- You can select two files (or three file if one of them is a common ancestor) in the **Project Explorer** view, right-click, and select one of the options in the **Compare With** menu (e.g. **Compare With > Each Other** to compare the selected files).
- If you use a versioning system, you can compare files directly from the **Synchronize** view (e.g. double-click a file or right-click selected files and choose **Open In Compare Editor**) or the **History** view.
**Visual Author Comparison Mode**

The visual **Author** file comparison mode makes it easier to see how the compared changes will look in the final output. It includes unique features such as actions to control the tags display mode, the ability to do second-level comparisons, and it presents differences made with *Change Tracking* enabled.

If there is a CSS associated with the documents (either directly in the document or in the framework definition), the visual comparison tool is presented automatically when you compare XML files in Oxygen XML Editor Eclipse plugin. If the comparison is automatically started in the text-based mode, you can switch to the visual comparison mode by clicking the **Switch to Author Mode** toolbar button.

⚠️ **Attention:**

If the documents do not have an associated CSS, the visual comparison mode cannot render the document properly, so the text-based mode is used in this situation.

You can compare versions in the Workbench with versions in the repository, or with the local edit history. You can also compare three files if a common ancestor exists. The two editors are constantly synchronized and the differences are refreshed when you save the modified document.

**Figure 573. Visual File Comparison Tool**

![Visual File Comparison Tool](image)

**Text-based Comparison Mode**

Oxygen XML Editor Eclipse plugin also includes a text-based comparison mode. When in the **Author** comparison mode, you can switch to the text-based mode by clicking the **Switch to Text Mode** toolbar button.

Most of the options, features, and actions that are available for the visual-based comparison mode are also available in the **Text** comparison mode, although more *algorithms* *(on page 2282)* are available in **Text** mode.
Highlight Colors

The differences are also highlighted in several colors, depending on the type of change. The highlighting colors can be customized in the **Diff > Appearance preferences page (on page 81)**. The default colors and their shades mean the following:

- **Pink** - Identifies modifications on either side. For 3-way comparisons, it identifies blocks of changes that include conflicts.
- **Gray** - Identifies an addition of a node in the left side (your outgoing changes). For 3-way comparisons, it identifies your outgoing changes that do not include conflicts.
- **Blue** - Identifies an addition of a node in the right side (incoming changes). For 3-way comparisons, it identifies incoming changes that do not include conflicts.
- **Lighter Shade** - Identifies blocks of changes that can be merged in their entirety.
- **Darker Shade** - Identifies specific changes within the blocks that can be merged more precisely.

Navigating Differences

To navigate through differences, do one of the following:

- Use the navigation buttons on the toolbar.
- Select a block of differences by clicking its small colored marker in the overview ruler located in the right-most part of the window. At the top of the overview ruler there is a success indicator that turns green where there are no differences, or red if differences are found.

Toolbar Actions

A variety of actions are available on the toolbar:

- **Switch to Text Mode (Not available in Author comparison mode)**
  Switches to the text-based file comparison mode.

- **Switch to Author Mode (Only available in Text mode)**
  Switches to the visual Author file comparison mode.

- **Tags Display Mode (Only available in Author comparison mode)**
  Allows you to select the amount of markup to be displayed in the editors. You can choose between: Full Tags with Attributes, Full Tags, Block Tags, Block Tags without Element Names, Inline Tags, Partial Tags, or No Tags.

- **Diff Options**
  Opens the Diff preferences page (on page 80) where you can configure various options.

- **Algorithm Drop-down menu (Only available in Text mode)**
  This drop-down menu allows you to select a diff algorithm (on page 2282) to use for the comparison (depending on whether it is a two-way or three-way comparison).
Swap Left and Right View
Swaps the file in the left pane with the one in the right pane.

Copy All Non-Conflicting Changes from Left to Right
Copies all non-conflicting changes from the file in the left pane to the file in the right pane.

Copy All Non-Conflicting Changes from Right to Left
Copies all non-conflicting changes from the file in the right pane to the file in the left pane.

Copy Current Change from Left to Right
Copies the current change from the file in the left pane to the file in the right pane.

Copy Current Change from Right to Left
Copies the current change from the file in the right pane to the file in the left pane.

Next Difference
Navigates to the next block of changes. This action is not available when the cursor is positioned on the last change block or when there are no changes.

Note:
A change block groups one or more consecutive lines that contain at least one change.

Previous Difference
Jumps to the previous block of changes. This action is not available when the cursor is positioned on the first change block or when there are no changes.

Next Change
Jumps to the next change from the current block of changes. When the last change from the current block of changes is reached, it highlights the next block of changes. This action is not available when the cursor is positioned on the last change or when there are no changes.

Previous Change
Jumps to the previous change from the current block of changes. When the first change from the current block of changes is reached, it highlights the previous block of changes. This action is not available when the cursor is positioned on the first change or when there are no changes.

Contextual Menu Actions
The following contextual menu actions are available in each editor pane:

Undo
Undo changes in the currently focused editor pane.

Redo
Redo changes in the currently focused editor pane.
Cut
Cut the selection from the currently focused editor pane to the clipboard.

Copy
Copy the selection from the currently focused editor pane to the clipboard.

Paste
Paste content from the clipboard into the currently focused editor pane.

Select all
Selects all content in the currently focused editor pane.

Find/Replace
Performs a find/replace operation in the currently focused editor pane.

Algorithms
In Text mode, you can select the diff algorithm to use for the comparison using the Algorithm Drop-down menu that is available on the toolbar. The following diff algorithms are available (depending on whether it is a two-way or three-way comparison):

- **Auto (only available for two-way comparisons)** - Selects the most appropriate algorithm, based on the compared content and its size (selected by default).
- **Characters (only available for two-way comparisons)** - Computes the differences at character level, meaning that it compares two files or fragments looking for identical characters.
- **Words (only available for two-way comparisons)** - Computes the differences at word level, meaning that it compares two files or fragments looking for identical words.
- **Lines** - Computes the differences at line level, meaning that it compares two files or fragments looking for identical lines of text.
- **Syntax Aware (only available for two-way comparisons)** - Computes differences for the file types or fragments known by Oxygen XML Editor Eclipse plugin, taking the syntax (the specific types of tokens) into consideration.
- **XML Fast** - Comparison that works well on large files or fragments, but it is less precise than XML Accurate.
- **XML Accurate** - Comparison that is more precise than XML Fast, at the expense of speed. It compares two XML files or fragments looking for identical XML nodes.

In Author mode, only the Auto, XML Fast, and XML Accurate algorithms are available and you can select them from the Diff preferences page (on page 80) (easily accessible by clicking the Diff Options toolbar button).

Second-Level Comparisons
The comparison tool automatically performs a second-level comparison for the XML Fast and XML Accurate algorithms. After the first comparison is finished, the second-level comparisons is processed on text nodes.
using a word-level comparison, meaning that it looks for identical words. This second-level comparison makes it easier to spot precise differences and you can merge or reject the precise modifications.

**Resources**

For more information about the visual editing support for JSON, watch our video demonstration:

https://www.youtube.com/embed/hkInwKhtqvQ
20. Troubleshooting

This section provides a collection of common performance and other types of problems that might be encountered when using Oxygen XML Editor Eclipse plugin, along with their possible solutions.

Performance Problems and Solutions

This section contains solutions for some common performance problems that may appear when running Oxygen XML Editor Eclipse plugin.

Out of Memory on External Processes

Problem

Oxygen XML Editor Eclipse plugin throws an Out Of Memory error when trying to generate PDF output with the built-in Apache FOP processor.

Cause

The amount of allocated memory might be insufficient.

Solutions

- Open the Preferences dialog box (on page 70), go to XML > PDF Output > FO Processors, and increase the value of the Memory available to the Apache FOP option (on page 184).
- For external XSL-FO processors, XSLT processors, and external tools, the maximum value of the allocated memory is set in the command line of the tool using the -Xmx parameter set to the Java virtual machine.

Related Information:
FO Processors Preferences (on page 183)
Custom Engines Preferences (on page 199)
How to Enable Debugging for FO Processor Transformations (on page 1266)

Performance Issues with Large Documents

Problem

The performance of the application slows down considerably over time when working with large documents.
Cause
A possible cause is that the application needs more memory to run properly.

Solutions

- You can increase the maximum amount of memory available to Oxygen XML Editor Eclipse plugin by setting the -vmargs and -Xmx parameters in the command used to launch the Eclipse platform.

⚠️ Attention:
The maximum amount of memory should be less than 75% of the physical amount of memory available on the machine. Otherwise, the operating system and other applications will have no memory available.

- Note:

Misc Problems and Solutions
This chapter presents common problems that may appear when running the application along with solutions for these problems.

Address Family Not Supported by Protocol Family

Problem
I have experienced the following error: "Address Family Not Supported by Protocol Family; Connect". How do I solve it?

Cause
This seems to be an IPv6 connectivity problem. By default, the Java runtime used by Oxygen XML Editor Eclipse plugin prefers to create connections via IPv6, if the support is available. However, even though it is available in appearance, IPv6 sometimes happens to be configured incorrectly on some systems.

Solution
A quick solution for this problem is to set the java.net.preferIPv4Stack Java property to true (java.net.preferIPv4Stack=true), by following this procedure:
1. Create a file named `custom_commons.vmoptions` and on a single line, add 
   `-Djava.net.preferIPv4Stack=true`. Then save the file and copy it to the Oxygen XML Editor Eclipse plugin installation folder (may need admin access).
2. Restart Oxygen XML Editor Eclipse plugin.
3. Make sure the procedure was successful by going to Help > About > System properties and check that the value of the `java.net.preferIPv4Stack` property is `true`.

**Application Takes Several Minutes to Start**

**Problem**
Oxygen XML Editor Eclipse plugin seems to take an abnormally long amount of time to start.

**Cause**
Some anti-virus software can cause Java applications, such as Oxygen XML Editor Eclipse plugin, to start very slowly due to scanning compressed archives (such as the JAR libraries that all Java applications use).

**Solution**
A possible solution is to add the Oxygen XML Editor Eclipse plugin folder to the list of exceptions in the anti-virus software settings.

**Blank Window is Shown When Starting the App Over an RDP Connection on Linux**

**Problem**
When starting Oxygen XML Editor Eclipse plugin or its installer on Linux, a blank window is displayed when started over an RDP connection.

**Cause**
Oxygen XML Editor Eclipse plugin and its installer are Java Swing apps that require a 24 bit color depth from the X server.

**Solution**
1. If you are using `xrdp`, find the `/etc/xrdp/xrdp.ini` file.
2. Uncomment the `xserverbpp=24` line.
3. Save your files and close all the apps (the subsequent step will terminate your remote session so you could lose your progress if you do not save your files first).
4. Restart the `xrdp` service:

   ```bash
   sudo systemctl restart xrdp.service
   ```
Cannot Open Files from Desktop/Downloads/OneDrive on macOS

Problem
When using Oxygen XML Editor Eclipse plugin on macOS, the application cannot open files from Desktop/Downloads/OneDrive.

Cause
Sometimes, macOS shows a popup about allowing the application access to some special folders (e.g. Downloads or Desktop), and unless you explicitly agree, it will leave it unchecked (the app does not allowed access). The popup can go unnoticed and disappears after a while, so it is easy to overlook it and the application will not have access to that folder.

Solution
Go to the macOS System preferences > Security & Privacy > Privacy tab > Files and Folders. You should find Oxygen in that list and the folders you were prompted to access. Check the box for the folder (i.e. Downloads or Desktop), if there is one unchecked.

Note:
If that does not work, look at “Full Disk Access” from the same Privacy tab. Add Oxygen there so that it has full access. However, only use this method as a last resort.

Compatibility Issue Between Java and Certain Graphics Card Drivers

Problem
Under certain settings, a compatibility issues can appear between Java and some graphics card drivers, which results in the text from the editor (in Author or Text mode) being displayed garbled.

Solution
If you encounter this problem, update your graphics card driver.

Damaged File Associations on macOS

Problem
After upgrading macOS and Oxygen XML Editor Eclipse plugin, it is no longer associated to the appropriate file types (such as XML, XSL, XSD). How can I re-create the file associations?
Cause

The upgrade damaged the file associations in the LaunchService Database on your macOS machine.

Solution

You can rebuild the LaunchService Database with the following procedure. This will reset all file associations and rescan the entire file system searching for applications that declare file associations and collect them in a database used by Finder.

1. Find all the Oxygen XML Editor Eclipse plugin installations on your hard drive.
2. Delete them by dragging them to the Trash.
3. Clear the Trash.
4. Unpack the Oxygen XML Editor Eclipse plugin installation kit on your desktop.
5. Copy the contents of the archive into the folder /Applications/Oxygen.
6. Run the following command in a Terminal:

   ```bash
   /System/Library/Frameworks/CoreServices.framework/Versions/A/Frameworks/LaunchServices.framework/Versions/A/Support/lsregister -kill -r -domain local -domain system -domain user
   ```
7. Restart Finder with the following command:

   ```bash
   killall Finder
   ```
8. Create an XML or XSD file on your desktop. It should have the Oxygen XML Editor Eclipse plugin icon.
10. Accept the confirmation.

Result: When you start Oxygen XML Editor Eclipse plugin, the file associations should work correctly.

Details to Submit in a Request for Technical Support Using the Online Form

Problem

What details should I add to my request for technical support on the online form in the product website?

Solution

When completing a request for Technical Support using the online form, include as many details as possible about your problem. For problems where a simple explanation may not be enough for the Technical Support team to reproduce or address the issue (such as server connection errors, unexpected delays while editing a document, an application crash, etc.), you should generate log files and attach them to the problem report. In the case of a crash, you should also attach the crash report file generated by your operating system.

If the text content of an XML document you want to send to the support team contains sensitive or private information, you can use the Randomize XML text content action (on page 41) to create filler content. Before
using this action, you need to copy the initial XML resources and save them in a separate folder. Otherwise, you might lose your original information.

To generate the Oxygen XML Editor Eclipse plugin log files, follow these steps:

1. Create a text file called logback.xml in the lib folder of the installed plugin folder, with the following content:

```xml
<configuration>
  <appender name="R2" class="ch.qos.logback.core.rolling.RollingFileAppender">
    <file>${user.home}/Desktop/oxygenLog/oxygen.log</file>
    <rollingPolicy class="ch.qos.logback.core.rolling.FixedWindowRollingPolicy">
      <fileNamePattern>${user.home}/Desktop/oxygenLog/oxygen%i.log.gz</fileNamePattern>
      <minIndex>1</minIndex>
      <maxIndex>20</maxIndex>
    </rollingPolicy>
    <triggeringPolicy class="ch.qos.logback.core.rolling.SizeBasedTriggeringPolicy">
      <maxFileSize>12MB</maxFileSize>
    </triggeringPolicy>
    <encoder>
      <pattern>%r %marker [%t] [%c] - %m%n</pattern>
    </encoder>
  </appender>
  <root level="debug">
    <appender-ref ref="R2"/>
  </root>
</configuration>
```

2. Restart the application.
3. Reproduce the error.
4. Close the application.
5. Delete the logback.xml file because it might cause performance issues if you leave it in the lib folder.

⚠️ Important:

The logging mode may severely decrease the performance of the application. Therefore, do not forget to delete the logback.xml file when you are done with the procedure.

Result: The resulting log files are named oxygen.log and oxygen#.log.gz (for example, oxygen.log, oxygen1.log.gz, oxygen2.log.gz, etc.) and are located in the Desktop\oxygenLog folder.
Dialog Boxes Cannot Be Resized on Mac

Problem
When using Oxygen XML Editor Eclipse plugin on macOS Big Sur, dialog boxes (for example the Find/Replace or Preferences dialog box) cannot be resized.

Cause
This is caused by an issue with resizing dialog boxes in Oxygen XML Editor Eclipse plugin on macOS Big Sur (and possibly later versions) causing crashes if the main application is in full screen mode.

Solution
Until this limitation is resolved in a future Oxygen XML Editor Eclipse plugin version, dialog boxes cannot be maximized or resized on macOS Big Sur.

DITA Map Transformation Fails (Cannot Connect to External Location)

Problem
DITA map (on page 2654) transformation fails because it cannot connect to an external location.

Solution
The transformation is run as an external Ant process so you can continue using the application as the transformation unfolds. All output from the process appears in the DITA Transformation tab.

The HTTP proxy settings are used for the Ant transformation, so if the transformation fails because it cannot connect to an external location, you can check the Network Connections.

DITA Map WebHelp Transformation Fails (Duplicate Topic References Found)

Problem
DITA Map WebHelp transformation fails with a message that indicates duplicate topic references were found.

Cause
By default the WebHelp transformation uses the force-unique parameter set to true to force the transformation to create unique output files for each instance of a resource when a map contains multiple references to a single topic. However, there are cases when this feature does not work as expected and the duplicate topic references are not handled properly.

Solution
To solve this issue, you should manually set a unique @copy-to attribute on any duplicate topic reference that was not handled automatically by DITA-OT:
DITA-OT Transformation Takes a Long Time to Process

Problem

A DITA transformation takes an extremely long time to process (over an hour, for example).

Cause

Large delays in DITA-OT processing are usually caused by intensive disk operations, CPU usage, or connections to remote websites. The DITA-OT processing is very disk-intensive, each stage takes the entire content from the transformation temporary files folder, reads it, modifies it, and then writes it back.

Solution

There are several things you can try to troubleshoot this problem:

- If you are using a shared or remote drive, it is recommended to specify a local drive for the output and temporary files directory (edit the transformation scenario and in the Output tab, select a local directory for Temporary files directory and Output directory).
- If you want to test if the publishing has a problem downloading remote resources, you could disable the network adapter on the computer and then try to publish. The purpose is to see if the publishing finishes without any reported error about obtaining a certain HTTP resource.
- Using DTDs instead of XML Schemas is faster. This is because of a default transformation parameter called args.grammar.cache that only works for DTD-based DITA topics.
- You can increase the memory available to Oxygen XML Editor Eclipse plugin (on page 2284). Sometimes, just increasing the amount of memory available to the DITA-OT process may be enough to lower the time necessary for the publishing to run.
- You can enable some logging to help you determine which stage in the process is taking a long time. Edit the transformation scenario and in the Advanced tab, enter logger org.apache.tools.ant.listener.ProfileLogger in the Additional arguments field. Then go to Options > Preferences > DITA > Logging and select Always for the Show console output option.
- You could try disabling antivirus applications since the publishing process is very disk intensive and certain antivirus application might slow down the process.
- If the published DITA map is part of a larger DITA project with lots of maps and topics, references from topics in the current map to topics in other sub-projects might result in problems resolving those references. You could look in the output folder to see if the number of HTML documents match the number of DITA topics in your map.
DITA PDF Transformation Fails

Problem

The DITA to PDF transformation fails.

Cause

To generate the PDF output, Oxygen XML Editor Eclipse plugin uses the DITA Open Toolkit. This process sometimes results in errors. For information about some of the most common errors, see DITA PDF Processing Common Errors (on page 2552).

Solution

If your transformation fails, you can detect some of the problems that caused the errors by running the Validate and Check for Completeness action (on page 2360). Depending on the options you select when you run it, this action reports errors such as topics referenced in other topics but not in the DITA map (on page 2654), broken links, and missing external resources.

You can analyze the Results tab of the DITA transformation and search for messages that contain text similar to [fop] [ERROR]. If you encounter this type of error message, edit the transformation scenario you are using and set the clean.temp parameter to no and the retain.topic.fo parameter to yes. Run the transformation, go to the temporary directory of the transformation, open the topic.fo file and go to the line indicated by the error. Depending on the XSL FO context try to find the DITA topic that contains the text that generates the error.

If none of the above methods helps you, go to Help > About > Components > Frameworks and check what version of the DITA Open Toolkit you are using. Copy the whole output from the DITA-OT console output and either report the problem on the DITA User List or send it to support@oxygenxml.com.

How to Enable Debugging for FO Processor Transformations (on page 1266)

DITA PDF Processing Common Errors

There are cases when the PDF processing fails when trying to publish DITA content to a PDF file. This topic lists some of the common problems and possible solutions.

Problem: Cannot Save PDF

The FO processor cannot save the PDF at the specified target. The console output contains messages like this:

[fop] [ERROR] Anttask - Error rendering fo file:
C:\samples\dita\temp\pdf\oxygen_dita_temp\topic.fo
<Failed to open C:\samples\dita\out\pdf\test.pdf>
Failed to open samples\dita\out\pdf\test.pdf
**Solution: Cannot Save PDF**

Such an error message usually means that the PDF file is already opened in a PDF reader application. The solution is to close the open PDF before running the transformation.

**Problem: Table Contains More Cells Than Defined in Colspec**

One of the DITA tables contains more cells in a table row than the defined number of `<colspec>` elements. The console output contains messages like this:

```
[fop] [ERROR] Anttask - Error rendering fo file: D:\projects\eXml\samples\dita\flowers\temp\pdf\oxygen_dita_temp\topic.fo
<net.sf.saxon.transform.XPathException: org.apache.fop.fo.ValidationException: The column-number or number of cells in the row overflows the number of fo:table-columns specified for the table.
(See position 179:-1)>net.sf.saxon.transform.XPathException: org.apache.fop.fo.ValidationException: The column-number or number of cells in the row overflows the number of fo:table-columns specified for the table.
(See position 179:-1)
[fop]     at org.apache.fop.tools.anttasks.FOPTaskStarter.renderInputHandler (Fop.java:657)
[fop]     at net.sf.saxon.event.ContentHandlerProxy.startContent (ContentHandlerProxy.java:375)
```

**Solution: Table Contains More Cells Than Defined in Colspec**

To resolve this issue, correct the `@colspec` attribute on the table that caused the issue. To locate the table that caused the issue:

1. Edit the transformation scenario and set the parameter `clean.temp` to `no`.
2. Run the transformation, open the `topic.fo` file in Oxygen XML Editor Eclipse plugin, and look in it at the line specified in the error message (See position 179:-1).
3. Look around that line in the XSL-FO file to find relevant text content that you can use (for example, with the Find/Replace in Files action in the DITA Maps Manager view (on page 2315)) to find the original DITA topic where the table was generated.
**Problem: Broken Link**

There is a broken link in the generated XSL-FO file. The PDF is generated but contains a link that is not working. The console output contains messages like this:

```
[fop] 1248 WARN [ main ] org.apache.fop.apps.FOUserAgent - 
Page 6: Unresolved ID reference "unique_4_Connect_42_wrongID" found.
```

**Solution: Broken Link**

To resolve this issue:

1. Use the Validate and Check for Completeness action available in the DITA Maps Manager view (on page 2315) to find such problems.
2. If you publish to PDF using a DITAVAL filter, select the same DITAVAL file in the DITA Map Completeness Check dialog box.
3. If the Validate and Check for Completeness action does not discover any issues, edit the transformation scenario and set the clean.temp parameter to no.
4. Run the transformation, open the topic.fo file in Oxygen XML Editor Eclipse plugin, and search for the unresolved ID references (for example: unique_4_Connect_42_wrongID).
5. Look in the XSL-FO file to find relevant text content that you can use (for example, with the Find/Replace in Files action in the DITA Maps Manager view (on page 2315)) to find the original DITA topic where the table was generated.

**Related Information:**

**DITA PDF CSS-based Processing Common Errors**

For information about possible common errors that could be encountered when processing CSS-based DITA to PDF output, see the Troubleshooting section in the CSS-based PDF Customization guide (on page 1777).

**DITA to CHM Transformation Fails - Cannot Open File**

**Problem**

The DITA to CHM transformation fails with the following error: [exec] HHC5010: Error: Cannot open "fileName.chm". Compilation stopped.

**Cause**

This error occurs when the CHM output file is opened and the transformation scenario cannot rewrite its content.

**Solution**

To solve this issue, close the CHM help file and run the transformation scenario again.
Tip:
It is a good practice to validate the DITA map (on page 2654) before executing the transformation scenario. To do so, run the Validate and Check for Completeness action (on page 2360). Depending on the selected options, it will report detected errors, such as topics referenced in other topics (but not in the DITA map), broken links, and missing external resources.

Related Information:
DITA Map CHM (Compiled HTML Help) Transformation (on page 2520)

DITA to CHM Transformation Fails - Compilation Failed

Problem

The DITA to CHM transformation fails with the following error: [exec] HHC5003: Error: Compilation failed while compiling fileName.

Cause 1

One possible cause for this error is that the processed file does not exist.

Solution 1

To solve this issue, fix the file reference before executing the transformation scenario again.

Cause 2

Another possible cause for this error is that the processed file has a name that contains space characters.

Solution 2

To solve the issue, remove any spacing from the file name and run the transformation scenario again.

Tip:
It is a good practice to validate the DITA map (on page 2654) before executing the transformation scenario. To do so, run the Validate and Check for Completeness action (on page 2360). Depending on the selected options, it will report detected errors, such as topics referenced in other topics (but not in the DITA map), broken links, and missing external resources.

Related Information:
DITA Map CHM (Compiled HTML Help) Transformation (on page 2520)
Eclipse Error Messages

Problem

When using the Oxygen XML Editor Eclipse plugin, I receive unusual error messages or warnings that seem to be originating from Eclipse (as opposed to the usual messages that come from Oxygen).

Cause

This problem could be caused by the Language Servers support in Eclipse. Certain enabled language servers could send unexpected errors or warnings to the Oxygen XML Editor Eclipse plugin.

Solution

Go to Preferences > Language Servers and disable the language servers that could be sending the errors.

Error After Switching Oxygen Products in Eclipse

Problem

On an Eclipse deployment, after installing and using the Editor product, I later decided to uninstall it and use Author or Developer instead. After installing the new product, I received an error that looked like this:

```
java.lang.Exception
 at org.eclipse.ui.internal.ViewReference.createErrorPart(ViewReference.java:112)
 at org.eclipse.ui.internal.ViewReference.createPart(ViewReference.java:98)
 at org.eclipse.ui.internal.e4.compatibility.CompatibilityPart.createPart
      (CompatibilityPart.java:279)
 at org.eclipse.ui.internal.e4.compatibility.CompatibilityPart.create
      (CompatibilityPart.java:317)
 at sun.reflect.NativeMethodAccessorImpl.invoke0(Native Method)
 at sun.reflect.NativeMethodAccessorImpl.invoke(NativeMethodAccessorImpl.java:62)
 at sun.reflect.DelegatingMethodAccessorImpl.invoke
      (DelegatingMethodAccessorImpl.java:43)
 at java.lang.reflect.Method.invoke(Method.java:498)
 ...```

Solution

You need to manually delete the perspective for the product you uninstalled by following this procedure:

1. Go to Window > Preferences > General > Perspectives.
2. Select the perspective for the product you uninstalled (for example, <oXygen/> XML) and click Delete.
3. Restart Eclipse.
4. Go to Window > Open Perspective and select the perspective for the new product (for example, <oXygen/> XML Author).
Format and Indent Fails

Problem

When I use the Format and Indent function, I get an error message that indicates the Format and Indent failed.

Cause

This happens because the application tries to limit the exposure to XXE attacks so the parser blocks the expansion of system entities (the ones that are loaded from disk or from remote sources).

Solution

If you are in complete control of the XML documents (you manage or trust those who are creating and editing the documents), you can disable this particular check by selecting the Enable system parameter entity expansion in other entity definitions option (on page 192) in the XML Parser preferences page.

Hunspell Spell Checker is Unusable on Your Platform Error

Problem

When trying to use the Check Spelling option, I receive the error Hunspell spell checker is unusable on your platform. It has crashed the application in a previous session.

Cause

There are instances where Oxygen XML Editor Eclipse plugin determines that an internal component (such as the spell checker) has crashed the application and disables that component from running in the future (to prevent a possible future crash).

Solution

To re-enable the spell checker component, follow these steps:

1. Close Oxygen XML Editor Eclipse plugin.
2. Open the %APPDATA%\com.oxygenxml folder and look for a file called something like HunspellCrashGuard*.txt. Delete that file.
3. Restart Oxygen XML Editor Eclipse plugin.

High Resolution Scaling Issues

Problem

I encounter scaling detection issues in a high resolution display (for example, some GUI components are too small).
Cause

This sometimes happens when using multiple displays with different resolutions because the application cannot detect the correct scaling setting.

Solution

You can use the `sun.java2d.uiScale` Java system property to instruct Java to use a particular scaling factor:

```
-Dsun.java2d.uiScale=1.5
```

Images Appear Stretched Out in the PDF Output

Problem

When publishing XML content (DITA, DocBook, etc.), images are sometimes scaled up in the PDF outputs but are displayed perfectly in the HTML (or WebHelp) output.

Solution

PDF output from XML content is obtained by first obtaining an intermediary XML format called XSL-FO and then applying an XSL-FO processor to it to obtain the PDF. This stretching problem is caused by the fact that all XSL-FO processors take into account the DPI (dots-per-inch) resolution when computing the size of the rendered image.

The PDF processor that comes out of the box with the application is the open-source Apache FOP processor. Here is what Apache FOP does when deciding the image size:

1. If the XSL-FO output contains width, height or a scale specified for the image `<external-graphic>` tag, then these dimensions are used. This means that if in the XML (DITA, DocBook, etc.) you set explicit dimensions to the image they will be used as such in the PDF output.
2. If there are no sizes (width, height or scale) specified on the image XML element, the processor looks at the image resolution information available in the image content. If the image has such a resolution saved in it, the resolution will be used and combined with the image width and height to obtain the rendered image dimensions.
3. If the image does not contain resolution information inside, Apache FOP will look at the FOP configuration file for a default resolution. The FOP configuration file for XSLT transformations that output PDF is located in the `[OXYGEN_INSTALL_DIR]/lib/fop.xconf`. DITA publishing uses the DITA Open Toolkit that has the Apache FOP configuration file located in `[DITA-OT-DIR/plugins/org.dita.pdf2.fop/fop/conf/fop.xconf]`. The configuration file contains two XML elements called `<source-resolution>` and `<target-resolution>`. The values set to those elements can be increased (usually a DPI value of 110 or 120 should render the image in PDF the same as in the HTML output).

The commercial RenderX XEP XSL-FO processor behaves similarly but as a fallback it uses 120 as the DPI value instead of using a configuration file.
Tip:
It is best to save your images without any DPI resolution information. For example, when saving a PNG image in the open-source GIMP image editor, you do not want to save the resolution. This allows you to control the image resolution from the configuration file for all referenced images.

Increasing the Memory for the Ant Process

Problem
The Ant build process runs out of memory.

Solution
For details about setting custom JVM arguments to the Ant build process, see JVM Arguments (on page 2539).

JPEG CMYK Color Space Issues

Problem
JPEG images with the CMYK color profile and have the color profiles embedded in the image aren't rendered in the Author mode.

Solution
If the color profile information is missing from the JPEG image but you have the ICC file available, you can copy the profileFileName.icc to the {OXYGEN_INSTALL_DIR}\lib directory.

If the color space profile is missing, JPEG images that have the CMYK color space are rendered without taking the color profile into account. The Unsupported Image Type message is displayed above the image.

Mac Touch Bar Function Keys Do Not Work

Problem
I am using a Mac that has a Touch Bar but its function keys do not work in Oxygen XML Editor Eclipse plugin.

Causes
By default, the Touch Bar function keys are not enabled for Oxygen XML Editor Eclipse plugin.
Solution

To enable the Touch Bar function keys for Oxygen XML Editor Eclipse plugin, follow these steps:

1. Go to System Preferences and select Keyboard.
2. Click Shortcuts.
3. From the left sidebar, select Function Keys.
4. Click the + symbol, select Oxygen from the list of apps, and click Add.

Server Signature Mismatch Error

Problem

I receive an error indicating that the current license was already activated on a License Server or that the License Server's Signature does not match.

During the license activation process, the license key becomes bound to a particular license server deployment. This means that a code that uniquely identifies your license server deployment (called Server Signature) is sent to the Oxygen servers, which in turn will sign the license key. The Server Signature is computed from the list of network interfaces of the server where you deployed the license.

When starting the license server, if you receive an error stating that your Server Signature does not match, there are several possible causes:

Possible Cause 1

The license key was moved to a new server that hosts your license server.

Solution

Revert to your previous configuration.

Possible Cause 2

A new network interface was changed, added, or activated in the server that hosts your license server.

Note:

A specific example of when this could happen is if the Bluetooth or the WiFi module is activated/deactivated.

Solution

If reverting is not possible, contact the Oxygen support team.

Possible Cause 3

The license server was restarted from a different location as the previous restart. For example, some server configurations will have the Apache Tomcat server installed in a versioned folder (/usr/local/apache-
tomcat-V.V.V) with a symbolic link to the typical folder (/usr/local/tomcat). The server can be restarted from either location, but it is recommended to always restart from the typical folder (/usr/local/tomcat) and always restart from the same location.

Solution

The server simply needs to always be restarted from the same location.

MSXML 4.0 Transformation Issues

Problem

When running a transformation scenario that uses the MSXML 4.0 transformer, I receive an error that looks like this:

```
Could not create the 'MSXML2.DOMDocument.4.0' object.
Make sure that MSXML version 4.0 is correctly installed on the machine.
```

Cause

It is likely that the latest MSXML 4.0 service pack is not installed on your computer.

Solution

To fix this issue, go to the Microsoft website and get the latest MSXML 4.0 service pack.

Navigation to a Web Page is Canceled when Viewing CHM on a Network Drive

Problem

When viewing a CHM on a network drive, I only see the TOC and an empty page that displays the message: Navigation to the web page was canceled.

Cause

This is actually normal behavior. The Microsoft viewer for CHM does not display the topics for a CHM open on a network drive.

Solution

As a workaround, copy the CHM file on your local system and view it there.

References Outside the Main DITA Map Folder

Problem

A reference to a DITA topic, map, or binary resource (for example, an image) that is located outside of the folder where the main DITA map (on page 2654) is located leads to problems when publishing the content using the DITA Open Toolkit.
Cause

DITA-OT often has trouble resolving references that are outside the directory where the published DITA map is found. By default, it does not even copy the referenced topics to the output directory.

Solution

To solve this, try one of the following solutions:

- Create another DITA map that is located in a folder path above all referenced folders and reference the original DITA map from this new map. Then transform this DITA map instead.
- Edit the transformation scenario and in the Parameters tab, change the value of the fix.external.refs.com.oxygenxml parameter to true. This parameter is used to specify whether or not the application tries to fix such references in a temporary files folder before the DITA Open Toolkit is invoked on the fixed references. The fix has no impact on your edited DITA content.

⚠️ Important:
The fix.external.refs.com.oxygenxml parameter is only supported when the DITA-OT transformation process is started from Oxygen XML Editor Eclipse plugin or using the transform script.

- For PDF output, you can edit the transformation scenario and in the Parameters tab set the value of the generate.copy.outer parameter to 3. This parameter specifies whether to generate output files for content that is not located in or beneath the directory containing the DITA map file. By setting the value of this parameter to 3, the transformation scenario shifts the output directory so that it contains all output for the publication.

⚠️ Important:
This method is recommended for transformation scenarios that use an external DITA-OT.

Syntax Highlights Not Available in Eclipse Plugin

Problem

I associated the .ext extension with Oxygen XML Editor Eclipse plugin in Eclipse but an .ext file opened with the Oxygen XML Editor Eclipse plugin plugin does not have syntax highlights.

Solution

Associate an extension with Oxygen XML Editor Eclipse plugin in Eclipse versions 4.5-4.29 by following these steps:

1. Associate the .ext extension with the Oxygen XML Editor Eclipse plugin plugin:
   a. Open the Preferences dialog box (on page 70) and go to General > Editors > File Associations.
   b. Add *.ext to the list of file types.
c. Select *.ext in the list by clicking it.

d. Add Oxygen XML Editor Eclipse plugin to the list of Associated editors and make it the default editor.

2. Associate the *.ext extension with the Oxygen XML content type:
   a. Open the Preferences dialog box (on page 70) and go to General > Content Types.
   b. Add *.ext to the File associations list for the Text > XML > Oxygen XML Editor Eclipse plugin content type.

3. Click the OK button in the Eclipse preferences dialog box.

Result: Now when an *.ext file is opened, the icon and the syntax highlights should be the same as for XML files opened with the Oxygen XML Editor Eclipse plugin.

**TocJS Transformation Does not Generate All Files for a Tree-Like TOC**

**Problem**

The TocJS transformation of a DITA map (on page 2654) does not generate all the files needed to display the tree-like table of contents.

**Solution**

To get a complete set of output files, follow these steps:

1. Run the XHTML transformation on the same DITA map. Make sure the output gets generated in the same output folder as for the TocJS transformation.

2. Copy the content of the DITA-OT-DIR/plugins/com.sophos.tocjs/basefiles folder to the transformation output folder.

3. Copy the DITA-OT-DIR/plugins/com.sophos.tocjs/sample/basefiles/frameset.html file to the transformation output folder.

5. Locate element `<frame name="contentwin" src="concepts/about.html">`.

6. Replace "concepts/about.html" with "index.html".

**Text Rendering Issues on macOS**

**Problem**

On macOS, I sometimes encounter issues there text is not rendered properly. For example, when tags are displayed in Author mode, sometimes the tag icon is rendered over the top of text (hiding the text) and sometimes text flows outside of code blocks.

**Cause**

This is an uncommon error that cannot be fixed in current versions.
Solution

Open the Preferences dialog box (on page 70), go to Editor > Edit modes > Author, and deselect the Fast text layout option (on page 137).

XSLT Debugger Is Very Slow

Problem

When I run a transformation in the XSLT Debugger perspective (on page 2656), it is very slow.

Solution

If the transformation produces HTML or XHTML output, you can disable rendering of output in the XHTML output view (on page 201) during the transformation process. To view the XHTML output result do one of the following:

- Run the transformation in the Editor perspective (on page 2656) and make sure the Open in Browser/System Application option (on page 1211) is selected.
- Run the transformation in the XSLT Debugger perspective (on page 2656), save the text output area to a file, and use a browser application for viewing it (for example, Firefox or Chrome).
DITA Authoring

DITA is an XML standard, an architectural approach, and a writing methodology, developed by technical communicators for technical communicators. It provides a standardised architectural framework for a common structure for content that promotes the consistent creation, sharing, and re-use of content.

Some of the benefits of using DITA include the following:

- **Flexibility** - DITA is a topic-based architecture and it offers flexibility in content organization.
- **Modularity** - DITA allows for content reuse that saves time and reduces the number of modifications.
- **Structured Authoring** - DITA offers a standardized, methodological approach that helps to reduce authoring time and improve consistency.
- **Single-Source Publishing** - DITA provides the ability to change content in one place and have the change propagate everywhere.
- **Multiple Output Formats** - DITA supports multiple types of output.
- **Inheritance** - The DITA inheritance model makes it easy to specialize topics or elements within topics and you only have to define how the element is different from its immediate ancestor.
- **Process Automation** - DITA offers various ways to automate processes, such as with index or glossary production, output delivery, validation, and more.
- **Specialization** - DITA allows you to define your own information types and semantic elements/attributes to suit the needs of your particular content model.
- **Multi-Lingual** - DITA is a translation-friendly structure that supports numerous languages and text encodings.
- **Conditional Profiling** - DITA supports conditional text processing and profiling to filter content in the publishing stage.

This chapter is designed to be a guide to help content authors who use DITA. It also presents the Oxygen XML Editor Eclipse plugin features that are specific to working with DITA documents and concepts.

**DITA Resources**

For more information and technical details about working with DITA, refer to the following resources:

- **The DITA Specifications.**
- **The DITA Style Guide Best Practices for Authors.**
- Various sample DITA topics and maps can be found in the [OXYGEN_INSTALL_DIR]/samples/dita folder.
- Webinar: **Getting Started with DITA Using Oxygen**
- Webinar: **DITA Project Management, Validation, and Translation in a Docs as Code Environment**
Getting Started with DITA

The information in this topic is meant to be a very basic starting point for those who are just getting started using DITA in Oxygen XML Editor Eclipse plugin. Oxygen XML Editor Eclipse plugin makes it easy to create, edit, manage, and publish DITA content, but it requires at least some basic DITA knowledge. To truly get the most out of Oxygen XML Editor Eclipse plugin and all of its DITA-related features, you should explore resources in the online DITA community to acquire knowledge of its concepts and uses.

Understanding DITA Topics

It is important to understand the role that a DITA topic plays in a DITA project. A DITA topic is not associated with a single published document. It is a separate entity that can potentially be included in many different books, help systems, or websites. Therefore, when you write a DITA topic you are not writing a book, a help system, or a website. You are writing an individual piece of content. This affects how you approach the writing task and how Oxygen XML Editor Eclipse plugin works to support you as you write.

Most of your topics are actually related to other topics, and those relationships can affect how you write and handle things such as links and content reuse. Oxygen XML Editor Eclipse plugin helps you manage those relationships. Depending on how your topics are related, you can use the tools provided in Oxygen XML Editor Eclipse plugin, along with the features of DITA, in a variety of ways.

Creating a DITA Topic in Oxygen XML Editor Eclipse plugin

To create a DITA topic (on page 2380):

1. Select File > New > Other > Oxygen XML Editor Eclipse plugin, or click the New button on the toolbar, and select New from Templates.

   Step Result: The New from Templates Wizard (on page 245) is displayed:
2. Go to **Framework templates** > **DITA** > **topic** and select the type of topic that you want to create, then click **Next**.

![New DITA Document from Templates Wizard](image)

**Note:**

If your organization has created DITA customizations, the appropriate template files may be in another location, and various types of topics may be provided for your use. Check with the person who manages your DITA system to see if you should be using templates from another directory.

3. Select a file path where it will be saved.
4. Click **Finish**.

**Result:** Your document is opened in the editor. Eventually, you will need to add a reference to it in your DITA map (on page 2309).
Your DITA topic is an XML document, thus all the editing features that Oxygen XML Editor Eclipse plugin provides for editing XML documents (on page 27) also apply to DITA topics. Oxygen XML Editor Eclipse plugin also provides additional specific DITA-related support for working with DITA topics (on page 2378), their associated DITA maps (on page 2313), and for creating DITA output (on page 2500).

**Role of Maps**

The basic method that DITA uses to express the relationship between topics is through a DITA map (on page 2654). Other relationships between topics, such as cross references, generally need to be made between topics in the same root map. DITA uses maps to determine which topics are part of any output that you create. While customized DITA solutions can use other mechanisms, generally DITA is not used as a way to publish individual topics. Output is created from a map and includes all the topics referenced by the map.

A publication is not always represented by a single map. For instance, if you are writing a book, you might use a submap to create each chapter and then organize the chapters in a main root map to create the book. This helps you to manage your content, offers the possibility of reusing submaps, and segregates content to support multiple people working on the same project.

**Creating a Map in Oxygen XML Editor Eclipse plugin**

To create a map (on page 2331):

1. Select File > New > Other > Oxygen XML Editor Eclipse plugin, or click the New button on the toolbar, and select New from Templates.
2. Go to Framework templates > DITA Map > map and select the type of map you want to create.
3. Choose whether you want to open the map in the Editor or in the DITA Maps Manager (on page 2315). Usually, opening it in the DITA Maps Manager is the best choice. The DITA Maps Manager presents a view of the DITA map that is similar to a table of contents.
Adding Existing Topics to a Map in Oxygen XML Editor Eclipse plugin

There are several ways to add a topic reference to a map (on page 2335). Perhaps the easiest method is to add a reference to a topic that is already open in the editor:

1. Open the DITA topic in the main editing window.

2. Right-click the DITA map in the DITA Maps Manager view (on page 2315) and choose Reference to the currently edited file from the Append Child, Insert Before, or Insert After submenu.

   **Step Result:** This opens the Insert Reference dialog box (on page 2340) with all of the required fields already filled in for you.

   ![Insert Reference Dialog Box](image)

   3. You can fill in additional information in the various tabs in this dialog box or add it to the map later.

   4. Select **Insert and close** to add a reference to your topic in the map.

   5. Save the DITA map.

Adding New Topics to a Map in Oxygen XML Editor Eclipse plugin

As you add topics to your map, you may want to create a new topic as a child or sibling of another topic. This is usually done at the map level.

To add a new topic to a map (on page 2335), follow these steps:
1. In the **DITA Maps Manager** *(on page 2315)*, right-click the node in the current map where you want to add the new topic.

2. Select one of the following actions:
   - **Append Child > New** - Select this action to insert the new topic as a child of the selected node. This action opens a *New file dialog box (on page 2381)* that allows you to select the type of document and assists you with naming it. After you have configured your new topic, click **Create**.
   - **Insert Before > New** - Select this action to insert the new topic as a sibling to the current node, before it. This action opens a *New file dialog box (on page 2381)* that allows you to select the type of document and assists you with naming it. After you have configured your new topic, click **Create**.
   - **Insert After > New** - Select this action to insert the new topic as a sibling to the current node, after it. This action opens a *New file dialog box (on page 2381)* that allows you to select the type of document and assists you with naming it. After you have configured your new topic, click **Create**.
   - **Duplicate** - Select this action to create a copy of the selected topic and insert it as a sibling. This action opens a dialog box that allows you to choose the file name and location for the newly created copy of the topic. After you have selected the name and path for your new topic, click **OK**.

   **Note:** The value of the root ID is generated taking the *Use the file name as the value of the root ID attribute* option from the **DITA > Topics** preferences page *(on page 86)* into account. When the option is deselected, a unique ID is generated.

   **Step Result:** The new topic is now referenced (as a `<topicref>`) in the **DITA map** at the location where you inserted it and the new topic is opened in the editor.

3. Save the **DITA map**.

You can also change the order and nesting of topics in the **DITA Maps Manager** view by doing either of the following:

- Select the topic to move while holding down the **Alt** key and use the arrow keys to move it around.
- Use the mouse to drag and drop the topic to the desired location.

The way your parent and child topics are organized in any particular output depends on both the configuration of those topics in the map and the rules of the output transformation that is applied to them. Do not assume that your topics must have the same organization for all output types. The map defines the organization of the topics, not the topics themselves. It is possible to create a variety of maps, each with different organization and configuration options to produce a variety of outputs.
Adding Submaps in Oxygen XML Editor Eclipse plugin

If you have a large set of information, such as a long book or extensive help system, a single map can become long and difficult to manage. To make it easier to manage, you can break up the content into smaller submaps (on page 2332). A submap might represent a chapter of a book, a section of a user manual, or a page on a website. To build a publication out of these smaller maps, you must add them to a map that represents the overall publication.

To add a child map to the current map (on page 2332):

1. Right-click the parent DITA map in the DITA Maps Manager view (on page 2315) and choose Append child > Map reference.

   **Step Result:** This opens the Insert Reference dialog box (on page 2340) with all of the required fields already filled in for you.

2. You can fill in additional information in the various tabs in this dialog box or add it to the map later.

3. Select Insert and close to add a reference to your submap in the main map.

4. Save the main DITA map.

Validating a Map in Oxygen XML Editor Eclipse plugin

Just as it is with your individual topics, it is important to validate your maps (on page 2360). Oxygen XML Editor Eclipse plugin provides a validation function for DITA maps that does more than simply validating that the XML is well-formed. It also does the following:

- Validates all of the relationships defined in the maps.
- Validates all of the files that are included in the map.
- Validates all of the links that are expressed in the files.

Validating the map that describes your entire publication validates all the files that make up the publication and all of the relationships between them.

To validate a map:

1. Click the Validate and Check for Completeness button in the DITA Maps Manager view (on page 2315).

   **Step Result:** This opens the DITA Map Completeness Check dialog box (on page 2361).

2. Select any of the various options you want to check.

3. Click Check to run the validation process.

Publishing Your Topics in Oxygen XML Editor Eclipse plugin

As noted previously, in DITA standards you usually do not publish output from an individual topic. Instead, you create published output (on page 2500) by running a DITA transformation on a map. This collects all the topics that are referenced in the map, organizes them, and produces output in a particular format. By default,
Oxygen XML Editor Eclipse plugin uses the transformations provided by the DITA Open Toolkit for publishing to various output formats (such as PDF, WebHelp or EPUB). Your organization may have created various custom transformations or modified the built-in DITA Open Toolkit transformations. In either case, Oxygen XML Editor Eclipse plugin manages them by using transformation scenarios.

To publish output for a map:

1. Click the Configure Transformation Scenario(s) button in the DITA Maps Manager view (on page 2315).

   **Step Result:** This opens the Configure Transformation Scenario(s) dialog box (on page 1284).

   ![Figure 577. Configure Transformation Scenarios Dialog Box](image)

   2. Select the appropriate transformation depending on the type of output you desire.

   3. To change or view the configuration or storage options for a transformation scenario, select the transformation and click **Edit**.

   4. Click **Apply associated**.

   **Result:** Depending on the configuration of the transformation scenario, when the transformation is finished, your output may automatically be opened in the appropriate application.

Working with Projects in DITA

Oxygen XML Editor Eclipse plugin provides the ability to organize your DITA resources in projects, the same as with other XML-related files. This helps you manage and organize your files and projects allow you to perform batch operations (such as validation and transformation) over multiple files or to use Main Files support to rename or move DITA resources (on page 2604) while updating the references to them.

To learn how to create a new project and how add resources and manage it, see Creating a New Project (on page 267).

To help you get more familiar with how to use projects in DITA, there are two DITA-specific sample project templates available when using the New Project action (available, for example, from the Project menu):

• **DITA Project With Editing Customizations** - This sample DITA project imposes custom general settings and an editing behavior using a DITA framework extension. More details can be found in the project's Readme.html file.

• **Sample DITA Project** - This sample DITA project is a best practice example that shows how DITA content can be organized to provide a scalable and flexible project structure. More details can be found in the project's Readme.html file.

Using Projects to Group Documents (on page 267)

Working with DITA Maps

In the DITA standard architecture you create documents by collecting topics into maps.
DITA Maps

A DITA map (on page 2654) organizes a set of topics into a hierarchy. In most output formats, the structure of the map becomes the structure of the table of contents. Oxygen XML Editor Eclipse plugin provides support for creating (on page 2331) and managing DITA maps (on page 2334) through the DITA Maps Manager (on page 2315). There are also specialized types of DITA maps, such as a bookmap (on page 2652), which is intended for creating the structure of a book.

Submaps

You do not have to create an entire publication using a single map. It is generally good practice to break up a large publication into several smaller submaps (on page 2332) that are easier to manage. You can reuse submaps in multiple publications by including them in each of the main maps. The DITA Maps Manager (on page 2315) provides support for easily creating and managing submaps.

Opening a DITA Map

There are several ways to open a DITA map and you can choose to open it in the DITA Maps Manager (on page 2315) or in the XML Editor. Use any of the following methods to open a map:

- To open a submap in its own tab in the DITA Maps Manager, simply double-click it (or right-click it and select Open).
- To open a map in the XML editor from the DITA Maps Manager, right-click it and select Open Map in Editor.
- Drag a DITA map file from your system browser and drop it in the XML editor. This will open the map in the editor.
- To open a map in the DITA Maps Manager, you can right-click a map file in the Project Explorer view (on page 268) and select Open in DITA Maps Manager.

Chunking DITA Maps

By default, many output types place a single topic on each output page. In some cases you may want to output multiple topics as a single output page (also known as chunking) (on page 2360). To support this, Oxygen XML Editor Eclipse plugin provides an Edit Properties dialog box (on page 2351) that allows you to easily configure the attributes of a topic to control how your table of contents and topics are rendered in the output.

Validating a Map

You should validate your maps (on page 2360) to make sure that the individual topics are valid and that the relationships between them are working. Oxygen XML Editor Eclipse plugin provides a validation function for DITA maps that performs a comprehensive validation of a map and its topics.

DITA Map Document Type (Framework) (on page 1095)
DITA Map Author Mode Actions (on page 2366)

DITA Maps Manager

Oxygen XML Editor Eclipse plugin provides a view for managing and editing DITA maps. The DITA Maps Manager view presents a DITA map as a tree or table of contents. It allows you to navigate the topics and maps, make changes, and apply transformation scenarios to obtain various output formats. By default, it is located to the left of the main editor. If the view is not displayed, it can be opened by selecting it from the Window > Show View menu.

The DITA Maps Manager includes a variety of useful actions to help you edit and organize the structure of your DITA maps and topics. The actions that are available and their functions depend on the type of nodes that are selected in the DITA Maps Manager. If you select multiple sibling nodes, the result of the actions will be applied to all the selected nodes. If you select multiple nodes that are not on the same hierarchical level, the actions will be applied to the parent node and the child nodes will inherit certain attributes from the parent node.

Figure 578. DITA Maps Manager View

An icon that represents its type of DITA resource is displayed on the left side of each node. For example, a DITA Map is displayed with the □ icon, a DITA Topic is displayed with □, a DITA Task is displayed with □, etc. Any node that has processing-role="resource-only" set in its properties is displayed with a gray dot in the bottom-right corner of the icon (□).
The title of the DITA resource is also displayed for each node. The displayed title depends on how the referenced resource is configured within the DITA structure. For example, the title could be resolved as the text value inside the referenced topic’s `<title>` element or the value of the `@navtitle` attribute specified within the DITA map. For non-DITA resources that are referenced in a DITA map, the file name of the resource is usually displayed for the title. However, it is possible to obtain the title from the referenced non-DITA documents by dynamically converting them using the process described in: Dynamic Word, Excel, OpenAPI, HTML, Markdown to DITA Conversion (on page 2547). In this case, the document title obtained from the conversion process is displayed as the resource title in the DITA Maps Manager.

Opening Maps in the DITA Maps Manager

The DITA Maps Manager view supports opening multiple maps at the same time, with each one presented in its own tab. To open a DITA map in the DITA Maps Manager, use any of the following methods:

• To open a submap in its own tab, simply double-click it (or right-click it and select Open).
• Right-click a map file in the Project Explorer view (on page 268) and select Open in DITA Maps Manager.

Submap Nodes

If your root map (on page 2658) (main DITA map) references other maps (submaps), they can be expanded and you can navigate their content in the DITA Maps Manager.

References within those submaps are not editable, by default, unless you open the submap separately in its own tab. If you want to be able to edit submaps when the main (root/parent) map is open in the DITA Maps Manager, go to Options > Preferences > DITA > Maps and select the Allow referenced submaps to be edited option (on page 84). The references within submap nodes are shown with a gray background if they are not editable.

Moving Nodes in the DITA Maps Manager

You can move topics or nodes within the same map, or other maps, by dragging and dropping them into the desired position. You can arrange the nodes by dragging and dropping one or more nodes at a time. You can arrange multiple topics by dragging them while pressing the Ctrl or Shift key. Drop operations can be performed before, after, or as child of the targeted node.

Operations include:

Copy

Select the nodes you want to copy and start dragging them. Before dropping them in the appropriate place, press and hold the Ctrl key. The mouse pointer changes to a + symbol to indicate that a copy operation is being performed.
Move

Select the nodes you want to move and drag and drop them in the appropriate place.

Promote (Alt + LeftArrow) / Demote (Alt + RightArrow)

You can move nodes between child and parent nodes by using the Promote (Alt + LeftArrow) and Demote (Alt + RightArrow) operations.

DITA Maps Manager Toolbar

The toolbar includes the following actions (also available in the DITA Maps menu) and their availability depend on the nodes that are selected:

- **New DITA Map**
  
  Opens the New Document wizard (on page 245) that you can use to create a new DITA map document.

- **Open Drop-down Menu**
  
  You can use this drop-down menu to open new DITA maps or to reopen recently viewed maps. The drop-down menu contains the following:

  - List of recently viewed DITA maps that can be selected to reopen them.
  - **Clear history** - Clears the history list of the recently viewed DITA maps.
  - **Open** - Allows you to open the map in the DITA Maps Manager view (on page 2315).
    
    You can also open a map by dragging it from the file system explorer and dropping it into the DITA Maps Manager view (on page 2315).
  - **Browse workspace** - Opens a file browser dialog box allowing you to select a file from the local workspace.
  - **Open URL** - Displays the Choose DITA Map dialog box where you can specify a URL (defined by a protocol, host, resource path, and an optional port) or use the browsing actions in the Browse for remote file drop-down menu.

- **Save (Ctrl + S (Meta + S on macOS))**

  Saves the current DITA map.

- **Validate and Check for Completeness**

  Opens the DITA Map Completeness Check dialog box where you can configure options for checking the validity and integrity (on page 2360) of the map.

- **Generate Metrics Report**

  Generate a report that contains statistics (on page 2522) about the entire DITA map in HTML format.

- **Apply Transformation Scenario(s)**
Applies the DITA Map transformation scenario (on page 1168) that is associated with the current map.

Configure Transformation Scenario(s)

Opens the Configure Transformation Scenarios(s) dialog box (on page 1284) where you can edit or create transformation scenarios or associate a DITA Map transformation scenario (on page 1228) with the current map.

Open Map in Editor with Resolved Topics

Opens the DITA map in the main editor area with content from all topic references expanded in-place. Referenced content is presented as read-only by default. To edit it, you must use the Edit Reference contextual menu action to open the source topic that contains the referenced content.

If you want to edit the referenced topics directly without having to open the source document, go to Options > Preferences > Editor > Edit Modes > Author and select the Allow referenced content to be edited option (on page 139). Since a single topic may be referenced in multiple places in the DITA map, be careful not to make conflicting changes to that topic.

Tip:

If you want to print the expanded content, you should consider changing selecting + Print ready from the Styles drop-down menu on the toolbar.

Open Map in Editor

For complex operations that cannot be performed in the simplified DITA Maps Manager view (for instance, editing a relationship table) you can open the map in the main editing area.

Note:

You can also use this action to open referenced DITA maps in the Editor.

Link with Editor

Toggles the synchronization between the file path of the current editor and the selected topic reference in the DITA Maps Manager view. If enabled, it results in the following types of synchronizations:

• If you select a topic tab in the main editing area and it is referenced in the map currently opened in the DITA Maps Manager, the reference to that topic is selected in the DITA Maps Manager.
• If you have a map opened in both the DITA Maps Manager and the main editor, selecting the map tab in the main editing area opens that map in the DITA Maps Manager.
• If you have a map opened in both the DITA Maps Manager and the main editor (Author mode), selecting one or more topicrefs in the DITA Maps Manager will also select the same topicrefs in the main editor.

• If you have a map opened in both the DITA Maps Manager and the main editor (Author mode), selecting one or more topicrefs in the main editor will also select the same topicrefs in the DITA Maps Manager.

Settings

Show extended toolbar
Toggles whether or not the extended toolbar will be displayed in the DITA Maps Manager toolbar.

Show context toolbar
Toggles whether or not the Context option (on page 2319) will be displayed in the DITA Maps Manager toolbar.

Show topic titles
Toggles how topics are presented in the DITA Maps Manager. If selected, the title of each topic is shown. Otherwise, the file path (value of the @href attribute) for each topic is shown.

Show key reference values
Toggles how key references are presented in the DITA Maps Manager. If selected, the value of the @keyref attribute for each key reference is shown.

Context Root Map Drop-down menu
The drop-down menu displayed after Context can be used to specify the DITA root map (on page 2658) that Oxygen XML Editor Eclipse plugin uses to define a hierarchical structure of submaps and to establish a key space (on page 2655) that defines the keys that are propagated throughout the entire map structure. For more information, see Selecting a Root Map (on page 2331).

Choose context root map browsing/search menu
You can use this drop-down menu to browse or search for root maps with the following choices:

• 🏡 Browse for local file - Opens a local file browser dialog box, allowing you to select a local root map.
• 🏡 Browse workspace - Allows you to select a root map from the local workspace.
• 🌐 Browse for remote file - Displays the Open using FTP/SFTP dialog box (on page 260) that allows you to select a remotely stored root map.
• 📦 Browse for archived file - Displays the Archive Browser (on page 1803) that allows you to browse the content of an archive and choose a root map.
- **Browse Data Source Explorer** - Opens the Data Source Explorer (on page 1809) that allows you to browse the data sources defined in the Data Sources preferences page (on page 74).

  **Tip:**
  You can open the Data Sources preferences page by using the Configure Database Sources shortcut from the Open URL dialog box.

- **Search for file** - Displays the Find Resource dialog box to search for a root map.
- **Choose context from main files** - Allows you to choose a context root map from the DITA maps and the DITA-OT project files that are set in the Main Files (on page 2604) folder.

### Profiling/Conditional Text Drop-down Menu

You can use this drop-down menu to select and apply a defined profiling condition set (on page 2564) to filter the content based on that condition set. The drop-down menu also contains the following other options:

- **Show Profiling Colors and Styles** - Select this option to turn on conditional styling. To configure the colors and styles open the Preferences dialog box (on page 70) and go to Editor > Edit modes > Author > Profiling/Conditional Text > Colors and Styles.
- **Show Profiling Attributes** - Select this option to display the values of the profiling attributes at the end of the titles of topic references. When selected, the values of the profiling attributes are displayed in both the DITA Maps Manager view and in the Author view.
- **Show Excluded Content** - Controls if the content filtered out by a particular condition set is hidden or grayed-out in the editor area and in the Outline (on page 325) and DITA Maps Manager views. When this option is selected, the content filtered by the currently applied condition set is grayed-out. To show only the content that matches the currently applied condition set, deselect this option.
- **Profiling Settings** - Opens the preferences page for adding and editing the profiling conditions that you can apply in the DITA Maps Manager view and the Author mode editing pane. When a profiling condition set (on page 446) is applied, the keys that are defined in the DITA map are gathered by filtering out the excluded content.

### Insert Topic Reference

Opens the Insert Reference dialog box (on page 2340) that allows you to insert references to targets such as topics, maps, topic sets, or key definitions.

### Refresh References

You can use this action to manually trigger a refresh and update of all referenced documents. This action is useful when the referenced documents are modified externally. When they
are modified and saved from Oxygen XML Editor Eclipse plugin, the **DITA map** is updated automatically.

**Edit Properties**

Opens the **Edit Properties** dialog box that allows you to configure the properties of a selected node. For more details about this dialog box, see *Edit Properties Dialog Box (on page 2351)*.

**Edit Attributes**

Opens a small in-place editor that allows you to edit the attributes of a selected node. You can find more details about this action in the *Attributes View in Author Mode (on page 403)* topic.

**Delete**

Deletes the selected node.

**Move Up**

Moves the selected node up within the **DITA map** tree.

**Move Down**

Moves the selected node down within the **DITA map** tree.

**Promote**

Moves the selected node up one level to the level of its parent node.

**Demote**

Moves the selected node down one level to the level of its child nodes.

**Contextual Menu of the DITA Maps Manager**

**Root Map**

The following actions can be invoked from the contextual menu on the **root map (on page 2658)** of an opened **DITA map** (many of them are also available in the **DITA Maps** menu):

- **Open Map in Editor**

  For complex operations that cannot be performed in the simplified **DITA Maps Manager** view (for instance, editing a relationship table) you can open the map in the main editing area.

- **Open Map in Editor with Resolved Topics**

  Opens the **DITA map** in the main editor area with content from all topic references, expanded in-place. Content from the referenced topics is presented as read-only and you have to use the contextual menu action **Edit Reference** to open the topic for editing.

- **Export DITA Map**
Opens a dialog box that allows you to choose a destination for exporting the *DITA map*. It also includes an **Export as Zip archive** option that allows you to package the *DITA map* as a zip archive. The result will contain all directly and indirectly referenced topics from the DITA Map.

**Find Unreferenced Resources**

Allows you to search for orphaned resources that are not referenced in the *DITA maps*.

**Show Feedback Comments Manager**

Opens the *Feedback Comments Manager* view. This view is for those who use *Oxygen Feedback* to provide a commenting component in WebHelp output. This view makes it possible to see all the comments added by users in WebHelp output directly in *Oxygen XML Editor* Eclipse plugin.

**Edit Properties**

Opens the *Edit Properties* dialog box that allows you to configure the properties of a selected node. For more details about this dialog box, see *Edit Properties Dialog Box (on page 2351)*.

**Fast Create Topics**

Opens the *Fast Create Topics* dialog box *(on page 2383)* that allows you to quickly create multiple skeleton topics at once and you can specify their hierarchical structure within the *DITA map (on page 2654)*.

**Append Child submenu**

Container sub-menu for a number of actions that create a map node as a child of the currently selected node:

- **New** - Opens a dialog box that allows you to configure some options for inserting a new topic *(on page 2380)*.
- **Reference** - Inserts a reference to a topic file. You can find more details about this action in the *Inserting References (on page 2340)* topic.
- **Reference to the currently edited file** - Inserts a reference to the currently edited file. You can find more details about this action in the *Inserting References (on page 2340)* topic.
- **Key Reference** - Opens an *Insert Key Definition* dialog box that allows you to insert a targeted key definition *(on page 2350)* (for example, to target a resource such as an image or external link).
- **Key Reference with Keyword** - Opens an *Insert Key Definition* dialog box that allows you to define a key and a value inside a *keyword (on page 2350)*.
• A set of actions that open the **Insert Reference** dialog box *(on page 2340)* that allows you to insert various reference specializations (such as **Anchor Reference**, **Glossary Reference**, **Map Reference**, **Navigation Reference**, **Topic Group**, **Topic Head**, **Topic Reference**, **Topic Set**, **Topic Set Reference**).

**Search References**

Searches all references to the current topic in the entire *DITA map* *(on page 2654)*. It also reports references that are defined as related links in relationship tables. If you have enabled **Main Files support** *(on page 2604)*, it also searches for references in the DITA maps added to the Main Files folder.

**Refactoring submenu**

The following actions are available from this submenu when invoked from a root map:

**Rename resource**

Allows you to **change the name of a resource linked in the edited DITA map** *(on page 2337)* and you have the option of updating all the references to the renamed DITA resource. If you have enabled **Main Files support** *(on page 2604)*, it also searches for references in the DITA maps added to the Main Files folder and it provides the option of updating all the references even for non-DITA resources.

**Move resource**

Allows you to **change the location on disk of a resource linked in the edited DITA map** *(on page 2337)* and you have the option of updating all the references to the moved DITA resources. If you have enabled **Main Files support** *(on page 2604)*, it also searches for references in the DITA maps added to the Main Files folder and it provides the option of updating all the references even for non-DITA resources.

**Rename Key**

Use this operation to rename a key. It also updates all references to it. Note that it does not work on DITA 1.3 key scopes.

**Convert to Concept**

Use this operation to convert a DITA topic (of any type) to a DITA Concept topic type (for example, Topic to Concept).

**Convert to General Task**

Use this operation to convert a DITA topic (of any type) to a DITA General Task topic type (for example, Task to General Task). A
DITA General Task is a less restrictive alternative to the Strict Task information type.

Convert to Reference

Use this operation to convert a DITA topic (of any type) to a DITA Reference topic type (for example, Topic to Reference).

Convert to Task

Use this operation to convert a DITA topic (of any type) to a DITA Task topic type (for example, Topic to Task).

Convert to Topic

Use this operation to convert a DITA topic (of any type) to a DITA Topic (for example, Task to Topic).

Convert to Troubleshooting

Use this operation to convert a DITA topic (of any type) to a DITA Troubleshooting topic type (for example, Topic to Troubleshooting).

Generate IDs

Use this operation to automatically generate unique IDs for elements.

Other XML Refactoring Actions

For your convenience, the last 5 XML Refactoring tool operations (on page 607) that were finished or previewed will also appear in this submenu.

XML Refactoring

Opens the XML Refactoring tool wizard (on page 607) that presents refactoring operations to assist you with managing the structure of your XML documents.

Check Spelling in Files

Allows you to spell check multiple files (on page 294).

Paste

Allows you to paste content from the clipboard into the DITA map.

Paste Before

Pastes the content of the clipboard (only if it is a part of the DITA map) before the currently selected DITA map node.

Paste After

Pastes the content of the clipboard (only if it is a part of the DITA map) after the currently selected DITA map node.

Expand All
Allows you to expand the entire *DITA map* structure.

**Collapse All**

Allows you to collapse the entire *DITA map* structure.

**Editable Child Nodes**

The following actions are available when the contextual menu is invoked on an editable child node of a *DITA map*:

**Note:**
If multiple nodes are selected, the availability of the actions depends on the nodes that are selected.

**Note:**
Topic references inside submaps are not editable by default. If you want to be able to edit submaps when the main (root/parent) map is open in the DITA Maps Manager, go to Options > Preferences > DITA > Maps and select the Allow referenced submaps to be edited option (on page 84).

**Open**

Opens the selected resource in the editor.

**Edit Properties**

Opens the Edit Properties dialog box that allows you to configure the properties of a selected node. For more details about this dialog box, see Edit Properties Dialog Box (on page 2351).

**Fast Create Topics**

Opens the Fast Create Topics dialog box (on page 2383) that allows you to quickly create multiple skeleton topics at once and you can specify their hierarchical structure within the *DITA map* (on page 2654).

**Append Child submenu**

Container sub-menu for a number of actions that create a map node as a child of the currently selected node:

- **New** - Opens a dialog box that allows you to configure some options for inserting a new topic (on page 2380).
- **Reference** - Inserts a reference to a topic file. You can find more details about this action in the Inserting References (on page 2340) topic.
- **Reference to the currently edited file** - Inserts a reference to the currently edited file. You can find more details about this action in the Inserting References (on page 2340) topic.
• **Key Reference** - Opens an Insert Key Definition dialog box that allows you to insert a targeted key definition (on page 2350) (for example, to target a resource such as an image or external link).

• **Key Reference with Keyword** - Opens an Insert Key Definition dialog box that allows you to define a key and a value inside a keyword (on page 2350).

• A set of actions that open the Insert Reference dialog box (on page 2340) that allows you to insert various reference specializations (such as Anchor Reference, Glossary Reference, Map Reference, Navigation Reference, Topic Group, Topic Head, Topic Reference, Topic Set, Topic Set Reference).

### Insert Before submenu

Container sub-menus for a number of actions that create a map node as a sibling of the currently selected node, above the current node in the map:

• **New** - Opens a dialog box that allows you to configure some options for inserting a new topic (on page 2380).

• **Reference** - Inserts a reference to a topic file. You can find more details about this action in the Inserting References (on page 2340) topic.

• **Reference to the currently edited file** - Inserts a reference to the currently edited file. You can find more details about this action in the Inserting References (on page 2340) topic.

• **Key Reference** - Opens an Insert Key Definition dialog box that allows you to insert a targeted key definition (on page 2350) (for example, to target a resource such as an image or external link).

• **Key Reference with Keyword** - Opens an Insert Key Definition dialog box that allows you to define a key and a value inside a keyword (on page 2350).

• A set of actions that open the Insert Reference dialog box (on page 2340) that allows you to insert various reference specializations (such as Anchor Reference, Glossary Reference, Map Reference, Navigation Reference, Topic Group, Topic Head, Topic Reference, Topic Set, Topic Set Reference).

### Insert After submenu

Container sub-menus for a number of actions that create a map node as a sibling of the currently selected node, below the current node in the map:

• **New** - Opens a dialog box that allows you to configure some options for inserting a new topic (on page 2380).

• **Reference** - Inserts a reference to a topic file. You can find more details about this action in the Inserting References (on page 2340) topic.
• **Reference to the currently edited file** - Inserts a reference to the currently edited file. You can find more details about this action in the Inserting References *(on page 2340)* topic.

• **Key Reference** - Opens an Insert Key Definition dialog box that allows you to insert a targeted key definition *(on page 2350)* (for example, to target a resource such as an image or external link).

• **Key Reference with Keyword** - Opens an Insert Key Definition dialog box that allows you to define a key and a value inside a keyword *(on page 2350)*.

• A set of actions that open the Insert Reference dialog box *(on page 2340)* that allows you to insert various reference specializations (such as Anchor Reference, Glossary Reference, Map Reference, Navigation Reference, Topic Group, Topic Head, Topic Reference, Topic Set, Topic Set Reference).

🔗 **Search References**

Searches all references to the current topic in the entire DITA map *(on page 2654)*. It also reports references that are defined as related links in relationship tables. If you have enabled Main Files support *(on page 2604)*, it also searches for references in the DITA maps added to the Main Files folder.

**Refactoring submenu**

The following actions are available from this submenu:

**Convert Markdown to DITA Topic (Available for Markdown documents)**

Opens a dialog box that allows you to configure options for converting the Markdown document into a DITA topic *(on page 2446)*.

**Rename resource**

Allows you to change the name of a resource linked in the edited DITA map *(on page 2337)* and you have the option of updating all the references to the renamed DITA resource. If you have enabled Main Files support *(on page 2604)*, it also searches for references in the DITA maps added to the Main Files folder and it provides the option of updating all the references even for non-DITA resources.

**Move resource**

Allows you to change the location on disk of a resource linked in the edited DITA map *(on page 2337)* and you have the option of updating all the references to the moved DITA resources. If you have enabled Main Files support *(on page 2604)*, it also searches for references in the DITA maps added to the Main Files folder and it
provides the option of updating all the references even for non-DITA resources.

**Extract to New DITA Map**

Use this operation to extract editable topics into a new *DITA map*. The operation will open a map creation dialog box where you can select the type of map and configure the title or file name. Click *Create* to complete the operation and a new DITA map will be inserted at the location where the action was invoked with the selected topic references moved into the new map.

**Rename Key**

Use this operation to rename a key. It also updates all references to it. Note that it does not work on DITA 1.3 key scopes.

**Convert Nested Topics to New Topics (Available from the contextual menu of editable maps/nodes in the DITA Maps Manager (on page 2315))**

Use this operation on topics that contain nested `<topic>` elements to convert each nested topic to a new topic. Also, the new topics are added in the DITA Maps Manager as the first child topics of the original topic.

**Convert Sections to New Topics (Available from the contextual menu of editable maps/nodes in the DITA Maps Manager (on page 2315))**

Use this operation on topics that contain multiple sections to convert each section to a new topic. Also, the new topics are added in the DITA Maps Manager as the first child topics of the original topic.

**Convert to Concept**

Use this operation to convert a DITA topic (of any type) to a DITA Concept topic type (for example, Topic to Concept).

**Convert to General Task**

Use this operation to convert a DITA topic (of any type) to a DITA General Task topic type (for example, Task to General Task). A DITA General Task is a less restrictive alternative to the Strict Task information type.

**Convert to Reference**

Use this operation to convert a DITA topic (of any type) to a DITA Reference topic type (for example, Topic to Reference).

**Convert to Task**

Use this operation to convert a DITA topic (of any type) to a DITA Task topic type (for example, Topic to Task).
Convert to Topic

Use this operation to convert a DITA topic (of any type) to a DITA Topic (for example, Task to Topic).

Convert to Troubleshooting

Use this operation to convert a DITA topic (of any type) to a DITA Troubleshooting topic type (for example, Topic to Troubleshooting).

Generate IDs

Use this operation to automatically generate unique IDs for elements.

Other XML Refactoring Actions

For your convenience, the last 5 XML Refactoring tool operations (on page 607) that were finished or previewed will also appear in this submenu.

XML Refactoring

Opens the XML Refactoring tool wizard (on page 607) that presents refactoring operations to assist you with managing the structure of your XML documents.

Check Spelling in Files

Allows you to spell check multiple files (on page 294).

Cut

Deletes the currently selected node and copies it to the clipboard.

Copy

Copies the currently selected node to the clipboard.

Paste

Allows you to paste content from the clipboard into the DITA map.

Paste Before

Pastes the content of the clipboard (only if it is a part of the DITA map) before the currently selected DITA map node.

Paste After

Pastes the content of the clipboard (only if it is a part of the DITA map) after the currently selected DITA map node.

Delete

Deletes the currently selected node from the DITA map.
This action can be used to remove the selected resource(s) from disk. Selecting this action will open a confirmation dialog box where you can also choose to remove the descendants by selecting the **Also remove all descendants** option. If you proceed, a search for references is triggered. If multiple references are detected for any of the selected resources, you will have the option to review them since this would lead to broken links. If you have enabled Main Files support *(on page 2604)*, it also searches for references in the DITA maps added to the Main Files folder.

**Organize**

Allows you to organize the *DITA map* with the several submenu actions:

- **Move Up** - Moves the selected node up within the *DITA map* tree.
- **Move Down** - Moves the selected node down within the *DITA map* tree.
- **Promote** - Moves the selected node up one level to the level of its parent node.
- **Demote** - Moves the selected node down one level to the level of its child nodes.

**Expand All**

Allows you to expand the entire *DITA map* structure.

**Collapse All**

Allows you to collapse the entire *DITA map* structure.

**Other Nodes**

The following additional actions are available when the contextual menu is invoked from other nodes, such as a *submap* node or a relationship table:

**Open Map in Editor (available when invoking on a submap)**

Opens the currently selected *DITA map* in the editor.

**Open parent DITA map (available when invoking on a read-only topic reference or a submap reference)**

Opens the parent *DITA map* of the currently selected reference in the *DITA Maps Manager*.

**Edit Attributes (only available for relationship table nodes)**

Opens a small in-place editor that allows you to edit the attributes of a selected node. You can find more details about this action in the *Attributes View in Author Mode (on page 403)* topic.

**Edit Profiling Attributes (only available for relationship table nodes)**
Allows you to change the profiling attributes (on page 440) defined on the selected node.

**Resources**

https://www.youtube.com/embed/ozFZz6YZMCY

**Related information**

- DITA Map Validation and Completeness Check (on page 2360)
- DITA Map Author Mode Actions (on page 2366)

**Creating a Map**

To create a DITA map (on page 2654), subject scheme map (on page 2658), bookmap (on page 2652), or other types of DITA maps, follow these steps:

1. Use the **New Document wizard** (on page 245) to start creating your map.

   **Tip:** If you want the map to be a submap, you can create it the same way by right-clicking the place in the current map where you want to add it (in the DITA Maps Manager (on page 2315)) and selecting **New** from the **Append Child**, **Insert Before**, or **Insert After** submenu.

2. Select one of the DITA Map templates from the Framework templates folder.
3. Click the **Next** button.
4. Select a parent folder and the file name and click **Finish**.
5. Save the map after opening it in the DITA Maps Manager (on page 2315) or the Editor.

**Related Information:**

- Customizing Profiling Values with a Subject Scheme Map (on page 2573)
- Managing DITA Maps (on page 2334)

**Selecting a Root Map**

Oxygen XML Editor Eclipse plugin allows you to select a root map (on page 2658) (a main DITA map (on page 2654)) that defines a hierarchical structure of submaps and establishes a key space (on page 2655) that defines the keys used in all the other DITA maps and topics in the project. Specifying the correct root map helps to prevent validation problems when you work with keyrefs and also acts as the foundation for content completion. All the keys that are defined in a root map are available in the submaps that are contained within the root map.
There are several ways to select or change the root map:

- The easiest method is to use the **Context drop-down menu (on page 2319)** on the **DITA Maps Manager (on page 2315)** toolbar to select the appropriate context root map that Oxygen XML Editor Eclipse plugin uses to define a hierarchical structure of submaps and to establish a key space (on page 2655) that defines the keys that are propagated throughout the entire map structure.

- You can use the **Choose context root map** drop-down on the **DITA Maps Manager (on page 2315)** toolbar to browse or search for root maps with the following choices:
  - **Browse for local file** - Opens a local file browser dialog box, allowing you to select a local root map.
  - **Browse workspace** - Allows you to select a root map from the local workspace.
  - **Browse for remote file** - Displays the Open using FTP/SFTP dialog box (on page 260) that allows you to select a remotely stored root map.
  - **Browse for archived file** - Displays the Archive Browser (on page 1803) that allows you to browse the content of an archive and choose a root map.
  - **Browse Data Source Explorer** - Opens the Data Source Explorer (on page 1809) that allows you to browse the data sources defined in the Data Sources preferences page (on page 74).

**Tip:**
You can open the Data Sources preferences page by using the Configure Database Sources shortcut from the Open URL dialog box.

- **Search for file** - Displays the Find Resource dialog box to search for a root map.
- **Choose context from main files** - Allows you to choose a context root map from the DITA maps and the DITA-OT project files that are set in the Main Files (on page 2604) folder.

- If you insert a key reference using the Cross Reference action from the Link drop-down menu (from the toolbar or Link submenu of the contextual menu) and keys are not gathered from the expected DITA map, you can change the root map by using the Change Root Map link in the Choose Key dialog box that is opened when you click the Choose Key Reference button.

- If you insert a content key reference or key reference using the Reuse Content action (from the toolbar, DITA menu, or Reuse submenu of the contextual menu) and keys are not gathered from the expected DITA map, you can change the root map by using the Change Root Map link in the Choose Key dialog box that is opened when you click the Choose Key Reference button.

### Creating DITA Submaps

You can break up a large DITA map (on page 2654) into more manageable pieces by creating submaps. A submap is simply a DITA map that is included by another DITA map. There is no separate markup for a submap.
For example, if you are creating a book, you might use one submap for each chapter of the book. If you are reusing a set of topics in multiple publications, you might collect them into a map and reuse the map as a submap in multiple other maps, rather than referencing the topics individually from the new maps.

You add a submap to a map the same way that you would add a new topic or insert an existing topic into a map (on page 2335), except you choose a map rather than a topic to create or add. When adding a submap to a map make sure that you use a `<mapref>` element or a `<topicref>` element with the `@format` attribute set to `ditamap`. In most cases, Oxygen XML Editor Eclipse plugin takes care of this for you.

**Adding a Submap to a Map**

To add a submap to a map:

1. Right-click the place in the current map where you want to add the new submap.

2. To insert the submap as a child of the selected node, select Append Child > New. To insert the submap as a sibling to the current node, select Insert After > New or Insert Before > New.

   **Step Result:** This opens a New DITA file dialog box (on page 2380) that allows you to select the type of document and assists you with naming it.

3. Select the type of map in one of the folders inside the DITA Map folder and give it a name (the file should have a `.ditamap` file extension).

4. Click Create to insert the submap.

You can manage and move submaps the same as you would with topics. They can also be expanded and you can navigate their content in the DITA Maps Manager when the root (main) DITA map is open, but the references within those submaps are not editable, by default, unless you open the submap separately in its own tab.

**Tip:**
If you want to be able to edit submaps when the main (root/parent) map is open in the DITA Maps Manager, go to Options > Preferences > DITA > Maps and select the Allow referenced submaps to be edited option (on page 84).

**Related Information:**
Managing DITA Maps (on page 2334)

**Creating a Bookmap in DITA**

If you want to create a traditional book in DITA, you can use a bookmap (on page 2652) to organize your topics into a book. A DITA bookmap is a specialized type of map, intended for creating output that is structured like a book. A bookmap allows you to add book-specific elements such as `<frontmatter>`, `<part>`, `<chapter>`, `<appendix>`, and `<backmatter>` to the map. How these book-specific elements are processed for publication is up to the processing script for each media. See the DITA documentation for details.
You can find additional support for creating books in DITA in the DITA for Publishers plugin, which is included with Oxygen XML Editor Eclipse plugin.

To create a book in DITA using a bookmap, follow these steps:

1. Create a new bookmap (on page 2333) (File > New > Framework templates > DITA Map > map > Bookmap). If you want the bookmap to be a submap, you can create it the same way by right-clicking the place in the current map where you want to add it (in the DITA Maps Manager (on page 2315)) and selecting New from the Append Child, Insert Before, or Insert After submenus.

2. Create the structure of your book by adding the appropriate book sections and defining containers for chapters and any appendices. To add sections to a bookmap, or children to a section, right-click the bookmap or section icon and choose any of the reference actions in the Append child menu. The selections offered in the menu will adjust depending on the element they are applied to. Consult the DITA documentation to fully understand the structure of a DITA bookmap and where to create each element.

3. Create special elements such as an index (on page 2358) and table of contents (on page 2357). The index and table of contents will be generated by the build process, based on the content of the map and the topics it points to.

4. Add topics (on page 2335) to your chapters to add content to your book. You may find it easier to manage if you use submaps (on page 2332) to create the content of your chapters. This keeps your bookmap from becoming long and difficult to manage.

Managing DITA Maps

This section includes various topics that describe how you can manage DITA maps and resources. You may want to manage your DITA maps (on page 2654) in a variety of ways, including:

- Change the order and nesting of topics in a map.
- Add topics to a map.
- Insert various types of references in a map.
- Find, move, or rename resources in a map.
- Change other properties of the items in a map.
- Use the Edit Properties dialog box to manage attributes, keys, metadata, or add profiling to any section of a map.

Resources

For more information about the DITA Maps Manager view and many of its features, watch our video demonstration:

https://www.youtube.com/embed/ozFZz6YZMCY

Change the Order of Topics in DITA Maps

You can change the order and nesting of the topics in a map in several ways:
• By dragging and dropping topics within the DITA Maps Manager (on page 2315).
• By showing the extended DITA Maps Manager (on page 2315) toolbar (click the Settings icon on the DITA Maps Manager (on page 2315) toolbar and select the extended toolbar) and then using the node moving buttons (↑ ▼ ← →) on the toolbar to move topics around in the map.

To understand how to organize topics in a DITA map using the DITA Maps Manager (on page 2315), you can examine and experiment with the sample map called flowers.ditamap, located in the \[OXYGEN_INSTALL_DIR\]/samples/dita folder.

Adding Topics to a DITA Map

When you are working in DITA, there are several approaches that you can use to create topics and maps. You can start by first creating topics and then assembling your finished topics into one or more documents by creating one or more maps, or you can start by creating a map and then adding new topics to it as you work.

The topics-first approach is generally more appropriate if you intend to do a lot of content reuse, as it encourages you to think of each topic as an independent unit that can be combined with other topics in various ways. The map-first approach will be more familiar to you if you are used to creating books or manuals as a whole. Oxygen XML Editor Eclipse plugin supports both approaches.

A DITA map (on page 2654) organizes content hierarchically, so you can add a topic as a child of the map root element or as a child or sibling of any item already in the map. Therefore, the first step to adding a topic to a map is always to choose the place it will be inserted into the map.

Adding Existing Topics to a Map

At the XML-level, a topic is added to a map by adding a reference to the map that points to the topic. There are a variety of reference types that you can use. The default type is the `<topicref>` element. See the DITA documentation for the full range of reference elements and their uses. Oxygen XML Editor Eclipse plugin provides several tools for inserting reference elements into a map:

Using the Insert Reference Dialog Box

The Insert Reference dialog box (on page 2340) allows you to create various reference types and configure the most commonly used attributes. You can open the Insert Reference dialog box with any of the following methods:

• Right-click an item in the current map where you want to add the reference, select Append Child, Insert Before, or Insert After and select the type of reference to enter.
• If the topic you want to add is currently open in the editor, you can right-click an item in the current map where you want to add the reference and select Reference to the currently edited file.
• Selecting an item in the map and click the Insert Reference button from the DITA Maps Manager (on page 2315) toolbar.
• Select Insert Reference from the DITA Maps menu.
Dragging and Dropping a File into the DITA Maps Manager

You can add a topic to a DITA map by dragging and dropping the file into the DITA Maps Manager (on page 2315). You can drag and drop files from any of the following:

- Your OS file system explorer.
- The Project Explorer view (on page 268).

Adding topics this way will not open the Insert Reference dialog box, but you can adjust all the same properties by invoking the contextual menu from the topic and selecting Edit Properties.

Adding a New Topic to a Map

To add a new topic to a map, follow these steps:

1. In the DITA Maps Manager (on page 2315), right-click the node in the current map where you want to add the new topic.

2. Select one of the following actions:
   - **Append Child > New** - Select this action to insert the new topic as a child of the selected node. This action opens a New file dialog box (on page 2381) that allows you to select the type of document and assists you with naming it. After you have configured your new topic, click Create.
   - **Insert Before > New** - Select this action to insert the new topic as a sibling to the current node, before it. This action opens a New file dialog box (on page 2381) that allows you to select the type of document and assists you with naming it. After you have configured your new topic, click Create.
   - **Insert After > New** - Select this action to insert the new topic as a sibling to the current node, after it. This action opens a New file dialog box (on page 2381) that allows you to select the type of document and assists you with naming it. After you have configured your new topic, click Create.
   - **Duplicate** - Select this action to create a copy of the selected topic and insert it as a sibling. This action opens a dialog box that allows you to choose the file name and location for the newly created copy of the topic. After you have selected the name and path for your new topic, click OK.

Note:
The value of the root ID is generated taking the Use the file name as the value of the root ID attribute option from the DITA > Topics preferences page (on page 86) into account. When the option is deselected, a unique ID is generated.

Step Result: The new topic is now referenced (as a <topicref>) in the DITA map at the location where you inserted it and the new topic is opened in the editor.

3. Save the DITA map.
Adding Multiple Skeleton Topics at Once

Oxygen XML Editor Eclipse plugin includes a feature in the DITA Maps Manager (on page 2315) that allows you to quickly create multiple skeleton topics at once and you can specify their hierarchical structure within the DITA map (on page 2654).

To access this feature, right-click a node in the DITA Maps Manager where you want the new topics to be inserted and select Fast Create Topics. This opens the Fast Create Topics dialog box where you can configure the structure for the new topics.

For more information, see Fast Create Multiple DITA Topics (on page 2383).

Adding Multiple References to the Same Topic in a Map

Oxygen XML Editor Eclipse plugin allows you to reuse entire topics by adding multiple references to the same topic in a DITA map. Whenever multiple references to the same topic are detected in the context of the current map in the DITA Maps Manager (on page 2315), an indicator will appear in the top-right corner of the Author mode editor that shows the number of times the topic is referenced in the DITA map. It also includes navigation arrows that allow you to jump to the next or previous reference.

Reference: References in map: [1 of 6]  

Remove Topics from a Map

You can remove topics from a map in a number of ways. Some ways to remove a topic from a map include:

• Highlight the topic and press the Delete key on your keyboard.
• Highlight the topic and click the Delete button on the DITA Maps Manager (on page 2315) extended toolbar.

Related Information: 
Fast Create Multiple DITA Topics (on page 2383)

Moving and Renaming Resources

You can move or rename resources referenced in your DITA project on disk directly from Oxygen XML Editor Eclipse plugin and you have the option of updating all the references to the moved or renamed resources. If the resources are referenced in the DITA map, you can do this from the DITA Maps Manager view (on page 2315). You can also move and rename resources (DITA topics, maps, or other resources such as folders, images, HTML files, audio, video, text files, Markdown documents) from the Project Explorer view (on page 268). If you have enabled Main Files support (on page 2604), you will also have the option to update all the references to the moved or renamed resource.
Moving or Renaming DITA Resources (Topics or Maps)

To move or rename resources (such as topics, maps, or other referenced non-DITA resources) referenced directly in the DITA map, use one of the following actions available in the Refactoring submenu of the contextual menu when invoked on the resource in the DITA Maps Manager view (on page 2315):

**Refactoring > Move resource**

This action allows you to change the location of a resource linked in the edited DITA map using the Move resource dialog box. This dialog box contains the following options:

- **Destination** - Specifies the target location of the edited resource.
- **File name** - Allows you to change the name of the edited resource.
- **Preview** - Select this button to display a preview of the changes Oxygen XML Editor Eclipse plugin is about to make.
- **Move** - Moves the edited resource in the target location on disk.
- **Cancel** - Cancels the Move resource operation. No changes are applied.

**Refactoring > Rename resource**

This action allows you to change the name of a resource linked in the edited DITA map (on page 2654) using the Rename resource dialog box. This dialog box contains the following options:

- **New name** - Presents the current name and allows you to change it.
- **Preview** - Select this button to display a preview of the changes Oxygen XML Editor Eclipse plugin is about to make.
- **Rename** - Executes the Rename resource operation.
- **Cancel** - Cancels the Rename resource operation. No changes are applied.

**Note:**

If a root DITA map (on page 2658) is not defined, the move and rename actions are executed in the context of the current DITA map.

Moving or Renaming Resources and Updating the References to Them Using the Project View

To move or rename DITA (topics, maps) or non-DITA resources (such as folders, images, HTML files, audio, video, text files, Markdown documents), you can simply follow the procedures described in Moving/Renaming Resources in the Project Explorer View (on page 275). However, this approach will not give you the option to update the references to the moved or renamed resources.

To perform move or rename operation on resources while also updating all the references to them, use the following sets of procedures:
1. Enable Main Files support and add your root DITA map (on page 2658) to the Main Files folder by following the procedure found here: How to Enable Main Files Support in DITA (on page 2604).
2. Move or rename resources and update the references to them by following the procedure found here: Moving or Renaming Non-DITA Resources and Updating the References to Them (on page 2605).

Related Information:
Main Files Support in DITA (on page 2604)
Finding Resources Not Referenced in DITA Maps (on page 2339)

Finding Resources Not Referenced in DITA Maps

Over the course of time, large projects can accumulate a vast amount of resources from a variety of sources. Especially in organizations with a large number of content authors or complex project structures, organizing the project resources can become a challenge. Over time a variety of actions can cause resources to become orphaned from DITA maps (on page 2654). To assist you with organizing project resources, Oxygen XML Editor Eclipse plugin includes the Find Unreferenced Resources action, that searches for such resources.

To perform this search, open the DITA map in the DITA Maps Manager (on page 2315), invoke the contextual menu on the map, and select the Find Unreferenced Resources action. This action opens the Find Unreferenced Resources dialog box, shown below.

![Find Unreferenced Resources Dialog Box](image)

The Find Unreferenced Resources dialog box includes the following options:
• **DITA Maps** - Provides a list of DITA maps to be included in the search and allows you to **Add** maps to the list or **Remove** them.

• **Folders** - Provides a list of folders to be included in the search and allows you to **Add** or **Remove** specific folders. All files from this list of folders that are not referenced from the maps specified in the DITA Maps list will be reported.

• **Filters** - Provides three combo boxes that allow you to filter the search to include or exclude certain files or folders:
  - **Include files** - Allows you to filter specific files to include in the search.
  - **Exclude files** - Allows you to filter specific files to exclude from the search.
  - **Exclude folders** - Allows you to filter specific folders to exclude from the search.

Note:
In any of the filter combo boxes you can enter multiple filters by separating them with a comma and you can use the ? and * wildcards. Use the drop-down arrow to select a previously used filter pattern.

When you click the **Find** button, if the search operation finds unreferenced resources, they are displayed in the **Results** panel at the bottom of the editor. If you want to delete an unreferenced resource, you can right-click its result and select **Remove from Disk**. If you want to see the resource before deciding what to do with it, you can right-click its result and select **Show in Explorer**.

**Inserting References in DITA Maps**

A **DITA map (on page 2654)** may contain various types of references. The targets of the references can be a variety of references, such as chapters, maps, topics, topic sets, or key definitions. You can insert references to such targets with the **Insert Reference** dialog box (on page 2340).

This section explains how to insert and configure references (such as topic references, topic groups, topic headings, and key definitions) in a DITA map.

**Insert Reference Dialog Box**

The **Insert Reference** dialog box allows you to insert and configure references in **DITA maps (on page 2654)**. There are numerous types of references that can be inserted into maps. They include references to topics, other maps, glossary terms, and keys. You can also use this dialog box to configure the attributes of a reference, add profiling or metadata, and define keys.

To open the **Insert Reference** dialog box, use one of the following methods:
• Select **Reference, Reference to the currently edited file**, or any of the other specific reference actions that are available from the **Append Child, Insert Before, and Insert After** submenus when invoking the contextual menu in the **DITA Maps Manager (on page 2315)**.
  
  ◦ To insert the reference as a child of the current node, select the reference from the **Append Child** submenu.
  
  ◦ To insert the reference as a sibling of the current node, below the current node in the map, select the reference from the **Insert After** submenu.
  
  ◦ To insert the reference as a sibling of the current node, above the current node in the map, select the reference from the **Insert Before** submenu.

**Note:**
The content of these submenus depends on the node that is selected in the **DITA map tree** when the contextual menu is invoked. For example, if the selected node is a topic reference (**<topicref>**), its possible child nodes include the following elements: **<anchorref>, <chapter>, <keydef>, <mapref>, <topicgroup>, <topichead>, <topicref>, <topicset>, and <topicsetref>**.

• Click the **Insert Reference** button on the **DITA Maps Manager** extended toolbar. This action will insert the reference as a sibling of the current node (below the current node in the map).

• Select **Insert Reference** from the **DITA Maps** menu. This action will insert the reference as a sibling of the current node (below the current node in the map).

For the **Reference** or **Reference to the currently edited file** actions, a **Reference type** drop-down list is displayed at the top of the **Insert Reference** dialog box and you can select the type of reference you want to insert. Depending on the place where the reference will be inserted, Oxygen XML Editor Eclipse plugin will propose only valid reference types. When you change the reference type, the fields in the various tabs of the dialog box are reconfigured depending upon the availability of the associated attributes. For the other reference actions in the **Append Child, Insert Before, and Insert After** submenus, the reference type is automatically chosen based upon the invoked action and you cannot change it.

The main section of the dialog box includes the following tabs: **Target, Keys, Attributes, Metadata, and Profiling.**

**Target Tab**
Figure 580. Insert Reference Dialog Box - Target Tab

The Target tab of the Insert Reference dialog box allows you to specify information about the target reference. It includes the following sections and fields:

**Choose a file location section**

You can browse for and select the source target file by using the file window in this section. You can use the File filter drop-down menu to narrow the list of possible file types that will be displayed.

**URL**

Displays the path to the target and allows you to select or change it by using the combo box or browsing buttons.

**ID**

The drop-down list displays all of the target elements that are available for the selected target URL.

**Href**

The selected target automatically modifies this value to point to the corresponding @href attribute of the target element.
**Note:**
If the **Reference type** is a **Navigation Reference**, the **Href** field is changed to **Mapref**, since a `<navref>` element requires a `@mapref` attribute instead.

**Keys Tab**

**Figure 581. Insert Reference Dialog Box - Keys Tab**

<table>

Choose target for defined key(s)
Edit metadata information for defined key(s)

The **Keys** tab allows you to use and define keys *(on page 2349)* for indirect referencing. For more information, see *Working with Keys in DITA *(on page 2448)*. This tab includes the following:

**Define keys**

Use this text field to define the `@keys` attribute for the target.

**Key scopes**

Use this text field to define or edit the value of a `@keyscope` attribute. **Key scopes** allow you to specify different sets of key definitions for different map branches.

**Key reference**

Instead of using the **Target** tab to select a file that contains the target reference, you can reference a key definition by using this text field. Use the **Choose key reference** button to access the list of keys that are already defined in the current root map *(on page 2658)*.

**Attributes Tab**
The Attributes tab of the Insert Reference dialog box allows you to insert and edit attribute values for the target reference. This tab includes the following sections and actions:

**Navigation title**

This text field allows you to specify a custom navigation title for the target reference. If you want this attribute to always be populated with a detected value (based on the specifications for the target file), select the Navigation title checkbox for the Always fill values for attributes option in the DITA preferences page (on page 84). For references to DITA resources, you can enforce the use of the specified title by selecting the Lock checkbox (otherwise, the topic `<title>` takes precedence).

**Collection type**

This drop-down list allows you to select the `@collection-type` attribute to create hierarchical linking between topics in a DITA map (for example, unordered, sequence, choice, family, `-dita-use-conref-target`).

**Type**

Allows you to select a `@type` attribute (such as `topic`, `task`, `concept`, etc.) for the target element. If you want this attribute to always be populated with a detected value (based on the specifications for the target file), select the Type checkbox for the Always fill values for attributes option in the DITA preferences page (on page 84).

**Scope**

This property corresponds to the `@scope` attribute of the target element. It is populated automatically, based on the selected file type, unless its value for the selected target file is the same as the default attribute value. If you want this attribute to always be populated with a
detected value based on the specifications (regardless of the default value), select the **Scope** checkbox for the **Always fill values for attributes** option in the DITA preferences page (on page 84).

**Format**

This property corresponds to the `@format` attribute of the target element. It is populated automatically, based on the selected file type, unless its value for the selected target file is the same as the default attribute value. If you want this attribute to always be populated with a detected value based on the specifications (regardless of the default value), select the **Format** checkbox for the **Always fill values for attributes** option in the DITA preferences page (on page 84).

**Processing Role**

This drop-down list allows you to set the `@processing-role` attribute to one of the allowed values for DITA reference elements (for example, `resource-only`, `normal`, `-dita-use-conref-target`).

**Other attributes table**

This table contains the attributes that are available for the selected reference. You can use this table to insert or edit the values of any of the listed attributes. Clicking a cell in the **Value** column allows you to use the combo box to enter, edit, or select attribute values.

**Metadata Tab**

**Figure 583. Insert Reference Dialog Box - Metadata Tab**

The **Metadata** tab allows you to add metadata elements to the target reference. Use the buttons on the right side of the tab to insert specific metadata elements (you can add the following metadata elements: `<navtitle>`, `<linktext>`, `<shortdesc>`, `<keyword>`, `<indexterm>`). The metadata elements are inserted inside a `<topicmeta>` element. The editing window allows you to easily insert and modify the content of the metadata that will be inserted.

**Profiling Tab**
The Profiling tab allows you to select or change profiling attributes for the selected reference. This tab displays profiling attributes and their values as determined by the following:

- If your root map (on page 2658) references a DITA subject scheme map (on page 2658) that defines values for the profiling attributes, those values are used.
- Otherwise, a basic default set of profiling attributes and values are used.

When you modify a selection of values in this tab, the change will also automatically be reflected in the Attributes tab. For more information, see DITA Profiling / Conditional Text (on page 2556).

**Finalizing Your Insert Reference Configuration**

Once you click Insert or Insert and close, the configured reference is added in the map.

**Tip:**
You can easily insert multiple references by keeping the Insert Reference dialog box opened, using the Insert button.

**Related Information:**
- DITA Profiling / Conditional Text (on page 2556)
- Working with Keys in DITA (on page 2448)

**Inserting Topic Headings**

The `<topichead>` element provides a title-only entry in a navigation map, as an alternative to the fully-linked title provided by the `<topicref>` element.

You can insert a topic heading by doing the following:
• Select **Topic Head** from the **Append Child, Insert Before**, or **Insert After** submenus when invoking the contextual menu in the **DITA Maps Manager** view (on page 2315).

• **Open the DITA map** in the XML editor (on page 2314) and select the **Insert Topic Heading** action from the main toolbar (or from the **Insert** submenu of the contextual menu).

Those actions open the **Insert Topic Head** dialog box (on page 2340) that allows you to easily insert a **<topichead>** element. A Navigation title (**@navtitle**) attribute is required but other attributes can also be specified from this dialog box (such as **Type**, **Scope**, **Format**, etc.).

**Figure 585. Insert Topic Heading Using the Insert Reference Dialog Box**

![Insert Topic Head dialog box](image)

**Related Information:**
*Insert Reference Dialog Box (on page 2340)*

**Inserting Topic Groups**

The **<topicgroup>** element identifies a group of topics (such as concepts, tasks, or references) or other resources. A **<topicgroup>** can contain other **<topicgroup>** elements, allowing you to express navigation or table-of-contents hierarchies, as well as implying relationships between the containing **<topicgroup>** and its children. You can set the collection-type of a container **<topicgroup>** to determine how its children are related to each
other. Relationships end up expressed as links in the output (with each participant in a relationship having links to the other participants by default).

You can insert a topic group by doing the following:

- Select **Topic Group** from the **Append Child**, **Insert Before**, or **Insert After** submenus when invoking the contextual menu in the **DITA Maps Manager** view (on page 2315).
- Open the **DITA map** in the XML editor (on page 2314) and select the [ ] **Insert Topic Group** action from the main toolbar (or from the **Insert** submenu of the contextual menu).

Those actions open the **Insert Topic Group** dialog box (on page 2340) that allows you to easily insert a `<topicgroup>` element and various attributes can be specified (such as **Collection type**, **Type**, **Scope**, **Format**, etc.)

Figure 586. Insert Topic Group Using the Insert Reference Dialog Box

![Insert Topic Group dialog box](image)

**Related Information:**

Defining Keys in DITA Maps

DITA uses keys (on page 2448) to insert content that may have different values in various circumstances. Keys provide the means for indirect referencing in DITA. This can make it easier to manage and to reuse content. In DITA, keys are defined in maps and can then be reused and referenced throughout the whole structure of the map. It is considered best practice to create a separate submap that contains all of the key definitions and reference that submap in the main (root) map (on page 2658). This makes it easier to manage since they're all in one location.

There are two types of key definitions that can be created in a map.

- Key with a value inside a keyword.
- Key with a target (for example, to target a resource such as an image or external link).

The following example is a DITA map (on page 2654) (a key definition submap) that contains some key definitions with various values for the product key and some targets to external URLs:

```xml
<map id="keydefs">
  <!-- product name -->
  <title>Key Definitions</title>
  <keydef keys="product" product="basic">
    <topicmeta>
      <keywords>
        <keyword>Basic Widget</keyword>
      </keywords>
    </topicmeta>
  </keydef>
  <keydef keys="product" product="pro">
    <topicmeta>
      <keywords>
        <keyword>Professional Widget</keyword>
      </keywords>
    </topicmeta>
  </keydef>
  <keydef keys="url_eula" href="https://www.example.com/eula.html" format="html" scope="external"/>
  <keydef keys="url_eula2" href="https://www.example.com/eula2.html" format="html" scope="external"/>
</map>
```
Note:
The profiling of the names is now contained in the map, where it only has to occur once to reuse throughout the whole map structure.

Key Definition with a Keyword Value

To define a key with a value inside a *keyword*, follow these steps:

1. **[Optional but Recommended]** Create a submap (on page 2332) that will contain all of your key definitions and reference the submap in your main (root) map (if you don't already have one created).
2. Open that map in the DITA Maps Manager (on page 2315).
3. Right-click the map or an item in the map where you want to add the reference and select **Key Definition with Keyword** from the Append Child, Insert Before, or Insert After submenu (depending on where you want to insert the *key definition*). This opens an Insert Key Definition dialog box.
4. Enter the name of the key in the **Key** field.
5. Enter the key's value in the **Keyword** field.
6. Click **Insert and close**.

**Tip:**
If you need to profile the key or add other attributes, you can right-click the key definition in the DITA Maps Manager, select ➕ Edit properties, and configure them in the Profiling tab or Attributes tab, respectively.

Key Definition with a Target

To insert a *targeted key definition* (for example, to target a resource such as an image or external link), follow these steps:

1. **[Optional but Recommended]** Create a submap (on page 2332) that will contain all of your key definitions and reference the submap in your main (root) map (if you don't already have one created).
2. Open that map in the DITA Maps Manager (on page 2315).
3. Right-click the map or an item in the map where you want to add the reference and select **Key Definition** from the Append Child, Insert Before, or Insert After submenu (depending on where you want to insert the *key definition* in the DITA map). This opens an Insert Key Definition dialog box.
4. Go to the **Keys** tab and enter the name of the key in the **Define keys** field.
5. Go to the **Target** tab and select a target resource (such as an image or external link).

**Tip:**
You can profile the key by using the Profiling tab and other attributes can also be defined in the Attributes tab.

6. Once you are done configuring the targeted key definition, click **Insert and close**.
Edit Properties Dialog Box

The DITA Maps Manager view (on page 2315) includes a feature that allows you to view and edit the properties of a selected node. The Edit properties action is available on both the DITA Maps Manager toolbar and in the contextual menu. This action is also available in the contextual menu when you edit a DITA map (on page 2654) document in Author mode. The action opens the Edit Properties dialog box and it includes several tabs with various functions and fields that are initialized with values based upon the node where the action was invoked.

**Note:**

If you select multiple sibling nodes and invoke the Edit properties action, only the Profiling tab will be available and your modifications in that tab will be applied to all the selected nodes. If you select multiple nodes that are not on the same hierarchical level, the other tabs will also be available and your modifications will be applied to the parent node (the child nodes will inherit the attributes of the parent node).

You can use the Edit Properties dialog box to modify or define attributes, metadata, profiling, or keys in DITA maps or topics. You can also use it to modify the title of root maps (on page 2658).

At the top of the Edit Properties dialog box, the Reference type drop-down list displays the type of the selected node and it depends on the node where the action was invoked.

The main section of the dialog box includes the following tabs: Target, Keys, Attributes, Metadata, and Profiling. The availability of the tabs and their functions depend on the selected node. For example, if you invoke the action on a root map (on page 2658), only the Attributes, Metadata, and Profiling tabs are accessible and the Title property can be configured. Also, if you select multiple nodes, only the Profiling tab is available.

**Target Tab**
The **Target** tab of the **Edit Properties** dialog box displays information about the target node on which the action was invoked and allows you to change the target. It includes the following sections and fields:

**Choose a file location section**

You can browse for and select the source target file by using the file window in this section. You can use the **File filter** drop-down menu to narrow the list of possible file types that will be displayed.

**URL**

Displays the path to the target and allows you to select or change it by using the combo box or browsing buttons.

**ID**

The drop-down list displays all of the target elements that are available for the selected target URL.

**Href**

The selected target automatically modifies this value to point to the corresponding `@href` attribute of the target element.
Note:
If the Reference type is a Navigation Reference, the Href field is changed to Mapref, since a <navref> element requires a @mapref attribute instead.

Keys Tab

![Figure 588. Edit Properties Dialog Box - Keys Tab](image)

The Keys tab allows you to use and define keys *(on page 2349)* for indirect referencing. For more information, see Working with Keys in DITA *(on page 2448)*. This tab includes the following:

Define keys
Use this text field to define the @keys attribute for the target.

Key scopes
Use this text field to define or edit the value of a @keyscope attribute. Key scopes allow you to specify different sets of key definitions for different map branches.

Key reference
Use this combo box (or the Choose key reference button) to select a key that is already defined in the root map *(on page 2658)*.

Attributes Tab
The **Attributes** tab of the **Edit Properties** dialog box allows you to insert and edit attribute values for the target node where the action was invoked.

If the target is a *root map* (on page 2658), the tab displays the title of the map. You can change it in the **Title** text field and assign it to an **Attribute**, **Element**, or **All**. However, if the title of the map contains elements other than plain text, the title is not editable and cannot be changed using this dialog box (you would need to open the DITA map in the main editor to edit the title).

For other types of targets, the tab includes the following sections and fields that can be used to edit the attributes of the target:

**Navigation title**

This text field allows you to specify a custom navigation title for the target reference. If you want this attribute to always be populated with a detected value (based on the specifications for the target file), select the **Navigation title** checkbox for the **Always fill values for attributes** option in the **DITA preferences** page (on page 84). For references to DITA resources, you can enforce...
the use of the specified title by selecting the Lock checkbox (otherwise, the topic `<title>` takes precedence).

Tip: You can also select the Prefer navigation title for topicref rendering option in the DITA preferences page (on page 84) to always enforce the use of the `@navtitle` value rather than selecting this Lock option on individual topics.

Collection type

This drop-down list allows you to select the `@collection-type` attribute to create hierarchical linking between topics in a DITA map (for example, unordered, sequence, choice, family, `-dita-use-conref-target`).

Type

Allows you to select a `@type` attribute (such as topic, task, concept, etc.) for the target element. If you want this attribute to always be populated with a detected value (based on the specifications for the target file), select the Type checkbox for the Always fill values for attributes option in the DITA preferences page (on page 84).

Scope

This property corresponds to the `@scope` attribute of the target element. It is populated automatically, based on the selected file type, unless its value for the selected target file is the same as the default attribute value. If you want this attribute to always be populated with a detected value based on the specifications (regardless of the default value), select the Scope checkbox for the Always fill values for attributes option in the DITA preferences page (on page 84).

Format

This property corresponds to the `@format` attribute of the target element. It is populated automatically, based on the selected file type, unless its value for the selected target file is the same as the default attribute value. If you want this attribute to always be populated with a detected value based on the specifications (regardless of the default value), select the Format checkbox for the Always fill values for attributes option in the DITA preferences page (on page 84).

Processing Role

This drop-down list allows you to set the `@processing-role` attribute to one of the allowed values for DITA reference elements (for example, resource-only, normal, `-dita-use-conref-target`).

Other attributes table

This table contains the attributes that are available for the selected reference. You can use this table to insert or edit the values of any of the listed attributes. Clicking a cell in the Value column allows you to use the combo box to enter, edit, or select attribute values.
Metadata Tab

The **Metadata** tab allows you to add metadata elements to the target node. Use the buttons on the right side of the tab to insert specific metadata elements (you can add the following metadata elements: `<navtitle>`, `<linktext>`, `<shortdesc>`, `<keyword>`, `<indexterm>`). The metadata elements are inserted inside a `<topicmeta>` element. The editing window allows you to easily insert and modify the content of the metadata that will be inserted.

Profiling Tab

The **Profiling** tab allows you to select or change profiling attributes for the selected target nodes. This tab displays profiling attributes and their values as determined by the following:

- If your root map (on page 2658) references a DITA subject scheme map (on page 2658) that defines values for the profiling attributes, those values are used.
- Otherwise, a basic default set of profiling attributes and values are used.
If you have a large list of profiling attributes, you can use the text filter field to search for attributes or values, and you can expand or collapse attributes by using the Expand All/Collapse All buttons to the right of the text filter or the arrow button to the left of the profiling attribute name.

When you modify a selection of values in this tab, the change will also automatically be reflected in the Attributes tab. For more information, see DITA Profiling / Conditional Text (on page 2556).

Note:
If you invoke the Edit properties action on a selection of multiple nodes that have different values for the same profiling attribute, a conflict panel will be displayed in the Profiling tab and you can choose between the following actions for resolving it:

- **Keep** - Preserves the current attribute values.
- **Change Now** - Allows you to edit the selection of values in this Profiling tab and the changes will be applied to all the selected nodes.

**Figure 593. Profiling Conflict Panel**

Finalizing Your Modifications

Once you click OK, all your changes are applied to the target node.

Related Information:
DITA Profiling / Conditional Text (on page 2556)
Working with Keys in DITA (on page 2448)

Generating a Table of Contents in DITA

In DITA, the order and hierarchy of the table of contents of a document is based directly on the DITA map that defines the document (on page 2313). In most cases, the processor generates a table of contents (TOC)
based on the hierarchy of the topics in a DITA map. By default, each `<topicref>` element in a map represents a node in the TOC.

It is also possible to instruct DITA where the table of contents should occur (or other content lists, such as a list of figures or tables). If you want to instruct the processor to generate a table of contents at a particular location within your DITA map structure, you can use the `<toc>` element in a *bookmap (on page 2333)* (as in the example below). For more information about the `<toc>` element, see https://docs.oasis-open.org/dita/v1.2/os/spec/langref/toc.html.

Example:

```xml
<bookmap>
   ....
   <frontmatter>
   <booklists>
   <toc href="chapter1.dita"/>
   </booklists>
   </frontmatter>
   ....
</bookmap>
```

Creating an Index in DITA

In DITA, indexes are created from `<indexterm>` elements. You can insert index term elements in the following:

- **The header of a topic**: In paginated media, such as a printed book or a PDF, this results in an index entry that points to the page where the topic starts, even if it is not the page in which the indexed term occurs.
- **In the `<topicref>` element in a map that references the topic**: This applies those index terms to that topic only when used in that map, allowing you to index topics differently in various publications. In paginated media, index entries point to the page where the topic starts.
- **In the body of a topic**: In paginated media, this results in an index entry that points to the page where the `<indexterm>` element occurs, even if that is not the page where the topic starts.

To add index terms to the text of a topic of the topic header, *create the elements as you normally would in Oxygen XML Editor Eclipse plugin (on page 2386)*. To add index terms to a map, open the map in the editor and add the elements, as you normally would, in a topic.

In some media, indexes will be generated automatically when index entries are found in the source. For other media, such as books, you may need to tell DITA where to place the index. For instance, to add an index to a *bookmap (on page 2652)*, you need to add an `<indexlist>` element to the `<backmatter>` of the book.

1. Open your *bookmap (on page 2333)* in the DITA Maps Manager (on page 2315).
2. Right-click the bookmap and select Append Child > Backmatter.
   The Insert Reference dialog box (on page 2340) appears.
3. Click Insert and Close to insert the `<backmatter>` element.
4. Right-click the `<backmatter>` element and create a `<booklists>` element using Append Child > Book Lists.
5. Use the same steps to create an `<indexlist>` element.

**CAUTION:**
Adding index entries and an `<indexlist>` to your project creates an instruction to the DITA publishing routines to create an index. There is no guarantee that all DITA output types or third-party customizations obey that instruction or create the index the way you want it. Modifying the output may be necessary to get the result you want.

---

### Resolving Topic References Through an XML Catalog

There are situations where you want to resolve references with an *XML Catalog*:

- You customized your [DITA map](#) to reference topics using URIs instead of local paths.
- You have URI content references in your DITA topic files and you want to map them to local files when the map is transformed.

In such situations, you have to add the catalog to Oxygen XML Editor Eclipse plugin. The [DITA Maps Manager view](#) will solve the displayed topic refs through the added XML catalog URI mappings. The resolution through the XML catalog URI mappings are done only for reference values starting with the `urn:` prefix.

To add an *XML catalog* to the DITA framework, follow these steps:

1. Create an XML catalog using the guidelines described in *Working with XML Catalogs*.
2. Open the Preferences dialog box and go to Document Type Association.
3. Select the DITA document type and use the Edit, Duplicate, or Extend button to open a Document type configuration dialog box.
4. Go to the Catalogs tab.
5. Click on the Add button to open a dialog box that allows you to add your created XML Catalog to the list.
6. After adding your catalog, click OK. You may need to reopen any currently edited files that use the new catalog or run a manual Validate action for the changes to take effect.

**Note:**
You could also add your created catalog to the list of global catalogs in the XML Catalog preferences page.

---

### Adding a Custom URI Resolver to Oxygen XML Editor Eclipse plugin

You can use the `XMLUtilAccess.addPriorityURIResolver(URIResolver)` API to add your own priority URI resolver from a Workspace Access plugin extension, allowing you to take control over how topic references in a DITA map are located or how references in DITA topics are resolved.
Publishing a DITA Map with References Resolved Through the XML Catalog

If you are publishing a DITA map that contains references to topics that need to be resolved through the XML catalog support in Oxygen XML Editor Eclipse plugin, you must enable the `fix.external.refs.com.oxygenxml` parameter in the Parameters tab of the transformation scenario configuration dialog box.

Chunking DITA Topics

By default, when a DITA map (on page 2654) is published to an online format, each topic becomes a separate page in the output. In some cases, you may want to combine multiple source topics into one output page. For instance, you may want to combine several types of information into a single page, or you may have chosen to create many small DITA topics for reuse purposes but feel they are too small to be useful to a reader by themselves. This is referred to as chunking.

To chunk DITA topics, you set the chunking attribute on the `<topicref>` that contains the sub-topics in a DITA map. There are several values that you can set on the chunking attribute (for example, by-topic or to-content). See the DITA documentation for full details. To achieve the effects you want in your topics and table of contents, you may also need to set the `@toc` and `@collection-type` attributes on the sub-topics or container topic to suitable values. See the DITA documentation for details.

You can set the `@collection-type` attribute on your topics using the Edit Properties action in the DITA Maps Manager (on page 2315). To set the `@toc` and `@chunk` attributes, you must open the map file in the editor and add or edit the attributes directly (double-click the map icon in the DITA Maps Manager to open the map in the editor).

DITA Map Validation and Completeness Check

You should validate your DITA maps (on page 2654) regularly to make sure that your maps and topics are valid, and all of the relationships between them are working. Changing one topic, image, or piece of metadata may create errors in references that rely on them. You may not discover these problems all at once. Validate your map to catch all of these kinds of problems. The longer you wait between validating your maps, the more difficult it may be to detect and correct any errors you find.

Validating a DITA Map

To validate a DITA, follow these steps:

1. In the DITA Maps Manager view (on page 2315), make sure that the tab that holds your root map (on page 2658) is selected and that the Context selection is set either to the name of your root map or to `<current_map>`.
2. It is a good practice to refresh your DITA map before running the validation process. To do so, select the DITA map in the DITA Maps Manager view and click File > Refresh (F5).
3. Click the Validate and Check for Completeness button on the DITA Maps Manager toolbar to open the DITA Map Completeness Check dialog box (on page 2361).
4. If you are using profiling, check the Use DITAVAL filters box and select the appropriate option.
5. Select any other options you want to check.
6. Click **Check** to run the validation process.

**Result:** The progress of the operation is shown as a task in the **Progress** view and the operation can be stopped from there.

**Validation Process**

The validation process of a **DITA map** includes the following:

- Verifies that the file paths of the topic references are valid. For example, if an `@href` attribute points to an invalid file path, it is reported as an error in the message panel at the bottom of the editor.
- Validates each referenced topic and map. Each topic file is opened and validated against the appropriate DITA DTD. If another **DITA map** is referenced in the main one, the referenced **DITA map** is verified recursively, applying the same algorithm as for the main map.
- If errors or warnings are found, they are displayed in a separate message pane at the bottom of the editor and clicking them takes you to the location of the error or warning in the file where it was found.

**DITA Map Completeness Check Dialog Box**

The **DITA Map Completeness Check** dialog box allows you to configure the **DITA map** validation.
You can configure the validation process with the following options that are available in the **DITA Map Completeness Check** dialog box:

**Batch validate referenced DITA resources**

This option specifies the level of validation that applies to referenced DITA files:

- If the checkbox is left unchecked (default setting), the DITA files will be validated using the rules defined in the DTD or XML Schema declared in the document.
- If the checkbox is selected, the DITA files will be validated using rules defined in their associated validation scenario (on page 555).

**Check the existence of non-DITA references resources**
Extends the validation of referenced resources to non-DITA files.

**Include remote resources**

Select this option if you want to check that remote referenced binary resources (such as images, movie clips, ZIP archives) exist at the specified location.

**Use DITAVAL filters**

The content of the map is filtered by applying a profiling condition set ([on page 2556](#)) before validation.

**Note:**

The validation process also takes branch filtering `<ditavalref>` elements into account as long as they appear before the referenced topics.

You can choose between the following options:

- **From the current condition set** - The map is filtered using the condition set currently applied in the DITA Maps Manager view ([on page 2315](#)). Clicking the Details icon opens a topic in the Oxygen XML Editor Eclipse plugin User Guide that explains how to create a profiling condition set.

- **From all available condition sets** - For each available condition set, the map content is filtered using that set before validation.

- **From the associated transformation scenario** - The filtering condition set is specified explicitly as a DITAVAL file in the current transformation scenario associated with the DITA map.

- **Other DITAVAL files** - For each DITAVAL file from this list, the map content is filtered using the DITAVAL file before validation. Use the Add or Remove buttons to configure the list. The Add button opens a dialog box that allows you to select a local or remote path to a DITAVAL file. You can specify the path by using the text field, its history drop-down, the Insert Editor Variables ([on page 218](#)) button, or the browsing actions in the Browse drop-down list.

**Report references to resources outside of the DITA map folder**

If selected, it will report any references to DITA resources that are located outside the main DITA map ([on page 2658](#)) folder.

**Report links to topics not referenced in DITA maps**

Checks that all the topics referenced by other topics are also linked in the DITA map. Also reports related links defined in relationship tables whose target topics are not referenced in the DITA Map.

**Report multiple references to the same topic**
If selected, it will report warnings when a topic is referenced multiple times in the *DITA map*, unless a unique `@copy-to` attribute is used on the `<topicref>` element for any topic that is referenced multiple times.

For example, it will **not** report a warning if there is a topic referenced twice, but the second `<topicref>` has a `@copy-to` attribute set:

```xml
<topicref href="topic.dita"/>
.....
<topicref href="topic.dita" copy-to="topic2.dita"/>
```

On the other hand, it **will** report a warning if there is a topic referenced twice and none of the reference-type elements has a `@copy-to` attribute set or both of them have the `@copy-to` attribute set to the same value:

```xml
<topicref href="topic.dita" copy-to="topic2.dita"/>
.....
<topicref href="topic.dita" copy-to="topic2.dita"/>
```

**Check for duplicate topic IDs within the DITA map context**

Checks for multiple topics with the same ID in the context of the entire map.

**Report duplicate key definitions**

Checks the *DITA map* for multiple key references with the same key defined for them. This is helpful because if you have two different resources with the same value for the `@keys` attribute, all references will point to the first one encountered and the other will be ignored.

- **Note:** This option takes *key scopes (on page 2480)* into account. For example, if you have something like this:

  ```xml
  <topicref href="t2.dita" keys="k2"/>
  <topicgroup keyscope="ks">
  <topicref href="t2.dita" keys="k2"/>
  </topicgroup>
  ```

  it will not report the "k2" key as a duplicate because it is defined in a *key scope (on page 2480)* on the second occurrence.

**Report unreferenced key definitions**

Checks the entire *DITA map* and reports any key definitions that are not referenced anywhere. Note that if the *Use DITAVAL filters* option is selected, this check will search for unreferenced key definitions based upon your selected filter.

**Report unreferenced reusable elements**
Checks the entire DITA map and reports any detected reusable elements that are not referenced anywhere. It looks for elements that have an ID specified in the following types of topic references:

- Any `<topicref>` that contains a `@processing-role` attribute set to `resource-only`.
- Any other referenced topic that contains elements that are reused elsewhere through a `@conref` or `@conkeyref`.

**Report table layout problems**

Looks for table layout problems. The types of errors that may be reported include:

- If a row has fewer cells than the number of columns detected.
- For a CALS table, if a cell has a vertical span greater than the available rows count.
- For a CALS table, if the number of `<colspecs>` is different than the number of columns detected from the table `@cols` attribute.
- For a CALS table, if the number of columns detected from the table `@cols` attribute is different than the number of columns detected in the table structure.
- For a CALS table, if the value of the `@cols`, `@rowsep`, or `@colsep` attributes are not numeric.
- For a CALS table, if the `@namest`, `@nameend`, or `@colname` attributes point to an incorrect column name.

**Identify possible conflicts in profile attribute values**

When the profiling attributes of a topic contain values that are not found in parent topic profiling attributes, the content of the topic is overshadowed when generating profiled output. This option reports these possible conflicts.

**Report attributes and values that conflict with profiling preferences**

Looks for profiling attributes and values that are not defined in the Profiling / Conditional Text preferences page (on page 145) (you can click the Profiling Preferences button to open this preferences page). It also checks if profiling attributes defined as `single-value` have multiple values set in the searched topics.

**Additional Schematron checks**

Allows you to select a Schematron file that Oxygen XML Editor Eclipse plugin will use for the validation of DITA resources. You can specify the path by using the text field, its history drop-down, the Insert Editor Variables (on page 218) button, or the browsing actions in the Browse drop-down list.

**Advanced Tip:**

Some APIs are available that retrieve information about DITA keys that are referenced within a topic. The APIs can be called from XSLT Stylesheets (including XML Refactoring operations) or Schematron schemas. For details, see API Documentation: DITAXSLTExtensionFunctionUtil.
Export settings

Allows you to export the settings assigned in this dialog box to an XML file that you can share with other users or use on other systems.

Import settings

Allows you to import settings for this dialog box from an XML file that was created by the Export settings action.

Check

Use the Check button to begin the validation process. The options that you choose in this dialog box are preserved between sessions.

Tip:

This function can be executed from an automated command-line script, for more details, see Scripting Oxygen (on page 2618).

Related information

DITA Maps Manager (on page 2315)

DITA Map Author Mode Actions

A variety of actions are available for DITA map documents that can be found in DITA menu, toolbar, contextual menu, and the Content Completion Assistant (on page 2653).

DITA Map Toolbar and Menu Actions

When a DITA map is opened in Author mode, the following default actions are available on the DITA Map toolbar (by default, they are also available in the DITA menu and in various submenus of the contextual menu):

- **Insert New DITA Resource**
  
  Opens a New DITA file dialog box (on page 2380) where you can choose the type of DITA document to create and inserts a reference to it at the current position within the map.

- **Insert Topic Reference**
  
  Opens the Insert Reference dialog box (on page 2340) where you can configure a topic reference and inserts it at the current position within the map.

- **Insert Key Definition with Keyword**
  
  Opens a dialog box where you can choose the name of a key and its keyword value and inserts the key definition at the current position within the map.

- **Reuse Content**
  
  Opens the Reuse Content dialog box (on page 2465) that allows you to insert and configure a content reference (@conref), or a content key reference (@conkeyref) at the cursor position.
- **Insert Topic Heading**
  Opens the **Insert Reference** dialog box (on page 2340) that allows you to insert a topic heading at the cursor position.

- **Insert Topic Group**
  Opens the **Insert Reference** dialog box (on page 2340) that allows you to insert a topic group at the cursor position.

- **Insert Relationship Table**
  Opens a dialog box that allows you to configure the relationship table to be inserted. The dialog box allows you to configure the number of rows and columns of the relationship table, if the header will be generated and if the title will be added.

- **Relationship Table Properties**
  Allows you to change the properties of rows in relationship tables.

- **Insert Relationship Row**
  Inserts a new table row with empty cells. The action is available when the cursor position is inside a table.

- **Insert Relationship Column**
  Inserts a new table column with empty cells after the current column. The action is available when the cursor position is inside a table.

- **Delete Relationship Column**
  Deletes the table column where the cursor is located.

- **Delete Relationship Row**
  Deletes the table row where the cursor is located.

- **Move Up**
  Moves the selected node up one position on its same level.

- **Move Down**
  Moves the selected node down one position on its same level.

- **Promote**
  Moves the selected node up one level to the level of its parent node.

- **Demote**
  Moves the selected node down one level to the level of its child nodes.

**DITA Map Contextual Menu Actions**

The following actions are available in the contextual menu when editing in **Author** mode (most of them are also available in the **DITA** menu at the top of the interface):
Edit Properties

Opens the Edit Properties dialog box that allows you to configure the properties of a selected node. For more details about this dialog box, see Edit Properties Dialog Box (on page 2351).

Cut (Ctrl + X (Command + X on macOS))

Removes the currently selected content from the document and places it in the clipboard.

Copy (Ctrl + C (Command + C on macOS))

Places a copy of the currently selected content in the clipboard.

Paste (Ctrl + V (Command + V on macOS))

Inserts the current clipboard content into the document at the cursor position.

Paste special submenu

This submenu includes the following special paste actions that are specific to the DITA framework:

Paste as content reference

Inserts a content reference (a DITA element with a @conref attribute) to the DITA XML element from the clipboard. An entire DITA XML element with an ID attribute must be present in the clipboard when the action is invoked. The conref attribute will point to this ID value.

Paste as content key reference

Allows you to indirectly reference content using the @conkeyref attribute. When the DITA content is processed, the key references are resolved using key definitions from DITA maps (on page 2654). To use this action, you must first do the following:

1. Make sure the DITA element that contains the copied content has an ID attribute assigned to it.
2. In the DITA Maps Manager view, make sure that the Context combo box points to the correct map that stores the keys.
3. Make sure the topic that contains the content you want to reference has a key assigned to it. To assign a key, right-click the topic with its parent map opened in the DITA Maps Manager, select Edit Properties, and enter a value in the Keys field.

Paste as link

Looks for the first element with an ID value in the clipboard and inserts an <xref> that points to that element. If no elements with an ID value are found, a message will appear that informs you that to use this action, the clipboard contents must include at least one element with a declared ID.
Paste as link (keyref)

Inserts a link to the element that you want to reference. To use this action, you must first do the following:

1. Make sure the DITA element that contains the copied content has an ID attribute assigned to it.
2. In the DITA Maps Manager view, make sure that the Context combo box points to the correct map that stores the keys.
3. Make sure the topic that contains the content you want to reference has a key assigned to it. To assign a key, right-click the topic with its parent map opened in the DITA Maps Manager, select Edit Properties, and enter a value in the Keys field.

Insert submenu

This submenu includes the following insert actions that are specific to the DITA Map framework:

Insert New DITA Resource

Opens a New DITA file dialog box (on page 2380) where you can choose the type of DITA document to create and inserts a reference to it at the current position within the map.

Insert Topic Reference

Opens the Insert Reference dialog box (on page 2340) where you can configure a topic reference and inserts it at the current position within the map.

Insert Key Definition with Keyword

Opens a dialog box where you can choose the name of a key and its keyword value and inserts the key definition at the current position within the map.

Reuse Content

Opens the Reuse Content dialog box (on page 2465) that allows you to insert and configure a content reference (@conref), or a content key reference (@conkeyref) at the cursor position.

Insert Topic Heading

Opens the Insert Reference dialog box (on page 2340) that allows you to insert a topic heading at the cursor position.

Insert Topic Group

Opens the Insert Reference dialog box (on page 2340) that allows you to insert a topic group at the cursor position.

Insert Entity
Allows you to insert a predefined entity or character entity. Surrogate character entities (range \#x10000 to \#x10FFFF) are also accepted. Character entities can be entered in one of the following forms:

- \#<decimal value>- e.g. \#65
- &\#<decimal value>- e.g. &\#65
- \#x<hexadecimal value>- e.g. \#x41
- &\#x<hexadecimal value>- e.g. &\#x41

### Relationship Table

Insert Relationship Table

Opens a dialog box that allows you to configure the relationship table to be inserted. The dialog box allows you to configure the number of rows and columns of the relationship table, if the header will be generated and if the title will be added.

### Generate IDs

Oxygen XML Editor Eclipse plugin generates unique IDs for the current element (or elements), depending on how the action is invoked:

- When invoked on a single selection, an ID is generated for the selected element at the cursor position.
- When invoked on a block of selected content, IDs are generated for all top-level elements and elements listed in the ID Options dialog box that are found in the current selection.

**Note:**
The Generate IDs action does not overwrite existing ID values. It only affects elements that do not already have an @id attribute.

### Search References

Finds the references to the @href or @keys attribute value of the topic/map reference element at the current cursor position, in all the topics from the current DITA map (opened in the DITA Maps Manager view (on page 2315)). The current topic/map reference element must have an @href or @keys attribute defined to complete the search.

### Show Key Definition

Available for elements that have a @conkeyref or @keyref attribute set (or elements with an ancestor element that has a @conkeyref or @keyref attribute). It computes the key name and opens the DITA map (on page 2654) that contains the definition of the key with the element that defines that key selected.

### Select submenu

This submenu allows you to select the following:

- Element
Selects the entire element at the current cursor position.

**Content**

Selects the entire content of the element at the current cursor position, excluding the start and end tag. Performing this action repeatedly will result in the selection of the content of the ancestor of the currently selected element content.

**Parent**

Selects the entire parent element at the current cursor position.

**Text submenu**

This submenu contains the following actions:

**To Lower Case**

Converts the selected content to lower case characters.

**To Upper Case**

Converts the selected content to upper case characters.

**Capitalize Sentences**

Converts to upper case the first character of every selected sentence.

**Capitalize Words**

Converts to upper case the first character of every selected word.

**Count Words**

Counts the number of words and characters (no spaces) in the entire document or in the selection for regular content and read-only content.

**Note:**

The content marked as deleted with change tracking (on page 2659) is ignored when counting words.

**Convert Hexadecimal Sequence to Character (Ctrl + Shift + H (Command + Shift + H on macOS))**

Converts a sequence of hexadecimal characters to the corresponding Unicode character (on page 298). The action can be invoked if there is a selection containing a valid hexadecimal sequence or if the cursor is placed at the right side of a valid hexadecimal sequence. A valid hexadecimal sequence can be composed of 2 to 4 hexadecimal characters and may or may not be preceded by the 0x or 0X prefix. Examples of valid sequences and the characters they will be converted to:

- \0x0045 will be converted to E
- \0x0125 to ĥ
- \265 to ü
Refactoring submenu

Contains a series of actions designed to alter the XML structure of the document:

- **Toggle Comment**
  Encloses the currently selected text in an XML comment, or removes the comment if it is commented.

- **Move Up (Alt + UpArrow (Option + UpArrow on macOS))**
  Moves the current node or selected nodes in front of the previous node.

- **Move Down (Alt + DownArrow (Option + DownArrow on macOS))**
  Moves the current node or selected nodes after the subsequent node.

- **Split Element**
  Splits the content of the closest element that contains the position of the cursor. Thus, if the cursor is positioned at the beginning or at the end of the element, the newly created sibling will be empty.

- **Join Elements**
  Joins two adjacent block elements (on page 2652) that have the same name. The action is available only when the cursor position is between the two adjacent block elements. Also, joining two block elements can be done by pressing the Delete or Backspace keys and the cursor is positioned between the boundaries of these two elements.

- **Surround with Tags (Alt + Shift + E)**
  Allows you to choose a tag to enclose a selected portion of content. If there is no selection, the start and end tags are inserted at the cursor position.
  - If the Position cursor between tags option (on page 120) is selected in the Content Completion preferences page, the cursor is placed between the start and end tag.
  - If the Position cursor between tags option (on page 120) is not selected in the Content Completion preferences page, the cursor is placed at the end of the start tag, in an insert-attribute position.
**Surround with `[tag]` (Alt + Shift + ForwardSlash)**

Surround the selected content with the last tag used.

**Rename Element**

The element from the cursor position, and any elements with the same name, can be renamed according with the options from the **Rename** dialog box.

**Delete Element Tags**

Deletes the tags of the closest element that contains the position of the cursor. This operation is also executed if the start or end tags of an element are deleted by pressing the **Delete** or **Backspace** keys.

**Remove All Markup**

Removes all the XML markup inside the selected block of content and keeps only the text content.

**Remove Text**

Removes the text content of the selected block of content and keeps the markup intact with empty elements.

**Attributes Refactoring Actions**

Contains built-in XML refactoring operations that pertain to attributes with some of the information preconfigured based upon the current context.

- **Add/Change attribute**
  
  Allows you to change the value of an attribute or insert a new one.

- **Convert attribute to element**

  Allows you to change an attribute into an element.

- **Delete attribute**

  Allows you to remove one or more attributes.

- **Rename attribute**

  Allows you to rename an attribute.

- **Replace in attribute value**

  Allows you to search for a text fragment inside an attribute value and change the fragment to a new value.

**Comments Refactoring Actions**

Contains built-in XML refactoring operations that pertain to comments with some of the information preconfigured based upon the current context.

- **Delete comments**
Allows you to delete comments found inside one or more elements.

**Elements Refactoring Actions**

Contains built-in XML refactoring operations that pertain to elements with some of the information preconfigured based upon the current context.

**Delete element**

Allows you to delete elements.

**Delete element content**

Allows you to delete the content of elements.

**Insert element**

Allows you to insert new elements.

**Rename element**

Allows you to rename elements.

**Unwrap element**

Allows you to remove the surrounding tags of elements, while keeping the content unchanged.

**Wrap element**

Allows you to surround elements with element tags.

**Wrap element content**

Allows you to surround the content of elements with element tags.

**Fragments Refactoring Actions**

Contains built-in XML refactoring operations that pertain to XML fragments with some of the information preconfigured based upon the current context.

**Insert XML fragment**

Allows you to insert an XML fragment.

**Replace element content with XML fragment**

Allows you to replace the content of elements with an XML fragment.

**Replace element with XML fragment**

Allows you to replace elements with an XML fragment.

**Review submenu**

This submenu includes the following actions:

🚀 **Track Changes**
Enables or disables the Track Changes (on page 2659) support for the current document.

✅ Accept Change(s) and Move to Next

Accepts the Tracked Change (on page 2659) located at the cursor position or all of the changes in a selection and then moves to the next change. If you select a part of a deletion or insertion change, only the selected content is accepted.

✅ Accept All Changes

Accepts all Tracked Changes (on page 2659) in the current document.

❌ Reject Change(s) and Move to Next

Rejects the Tracked Change (on page 2659) located at the cursor position or all of the changes in a selection and then moves to the next change. If you select a part of a deletion or insertion change, only the selected content is rejected.

❌ Reject All Changes

Rejects all Tracked Changes (on page 2659) in the current document.

📝 Comment Change

Opens a dialog box that allows you to add a comment to an existing Tracked Change (on page 2659). The comment will appear in a callout and a tooltip when hovering over the change. If the action is selected on an existing commented change, the dialog box will allow you to edit the comment.

📝 Highlight

Enables the highlighting tool that allows you to mark text in your document.

Colors

Allows you to select the color for highlighting text.

Stop highlighting

Use this action to deactivate the highlighting tool.

Remove highlight(s)

Use this action to remove highlighting from the document.

✉️ Add Comment

 Inserts a comment at the cursor position. The comment appears in a callout box and a tooltip (when hovering over the change).

✉️ Show/Edit Comment

Opens a dialog box that displays the discussion thread and allows the current user to edit comments that do not have replies. If you are not the author who inserted the original comment, the dialog box just displays the comment without the possibility of editing it.
Remove Comment

Removes a selected comment. If you remove a comment that contains replies, all of the replies will also be removed.

Manage Reviews

Opens the Review view (on page 436).

Folding submenu

This submenu includes the following actions:

- **Toggle Fold**
  Toggles the state of the current fold.

- **Collapse Other Folds**
  Folds all the elements except the current element.

- **Collapse Child Folds**
  Folds the elements indented with one level inside the current element.

- **Expand Child Folds (Ctrl + NumPad+ (Command + NumPad+ on macOS))**
  Unfolds all child elements of the currently selected element.

- **Expand All**
  Unfolds all elements in the current document.

About Element > Go to Definition

Moves the cursor to the definition of the current element.

Inspect Styles

Opens the CSS Inspector view (on page 412) that allows you to examine the CSS rules that match the currently selected element.

Options

Opens the Author mode preferences page (on page 136) where you can configure various options with regard to the Author editing mode.

Floating Contextual Toolbar for DITA

Oxygen XML Editor Eclipse plugin includes a dynamic feature where certain editing contexts will trigger a floating toolbar with common actions that are available in the current editing context.

The floating contextual toolbar is automatically displayed when editing DITA map documents when a `<topicref>` element is selected and it includes actions for moving the topic reference node up or down (or promoting/demoting the node).
DITA Map Drag/Drop Actions

Dragging a file from the Project Explorer view (on page 268) or DITA Maps Manager view (on page 2315) and dropping it into a DITA map document that is edited in Author mode creates a link to the dragged file (a <topicref> element, <chapter>, <part>, etc.) at the drop location.

Opening a Topic from a DITA Map in Author Mode

If a DITA map is open in the Author visual editing mode, you can open a referenced topic by clicking the icon to the left of the particular topic. The source topic is opened in a new tab in the main editor.

Tip:
For information about customizing Author mode actions for a particular framework (on page 2655) (document type), see the Customizing the Author Mode Editing Experience for a Framework (on page 1933) section.

Related Information:
Customizing the Author Mode Editing Experience for a Framework (on page 1933)

Opening a DITA Map With Topic Content Resolved

It is possible to open a DITA map in the main editor with all the content from the referenced topics resolved and presented in one document. To do this, select the DITA map in the DITA Maps Manager view and click the Open Map in Editor with Resolved Topics toolbar button. This opens the DITA map in the main editor area with content from all topic references expanded in-place.

If the Display referenced content setting in the Author Preferences (on page 136) page is not selected, references to maps, topics, and content references can be expanded on demand by clicking the small Expand Reference expansion button located next to each element that contains a reference.

Content from the resolved topics that is referenced using a @conref or @conkeyref attribute is presented as read-only by default. To edit it, you must use the Edit Reference contextual menu action to open the source topic that contains the referenced content.

Editing Referenced Content Directly

If you want to edit the referenced content directly without having to open the source document, go to Options > Preferences > Editor > Edit Modes > Author and select the Allow referenced content to be edited option (on page 139). The referenced content becomes editable in-place and saving the document will save all other modified topics.
Things to be Aware of When Enabling This Option:

- The references become editable only if the referenced topics are the root elements. If, for example, in the DITA map, there are references directly to subtopics embedded in a larger topic, those references will not be editable.
- If the content is stored in a CMS, you need to deselect the Local files only option (on page 139) to edit such remote referenced topics directly but this feature might not function properly with remote resources (it depends on the capabilities of the CMS connector).
- Since a single topic may be referenced in multiple places in the DITA map, be careful not to make conflicting changes to that topic.
- When modified topics are saved, the Only modified content option in the Options > Preferences > Editor > Edit Modes > Author > Serialization page (on page 157) is ignored.
- The toolbar has two DITA map-specific actions for inserting topic references and all DITA topic-specific actions that can be used to make changes in the referenced DITA topics.
- The content completion and schema-aware insertion strategies work in each referenced topic according to their respective schema.
- The contextual menu presents the relevant actions in each referenced topic.
- Validation works for each individual referenced topic but only if it contains modifications.

Working with DITA Topics

DITA is a structured writing format. Structure can have several meanings, all of which are relevant to DITA. This section includes information about working with DITA topics and the structure.

Information Types

The structure of a piece of content refers to how the words and images are selected and organized to convey information. One approach to structured writing is to divide content into discrete blocks that contain various types of information, and then to combine those blocks to form publications. DITA is based on this approach, and encourages the author to write in discrete blocks called topics. DITA provides three base topic types (concept, task, and reference), a number of extended topic types, and the capability to create new topic types through specialization.

Text Structure

Every piece of text is made up of certain text structures, such as paragraphs, lists, and tables. DITA supports text structures through XML elements such as `<p>`, `<ol>`, and `<simpletable>`. The DITA markup specifies the text structures, but not how they will be published in various types of media. The formatting of text structures is determined by the output transformations and may be customized to meet the needs of various organizations and type of media.
Semantic Structure

Semantic structure is structure that shows the meaning of things. For example:

- A `<task>` element specifies that a block of content contains the description of a task.
- A `<codeblock>` element specifies that a block of text consists of programming code.
- A `<uicontrol>` element specifies that a word is the name of a control in a computer GUI.
- The `@platform` profiling attribute specifies that a particular piece of content applies only to certain computing platforms.

Semantic structure is important in a structured writing system because it allows both authors and readers to find content, and it allows processing scripts to process various pieces of content differently, based on their role or meaning. This can be used to do things such as filtering content related to a specific product so that you can produce documentation on many products from the same source.

There can be many forms of semantics captured in a document set. DITA captures some of these in topics and some of them in maps. If you are using a CMS, it may capture additional semantics.

Document Semantics

Documents consist of elements that may be made up of the same basic text structures as the rest of the text, but have a special function within the structure of the document. For instance, both tables of contents and indexes are lists, but they play a special role in the document. Chapters and sections are just sequences of paragraphs and other text structures, yet they are meaningful in the structure of the document. In some cases, such as indexes and tables of contents, these structures can be generated from semantic information embedded in the source. For instance, a table of contents can be built by reading the titles of chapters and sections. DITA provides elements to describe common document semantics.

Subject Matter Semantics

In some cases, the semantics of the content relate directly to the subject matter that the content describes. For instance, DITA supports tags that allow you to mark a piece of text as the name of a window in a software application (`<wintitle>`), or to mark a piece of text as applying only to a particular product.

Audience Semantics

In some cases, the semantics of the content relate to the audience that it is addressed to. For instance, a topic might be addressed to a particular role, or to a person with a particular level of experience. DITA provides an `<audience>` element to capture audience metadata.

Creating Topic Structures

Oxygen XML Editor Eclipse plugin provides a number of tools to help you create topic structures:

- **Content Completion Assistant** (on page 2653) - Shows you which elements can be created at the current position.
- **Model view** (on page 330) - Shows you the complete structure supported by the current element.
• Outline view (on page 325) - Shows you the current structure of your document.
• DITA toolbar - Helps you to easily insert many common structures.

Resources

For more information about getting started with DITA and how to work with DITA in Oxygen XML Editor Eclipse plugin, see our compiled collection of DITA-related webinars that are meant to help you with your journey into working with DITA: Webinars: Working with DITA in Oxygen.

Creating a New DITA Topic

The basic building block for DITA information is the DITA topic. DITA provides a variety of specialized topic types, the most common of which are:

• Topic - The base topic type from which all other topic types are specialized. Typically, it is used when a more specialized topic type is inappropriate.
• Task - For procedural information such as how to use a dialog box.
• Concept - For general, conceptual information such as a description of a product or feature.
• Reference - For reference information.

Oxygen XML Editor Eclipse plugin also supports numerous other specialized topic types that you will find templates for in the various folders in the New DITA file dialog box (on page 2381). They include DITA 1.3 specializations, Lightweight DITA templates, MathML composites, Markdown documents, and other DITA specialized topic and DITA map (on page 2654) types such as Glossentry, Troubleshooting, Questions and Answers, Bookmap (on page 2652), and Subject Scheme Map (on page 2658).

To create a new DITA topic and add a reference to it in your DITA map (on page 2654), follow these steps:

1. In the DITA Maps Manager (on page 2315), right-click the node in the current map where you want to add the new topic.

2. Select one of the following actions:
   ◦ Append Child > New - Select this action to insert the new topic as a child of the selected node. This action opens a New file dialog box (on page 2381) that allows you to select the type of document and assists you with naming it. After you have configured your new topic, click Create.
   ◦ Insert Before > New - Select this action to insert the new topic as a sibling to the current node, before it. This action opens a New file dialog box (on page 2381) that allows you to select the type of document and assists you with naming it. After you have configured your new topic, click Create.
   ◦ Insert After > New - Select this action to insert the new topic as a sibling to the current node, after it. This action opens a New file dialog box (on page 2381) that allows you to select the
type of document and assists you with naming it. After you have configured your new topic, click Create.

- **Duplicate** - Select this action to create a copy of the selected topic and insert it as a sibling. This action opens a dialog box that allows you to choose the file name and location for the newly created copy of the topic. After you have selected the name and path for your new topic, click OK.

**Note:**
The value of the root ID is generated taking the *Use the file name as the value of the root ID attribute* option from the DITA > Topics preferences page (on page 86) into account. When the option is deselected, a unique ID is generated.

**Step Result:** The new topic is now referenced (as a `<topicref>`) in the DITA map at the location where you inserted it and the new topic is opened in the editor.

3. Save the DITA map.

### Creating a New DITA Topic Using the New File Wizard

The **New** DITA file dialog box allows you to create a new DITA topic using various types of DITA file templates and provides some options that help you to configure the new topic.
Figure 595. New DITA File Dialog Box

Choose a file template:

Use the template preview pane to select the appropriate type of DITA file you want to create. Once you select a template, the other options will appear below the preview pane.

Tip:
You can use the text filter field at the top of the dialog box to search for a specific template.

Title
Depending on the selected file template, the value of the Title field is set in:

Note:
The templates that appear in this dialog box include all templates that have an associated .properties file and the type property is set to dita, as well as templates that do not have an associated properties file or the type property is not defined. It will also include custom templates that you create using the procedures presented in Creating New Document Templates (on page 252).
• The `<title>` element of a DITA topic file. The `<title>` element needs to be the first child of the root element.
• The `<glossterm>` element of a Glossentry file.

**New Topics Preferences**

Pressing this button opens the DITA New Topics preference page (on page 86).

**Save as**

Use this option to specify a file name and path for the new file. You can specify the path by using the text field, the history drop-down, or the browsing actions in the **Browse** drop-down menu.

**Create**

When you click this button, a reference (`<topicref>`) to the new topic is added to the current DITA map and the new topic is opened in the editor.

**Other Ways to Create a New DITA Topic**

In addition to the methods described above, Oxygen XML Editor Eclipse plugin also provides other ways to create DITA topics, including the following:

• **Fast Create Topics** - You can use the Fast Create Topics feature (on page 2383) to quickly create multiple skeleton topics at once and you can specify their hierarchical structure within the DITA map.

• **Extract Topic From Selection** - When editing a DITA topic in Author mode, an Extract Topic From Selection action is available in the contextual menu (and the DITA menu). It creates a new DITA topic from a selection of content in the current topic.

**Related Information:**

Getting Started with DITA (on page 2306)
Adding Topics to a DITA Map (on page 2335)
Working with Markdown Documents in DITA (on page 2445)
Fast Create Multiple DITA Topics (on page 2383)

**Fast Create Multiple DITA Topics**

The DITA Maps Manager (on page 2315) includes a feature that allows you to quickly create multiple skeleton topics at once and you can specify their hierarchical structure within the DITA map (on page 2654).

A common use-case for using this feature is when you need to insert a new chapter or section that will include multiple topics and you have the structure and titles planned out in advance.

**Note:**

The Fast Create Topics feature works for the following types of local and remote resource protocols: `file, http, https, ftp, ftps`. 
To access this feature, right-click a node in the **DITA Maps Manager** where you want the new topics to be inserted and select **Fast Create Topics**. This opens the **Fast Create Topics** dialog box where you can configure the structure for the new topics.

**Figure 596. Fast Create Topics Dialog Box**

The **Fast Create Topics** dialog box includes the following features and options:

**Hierarchy Text Pane**

Use this text area to enter the titles for your new topics, one per line, and specify the hierarchy by using indents (**Tab** or **Space**). Topic references will be created in the **DITA map** according to the hierarchy you enter in this section.

**File name generation rules**

The titles that you enter in the text pane will not only be used for the topic titles but also to generate their file names and you can click the **File name generation rules** link to configure the rules *(on page 86)* for how those file names will be generated.
Tip:
If you have added a file name prefix or suffix to the properties file (on page 255) for DITA document templates, the generated file name will include that prefix or suffix.

File name prefix

Use this option to add a specified prefix to the file name. If you have added a file name prefix to the properties file (on page 255) for DITA document templates, the prefix you enter here will override the one from the properties file.

File name suffix

Use this option to add a specified suffix to the end of the file name. If you have added a file name suffix to the properties file (on page 255) for DITA document templates, the suffix you enter here will override the one from the properties file.

Topic type

All of the topics that will be created will have the same DITA topic type, which is detected from the most recently created topic. You can click the Change button to select a different type from a list of possible DITA templates.

Tip:
You can convert any of these new files to a different DITA topic type at a later time by using another feature that allows you to easily convert DITA documents to other types (on page 2389).

Add created topic hierarchy relative to the selection as

By default, the hierarchy of topics will be added to the DITA map as the First Child of the node where the action was invoked. You can change this to Last Child, Preceding Sibling, or Following Sibling if the selected node allows topics to be inserted as such.

Create

When you click Create, the specified hierarchy is added as topic references in the DITA map. The new documents are created as bare skeleton topics with only the topic title and possibly the root ID populated.

Tip:
You can easily change the order of the topics in the DITA map (on page 2334) at a later time, Related Information:

Adding Topics to a DITA Map (on page 2335)
Converting DITA Topics to Another Type (on page 2389)
Editing DITA Topics

Oxygen XML Editor Eclipse plugin provides a number of features to help you edit DITA topics. A DITA topic is an XML document, thus all the editing features that Oxygen XML Editor Eclipse plugin provides for editing XML documents also apply to DITA topics. Oxygen XML Editor Eclipse plugin also provides extensive additional support specifically for DITA.

Opening a DITA Topic

There are several ways to open a DITA topic in the XML editor. Use any of the following methods to open a topic:

- Double-click the topic in the DITA Maps Manager (on page 2315) (or right-click the topic and select Open).
- Double-click the file in the Project Explorer view (on page 268) (or right-click the file and select Open).
- If you have a DITA map (on page 2654) opened in the XML editor, you can click the icon to the left of the topic.
- Drag a DITA file from your system browser and drop it in the XML editor.

Visual Editing in Author Mode

DITA is an XML format (on page 27), although you do not have to write raw XML to create and edit DITA topics. Oxygen XML Editor Eclipse plugin provides a graphical view of your topics in Author mode (on page 241). Your topics will likely open in Author mode by default, so this is the first view you will see when you open or edit a DITA topic. If your topic does not open in Author mode, just click Author at the bottom left of the editor window to switch to this mode.

Author mode presents a graphical view of the document you are editing, similar to the view you would see in a word processor. However, there are some differences, including:

- Author mode is not a WYSIWYG view. It does not show you exactly what your content will look like when printed or displayed on-screen. The appearance of your output is determined by the DITA publishing process, and your organization may have modified that process to change how the output is displayed. Oxygen XML Editor Eclipse plugin has no way of determining what your final output will look like or where line breaks or page breaks will fall. Treat Author mode as a friendly visual editing environment, not a faithful preview of your output.
- Your document is still an XML document. Author mode creates a visual representation of your document by applying a CSS stylesheet to the XML. You can see the XML at any time by switching to Text mode (on page 240). You, or someone in your organization, can change how the Author view looks by changing the CSS stylesheet or providing an alternate stylesheet.
- Your aim in editing a DITA document is not to make it look right, but to create a complete and correct DITA XML document. Author mode keeps you informed of the correctness of your content by highlighting XML errors in the text and showing you the current status in a box at the top right of the editor window. Green means that your document is valid, yellow means valid with warnings, and red means invalid. Warnings and errors are displayed when you place the cursor on the error location.
Your XML elements may have attributes set on them. Conventionally, attributes are used to contain metadata that is not displayed to the reader. By default, attributes are not displayed in the Author view (though there are some exceptions) and cannot be edited directly in the Author view (though in some cases the CSS that drives the display may use form controls to let you edit attributes directly). To edit the attributes of an element, place your cursor on the element and press Alt+Enter to bring up the attribute editor. Alternatively, you can use the Attributes view (on page 403) to edit attributes.

Tip:
You can select Hints from the Styles drop-down menu (available on the Author Styles toolbar) to display tooltips throughout the DITA document that offers additional information to help you with the DITA structure. For more information, see the Selecting and Combining Multiple CSS Styles (on page 1933) section.

Content Completion Assistance

Since it is a structured format, DITA only allows certain elements in certain places. The set of elements allowed differs from one DITA topic type to another (this is what makes one topic type different from another). To help you figure out which elements you can add in any given place and help you understand what they mean, Oxygen XML Editor Eclipse plugin has a number of Content Completion Assistant (on page 2653) features.

- The Enter key: In Author mode, the Enter key does not create line breaks, it brings up the Content Completion Assistant to help you enter a new element. In XML, you do not use line breaks to separate paragraphs. You create paragraphs by creating paragraph elements (element <p> in DITA) and tools insert the line breaks in the output and on-screen.

Figure 597. Content Completion Assistant

The Content Completion Assistant not only suggests new elements you can add. If you press Enter at the end of a block element (on page 2652) (such as a paragraph) it suggests creating a new element of the same type. If you press Enter in the middle of a block element, it suggests splitting that element into two elements.

A useful consequence of this behavior is that you can create a new paragraph simply by hitting Enter twice (just as you might in a text editor).
As you highlight an element name, a basic description of the element is displayed. Select the desired element and press Enter to create it.

To wrap an element around an existing element or piece of text, simply select it and press Enter and use the Content Completion Assistant to choose the wrapper element.

- **The Model view**: You can see the entire model of the current element by opening the Model view (on page 330) (Window > Show View > Model, if the view is not already open). The Model view shows you what type of content the current element can contain, all the child elements it can contain, all its permitted attributes, and their types.

**Tip:**
You can also select Inline actions from the Styles drop-down menu (available on the Author Styles toolbar) to display possible elements that are allowed to be inserted at various locations throughout the DITA document. For more information, see the Selecting and Combining Multiple CSS Styles (on page 1933) section.

**DITA Editing Actions**

A variety of actions are available in the DITA framework (on page 2655) to specifically assist you with editing DITA documents. These various actions are available in the contextual menu, the DITA menu, the DITA (Author Custom Actions) toolbar, or the Content Completion Assistant.

The DITA toolbar contains buttons for inserting a number of common DITA elements (elements that are found in most DITA topic types).

If the DITA toolbar is not displayed, right-click anywhere on the toolbar area, select Configure Toolbars, and select it from the displayed dialog box.

**Note:**
The DITA toolbar contains a list of the most common elements and actions for DITA, such as inserting an image, creating a link, inserting a content reference, or creating a table. It does not contain a button for inserting every possible DITA element. For a complete list of elements that you can insert at the current location in your document, press Enter to open the Content Completion Assistant.

Whenever the current document in the editor is a DITA document, the DITA menu is displayed in the menu bar. It contains a large number of actions for inserting elements, creating content references and keys, editing DITA documents, and controlling the display. These actions are specific to DITA and supplement the general editing commands available for all document types. Many of these actions are also conveniently available in the contextual menu. In addition to the DITA framework-specific actions (on page 2422), the contextual menu also includes various general Author mode contextual menu actions (on page 529).
Converting DITA Topics to Another Type

Oxygen XML Editor Eclipse plugin includes a feature that allows you to convert an existing DITA document to a different topic type. For example, if you want to convert a DITA Task to a DITA Topic, or vice versa. There are several ways to access these refactoring actions and you can choose a scope for the operation and some filtering options.

DITA Conversion Refactoring Operations for DITA

The following conversion operations are available:

- **Convert Nested Topics to New Topics** (Available from the contextual menu of editable maps/nodes in the DITA Maps Manager (on page 2315))
  
  Use this operation on topics that contain nested `<topic>` elements to convert each nested topic to a new topic. Also, the new topics are added in the DITA Maps Manager as the first child topics of the original topic.

- **Convert Sections to New Topics** (Available from the contextual menu of editable maps/nodes in the DITA Maps Manager (on page 2315))
  
  Use this operation on topics that contain multiple sections to convert each section to a new topic. Also, the new topics are added in the DITA Maps Manager as the first child topics of the original topic.

- **Convert to Concept**
  
  Use this operation to convert a DITA topic (of any type) to a DITA Concept topic type (for example, Topic to Concept).

- **Convert to General Task**
  
  Use this operation to convert a DITA topic (of any type) to a DITA General Task topic type (for example, Task to General Task). A DITA General Task is a less restrictive alternative to the Strict Task information type.

- **Convert to Reference**
  
  Use this operation to convert a DITA topic (of any type) to a DITA Reference topic type (for example, Topic to Reference).

- **Convert to Task**
  
  Use this operation to convert a DITA topic (of any type) to a DITA Task topic type (for example, Topic to Task).

- **Convert to Topic**
Use this operation to convert a DITA topic (of any type) to a DITA Topic (for example, Task to Topic).

**Convert to Troubleshooting**

Use this operation to convert a DITA topic (of any type) to a DITA Troubleshooting topic type (for example, Topic to Troubleshooting).

**Methods for Accessing the DITA Conversion Refactoring Operations**

To access the conversion operations, use one of the following methods:

**Single Document Method**

With the document opened in the editor, right-click anywhere in the main editing pane (or right-click the topic reference in the DITA Maps Manager (on page 2315)), go to the Refactoring submenu, and choose whichever operation is appropriate for your needs.

**Multiple Documents At Once Method**

Select XML Refactoring from the XML Tools menu (or from the Refactoring submenu when you right-click one or more documents in the Project Explorer view (on page 268) or the DITA Maps Manager view (on page 2315)). Then select whichever operation is appropriate for your needs.

**XML Refactoring Wizard Dialog Box**

When you select any of the operations, Oxygen XML Editor Eclipse plugin proceeds to the XML Refactoring Wizard. If you used the Multiple Documents At Once Method (on page 2390), the wizard page allows you to choose a scope for the operation and some filtering options:

- **Scope** - Select from a variety of options to define the scope that will have resources affected by the operation. For example, you can choose to affect all resources in the Project, All opened files, Current DITA map hierarchy, Selected reference, and others depending on the context.
- **Filters** section
  - **Include files** - Specifies files to be excluded from the operation. You can specify multiple files by separating them with commas and the patterns can include wildcards (such as * or ?).
  - **Restrict to known XML file types only** - Excludes non-XML file types from the operation.

If you used the Single Document Method (on page 2390), the scope will be the current file so the scope and filtering options are not displayed.

You can then use one of the following buttons to proceed with the operation:

- **Preview**
  
  You can use the Preview button to open a comparison panel where you can review all the changes that will be made by the refactoring operation before applying the changes.
Warning:

It is always recommended to use the **Preview** button to make sure the operation is not going to do something unexpected and after you click the **Finish** button, any **Undo** action will only revert changes on the current document.

---

**Handling Special Characters When Generating New File Names**

For refactoring operations that generate a new file, if special characters are detected in an element that will be used to generate the new file name, the special characters will automatically be replaced with their ASCII equivalents (for example, Ä is changed to AE). If an ASCII equivalent does not exist, it will be replaced with an underline character (_). The purpose of this functionality is to avoid generating invalid file names.

It is possible to customize the list of replaceable symbols by editing the following XSLT character map file:

```
/OXYGEN_INSTALL_DIR/folders/dita/refactoring/utils/character-map.xsl
```

---

**Converting To and From DITA Specialization Document Types**

If you use your own [DITA specialization document type](#), you can modify mappings for the predefined conversion operations to work with your specialization.

To use the conversion operations with your DITA specialization, follow these steps:

1. Locate the conversion stylesheets in the following directory (and its subdirectories):
   
```
/OXYGEN_INSTALL_DIR/frameworks/dita/refactoring/.
```

   **Note:**
   
   The stylesheets for converting entire files (from one type to another) are located in the `dita-files-conversion-stylesheets` folder. Each of these conversion operations has a stylesheet with the word `entrypoint` at the end of its name. Edit the appropriate `*-*entrypoint.xsl` file (for example, to modify the **Convert to Task** operation, edit the `convert-resource-to-task-entrypoint.xsl` file).

2. Depending on whether you use a DTD, XML Schema, or Relax NG-based specialization, you can:
a. Modify the values of the declared `root-element`, `public-literal-target`, and `system-literal-target` variables to match your specialization's DTD information.

b. Modify the value of the declared `schema-location` variable to match the location of your specialization's XML schema.

c. Modify the value of the declared `xml-model-location` variable to match your Relax NG specialization.

3. For the Convert Nested Topics to New Topics and Convert Sections to New Topics operations, if your DITA specialization uses your own custom URN or DOCTYPE, you can replace the default mappings in the `{OXYGEN_INSTALL_DIR}/frameworks/dita/refactoring/utils/dita-formats.xsl` stylesheet with your own values for the `DOCTYPE` or `xml-model`.

4. If you want to change the name of the operation that will be displayed in Oxygen XML Editor Eclipse plugin, follow these substeps:
   a. Locate the resource XML file for the same conversion operation in the following directory: `{OXYGEN_INSTALL_DIR}/frameworks/dita/refactoring/` (for example, for the Convert to Task operation, it is `convertResource2Task.xml`).
   b. Edit that XML file and change the `name` attribute to match whatever you want to be displayed for that operation (for example, `name="Convert to My DocType"`).

5. Save your changes to all modified files.

6. Restart Oxygen XML Editor Eclipse plugin

Result: You should now see your changes when accessing the conversion operations (on page 2390).

Tip: You can also create your own customized refactoring operations. For more information, see Custom Refactoring Operations (on page 623).

Related Information:
- Editing DITA Topics (on page 2386)
- Refactoring XML Documents (on page 607)

Changing the Look of DITA Documents in Author Mode Using the Styles Menu

The Author mode renders the content of the DITA documents visually, based on CSS stylesheets associated with the document.

Oxygen XML Editor Eclipse plugin provides a Styles drop-down menu on the toolbar that allows you to select one main (non-alternate) CSS style (on page 2656) and multiple alternate CSS styles (on page 2652). This makes it easy to change the look of the document as it appears in Author mode.
You can use the **Styles** drop-down menu to select a *main css style (on page 2656)* that applies to the whole document and then select one or more *alternate css styles (on page 2652)* that behave like layers and are merged sequentially with the *main style*. Each of the styles that are listed in this drop-down menu have a corresponding CSS file that defines how your documents are rendered in Author mode and in the output. Also, the selections from this drop-down menu are persistent, meaning that Oxygen XML Editor Eclipse plugin remembers them when subsequent documents are opened.

### Unique CSS Styles for DITA

Oxygen XML Editor Eclipse plugin comes with a set of built-in CSS layer stylesheets for DITA documents (as well as some that are specifically for DITA maps (on page 2654)).

Some of these unique alternate styles for DITA documents include:

- **Hints** - Displays tooltips throughout DITA documents that offer additional information to help you with the DITA structure.
- **Inline actions** - Displays possible elements that are allowed to be inserted at various locations throughout DITA documents.
- **Inline insertion actions** - Displays a widget near each empty paragraph that makes it easy to insert DITA elements (for example, to insert lists, notes, or tables).

**Tip:**

For information about configuring the **Styles** drop-down menu, see Configuring and Managing Multiple CSS Styles for a Framework (on page 1933).
Working with Images in DITA Topics

There are several ways to add images to a DITA topic, depending on if you want to create a figure element (with a title and caption), just insert an image inline, or if you want to use multiple versions of a graphic depending on the situation. For instance, you might want to use a specific image for each different product version or output media.

Adding an Image Inline with the Insert Image Dialog Box

Use the following procedure to add an image inline:

1. Place the cursor in the position you want the graphic to be inserted.

2. Select the Insert Image action. The Insert Image dialog box appears.

3. Configure the options in this dialog box and click Insert.

   The Insert Image dialog box includes the following options and features for inserting images into a DITA document:

   **Location**
   
   Use this option to specify a URL for the image as the value of an @href attribute inside the <image> element. You can type the URL of the image you want to insert or use browsing actions in the Browse drop-down menu (there is also a history drop-down).

   **Key**
Use this option to insert the selected key as the value of a `@keyref` attribute inside the `<image>` element. All keys that are presented in the dialog box are gathered from the root map (on page 2658) of the current DITA map. You can use the Choose Key Reference button to open the Choose Key dialog box that presents the list of keys available in the selected root map.

Note:

If your defined keys are not listed in this dialog box, it is most likely trying to gather keys from the wrong root map. You can change the root map by using the Change Root Map link in the Choose Key dialog box or change it in the Context option in the toolbar of the DITA Maps Manager.

Figure title

Use this text box to insert a `<title>` and `<image>` element inside a `<fig>`.

Alternate text

Use this text box to insert an `<alt>` element inside the `<image>`.

Size

Use this section to configure the Width and Height of the image, or Scale the image. Specifying a value in these options inserts a `@width`, `@height`, and `@scale` attribute, respectively.

Layout

Use the options in this section to insert `@placement` and `@align` attributes into the `<image>` element.

Preview

The Preview box shows a thumbnail of the selected image so that you can see a preview of the image before clicking Insert.

Adding an Image Inline with Drag/Drop (or Copy/Paste) Actions

You can drag images from your system explorer or the Project Explorer view (on page 268) and drop them into a DITA document (or copy and paste). This will insert the path of the image file as the value of the `@href` attribute in a DITA `<image>` element:

```xml
<image href="../images/image_file.png"/>
```

Tip:

To replace an image, just drag and drop a new image over the existing one. Oxygen XML Editor Eclipse plugin will automatically update the reference to the new image.
Adding an Image in a Figure Element

To add an image in a figure:

1. Add a `<fig>` element to your document at the appropriate place.
2. Add a `<title>` and/or `<desc>` element to `<fig>`, according to your needs.
3. Add an `<image>` element (on page 2394) to the `<fig>` element.

**Note:**
The `<fig>` element has a number of other child elements that may be appropriate to your content. See the DITA documentation for complete information about `<fig>`.

**Note:**
The order that the content of the `<image>`, `<title>`, and `<desc>` elements will appear in the output is determined by the output transformation. If you want to change how they appear, you may have to modify the output transformation, rather than your source content.

Floating Images in DITA Topics for PDF or XHTML Output

Oxygen XML Editor Eclipse plugin provides the possibility of floating an image to the left or right of blocks of content in DITA topics, for both PDF and XHTML output.

To float an image, you simply need to set the `<outputclass>` attribute on the `<image>` element. The possible values are:

- `float-left`
- `float-right`

For example, the following DITA structure will present the image to the right of the paragraph content in the output:

```dita
<p><image href="../..//images/Lilac.jpg" scale="45" outputclass="float-right"/>

<b>Lilac</b> (Syringa) is a genus of about 20–25 species of flowering plants in the olive family (<b>Oleaceae</b>), native to Europe and Asia.
</p>
```

**Figure 600. Image Floated to the Right**

Lilac (Syringa) is a genus of about 20–25 species of flowering plants in the olive family (Oleaceae), native to Europe and Asia.
Searching for References to Images

You can search for all references to an image by selecting Search References from the contextual menu. The result depends on how the image is defined, as follows:

- If the action is invoked on an `<image>` element that contains an `@href` attribute but does not include an `@id` attribute, all direct references to the image are reported. If the `<image>` element does have an `@id` attribute, all links to the specified ID are also reported.
- If the action is invoked on an `<image>` element that contains a `@keyref` attribute but does not include an `@id` attribute, all direct references to the image are reported along with all instances where the key is used. If the `<image>` element does have an `@id` attribute, all links to the specified ID are also reported.

Adding Video, Audio, and Embedded HTML Resources in DITA Topics

You can insert references to media resources (such as videos, audio clips, or embedded HTML frames) in your DITA topics. The media resources can be played directly in Author mode and in all HTML5-based outputs. There is a toolbar button that allows you to insert and configure a reference to the media resource. You can also drag media files from your system explorer or the Project Explorer view (on page 268) and drop them into your documents (or copy and paste them).

Adding a Media Resource

To insert a media resource in a DITA document, use the following procedure:

1. Place the cursor at the location where you want the media resource.

2. Select the Insert Media Resource action from the toolbar. The Insert Media dialog box appears.

   ![Insert Media Dialog Box](image)

   Note:
   You can also drag media files from your system explorer or the Project Explorer view (on page 268) and drop them into your documents (or copy and paste them). Note that this method will bypass the Insert Media dialog box, so if you need to adjust the size you will need to adjust the @width or @height attributes manually.

3. Configure the options in this dialog box and click Insert.

   The Insert Media dialog box includes the following options:
Location

Use this option to specify a URL for the media resource as the value of a @data attribute inside the <object> element. You can type the URL of the resource you want to insert or use browsing actions in the Browse drop-down menu (there is also a history drop-down).

Key

Use this option to insert the selected key as the value of a @datakeyref attribute inside the <object> element. All keys that are presented in the dialog box are gathered from the root map (on page 2658) of the current DITA map. You can use the Choose Key Reference button to open the Choose Key dialog box that presents the list of keys available in the selected root map.

**Note:**
If your defined keys are not listed in this dialog box, it is most likely trying to gather keys from the wrong root map. You can change the root map by using the Change Root Map link in the Choose Key dialog box or change it in the Context option in the toolbar of the DITA Maps Manager.

Type

Oxygen XML Editor Eclipse plugin detects and automatically selects the media type based upon the specified resource in the URL field (on page 2399). You can manually change the type, but keep in mind that in the publishing stage the object element is converted to an HTML5 element (on page 2399) based upon the type selected here. You can choose between: audio, video, or iframe.

Size

Use this section to configure the Width and Height of the frame for the media resource. Specifying a value in these options inserts a @width and @height attribute, respectively. For audio clips, only the Width can be adjusted.

**Result in Author Mode:** A reference to the specified video, audio, or embedded HTML frame is inserted in an <object> element and it is rendered in Author mode so that it can be played directly from there.

**Attention:**
- On Ubuntu 17.10, if you receive an error when trying to play videos in Author mode, you need to install the libavformat57 library.

**Result in Output:** In the publishing stage, the <object> element is converted to an HTML5 element so that it can be rendered properly and played in all HTML5-based outputs.
• **Videos** - The `<object>` element is converted to an HTML5 `<video>` element.

• **Audio Clips** - The `<object>` element is converted to an HTML5 `<audio>` element.

• **Embedded HTML Frames** - The `<object>` element is converted to an HTML5 `<iframe>` element.

**Tip:**
There is an even faster way of inserting an embedded video (such as a YouTube, Vimeo, or Vidyard). If you copy the embed code from the source (for example, you can right-click on a YouTube video and select *Copy embed code*), you can then paste the contents of the clipboard in the **URL** field (on page 2399) and the **Type** (on page 2399) will automatically be set on iframe, while the **Width** and **Height** (on page 2399) will be populated according to the detected size, and an **allowfullscreen** parameter will automatically be added (set the value of this parameter to **true** to allow videos to play in full screen mode once the document is converted to XHTML output).

**Inserting Media in HTML Outputs That Do Not Support Embedded Media**

For certain types of HTML output (for example, CHM) that do not support embedded media (such as videos or audio files), Oxygen XML Editor Eclipse plugin provides a parameter that can be set in the transformation scenario to present the media object as a plain link in the output.

This can be achieved by following these steps:

1. **Edit the DITA transformation scenario** (on page 2527) for the output type that does not support embedded objects (for example, DITA Map CHM).
2. Go to the **Parameters tab** (on page 2534) and click the **New** button to add a new parameter.
3. For the **Name**, enter: `com.oxygenxml.xhtml.linkToMediaResources`.
4. For the **Value**, enter: `true`.
5. Click **OK** and run the transformation.

**Result:** The media object will appear in the output as a plain link instead of an embedded object.

**Resources**

For more information, see the following video demonstration:

[https://www.youtube.com/embed/lIX11gS4WaU](https://www.youtube.com/embed/lIX11gS4WaU)

**Related Information:**

- How to Add Video and Audio Objects in DITA WebHelp Output (on page 1410)

**Working with Image Maps in DITA**

Oxygen XML Editor Eclipse plugin includes support for **image maps** in DITA documents through the use of the `<imagemap>` element. This feature provides an easy way to create hyperlinks in various areas within an image
without having to divide the image into separate image files. The visual Author editing mode includes an Image Map Editor that helps you to easily create and configure image maps.

**Image Map Editor Interface in DITA**

The interface of the Image Map Editor consists of the following sections and actions:

**Toolbar**

- **New Rectangle**
  
  Use this button to draw a rectangular shape over an area in the image. You can drag any of the four points to adjust the size and shape of the rectangle.

- **New Circle**
  
  Use this button to draw a circle over an area in the image. You can drag any of the four points to adjust the size of the circle.

- **New Polygon**
  
  Use this button to draw a polygon shape over an area in the image. This action opens a dialog box that allows you to select the number of points for the polygon. You can drag any of the points to adjust the size and shape of the polygon.

- **New Free Form Shape**
Use this button to draw a free form shape over an area in the image. After selecting this button, left-click anywhere in the image to place the first point of your shape. Then move the cursor to the location of the next desired point and left-click to place the next point, and so on. To complete the shape (area), click the first point again and a line will automatically be added from the last point that was added, or simply double-click the last point to automatically add the line from the last point back to the first.

\[ \text{Duplicate} \]
Use this button to create a duplicate of the currently selected shape.

\[ \times \text{ Delete} \]
Use this button to delete the currently selected shape.

\[ \leftarrow \text{ Undo} \]
Use this button to undo the last action.

\[ \rightarrow \text{ Redo} \]
Use this button to redo the last action that was undone.

\[ \square \text{ Show/Hide Numbers} \]
Use this button to toggle between showing or hiding the numbers for the shapes.

\[ \text{Bring Shape to Front} \]
Use this button to bring the currently selected shape forward to the top layer.

\[ \text{Bring Shape Forward} \]
Use this button to bring the currently selected shape forward one layer.

\[ \text{Send Shape Backward} \]
Use this button to send the currently selected shape back one layer.

\[ \text{Send Shape to Back} \]
Use this button to send the currently selected shape back to the bottom layer.

\[ \text{Color Chooser} \]
Use this drop-down menu to select a color scheme for the lines and numbers of the shapes.

\[ \text{Zoom Slider} \]
Use this slider to zoom the image in or out in the main image pane.
This main Image Pane is where you work with shapes to add hyperlinks to multiple areas within an image. The editing mechanisms that are supported in the Image Pane include the following:

**Mouse Controls and Keyboard Shortcuts**

- Use the mouse to select and move shapes around in the image pane. It is easy to see which shape is selected in this image pane because the border of the selected shape changes from a solid line to a dotted one.
- You can also drag any of the points of a selected shape to adjust its size and shape.
- You can hold down the `Ctrl` key to select multiple shapes and then move them simultaneously.
- You can also move shapes by using the arrow keys on your keyboard. In addition, you can hold down `Shift` while using the arrow keys to move the shape further or `Alt` to move it 1 pixel at a time.
- To zoom in or out, you can use the `NumPad +` or `NumPad -` keys respectively. Use `Ctrl + NumPad 0` to reset the zoom level to its default value.
- You can use `Ctrl + Z` to undo an action or `Ctrl + Y` to redo the last action that was undone.

**Contextual Menu Actions Available in the Image Pane**

You can right-click the shapes, points, or anywhere in the Image Pane to invoke the contextual menu where the following actions are available:

- **Add Point**
  Adds a point to *Polygon* or *Free Form* shapes.

- **Remove Point**
  Removes the current point from *Polygon* or *Free Form* shapes.

- **Duplicate**
  Create a duplicate of the currently selected shape.

- **Delete**
  Delete the currently selected shape.

- **New Rectangle**
  Creates a rectangular shape over an area in the image. You can drag any of the four points to adjust the size and shape of the rectangle.

- **New Circle**
Creates a circle over an area in the image. You can drag any of the four points to adjust the size of the circle.

- **New Polygon**
  Creates a polygon shape over an area in the image. This action opens a dialog box that allows you to select the number of points for the polygon. You can drag any of the points to adjust the size and shape of the polygon.

- **Undo**
  Use this action to undo the last action.

- **Redo**
  Use this action to redo the last action that was undone.

**Shape Table**

The table at the right of the *Image Pane* is a sequential list of all the areas (shapes) that have been added in the image. It shows their number, type, and description (if one has been added). If you select one of the entries in the table, the corresponding shape will be selected in the *Image Pane*.

**Properties**

- **Type**
  Displays information about the selected coordinate.

- **Target**
  Allows you to choose the target resource that you want the selected area (shape) to be linked to. Select a target by using the • *Link* drop-down menu to the right of the text field. You can choose between the following types of links: **Cross Reference**, **File Reference**, or **Web Link**. All three types will open a dialog box that allows you to define the target resource. This linking process is similar to the normal process of inserting links in DITA *(on page 2492)* by using the identical • *Link* drop-down menu from the main toolbar.

  When you click **OK** to finalize your changes in the *Image Map Editor*, an `<xref>` element will be inserted with either an `@href` attribute or a `@keyref` attribute. Additional attributes may also be inserted and their values depend on the target and the type of link. For details about the three types of links and their dialog boxes, see *Inserting a Link in Oxygen XML Editor Eclipse plugin* *(on page 2492)*.

**Description**

You can enter an optional description for the selected area (shape) that will be displayed in the *Image Map Details* section *(on page 2405)* in **Author** mode and as a tooltip message when the end-user hovers over the hyperlink in the output.
How to Create an Image Map in DITA

To create an image map on an existing image in a DITA document, follow these steps:

1. Right-click the image and select **Image Map Editor**.

   **Step Result:** This action will apply an *image map* to the current image and open the **Image Map Editor** dialog box.

2. Add hyperlinks to the image by selecting one of the shape buttons (New Rectangle, New Circle, or New Polygon).

3. Move the shape to the desired area in the image and drag any of the points on the shape to adjust its size or form. You can use the other buttons on the toolbar (on page 2401) to adjust its layer and color, or to perform other editing actions.

   **Tip:**
   You can right-click any of the points, shapes, or anywhere in the Image Pane to access various helpful contextual menu actions (on page 2403). For example, the easiest way to remove a point is to right-click the point and select ✗ Remove Point.

4. With the shape selected, use one of the linking options (on page 2404) in the Link drop-down menu to select a target resource (or enter its path in the Target (on page 2404) text field).

5. (Optional) Enter a Description (on page 2404) for the selected area (shape).

6. If you want to add more hyperlinks to the image, select a shape button again and repeat the appropriate steps.

7. When you are finished creating hyperlinks, click **OK** to process your changes.

**Result:** The *image map* is applied on the image and the appropriate elements and attributes are automatically added. In **Author** mode, the image map is now rendered over the image. If the image includes an `<alt>` element, its value will be displayed under the image. The following two buttons will also now be available under the image in **Author** mode:

- **Image Map Editor** - Click this button to open the **Image Map Editor**.
- **Image Map Details** - Click this button to expand a section that displays the details of the image map and allows you to change the shape and coordinates of the hyperlinked areas. Keep in mind that if you change the shape in this section, you also need to add or remove coordinates to match the requirements of the new shape.
How to Edit an Existing Image Map in DITA

To edit an existing image map, use any of the following methods:

- Simply double-click the image.
- Right-click the image and select **Image Map Editor**.
- Click the **Image Map Editor** button below the image.

All three methods open the **Image Map Editor** where you can make changes to the image map using the various features described above. You can also make changes to the XML structure of the image map in the **Text editing mode**.

You can also click the **Image Map Details** button below the image to expand a section that displays the details of the image map and allows you to change the shape and coordinates of the hyperlinked areas. Keep in mind that if you change the shape in this section, you also need to add or remove coordinates to match the requirements of the new shape.

**Overlapping Areas**

If shapes overlap one another in the **Image Map Editor**, the one on the top layer takes precedence. The number shown inside each shape represents its layer (if the numbers are not displayed, click the **Show/Hide Numbers** button on the **Image Map Editor** toolbar *(on page 2401)*). To change the layer order for a shape, use the layer buttons on the **Image Map Editor** toolbar *(on page 2401)* (*, *, *, *).

If you insert a shape and all of its coordinates are completely inside another shape, the **Image Map Editor** will display a warning to let you know that the shape is entirely covered by a bigger shape. Keep in mind that if a shape is completely inside another shape, its hyperlink will only be accessible if its layer is on top of the bigger shape.

**Related Information:**

- DITA `imagemap` Element Specifications
- Working with Images in DITA Topics *(on page 2394)*
Adding Tables in DITA Topics

You can use the **Insert Table** action on the toolbar or from the contextual menu to add a table in a DITA topic. By default, DITA supports four types of tables:

- **DITA Simple table model (on page 2407)** - This is the most commonly used model for basic tables.
- **CALS table model (OASIS Exchange Table Model) (on page 2409)** - This is used for more advanced functionality.
- **DITA Choice table model (on page 2412)** - This is used within a `<step>` element in a DITA Task document to describe a series of optional choices that a user must make before proceeding.
- **DITA Properties table model (on page 2413)** - This is used in DITA Reference documents to describe a property (for example, its type, value, and description).

If you are using a specialized DITA vocabulary, it may contain specialized versions of these table models.

Since DITA is a structured format, you can only insert a table in places in the structure of a topic where tables are allowed. The Oxygen XML Editor Eclipse plugin toolbar provides support for entering and editing tables. It also helps to indicate where you are allowed to insert a table or its components by disabling the appropriate buttons.

**Inserting a Simple Table Model**

To insert a Simple DITA table, select the **Insert Table** action on the toolbar or from the contextual menu (or the Table submenu from the DITA menu). The **Insert Table** dialog box appears. Select Simple for the table Model.

![Insert Table Dialog Box - Simple Model](image)
The dialog box allows you to configure the following options when you select the Simple table model:

**Title**

If this checkbox is selected, you can specify a title for your table in the adjacent text box.

**Generate table header**

If selected, an extra row will be inserted at the top of the table to be used as the table header.

**Column widths**

Allows you to specify the type of properties for column widths (@colwidth attribute). You can choose one of the following properties for the column width:

- **proportional** - The width is specified in proportional (relative) units of measure. The proportion of the column is specified in a @relcolwidth attribute with the values listed as the number of shares followed by an asterisk. The value of the shares is totaled and rendered as a percent. For example, relcolwidth="1* 2* 3*" causes widths of 16.7%, 33.3%, and 66.7%. When entering content into a cell in one column, the width proportions of the other columns are maintained. If you change the width by dragging a column in Author mode, the values of the @relcolwidth attribute are automatically changed accordingly. By default, when you insert, drag and drop, or copy/paste a column, the value of the @relcolwidth attribute is 1*.

- **dynamic** - If you choose this option, the columns are created without a specified width. Entering content into a cell changes the rendered width dynamically. If you change the width by dragging a column in Author mode, a dialog box will be displayed that asks you if you want to switch to proportional or fixed column widths.

**Frame**

Allows you to specify a value for the @frame attribute. It is used to specify where a border should appear in the table. The allowed values are as follows:

- **none** - No border will be added.
- **all** - A border will be added to all frames.
- **top** - A border will be added to the top frame.
- **topbot** - A border will be added to the top and bottom frames.
- **bottom** - A border will be added to the bottom frame.
- **sides** - A border will be added to the side frames.

- **-dita-use-conref-target** - Normally, when using a @conref, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the @conref target. For more information, see https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html.
Note:
The options in the Insert Table dialog box for DITA documents are persistent, so changes made in one session will carry over to another.

When you click Insert, a simple table is inserted into your document at the current cursor position.

Inserting a CALS Table Model (OASIS Exchange Table)

To insert an OASIS Exchange Table (CALS), select the Insert Table action on the toolbar or from the contextual menu (or the Table submenu from the DITA menu). The Insert Table dialog box appears. Select CALS for the table Model. This model allows you to configure more properties than the Simple model.

The dialog box allows you to configure the following options when you select the CALS table model:

**Title**
If this checkbox is selected, you can specify a title for your table in the adjacent text box.

**Table Size**
Allows you to choose the number of Rows and Columns for the table.

**Generate table header**
If selected, an extra row will be inserted at the top of the table to be used as the table header.

**Column widths**
Allows you to specify the type of properties for column widths (@colwidth attribute). You can choose one of the following properties for the column width:
• **proportional** - The width is specified in proportional (relative) units of measure. The proportion of the column is specified in a `@colwidth` attribute with the values listed as the number of shares followed by an asterisk. The value of the shares is totaled and rendered as a percent. For example, `colwidth="1* 2* 3*"` causes widths of 16.7%, 33.3%, and 66.7%. When entering content into a cell in one column, the width proportions of the other columns are maintained. If you change the width by dragging a column in **Author** mode, the values of the `@colwidth` attribute are automatically changed accordingly. By default, when you insert, drag and drop, or copy/paste a column, the value of the `@colwidth` attribute is `1*`.

• **dynamic** - If you choose this option, the columns are created without a specified width (`@colwidth` attribute). Entering content into a cell changes the rendered width dynamically. If you change the width by dragging a column in **Author** mode, a dialog box will be displayed that asks you if you want to switch to proportional or fixed column widths.

• **fixed** - The width is specified in fixed units. By default, the `pt` unit is inserted, but you can change the units in the `colspecs` (column specifications) section above the table or in **Text** mode. The following units are allowed: `pt` (points), `cm` (centimeters), `mm` (millimeters), `pi` (picas), `in` (inches).

**Frame**

Allows you to specify a value for the `@frame` attribute. It is used to specify where a border should appear in the table. The allowed values are as follows:

• **none** - No border will be added.
• **all** - A border will be added to all frames.
• **top** - A border will be added to the top frame.
• **topbot** - A border will be added to the top and bottom frames.
• **bottom** - A border will be added to the bottom frame.
• **sides** - A border will be added to the side frames.
• **-dita-use-conref-target** - Normally, when using a `@conref`, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the `@conref` target. For more information, see [https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html](https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html).

**Row separator**

Specifies whether or not to include row separators (`@rowsep` attribute). The allowed values are: 0 (no separator) and 1 (include separators).

**Column separator**

Specifies whether or not to include column separators (`@colsep` attribute). The allowed values are: 0 (no separator) and 1 (include separators).

**Alignment**

Specifies the alignment of the text within the table (`@align` attribute). The allowed values are:
• **left** - Aligns the text to a left position.
• **right** - Aligns the text to a right position.
• **center** - Aligns the text to a centered position.
• **justify** - Stretches the line of text so that it has equal width.

**Note:**
The justify value cannot be rendered in **Author** mode, so you will only see it in the output.

• **char** - Aligns text to the leftmost occurrence of the value specified on the @char attribute for alignment.
• **-dita-use-conref-target** - Normally, when using a @conref, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the @conref target. For more information, see https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html.

**Note:**
The options in the **Insert Table** dialog box for DITA documents are persistent, so changes made in one session will carry over to another.

When you click **Insert**, a CALS table is inserted into your document at the current cursor position.

When you insert a CALS table, you see a link for setting the colspecs (column specifications) of your table. Click the link to open the controls that allow you to adjust various column properties. Although they appear as part of the **Author mode (on page 241)**, the colspecs link and its controls will not appear in your output. They are just there to make it easier to adjust how the columns of your table are formatted.

**Figure 606. CALS Table in DITA**

```
<table>

</tr>
<tr>
<td>-------------------------------------</td>
</tr>
</tbody>
</table>
```
Inserting a Choice Table Model

To insert a `Choice` table within a `<step>` element in a DITA Task document, select the `Insert Table` action on the toolbar or in the `Insert` submenu from the contextual menu (or the `Table` submenu from the DITA menu), or select `choicetable` from the `Content Completion Assistant (on page 2653)`. The `Insert Table` dialog box appears. Select `Simple` for the table `Model`.

**Figure 607. Insert Table Dialog Box - Choice Model**

The dialog box allows you to configure the following options when you insert a `Choice` table model within a DITA Task:

**Table Size**

Allows you to choose the number of **Rows** and **Columns** for the table.

**Generate table header**

If selected, an extra row will be inserted at the top of the table to be used as the table header.

**Column widths**

Allows you to specify the type of properties for column widths (`@colwidth` attribute). You can choose one of the following properties for the column width:

- **proportional** - The width is specified in proportional (relative) units of measure. The proportion of the column is specified in a `@relcolwidth` attribute with the values listed as the number of shares followed by an asterisk. The value of the shares is totaled and rendered as a percent. For example, `relcolwidth="1* 2* 3*"` causes widths of 16.7%, 33.3%, and 66.7%. When entering content into a cell in one column, the width proportions of the other columns are maintained. If you change the width by dragging a column in **Author** mode, the values of the `@relcolwidth` attribute are automatically changed accordingly. By default, when you insert, drag and drop, or copy/paste a column, the value of the `@relcolwidth` attribute is `1*`.

- **dynamic** - If you choose this option, the columns are created without a specified width. Entering content into a cell changes the rendered width dynamically. If you change the width by dragging a column in **Author** mode, a dialog box will be displayed that asks you if you want to switch to proportional or fixed column widths.
Frame

Allows you to specify a value for the @frame attribute. It is used to specify where a border should appear in the table. The allowed values are as follows:

- **none** - No border will be added.
- **all** - A border will be added to all frames.
- **top** - A border will be added to the top frame.
- **topbot** - A border will be added to the top and bottom frames.
- **bottom** - A border will be added to the bottom frame.
- **sides** - A border will be added to the side frames.
- **-dita-use-conref-target** - Normally, when using a @conref, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the @conref target. For more information, see https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html.

When you click **Insert**, a **Choice** table is inserted into your DITA Task document at the current cursor position (within a `<step>` element).

**Inserting a Properties Table Model**

To insert a **Properties** table within a `<refbody>` element in a DITA Reference document, select the **Insert Table** action on the toolbar or in the **Insert** submenu from the contextual menu (or the **Table** submenu from the DITA menu), or select **properties(wizard)** from the **Content Completion Assistant (on page 2653)**. The **Insert Table** dialog box appears. Select **Properties** for the table **Model**.

![Figure 608. Insert Table Dialog Box - Properties Model](image)
The dialog box allows you to configure the following options when you insert a *Properties* table model within a DITA Reference:

**Table Size**

Allows you to choose the number of **Rows** and **Columns** for the table.

**Generate table header**

If selected, an extra row will be inserted at the top of the table to be used as the table header.

**Frame**

Allows you to specify a value for the `@frame` attribute. It is used to specify where a border should appear in the table. The allowed values are as follows:

- **none** - No border will be added.
- **all** - A border will be added to all frames.
- **top** - A border will be added to the top frame.
- **topbot** - A border will be added to the top and bottom frames.
- **bottom** - A border will be added to the bottom frame.
- **sides** - A border will be added to the side frames.
- **-dita-use-conref-target** - Normally, when using a `@conref`, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the `@conref` target. For more information, see https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html.

When you click **Insert**, a *Properties* table is inserted into your DITA Reference document at the current cursor position (within a `<refbody>` element).

**Editing an Existing Table**

You can edit the structure of an existing table using the table buttons on the toolbar (or in the contextual menu) to add or remove cells, rows, or columns, and to set basic table properties. Additional attributes can be used to fine-tune the formatting of your tables by using the Attributes view (on page 403) (Window > Show View > Attributes). See the DITA documentation for a full explanation of these attributes.

You can also use the **Table Properties** (Ctrl + T (Command + T on macOS)) (on page 2417) action from the toolbar or contextual menu (or DITA menu) to modify many of the properties of the table (on page 2417).

Also, remember that underneath the visual representation, both table models are really just XML. If necessary, you can edit the XML directly by switching to Text mode (on page 240).

You can use normal copy/paste shortcuts to move content between cells. Oxygen XML Editor Eclipse plugin includes a *Smart Paste feature* (on page 388) that preserves certain style and structure information when pasting content.
Tip:
When copying a multiple selection of table cells and pasting them outside the table, a new table will be created. When pasting into space-preserved elements, the cell content will be pasted as plain text.

Related Information:
Editing Tables in Author Mode (on page 454)

DITA Table Layouts

Depending on the context, DITA accepts the following table layouts:

- **CALS table model (on page 2415)**
- **Simple table model (on page 2416)**
- **Choice table model (on page 2416)**
- **Properties table model (on page 2416)**

CALS Table Model Layout

The **CALS** table model allows for more flexibility and table customization than other models. When choosing a **CALS** table model from the **Insert Table** dialog box, you have access to more configurable properties. The layout of a **CALS** table includes a **colspecs** section that allows you to easily configure some properties without opening the **Table Properties** dialog box. For example, you can change the value of column widths (**@colwidth** attribute) or the text alignment (**@align** attribute). Although they appear as part of the **Author mode (on page 241)**, the **colspecs** link and its controls will not appear in your output. They are just there to make it easier to adjust how the columns of your table are formatted.

![Sample CALS Table with no specified width and proportional column widths](Image)

**Figure 609. CALS Table in DITA**
Tip:
A sample plugin is available that can be used as inspiration to add support for CALS tables in any XML document: Sample Plugin: Add CALS Support for any XML Document.

Simple Table Model Layout

When choosing a Simple table model from the Insert Table dialog box, you only have access to configure a few properties. For example, you can choose the number of rows and columns, specify values for frames, and choose from a few types of properties for the column width. The layout of this type of table is very simple, as the name suggests.

![Simple Table](image)

**Figure 610. DITA Simple Table**

<table>
<thead>
<tr>
<th>Header 1</th>
<th>Header 2</th>
</tr>
</thead>
<tbody>
<tr>
<td>Column 1</td>
<td>Column 2</td>
</tr>
</tbody>
</table>

Choice Table Model Layout

A Choice table model is used within a `<step>` element in a DITA Task document to describe a series of optional choices that a user must make before proceeding. The `<choicetable>` element is a useful device for documenting options within a single step of a task. You can insert Choice tables in DITA Task documents either by selecting `choicetable` from the Content Completion Assistant (on page 2653) (within a `<step>` element) or by using the Insert Table action on the toolbar or from the contextual menu). The options and layout of a Choice table is similar to the Simple table model.

![Choice Table](image)

**Figure 611. DITA Choice Table**

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Opt A</td>
<td></td>
</tr>
<tr>
<td>Opt B</td>
<td></td>
</tr>
<tr>
<td>Opt C</td>
<td></td>
</tr>
</tbody>
</table>

Properties Table Model Layout

A Properties table model is used within a `<refbody>` element in a DITA Reference document to describe a property (for example, its type, value, and description). You can insert Properties tables in DITA Reference documents either by selecting `properties(wizard)` from the Content Completion Assistant (on page 2653) (within a `<refbody>` element) or by using the Insert Table action on the toolbar (or from the contextual menu) and selecting Properties for the Model. The layout of a Properties table is very simple. It allows for a maximum of 3 columns (typically for property type, value, and description) and the only options available are for whether or not you want a header row and for specifying frames (borders).
Table Validation in DITA

Oxygen XML Editor Eclipse plugin reports table layout problems that are detected in manual or automatic validations. When you validate a DITA map (on page 2654) with the Validate and Check for Completeness action, if the Report table layout problems option (on page 2365) is selected in the DITA Map Completeness Check dialog box, table layout problems will be reported in the validation results. The types of errors that may be reported for DITA table layout problems include:

**CALS Tables**

- A row has fewer cells than the number of columns detected from the table `@cols` attribute.
- A row has more cells than the number of columns detected from the table `@cols` attribute.
- A cell has a vertical span greater than the available rows count.
- The number of `<colspecs>` is different than the number of columns detected from the table `@cols` attribute.
- The number of columns detected from the table `@cols` attribute is different than the number of columns detected in the table structure.
- The value of the `@cols`, `@rowsep`, or `@colsep` attributes are not numeric.
- The `@namest`, `@nameend`, or `@colname` attributes point to an incorrect column name.

**Simple or Choice Tables**

A row has fewer cells than the number of table columns.

Editing Table Properties in DITA

To customize the look of a table in DITA, place the cursor anywhere in a table and invoke the Table Properties (Ctrl + T (Command + T on macOS)) action from the toolbar or the Table submenu of the contextual menu (or DITA menu). This opens the Table properties dialog box.

The Table properties dialog box allows you to set specific properties to the table elements. The options that are available depend on the context and location within the table where the action was invoked.

**Note:**

Some properties allow the following special values, depending on the context and the current properties or values:
• `<not set>` - Use this value if you want to remove a property.
• `<preserve>` - If you select multiple elements that have the same property set to different values, you can choose this value to keep the values that are already set. In some cases it can also be used to keep the current non-standard value for a particular property.

Edit Table Properties for a CALS Table Model

For a CALS table model, the **Table properties** dialog box includes four tabs of options:

- **Table** tab - The options in this tab apply to the entire table.
- **Row** tab - The options in this tab apply to the current row or selection of multiple rows. A message at the bottom of the tab tells you how many rows will be affected.
- **Column** tab - The options in this tab apply to the current column or selection of multiple columns. A message at the bottom of the tab tells you how many columns will be affected.
- **Cell** tab - The options in this tab apply to the current cell or selection of multiple cells. A message at the bottom of the tab tells you how many cells will be affected.

The options in four tabs include a **Preview** pane that shows a representation of the modification.

Figure 613. Table Properties Dialog Box with Cell Tab Selected (DITA CALS Table Model)

The options in the four tabs include the following:

**Horizontal alignment (Available in the Table, Column, and Cell tabs)**
Specifies the horizontal alignment of text within the current table/column/cell or selection of multiple columns/cells (align attribute). The allowed values are as follows:

- **left** - Aligns the text to a left position.
- **right** - Aligns the text to a right position.
- **center** - Aligns the text to a centered position.
- **justify** - Stretches the line of text so that it has equal width.

**Note:**
The justify value cannot be rendered in Author mode, so you will only see it in the output.

- **char** - Aligns text to the leftmost occurrence of the value specified on the @char attribute for alignment.
- **-dita-use-conref-target** - Normally, when using a @conref, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the @conref target. For more information, see [https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html](https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html).

**Vertical alignment (Available in the Row and Cell tabs)**

Specifies the vertical alignment of text within the current row/cell or selection of multiple rows/cells (valign attribute). The allowed values are as follows:

- **top** - Aligns the text at the top of the cell.
- **middle** - Aligns the text in a vertically centered position.
- **bottom** - Aligns the text at the bottom of the cell.
- **-dita-use-conref-target** - Normally, when using a @conref, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the @conref target. For more information, see [https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html](https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html).

**Column separator (Available in the Table, Column, and Cell tabs)**

Specifies whether or not to include column separators (borders/grid lines) in the form of the @colsep attribute. The allowed values are: 0 (no separator) and 1 (include separators).

**Row separator (Available in all four tabs)**

Specifies whether or not to include row separators (borders/grid lines) in the form of the @rowsep attribute. The allowed values are: 0 (no separator) and 1 (include separators).

**Frame (Available only in the Table tab)**

Allows you to specify a value for the @frame attribute. It is used to specify where a border should appear in the table. The allowed values are as follows:
Edit Table Properties for a Simple, Choice, or Properties Table Model

For a Simple, Choice, Properties table model, the Table properties dialog box only allows you to edit a few options.

Table tab

Frame

Allows you to specify a value for the @frame attribute. It is used to specify where a border should appear in the table. The allowed values are as follows:

- **none** - No border will be added.
- **all** - A border will be added to all frames.
- **top** - A border will be added to the top frame.
- **topbot** - A border will be added to the top and bottom frames.
- **bottom** - A border will be added to the bottom frame.
- **sides** - A border will be added to the side frames.
- **-dita-use-conref-target** - Normally, when using a `@conref`, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the `@conref` target. For more information, see [https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html](https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html).

Row tab (not available for Properties tables)

Row type

Allows you change the row to a body or header type of row.

Related Information:

Adding Tables in DITA Topics (on page 2407)
Editing Tables in Author Mode (on page 454)
Adding MathML Equations in DITA Topics

You can add MathML equations in a DITA document open in the **Author** visual editing mode using one of the following methods:

- Embed MathML directly into a DITA topic. You can use **Insert > Σ: Insert Equation** from the contextual menu or the main menu **DITA > Insert > Insert Equation** action to insert a MathML equation. Clicking on the equation will open a **MathML Editor** where you can edit the code.
- Reference an external MathML file as an image, using the **Insert Image** action that is available on the DITA toolbar (or from the **DITA > Insert** menu).

**Publishing Notes:**

- MathML equations contained in DITA topics can be published out-of-the-box in PDF using the **DITA PDF** transformation scenario.
- The **DITA Map PDF - based on HTML5 & CSS** transformation scenario (on page 1521) support MathML equations (on page 1698).
- For details about HTML output, see How to View MathML Equations in HTML Output (on page 1456).
- For other publishing formats, you might need to employ additional customizations for handling MathML content.

Adding LaTeX Equations in DITA Topics

LaTeX is a high-quality typesetting system that includes features designed for the production of technical and scientific documentation. LaTeX can also be used to express mathematical formulas in a textual format. By default, web browsers and PDF readers do not have support to show mathematical equations written in LaTeX, but there are open-source projects that can read LaTeX and convert it to other image types.

Adding support for writing LaTeX equations in a DITA topic implies three stages:

1. Find a way to write the equation in the DITA XML content. You can either create a DITA DTD specialization and add a new element (for example, called `<latex>` and it extends the DITA `<foreign>` element). Alternatively, you can directly use the DITA `<foreign>` element with a specific `@outputclass` attribute value:

```xml
<!DOCTYPE topic PUBLIC "-//OASIS//DTD DITA Topic//EN" "topic.dtd">
<topic id="testEquation">
  <title>Test equation</title>
  <body>
    <p><foreign outputclass="embed-latex">L' = \sqrt{1 - \frac{v^2}{c^2}}</foreign></p>
  </body>
</topic>
```
2. If you want Oxygen XML Editor Eclipse plugin to properly present the LaTeX equation when editing in the **Author** visual mode, you need a plugin that converts the equation content to an image. There is a sample plugin that does that here: [https://github.com/oxygenxml/wsaccess-javascript-sample-plugins/tree/master/latex-images-support](https://github.com/oxygenxml/wsaccess-javascript-sample-plugins/tree/master/latex-images-support). You can download and copy the plugin folder `latex-images-support` to the Oxygen XML Editor Eclipse plugin `plugins` folder, then restart Oxygen XML Editor Eclipse plugin.

3. The final stage would be to publish the content to HTML-based or PDF output. The following DITA Open Toolkit plugin automatically converts LaTeX images to SVG when publishing: [https://github.com/oxygenxml/dita-latex](https://github.com/oxygenxml/dita-latex).

**DITA Questions and Answers Topic Type**

You can create a new DITA *Questions and Answers* topic using the Oxygen XML Editor Eclipse plugin **File > New** file wizard. It is found in the **Framework templates > DITA > Topics > RNG** folder (or you can search for it using the search filter at the top of the dialog box).

This type of topic groups together multiple question/answer sections and can be used to create a frequently asked questions document (for example).

There is an **Insert Question/Answer Group** action that is available on the toolbar and in the **DITA Q/A** main menu that can be used to insert multiple question/answer groups. You can also define multiple questions in the same group, all paired to the same answer.

When producing WebHelp output from DITA content, Q/A-specific **Google Structured Data** in the HTML files is generated from these Questions and Answers DITA topic types.

**Related information**

[How to Generate Google Structured Data (on page 1462)]

**DITA Topic Author Mode Actions**

A variety of actions are available for DITA documents that can be found in **DITA** menu, toolbar, contextual menu, and the **Content Completion Assistant (on page 2653)**.

**DITA Toolbar Actions**

The following default actions are available on the DITA toolbar when editing in **Author** mode (by default, most of them are also available in the **DITA** menu and in various submenus of the contextual menu):

- **Bold**

  Surrounds the selected text with a `<b>` tag. You can use this action on multiple non-contiguous selections.

- **Italic**

  Surrounds the selected text with an `<i>` tag. You can use this action on multiple non-contiguous selections.
Underline

Surrounds the selected text with a `<u>` tag. You can use this action on multiple non-contiguous selections.

🔗 Link Actions Drop-Down Menu

The following link actions are available from this menu:

Cross Reference

Opens the Cross Reference (xref) dialog box (on page 2492) that allows you to insert a link to a target DITA resource at the current location within a document. The target resource can be the location of a file or a key that is already defined in your DITA map (on page 2654) structure. Once the target resource has been selected, you can also target specific elements within that resource. For more information, see Linking in DITA Topics (on page 2492).

File Reference

Opens the File Reference dialog box (on page 2493) that allows you to insert a link to a target non-DITA file resource at the current location within a document. The target resource can be the location of a file or a key that is already defined in your DITA map structure. For more information, see Linking in DITA Topics (on page 2492).

Web Link

Opens the Web Link dialog box (on page 2493) that allows you to insert a link to a target web-related resource at the current location within a document. The target resource can be a URL or a key that is already defined in your DITA map structure. For more information, see Linking in DITA Topics (on page 2492).

Related Link to Topic

Opens the Cross Reference (xref) dialog box (on page 2493) that allows you to insert a link to a target DITA resource in a related links section at the bottom of the current document. The target resource can be the location of a file or a key that is already defined in your DITA map structure. Once the target resource has been selected, you can also target specific elements within that resource. If a related links section does not already exist, this action creates one. For more information, see Linking in DITA Topics (on page 2492).

Tip:

You can use the Find Similar Topics action (available in the contextual menu or DITA menu) to quickly find related topics that can be added as related links. It opens the Open/Find Resource view and performs a search using text content from the `<title>`, `<shortdesc>`, `<keyword>`, and `<indexterm>` elements.
Related Link to File

Opens the **File Reference dialog box (on page 2494)** that allows you to insert a link to a target non-DITA file resource in a related links section at the bottom of the current document. The target resource can be the location of a file or a key that is already defined in your **DITA map** structure. If a related links section does not already exist, this action creates one. For more information, see **Linking in DITA Topics (on page 2492)**.

Related Link to Web Page

Opens the **Web Link dialog box (on page 2494)** that allows you to insert a link to a target web-related resource in a related links section at the bottom of the current document. The target resource can be a URL or a key that is already defined in your **DITA map** structure. If a related links section does not already exist, this action creates one. For more information, see **Linking in DITA Topics (on page 2492)**.

**Insert Image**

Opens the **Insert Image dialog box (on page 2394)** that allows you to configure the properties of an image to be inserted into a DITA document at the cursor position.

**Insert Media Resource**

Opens the **Insert Media dialog box (on page 2397)** that allows you to select and configure the properties of a media object to be inserted into a DITA document at the cursor position. The result will be that a reference to the specified video, audio, or embedded HTML frame is inserted in an **<object>** element and it is rendered in **Author** mode so that it can be played directly from there.

**Insert Section Drop-Down Menu**

The following insert actions are available from this menu:

- **Insert Section**
  
  Inserts a new **<section>** element in the document, depending on the current context.

- **Insert Concept**
  
  Inserts a new **<concept>** element, depending on the current context. Concepts provide background information that users must know before they can successfully work with a product or interface.

- **Insert Task**
  
  Inserts a new **<task>** element, depending on the current context. Tasks are the main building blocks for task-oriented user assistance. They generally provide step-by-step instructions that will help a user to perform a task.

- **Insert Topic**
Inserts a new `<topic>` element, depending on the current context. Topics are the basic units of DITA content and are usually organized around a single subject.

**Insert Reference**

Inserts a new `<reference>` element, depending on the current context. A reference is a top-level container for a reference topic.

**Insert Note**

Inserts a new `<note>` element, depending on the current context.

**Insert Codeblock**

Inserts a new `<codeblock>` element, depending on the current context.

**Insert Intent Question**

Inserts a new special `<data>` element that contains a question or intent. The intent can be used to generate Google Structured data (on page 1462) content in WebHelp Responsive output.

**Insert Paragraph**

Inserts a new paragraph at current cursor position.

**Reuse Content**

This action provides a mechanism for reusing content fragments. It opens the Reuse Content dialog box (on page 2465) that allows you to insert several types of references to reusable content at the cursor position. The types of references that you can insert using this dialog box include content references (@conref) (on page 2466), content key references (@conkeyref) (on page 2468), or key references to metadata (@keyref) (on page 2471).

**Insert step or list item**

Inserts a new list or step item in the current list type.

**Insert Unordered List**

Inserts an unordered list at the cursor position. A child list item is also automatically inserted by default. You can also use this action to convert selected paragraphs or other types of lists to an unordered list.

**Insert Ordered List**

Inserts an ordered list at the cursor position. A child list item is also automatically inserted by default. You can also use this action to convert selected paragraphs or other types of lists to an ordered list.

**Sort**

Sorts cells or list items in a table.

**Insert Table**
Opens a dialog box that allows you to configure and insert a table. You can generate a header and footer, set the number of rows and columns of the table and decide how the table is framed. You can also use this action to convert selected paragraphs, lists, and inline content (mixed content, text plus markup, that is rendered inside a block element (on page 2652)) into a table, with the selected content inserted in the first column, starting from the first row after the header (if a header is inserted).

**Note:**
If the selection contains a mixture of elements that cannot be converted, you will receive an error message saying that **Only lists, paragraphs, or inline content can be converted to tables.**

**Insert Row**
Inserts a new table row with empty cells below the current row. This action is available when the cursor is positioned inside a table.

**Delete Row(s)**
Deletes the table row located at the cursor position or multiple rows in a selection.

**Insert Column**
Inserts a new table column with empty cells after the current column. This action is available when the cursor is positioned inside a table.

**Delete Column(s)**
Deletes the table column located at the cursor position or multiple columns in a selection.

**Table Properties**
Opens the **Table properties** dialog box that allows you to configure properties of a table (such as frame borders).

**Join Cells**
Joins the content of the selected cells (both horizontally and vertically).

**Split Cell**
Splits the cell at the cursor location. If Oxygen XML Editor Eclipse plugin detects more than one option to split the cell, a dialog box will be displayed that allows you to select the number of rows or columns to split the cell into.

**DITA Contextual Menu Actions**
The following actions are available in the contextual menu when editing in **Author** mode (most of them are also available in the **DITA** menu at the top of the interface):

- **Edit Attributes**
Displays an in-place attributes editor (on page 405) that allows you to manage the attributes of an element.

**Edit Profiling Attributes**

Allows you to change the profiling attributes (on page 440) defined on all selected elements.

- **Cut** (Ctrl + X (Command + X on macOS))
  Removes the currently selected content from the document and places it in the clipboard.

- **Copy** (Ctrl + C (Command + C on macOS))
  Places a copy of the currently selected content in the clipboard.

- **Paste** (Ctrl + V (Command + V on macOS))
  Inserts the current clipboard content into the document at the cursor position.

**Paste special submenu**

This submenu includes the following special paste actions that are specific to the DITA framework:

- **Paste as content reference**
  Inserts a content reference (a DITA element with a @conref attribute) to the DITA XML element from the clipboard. An entire DITA XML element with an ID attribute must be present in the clipboard when the action is invoked. The conref attribute will point to this ID value.

- **Paste as content key reference**
  Allows you to indirectly reference content using the @conkeyref attribute. When the DITA content is processed, the key references are resolved using key definitions from DITA maps (on page 2654). To use this action, you must first do the following:

  1. Make sure the DITA element that contains the copied content has an ID attribute assigned to it.
  2. In the DITA Maps Manager view, make sure that the Context combo box points to the correct map that stores the keys.
  3. Make sure the topic that contains the content you want to reference has a key assigned to it. To assign a key, right-click the topic with its parent map opened in the DITA Maps Manager, select Edit Properties, and enter a value in the Keys field.

- **Paste as link**
  Looks for the first element with an ID value in the clipboard and inserts an `<xref>` that points to that element. If no elements with an ID value are found, a message
will appear that informs you that to use this action, the clipboard contents must include at least one element with a declared ID.

**Paste as link (keyref)**

Inserts a link to the element that you want to reference. To use this action, you must first do the following:

1. Make sure the DITA element that contains the copied content has an ID attribute assigned to it.
2. In the **DITA Maps Manager** view, make sure that the **Context** combo box points to the correct map that stores the keys.
3. Make sure the topic that contains the content you want to reference has a key assigned to it. To assign a key, right-click the topic with its parent map opened in the **DITA Maps Manager**, select **Edit Properties**, and enter a value in the **Keys** field.

**Insert submenu**

This submenu includes the following insert actions that are specific to the DITA *framework*:

**Insert Table**

Opens a dialog box that allows you to configure and insert a table. You can generate a header and footer, set the number of rows and columns of the table and decide how the table is framed. You can also use this action to convert selected paragraphs, lists, and inline content (mixed content, text plus markup, that is rendered inside a *block element (on page 2652)*) into a table, with the selected content inserted in the first column, starting from the first row after the header (if a header is inserted).

**Note:**

If the selection contains a mixture of elements that cannot be converted, you will receive an error message saying that **Only lists, paragraphs, or inline content can be converted to tables**.

**Insert Image**

Inserts an image reference (on page 489) at the cursor position. Depending on the current location, an image-type element is inserted.

**Insert Media Resource**

Opens a *Choose Media* dialog box (on page 517) that allows you to select the URL of a media object to be inserted into a document at the cursor position. The result will be that a reference to the specified video, audio, or embedded HTML frame is inserted and rendered in **Author** mode so that it can be played directly from there.
Insert Equation

Opens the XML Fragment Editor that allows you to insert and edit MathML notations (on page 519).

Insert Note

Inserts a new `<note>` element at the current cursor position.

Insert Code Block

Inserts a new `<codeblock>` element at current cursor position.

Insert Menu Cascade

Inserts a new `<menucascade>` element at current cursor position.

Insert Label

Inserts a special label keyword in the prolog. The label is helpful for searching WebHelp Responsive output for similar topics with the same label.

Insert Paragraph

Inserts a new `<p>` (paragraph) element at current cursor position.

Insert Section

Inserts a new `<section>` element in the document, depending on the current context.

Insert Topic

Inserts a new `<topic>` element, depending on the current context. Topics are the basic units of DITA content and are usually organized around a single subject.

Insert Entity

Allows you to insert a predefined entity or character entity. Surrogate character entities (range #x10000 to #x10FFFF) are also accepted. Character entities can be entered in one of the following forms:

- `#<decimal value>` - e.g. #65
- `&#<decimal value>` - e.g. &#65
- `#x<hexadecimal value>` - e.g. #x41
- `&#x<hexadecimal value>` - e.g. &#x41

Style submenu

This submenu includes the following text styling actions:

- **Bold**
  Emphasizes the selected text by surrounding it with a `<b>` (bold) tag. You can use this action on multiple non-contiguous selections.

- **Italic**
Emphasizes the selected text by surrounding it with an `<i>` (italic) tag. You can use this action on multiple non-contiguous selections.

**Underline**

Emphasizes the selected text by surrounding it with a `<u>` (underline) tag. You can use this action on multiple non-contiguous selections.

**Subscript**

Surrounds the selected text with a `<sub>` (subscript) tag, used for inserting a character (number, letter, or symbol) that will appear slightly below the baseline and slightly smaller than the rest of the text.

**Superscript**

Surrounds the selected text with a `<sup>` (superscript) tag, used for inserting a character (number, letter, or symbol) that will appear slightly above the baseline and slightly smaller than the rest of the text.

**Code**

Surrounds the selected text with a `<codeph>` tag.

**UI Control**

Surrounds the selected text with a `<uicontrol>` tag, used to mark up names of buttons, entry fields, menu items, or other interface objects.

**Filepath**

Surrounds the selected text with a `<filepath>` tag, used to indicate the name, and optionally the location of a referenced file. You can specify the directory that contains the file and other directories that may precede it in the system hierarchy.

**Image Map Editor**

This action is available in the contextual menu when it is invoked on an image. This action applies an *image map* to the current image (if one does not already exist) and opens the Image Map Editor dialog box. This feature allows you to create hyperlinks in specific areas of an image that will link to various destinations.

**Table Actions**

A variety of table editing actions are available in the contextual menu when it is invoked on a table (depending on the context, the table-related actions are promoted to the top level of the contextual menu and the Other Actions submenu provides access to the other actions):

**Insert Rows**

Opens a dialog box that allows you to insert any number of rows and specify the position where they will be inserted *(Above or Below the current row).*

**Delete Row(s)**
Deletes the table row located at the cursor position or multiple rows in a selection.

**Insert Columns**

Opens a dialog box that allows you to insert any number of columns and specify the position where they will be inserted (Above or Below the current column).

**Delete Column(s)**

Deletes the table column located at the cursor position or multiple columns in a selection.

**Join Cells**

Joins the content of the selected cells (both horizontally and vertically).

**Split Cell**

Splits the cell at the cursor location. If Oxygen XML Editor Eclipse plugin detects more than one option to split the cell, a dialog box will be displayed that allows you to select the number of rows or columns to split the cell into.

**Sort**

Sorts cells or list items in a table.

**Table Properties**

Opens the Table properties dialog box that allows you to configure properties of a table (such as frame borders).

**Other Actions submenu**

This submenu give you access to all the usual contextual menu actions.

**Link submenu**

The following link actions are available from this submenu:

**Cross Reference**

Opens the Cross Reference (xref) dialog box (on page 2492) that allows you to insert a link to a target DITA resource at the current location within a document. The target resource can be the location of a file or a key that is already defined in your DITA map (on page 2654) structure. Once the target resource has been selected, you can also target specific elements within that resource. For more information, see Linking in DITA Topics (on page 2492).

**File Reference**

Opens the File Reference dialog box (on page 2493) that allows you to insert a link to a target non-DITA file resource at the current location within a document. The target resource can be the location of a file or a key that is already defined in your DITA map structure. For more information, see Linking in DITA Topics (on page 2492).
Web Link

Opens the Web Link dialog box (on page 2493) that allows you to insert a link to a target web-related resource at the current location within a document. The target resource can be a URL or a key that is already defined in your DITA map structure. For more information, see Linking in DITA Topics (on page 2492).

Related Link to Topic

Opens the Cross Reference (xref) dialog box (on page 2493) that allows you to insert a link to a target DITA resource in a related links section at the bottom of the current document. The target resource can be the location of a file or a key that is already defined in your DITA map structure. Once the target resource has been selected, you can also target specific elements within that resource. If a related links section does not already exist, this action creates one. For more information, see Linking in DITA Topics (on page 2492).

Tip:

You can use the Find Similar Topics action (available in the contextual menu or DITA menu) to quickly find related topics that can be added as related links. It opens the Open/Find Resource view and performs a search using text content from the <title>, <shortdesc>, <keyword>, and <indexterm> elements.

Related Link to File

Opens the File Reference dialog box (on page 2494) that allows you to insert a link to a target non-DITA file resource in a related links section at the bottom of the current document. The target resource can be the location of a file or a key that is already defined in your DITA map structure. If a related links section does not already exist, this action creates one. For more information, see Linking in DITA Topics (on page 2492).

Related Link to Web Page

Opens the Web Link dialog box (on page 2494) that allows you to insert a link to a target web-related resource in a related links section at the bottom of the current document. The target resource can be a URL or a key that is already defined in your DITA map structure. If a related links section does not already exist, this action creates one. For more information, see Linking in DITA Topics (on page 2492).

Sort

Available when invoked on a list, it opens a dialog box where you can configure a sorting operation for an entire list or a selection of list items.

Generate IDs
Oxygen XML Editor Eclipse plugin generates unique IDs for the current element (or elements), depending on how the action is invoked:

- When invoked on a single selection, an ID is generated for the selected element at the cursor position.
- When invoked on a block of selected content, IDs are generated for all top-level elements and elements listed in the ID Options dialog box that are found in the current selection.

**Note:**
The Generate IDs action does not overwrite existing ID values. It only affects elements that do not already have an @id attribute.

**Reuse submenu**

This submenu includes the following actions regarding reusing content in DITA:

- **Reuse Content**
  This action provides a mechanism for reusing content fragments. It opens the Reuse Content dialog box (on page 2465) that allows you to insert several types of references to reusable content at the cursor position. The types of references that you can insert using this dialog box include content references (@conref) (on page 2466), content key references (@conkeyref) (on page 2468), or key references to metadata (@keyref) (on page 2471).

- **Push Current Element**
  Opens the Push current element dialog box (on page 2474) that allows content from a source topic to be inserted into another topic without any special coding in the topic where the content will be re-used.

- **Edit Content Reference**
  This action is available for elements with a @conref or @conkeyref attribute. It opens the Edit Content Reference dialog box that allows you to edit the source location (or key) and source element of a content reference (or content key reference), and the reference details (@conref/@conkeyref and @conrefend attributes). For more information, see Reuse Content Dialog Box (on page 2465).

- **Replace Reference with Content**
  Replaces the referenced fragment (@conref or @conkeyref) at the cursor position with its content from its source. This action is useful if you want to make changes to the content in the currently edited document without changing the referenced fragment in its source location. If the source content includes references to other topics/resources (hrefs), the operation also resolves those references relative to the new location. Attributes are preserved according to the following priority:
1. Attributes from the elements in the current document that reference other content are preserved except for attributes with a `dita-use-conref-target` value.

2. Attributes from the referenced content are brought into the replaced elements in the current document except for `@id` attributes.

**Replace All References with Content**

Replaces all referenced fragments (`@keyref`, `@conref`, or `@conkeyref`) in the current document with the content. Attributes are preserved according to the following priority:

1. Attributes from the elements in the current document that reference other content are preserved except for attributes with a `dita-use-conref-target` value.

2. Attributes from the referenced content are brought into the replaced elements in the current document except for `@id` attributes.

For `keyrefs` inside `<xref>` or `<link>` elements, the `@keyref` attribute is changed to an `@href` attribute, while the rest of the content for the `keyref` is replaced with its source content.

If the source content includes references to other topics/resources (`hrefs`), the operation also resolves those references relative to the new location.

**Remove Content Reference**

Removes the content reference (`@conref` or `@conkeyref`) inside the element at the cursor position.

**Create Reusable Component**

Opens a dialog box that helps you to create a reusable component from the current element or selection of elements. If the **Replace selection with content reference** option is selected in the dialog box, the selection will be replaced with a content reference (`@conref`). If multiple elements are selected (for example, multiple steps or list items), the selection will be replaced with a content reference range (`@conref` and `@conrefend`). For more information, see Creating a Reusable Content Component (on page 2477).

**Insert Reusable Component**

Inserts a reusable component at cursor location. For more information, see Inserting a Reusable Content Component (on page 2478).

**Extract Topic From Selection**

Creates a new DITA topic from a selection of content in the current topic.

**Search References** (Ctrl + Shift + G (Command + Shift + G on macOS))
Finds the references to the \texttt{@id} attribute value for the element at the current cursor position, in all the topics contained in the current DITA map (on page 2654) (opened in the DITA Maps Manager view (on page 2315)). If no references are found for the current element, a dialog box will be displayed that offers you the option of searching for references to its ancestor elements.

**Figure 614. Search References to Ancestors Dialog Box**

![Search References to Ancestors Dialog Box]

**Tip:**
If you are invoking the action on an image, see Searching for References to Images (on page 2397) for details about what will be reported.

**Find Similar Topics**
Opens the Open/Find Resource view and performs a search using text content from the \texttt{<title>}, \texttt{<shortdesc>}, \texttt{<keyword>}, and \texttt{<indexterm>} elements. It is helpful for quickly finding related topics that can be added as related links.

**Show Key Definition**
Available for elements that have a \texttt{@conkeyref} or \texttt{@keyref} attribute set (or elements with an ancestor element that has a \texttt{@conkeyref} or \texttt{@keyref} attribute). It computes the key name and opens the DITA map (on page 2654) that contains the definition of the key with the element that defines that key selected.

**About Element submenu**
This submenu includes the following actions:

**Style Guide**
Opens the DITA Style Guide Best Practices for Authors in your browser and displays a topic that is relevant to the element at the cursor position. When editing DITA documents, this action is available in the contextual menu of the editing area (under the About Element sub-menu), in the DITA menu, and in some of the documentation tips that are displayed by the Content Completion Assistant (on page 2653).

**Browse reference manual**
Opens a reference to the documentation of the XML element closest to the cursor position in a web browser.
Go to Definition

Moves the cursor to the definition of the current element.

Select submenu

This submenu allows you to select the following:

Element

Selects the entire element at the current cursor position.

Content

Selects the entire content of the element at the current cursor position, excluding the start and end tag. Performing this action repeatedly will result in the selection of the content of the ancestor of the currently selected element content.

Parent

Selects the entire parent element at the current cursor position.

Text submenu

This submenu contains the following actions:

To Lower Case

Converts the selected content to lower case characters.

To Upper Case

Converts the selected content to upper case characters.

Capitalize Sentences

Converts to upper case the first character of every selected sentence.

Capitalize Words

Converts to upper case the first character of every selected word.

Count Words

Counts the number of words and characters (no spaces) in the entire document or in the selection for regular content and read-only content.

Note:
The content marked as deleted with change tracking (on page 2659) is ignored when counting words.

Convert Hexadecimal Sequence to Character (Ctrl + Shift + H (Command + Shift + H on macOS))

Converts a sequence of hexadecimal characters to the corresponding Unicode character (on page 298). The action can be invoked if there is a selection
containing a valid hexadecimal sequence or if the cursor is placed at the right side of a valid hexadecimal sequence. A valid hexadecimal sequence can be composed of 2 to 4 hexadecimal characters and may or may not be preceded by the 0x or 0X prefix. Examples of valid sequences and the characters they will be converted to:

- \0x0045 will be converted to E
- \0X0125 to h
- 265 to ɥ
- 2190 to ←

Note:
For more information about finding the hexadecimal value of a character, see Finding the Decimal, Hexadecimal, or Character Entity Equivalent (on page 300).

Refactoring submenu

Contains a series of actions designed to alter the XML structure of the document:

Toggle Comment
Encloses the currently selected text in an XML comment, or removes the comment if it is commented.

Move Up (Alt + UpArrow (Option + UpArrow on macOS))
Moves the current node or selected nodes in front of the previous node.

Move Down (Alt + DownArrow (Option + DownArrow on macOS))
Moves the current node or selected nodes after the subsequent node.

Split Element
Splits the content of the closest element that contains the position of the cursor. Thus, if the cursor is positioned at the beginning or at the end of the element, the newly created sibling will be empty.

Join Elements
Joins two adjacent block elements (on page 2652) that have the same name. The action is available only when the cursor position is between the two adjacent block elements. Also, joining two block elements can be done by pressing the Delete or Backspace keys and the cursor is positioned between the boundaries of these two elements.

Surround with Tags (Alt + Shift + E)
Allows you to choose a tag to enclose a selected portion of content. If there is no selection, the start and end tags are inserted at the cursor position.
• If the Position cursor between tags option (on page 120) is selected in the Content Completion preferences page, the cursor is placed between the start and end tag.

• If the Position cursor between tags option (on page 120) is not selected in the Content Completion preferences page, the cursor is placed at the end of the start tag, in an insert-attribute position.

**Surround with '[tag]' (Alt + Shift + ForwardSlash)**

Surround the selected content with the last tag used.

**Rename Element**

The element from the cursor position, and any elements with the same name, can be renamed according with the options from the Rename dialog box.

**Delete Element Tags**

Deletes the tags of the closest element that contains the position of the cursor. This operation is also executed if the start or end tags of an element are deleted by pressing the Delete or Backspace keys.

**Remove All Markup**

Removes all the XML markup inside the selected block of content and keeps only the text content.

**Remove Text**

Removes the text content of the selected block of content and keeps the markup intact with empty elements.

**DITA-related Refactoring Actions**

A variety of built-in XML refactoring operations that pertain to DITA documents with some of the information preconfigured based upon the current context.

**Change Topic ID to File Name**

Use this operation to change the ID of a topic to be the same as its file name.

**Convert CALS Tables to Simple Tables**

Use this operation to convert DITA CALS tables to simple tables. If you invoke this operation from a nested table (a table inside a table), only the nested table will be affected. If it is invoked on a parent table that contains nested tables, all of the contained tables will be converted.

**Convert conrefs to conkeyrefs**
Use this operation to convert @conref attributes to @conkeyref attributes.

**Convert Simple Tables to CALS Tables**

Use this operation to convert DITA simple tables to CALS tables. If you invoke this operation from a nested table (a table inside a table), only the nested table will be affected. If it is invoked on a parent table that contains nested tables, all of the contained tables will be converted.

**Convert to Concept**

Use this operation to convert a DITA topic (of any type) to a DITA Concept topic type (for example, Topic to Concept).

**Convert to General Task**

Use this operation to convert a DITA topic (of any type) to a DITA General Task topic type (for example, Task to General Task). A DITA General Task is a less restrictive alternative to the Strict Task information type.

**Convert to Reference**

Use this operation to convert a DITA topic (of any type) to a DITA Reference topic type (for example, Topic to Reference).

**Convert to Task**

Use this operation to convert a DITA topic (of any type) to a DITA Task topic type (for example, Topic to Task).

**Convert to Topic**

Use this operation to convert a DITA topic (of any type) to a DITA Topic (for example, Task to Topic).

**Convert to Troubleshooting**

Use this operation to convert a DITA topic (of any type) to a DITA Troubleshooting topic type (for example, Topic to Troubleshooting).

**Rename Key**

Available when invoked on a key, and can be used to quickly rename a key. It also updates all references to it. Note that it does not work on DITA 1.3 key scopes.

**Generate IDs**

Use this operation to automatically generate unique IDs for elements.

**Attributes Refactoring Actions**
Contains built-in XML refactoring operations that pertain to attributes with some of the information preconfigured based upon the current context.

**Add/Change attribute**
Allows you to change the value of an attribute or insert a new one.

**Convert attribute to element**
Allows you to change an attribute into an element.

**Delete attribute**
Allows you to remove one or more attributes.

**Rename attribute**
Allows you to rename an attribute.

**Replace in attribute value**
Allows you to search for a text fragment inside an attribute value and change the fragment to a new value.

**Comments Refactoring Actions**
Contains built-in XML refactoring operations that pertain to comments with some of the information preconfigured based upon the current context.

**Delete comments**
Allows you to delete comments found inside one or more elements.

**Elements Refactoring Actions**
Contains built-in XML refactoring operations that pertain to elements with some of the information preconfigured based upon the current context.

**Delete element**
Allows you to delete elements.

**Delete element content**
Allows you to delete the content of elements.

**Insert element**
Allows you to insert new elements.

**Rename element**
Allows you to rename elements.

**Unwrap element**
Allows you to remove the surrounding tags of elements, while keeping the content unchanged.

**Wrap element**
Allows you to surround elements with element tags.

Wrap element content

Allows you to surround the content of elements with element tags.

Fragments Refactoring Actions

Contains built-in XML refactoring operations that pertain to XML fragments with some of the information preconfigured based upon the current context.

Insert XML fragment

Allows you to insert an XML fragment.

Replace element content with XML fragment

Allows you to replace the content of elements with an XML fragment.

Replace element with XML fragment

Allows you to replace elements with an XML fragment.

Review submenu

This submenu includes the following actions:

Track Changes

Enables or disables the Track Changes (on page 2659) support for the current document.

Accept Change(s) and Move to Next

Accepts the Tracked Change (on page 2659) located at the cursor position or all of the changes in a selection and then moves to the next change. If you select a part of a deletion or insertion change, only the selected content is accepted.

Accept All Changes

Accepts all Tracked Changes (on page 2659) in the current document.

Reject Change(s) and Move to Next

Rejects the Tracked Change (on page 2659) located at the cursor position or all of the changes in a selection and then moves to the next change. If you select a part of a deletion or insertion change, only the selected content is rejected.

Reject All Changes

Rejects all Tracked Changes (on page 2659) in the current document.

Comment Change

Opens a dialog box that allows you to add a comment to an existing Tracked Change (on page 2659). The comment will appear in a callout and a tooltip when
hovering over the change. If the action is selected on an existing commented change, the dialog box will allow you to edit the comment.

**Highlight**

Enables the highlighting tool that allows you to mark text in your document.

**Colors**

Allows you to select the color for highlighting text.

**Stop highlighting**

Use this action to deactivate the highlighting tool.

**Remove highlight(s)**

Use this action to remove highlighting from the document.

**Add Comment**

Inserts a comment at the cursor position. The comment appears in a callout box and a tooltip (when hovering over the change).

**Show/Edit Comment**

Opens a dialog box that displays the discussion thread and allows the current user to edit comments that do not have replies. If you are not the author who inserted the original comment, the dialog box just displays the comment without the possibility of editing it.

**Remove Comment**

Removes a selected comment. If you remove a comment that contains replies, all of the replies will also be removed.

**Manage Reviews**

Opens the **Review view** *(on page 436)*.

**Manage IDs submenu**

This submenu is available for topics that have an associated DTD or schema. It includes the following actions:

**Rename in**

Renames the ID and all its occurrences. Selecting this action opens the **Rename XML ID** dialog box. This dialog box lets you insert the new ID value and choose the scope of the rename operation.

**Search References**

Searches for the references of the ID. By default, the scope of this action is the current project. If you configure a scope using the **Select the scope for the Search and Refactor operations** *(on page 598)* dialog box, this scope will be used instead.
Search References in

Searches for the references of the ID. Selecting this action opens the Select the scope for the Search and Refactor operations (on page 598).

Search Occurrences in file

Searches for the occurrences of the ID in the current document.

Folding submenu

This submenu includes the following actions:

- **Toggle Fold**
  Toggles the state of the current fold.

- **Collapse Other Folds**
  Folds all the elements except the current element.

- **Collapse Child Folds**
  Folds the elements indented with one level inside the current element.

- **Expand Child Folds (Ctrl + NumPad+ (Command + NumPad+ on macOS))**
  Unfolds all child elements of the currently selected element.

- **Expand All**
  Unfolds all elements in the current document.

Inspect Styles

Opens the CSS Inspector view (on page 412) that allows you to examine the CSS rules that match the currently selected element.

Options

Opens the Author mode preferences page (on page 136) where you can configure various options with regard to the Author editing mode.

Floating Contextual Toolbar for DITA

Oxygen XML Editor Eclipse plugin includes a dynamic feature where certain editing contexts will trigger a floating toolbar with common actions that are available in the current editing context.

Figure 615. DITA Floating Contextual Toolbar

The floating contextual toolbar is automatically displayed when editing DITA documents in various situations, including:
• When a `<p>`, `<li>`, or `<shortdesc>` element has a selection inside, the floating toolbar includes actions such as **Bold**, *Italic*, _Underline_, a Link submenu, and more.

• When an `<image>` or `<xref>` element is selected:
  ◦ If the element has an `@href` attribute, the floating toolbar includes a URL chooser where you can select the appropriate target.
  ◦ If the element has a `@keyref` attribute, the floating toolbar includes a drop-down control where you can select the appropriate target key reference.

• When an `<object>` element is selected:
  ◦ If the element has a `@data` attribute, the floating toolbar includes a URL chooser where you can select the appropriate target.
  ◦ If the element has a `@datakeyref` attribute, the floating toolbar includes a drop-down control where you can select the appropriate target key reference.

• When an element with a `@conref` attribute is selected, the floating toolbar includes actions for editing, removing, or replacing content references.

• When a `<codeblock>` element is selected, the floating toolbar includes a drop-down control where you can select the value of the `@outputclass` attribute.

• When a `<ul>` element is selected, the floating toolbar includes actions for converting it to an ordered list or sorting the list.

• When an `<ol>` element is selected, the floating toolbar includes actions for converting it to an unordered list or sorting the list.

• When an `<li>` or `<step>` element is selected, the floating toolbar includes actions for moving the item up or down in the list/procedure.

• When a `<row>` or `<strow>` element is selected in a table, the floating toolbar includes various table-related actions (such as actions for editing table properties, inserting rows, or deleting rows).

• When an `<entry>` or `<stentry>` element is selected in a table, the floating toolbar includes various table-related actions (such as actions for editing table properties, inserting/deleting rows, or inserting/deleting columns).

• When a `<table>` or `<simpletable>` element is selected, the floating toolbar includes actions for editing table properties or sorting the table.

**DITA Drag/Drop (or Copy/Paste) Actions**

Dragging a file from the Project Explorer view (on page 268) or DITA Maps Manager view (on page 2315) and dropping it into a DITA document that is edited in Author mode, creates a link to the dragged file (the `<xref>` DITA element with the `@href` attribute) at the drop location. Copy and paste actions work the same.

You can also drag images or media files from your system explorer or the Project Explorer view (on page 268) and drop them into a DITA document (or copy and paste). This will insert the appropriate element at the drop or paste location (for example, dropping/pasting an image will insert the DITA `<image>` element with an `@href` attribute).

Working with Markdown Documents in DITA

Oxygen XML Editor Eclipse plugin includes some unique features that allow you to easily integrate Markdown documents in a DITA project. This is especially helpful for teams that have contributors who are familiar with the Markdown syntax, but they want their output to be generated from DITA projects. The integration between the Markdown editor and DITA includes actions to export or convert Markdown documents to DITA topics and the DITA tab in the Preview pane provides a visualization of how the DITA topic will look after conversion. Likewise, the XDITA tab in the Preview pane provides a visualization of how a Lightweight DITA topic will look after conversion. Keys that are defined in the root map are also resolved in the Preview pane.

Export Markdown as a DITA Topic

The Markdown editor includes an option to quickly convert the current Markdown document into a DITA topic. The Export as DITA Topic action is available in the contextual menu.

The conversion creates a new XML file that is defined as a DITA topic and opens it in the Text editing mode. You can then work with the document as you would with any other DITA topic, although you may need to manually correct some issues where the parser could not properly map Markdown syntax to DITA markup.

Working with Markdown Documents in the DITA Maps Manager

Oxygen XML Editor Eclipse plugin has some specialized features that allow you to integrate Markdown documents directly into your DITA project using the DITA Maps Manager (on page 2315). The following features are available for Markdown documents in the DITA Maps Manager view:

- **Insert Reference to Markdown Document** - You can use the New, Reference, and Reference to the currently edited file actions from the Append Child, Insert Before, or Insert After submenu when invoking the contextual menu in the DITA Maps Manager to insert a reference to a Markdown document at the selected location in the map. Markdown documents will be inserted as a topic reference (topicref element) with the format attribute set to markdown.

- **Validate Markdown Documents in DITA Maps** - When you use the Validate and Check for Completeness action from the DITA Maps Manager toolbar to check the integrity of the structure of a DITA map, Markdown documents that are referenced in the DITA map will be converted to DITA topics in the background and validated the same as any other DITA topic.
• **Transforming DITA Maps with Markdown Documents** - When transforming DITA maps that have Markdown documents referenced, the transformation will convert the Markdown documents to normal DITA output without you needing to manually convert the Markdown documents to DITA topics.

• **Manually Convert Markdown Documents to DITA Topics** - If you need to use DITA semantics that are not possible in Markdown syntax (such as content references, related links, and other DITA-specific syntax), you can manually convert the Markdown document into a DITA topic. To do so, right-click the Markdown document in the DITA Maps Manager and select Refactoring > Convert Markdown to DITA Topic. This will open a dialog box that allows you to configure options for converting the document to an XML file that is defined as a DITA topic.

![Figure 616. Convert Markdown to DITA Topic Dialog Box](image)

This dialog box includes the following options:

**Destination**

The destination path for the new DITA topic.

**File Name**

Presents the current name and allows you to change it.

**Update references**

Select this option to update all references of the file in the DITA map and in the files referenced from the DITA map.

**Delete Markdown file**

If selected, the Markdown version of the file is deleted when the document is converted into a DITA file. If deselected (default value), when the document is converted into a DITA file, the original Markdown file is also preserved in its current location.

**Preview**

Select this button to display a preview of the changes Oxygen XML Editor Eclipse plugin is about to make.
Convert

Select this button to perform the conversion. If the Markdown file has `format="markdown"`, it will be converted to a DITA topic. If it has `format="mdita"`, it will be converted to a LightWeight DITA topic.

Tip:
Oxygen XML Editor Eclipse plugin comes with a sample ditamap project for converting Markdown to DITA. Go to the Project Explorer view (on page 268), open the `sample.xpr` project, and navigate to the `dita/markdown-dita` folder.

DITA-Related Markdown Syntax

For a list of Markdown rules and syntax examples that are specific to DITA, see the Markdown DITA Syntax Reference.

Working with DITA-Compatible Documents

Oxygen XML Editor Eclipse plugin includes powerful dynamic publishing features (on page 2547) that allow you to easily integrate Word, Excel, OpenAPI, HTML, Markdown documents into a DITA project and have them automatically converted to DITA at the time of publishing. This is especially helpful for teams that have contributors who work with non-DITA documents but want their output to be generated from DITA projects.

Attention:
These features are available with no restrictions when the publishing process is done using the default publishing engine that is bundled in Oxygen XML Editor Eclipse plugin or if you have integrated the DITA-OT dynamic converter plugin into a custom DITA-OT distribution.

Working with DITA-Compatible Documents in the DITA Maps Manager

Oxygen XML Editor Eclipse plugin has some specialized features that allow you to integrate DITA-compatible documents directly into your DITA project using the DITA Maps Manager (on page 2315). The following features are available in the DITA Maps Manager view:
• **Insert References to DITA-Compatible Documents** - You can use the New, Reference, and Reference to the currently edited file actions from the Append Child, Insert Before, or Insert After submenu when invoking the contextual menu in the DITA Maps Manager to insert a reference to a Word, Excel, OpenAPI, HTML or Markdown document at the selected location in the map. A topic reference (<topicref>) element with the appropriate @format attribute value will be inserted.

• **Title of Referenced Resources is Displayed** - The title of each referenced DITA-compatible resource is presented in the DITA Maps Manager view.

• **Validate DITA-Compatible Documents in DITA Maps** - When you use the Validate and Check for Completeness action from the DITA Maps Manager toolbar to check the integrity of the structure of a DITA map, DITA-compatible documents that are referenced in the DITA map are converted to DITA topics in the background and validated the same as any other DITA topic.

• **IDs Presented When Inserting References** - When inserting topic references, cross references, or content references to content inside DITA-compatible documents, the application presents a list of DITA-specific IDs from the target document.

• **Transform DITA Maps with DITA-Compatible Documents** - When transforming DITA maps that have DITA-compatible documents referenced, the transformation converts the documents to normal DITA output without you needing to manually convert the documents to DITA topics.

**Resources**

For more information about working with DITA-compatible resources, see the following resources:

**Working with Keys in DITA**

DITA uses keys to insert content that may have different values in particular circumstances. Keys provide a way to reference something indirectly. This can make it easier to manage and to reuse content in a various ways.

You can think of keys as like renting a post office box. Instead of the mail going directly from the sender to your house, it now goes to the post office box. You then go to the post office box and bring the mail back to your house. If you move to a new house, your mail still gets to you because it comes to the same post office box. You do not have to send change of address cards to all the people who send you mail. Your mailbox address is the key that makes sure your mail always reaches you, even if you move.

Similarly, if you use keys in your content to reference other content, you do not have to update the source content to change the value of the key or what it points to. You just change the definition of the key.
Defining Keys in DITA Maps

Keys are defined in maps and can then be reused and referenced throughout the whole structure of the map. It is considered best practice to create a separate submap that contains all of the key definitions and reference that submap in the main (root) map. This makes it easier to manage since they’re all in one location.

There are two types of key definitions that can be created in a map:

- Key with a value inside a `<keyword>`. To define this type of key, follow these instructions: Key Definition with a Keyword Value (on page 2350).
- Key with a target (for example, to target a resource such as an image or external link). To define this type of key, follow these instructions: Key Definition with a Target (on page 2350).

Using Keys for Values

You can use keys to represent values that may vary depending on the type of output. For instance, you may have several products that share a common feature. When you want to describe that feature, you need a way to insert the name of the product, even though that name is different depending on which product the feature description is being used for. For more information, see Working with Variable Text in DITA (on page 2478).

Assigning Keys to Topics

You can assign a key to a topic and use that key to reference that topic for various purposes, such as reuse or linking. As always, keys are defined in maps, so the key definition is done using the `<topicref>` element:

```xml
<topicref href="quick-heat.dita" keys="feature.quick-heat"/>
```

The easiest way to assign keys to a topic (and insert the `<topicref>` element in its DITA map) is to use the Keys tab in the Edit Properties dialog box (on page 2353). In the DITA Maps Manager (on page 2315), invoke the contextual menu on the topic that will have the key assigned and select Edit Properties. Go to the Keys tab and enter the name of the key in the Define keys field.

Once a key is assigned to a topic, you can use it to reference that topic for various purposes:

- You can create a link (on page 2492) to it using `<xref keyref="feature.quick-heat">`. This allows you to change the target of the link by changing the topic that is pointed to by the key (for example, by profiling).
- You can use it in a map to create a reference to a topic (on page 2335) by key: `<topicref keyref="feature.quick-heat">`. This allows you to change which topic is inserted in the map by the build, by changing the topic that is pointed to by the key.
- You can use it to insert a content reference (on page 2460). In this case, the content reference uses the key to locate the topic to pull content from. It uses a `@conkeyref` attribute: `<procedure conkeyref="feature.quick-heat/preheat-procedure">`. In this example, `feature.quick-heat` is the key,
Assigning Keys to Graphics

You can assign a key to an image (using a map to point to the image file (on page 2350)) and then insert the image using the key (on page 2394).

Example of a key definition for a targeted image file:

```xml
<map id="keydefs">
  <!-- product name -->
  <title>Key Definitions</title>
  <keydef keys="image1" href="../img/image1.png" format="png"/>
</map>
```

Working with a Glossary of Terms in DITA

There are several ways to manage a Glossary of Terms in DITA, but it is considered best practices to create a separate submap for the glossary and embed that glossary map in the main (root) map (on page 2658). The actual glossary terms are small glossary entry topics that are referenced in the glossary map. You can add links to the glossary terms (on page 2451) in the output and you can even define abbreviated forms (on page 2452) for terms that have an acronym or some other type of abbreviation.

How to Create a Glossary of Terms in Oxygen XML Editor Eclipse plugin

Even though there are several ways to create a glossary and reference the glossary terms, the following is the recommended approach:

1. Create a new submap (on page 2333) for your glossary and embed it in your main map.

2. Create a glossary entry topic (glossentry) for each glossary term. The <glossentry> element may contain numerous optional glossentry elements, but every glossentry topic must contain a <glossterm> and <glossdef> element. The <glossterm> is the name of the term while the <glossdef> is its definition.
Here is a simple example:

```xml
<glossentry id="ddl">
  <glossterm>Data Definition Language</glossterm>
  <glossdef>A language used for defining database schemas.</glossdef>
</glossentry>
```

The easiest way to create a glossentry topic in Oxygen XML Editor Eclipse plugin:

a. Click the New file wizard button on the toolbar.

b. Type glossentry in the search field at the top of the dialog box.

c. Select the Glossentry DITA topic type, configure the name and optionally the title, and click Create.

3. Reference each glossary entry topic in your glossary submap using the <glossref> element. This element requires a @keys attribute. Please make sure the @print attribute is set to yes to show the glossary also in the PDF output.

```xml
<glossref keys="gloss_ddl" href="ddl.dita" print="yes"/>
```

The easiest way to reference a glossentry in Oxygen XML Editor Eclipse plugin:

a. With the glossary entry topic opened in the main editor, open the glossary submap in the DITA Maps Manager, right-click the map node and select Append Child > Reference to the currently edited file (if you already have existing glossentry topics, you can right-click the glossentry where you want to insert the new one and select Insert After > Reference to the currently edited file).

  **Step Result:** This opens the Insert Reference dialog box (on page 2340).

b. Go to the Keys tab and enter a name in the Define keys field.

c. Go to the Attributes tab and select Glossary Reference from the Reference type drop-down list at the top of the dialog box.

d. Click Insert and Close.

**Tip:**

You could also group multiple glossentry topics into a single collection by using the <glossgroup> element.

### How to Create Links to Glossary Terms

To specify that a link is generated in the output from the glossary term to its definition, use the <term> element (or <abbreviated-form> element as described in the next section (on page 2452)) with a @keyref attribute that references the corresponding key specified in the <glossref>. Of course, the <glossref> points to the <glossentry> topic where the glossary term is defined.

```xml
<term keyref="gloss_ddl"/>
```
In the output, the text specified in the `<glossterm>` element is displayed for the glossary term with a link to its glossentry topic that contains its definition.

The easiest way to add a `<term>` element and reference the glossary term in Oxygen XML Editor Eclipse plugin:

1. Place the cursor at the location where you want to insert a link to the glossary term.
2. In the DITA Reusable Components view (on page 2483), go to the Keys tab and use the search filter field at the top of the view to find the key for the particular glossary term.
3. Right-click the key and select **Insert as Keyref > More > Term**.

**Using Abbreviated Forms (Acronyms) with Glossary Terms**

The `<abbreviated-form>` element can be used for glossary terms that you want to appear in an abbreviated form (such as an acronym). Abbreviated forms are expanded to their full form the first time that they appear in a document, and then all subsequent instances will display the short form (or acronym). You would need to define the long and short forms in the `<glossentry>` and then reference it with the `<abbreviated-form>` element (instead of the `<term>` element).

The recommended best practices for defining the long and short forms would be to use a structure similar to this:

```markdown
<glossentry id="ddl">
  <glossterm>Data Definition Language</glossterm>
  <glossBody>
    <glossSurfaceForm>Data Definition Language (DDL)</glossSurfaceForm>
    <glossAlt>
      <glossAcronym>DDL</glossAcronym>
    </glossAlt>
  </glossBody>
</glossentry>
```

The long form is declared using the `<glossSurfaceForm>` element while the short form is declared using the `<glossAcronym>` element.

Then you need to reference the glossentry that contains the long and short forms using the `<abbreviated-form>` element:

```markdown
<abbreviated-form keyref="gloss_ddl"/>
```

For more information about the recommended best practices for using abbreviations, including information about using multiple languages, see: [http://www.oasis-open.org/committees/download.php/29734/AcronymBestPractice_08112008.doc](http://www.oasis-open.org/committees/download.php/29734/AcronymBestPractice_08112008.doc).

- [https://docs.oasis-open.org/dita/v1.2/os/spec/langref/abbreviated-form.html](https://docs.oasis-open.org/dita/v1.2/os/spec/langref/abbreviated-form.html)
Reusing DITA Content

Reusing content is one of the key features of DITA and DITA provides several methods for reusing content. Oxygen XML Editor Eclipse plugin provides support for each of these methods.

**Reusing Topics in DITA Maps**

A DITA topic does not belong to any one publication. You add a DITA topic to a publication by referencing it in a map. You can reference the same topic in multiple maps (on page 2456).

**Reusing Content with References and Keys**

DITA allows you to reuse content by referencing it in another topic. DITA provides several mechanisms for including content by reference (on page 2457) (conref, conkeyref, coderef). A **conref** (content reference) (on page 2458) creates a direct reference to a specific element of another topic. A **conkeyref** (content key reference) (on page 2460) creates a reference to a key, which then points to a specific element in another topic. The advantage of using a **conkeyref** is that you can change the element that is included by changing the key reference. For example, since keys are defined in maps, if you include a topic in multiple maps, you can use a different key reference in each map. A **coderef** references an external file that contains literal code.

Oxygen XML Editor Eclipse plugin provides support for all of these mechanisms.

While the **conref** and **conkeyref** mechanisms can be used to reference any content element, it is considered best practice to only **conref** or **conkeyref** content that is specifically set and managed as reusable content. This practice helps reduce expensive errors, such as an author accidentally deleting the source element that other topics are including by the reference. Oxygen XML Editor Eclipse plugin can help you create a reusable component from your current content.

**Reusing Content with Reusable Components**

DITA allows you to select content in a topic, create a **reusable component** (on page 2476) from it and reference that component in other locations. Each reusable component is created as a separate file. Anytime the content needs to be edited, you only need to update it in the component file and all the locations in your topics that reference it will also be updated. This can help you to maintain continuity and accuracy throughout your documents.

**Reusing Content with Variables**

DITA allows you to replace the content of certain elements with a value that is pointed to by a key. This mechanism effectively means that you can create variables in your content (on page 2478), which you can then create multiple outputs by changing the value that the key points to. This is done by profiling the definition of the key value, or by substituting another map with a different key value.

**Reusing Content with DITA 1.3 Concepts**

DITA 1.3 allows you to use some advanced concepts to expand content reuse possibilities even further. **Key Scopes** (or scoped keys) (on page 2480) allow you to reuse topics with variable content depending on the
particular context and it maximizes reuse possibilities for keys. *Branch Filtering (on page 2482)* allows you
to reuse the same content that is profiled in multiple ways within the same publication, each time using a
different filter.

**DITA Reusable Components View**

If you use a large amount of keys or reusable components in your DITA project, the *DITA Reusable
Components view (on page 2483)* can be quite helpful. It collects all of the keys and reusable components
that are defined in the *root map (on page 2658)* and presents them in a dynamic table where you can easily
locate and insert references to them.

**Reuse Actions in Oxygen XML Editor Eclipse plugin**

Oxygen XML Editor Eclipse plugin includes some actions that are specifically designed for DITA reusable
content. These actions are available in the contextual menu, the *DITA* menu, and some are available on the
toolbar.

**Reuse Content**

This action provides a mechanism for reusing content fragments. It opens the *Reuse Content
dialog box (on page 2465)* that allows you to insert several types of references to reusable
content at the cursor position. The types of references that you can insert using this dialog box
include content references (*@conref* (on page 2466)), content key references (*@conkeyref* (on
page 2468)), or key references to metadata (*@keyref* (on page 2471)).

**Push Current Element**

Opens the *Push current element dialog box (on page 2474)* that allows content from a source
topic to be inserted into another topic without any special coding in the topic where the content
will be re-used.

**Edit Content Reference**

This action is available for elements with a *@conref* or *@conkeyref* attribute. It opens the
*Edit Content Reference* dialog box that allows you to edit the source location (or key) and
source element of a content reference (or content key reference), and the reference details
(*@conref/@conkeyref* and *@conrefend* attributes). For more information, see *Reuse Content Dialog
Box (on page 2465)*.

**Replace Reference with Content**

Replaces the referenced fragment (@conref or @conkeyref) at the cursor position with its content
from it source. This action is useful if you want to make changes to the content in the currently
edited document without changing the referenced fragment in its source location. If the source
content includes references to other topics/resources (hrefs), the operation also resolves those
references relative to the new location. Attributes are preserved according to the following
priority:
1. Attributes from the elements in the current document that reference other content are preserved except for attributes with a -dita-use-conref-target value.
2. Attributes from the referenced content are brought into the replaced elements in the current document except for @id attributes.

**Replace All References with Content**

Replaces all referenced fragments (@keyref, @conref, or @conkeyref) in the current document with the content. Attributes are preserved according to the following priority:

1. Attributes from the elements in the current document that reference other content are preserved except for attributes with a -dita-use-conref-target value.
2. Attributes from the referenced content are brought into the replaced elements in the current document except for @id attributes.

For keyrefs inside <xref> or <link> elements, the @keyref attribute is changed to an @href attribute, while the rest of the content for the keyref is replaced with its source content.

If the source content includes references to other topics/resources (hrefs), the operation also resolves those references relative to the new location.

**Remove Content Reference**

Removes the content reference (@conref or @conkeyref) inside the element at the cursor position.

**Create Reusable Component**

Opens a dialog box that helps you to create a reusable component from the current element or selection of elements. If the **Replace selection with content reference** option is selected in the dialog box, the selection will be replaced with a content reference (@conref). If multiple elements are selected (for example, multiple steps or list items), the selection will be replaced with a content reference range (@conref and @conrefend). For more information, see **Creating a Reusable Content Component** (on page 2477).

**Insert Reusable Component**

Inserts a reusable component at cursor location. For more information, see **Inserting a Reusable Content Component** (on page 2478).

**Resources**

For more information about reusing strategies in DITA, see the following resources:

**Related information**

Working with Keys in DITA (on page 2448)
Reusing DITA Topics in Multiple Maps

You can reuse an entire DITA topic simply by referencing it in multiple maps (or multiple locations within the same map (on page 2337)) using one of the following procedures:

Reuse Topics Using the DITA Maps Manager

1. Make sure the DITA map (on page 2654) is opened in the DITA Maps Manager (on page 2315).
2. Add a reference to an existing topic by using one of the following methods (depending on your particular situation):
   a. If the topic already exists in this DITA map, do one of the following:
      ▪ Simply drag the topic and press Ctrl (or Alt on macOS) at the new location within the map (or use the Copy and Paste contextual menu actions).
      ▪ If the topic is the currently open document in the main editor, determine the new location in the map (in the DITA Maps Manager (on page 2315)), right-click a parent or sibling topic, and select Append Child > Reference to the currently edited file or Insert After > Reference to the currently edited file.
   b. If the topic already exists in another DITA map, do one of the following:
      ▪ Open the other map in the DITA Maps Manager (on page 2315), right-click the topic, select Copy, switch back to the original DITA map in the DITA Maps Manager, determine the new location in the map, right-click a parent or sibling topic, and use one of the Paste contextual menu actions (Paste, Paste Before, or Paste After).
      ▪ If the topic is the currently open document in the main editor, determine the new location in the map (in the DITA Maps Manager (on page 2315)), right-click a parent or sibling topic, and select Append Child > Reference to the currently edited file or Insert After > Reference to the currently edited file.
   c. If the topic exists in the project, but has not yet been added to a DITA map, do one of the following:
      ▪ Right-click the topic in the Project Explorer view (on page 268) (or the file system), select Copy, switch to the DITA Maps Manager (on page 2315) view, determine the new location in the map, right-click a parent or sibling topic, and use one of the Paste contextual menu actions (Paste, Paste Before, or Paste After).
      ▪ If the topic is the currently open document in the main editor, determine the new location in the map (in the DITA Maps Manager (on page 2315)), right-click a parent or sibling topic, and select Append Child > Reference to the currently edited file or Insert After > Reference to the currently edited file.
3. If your topic uses a key reference (on page 2448), set up the appropriate key definition in your map (on page 2349).
4. If you want to define relationships between topics, other than those defined in the topics themselves, you can add a relationship table to your map (on page 2498).
5. When you have finished adding topics, check that your map is complete and that all topic links and keys resolve correctly. To do this validation, click the Validate and Check for Completeness action (on page 2360) on the toolbar in the DITA Maps Manager.
Reuse Topics Using Author Mode Editor

1. Open the DITA map (on page 2314) in the Author mode editor.
2. Add a reference to an existing topic by dragging it from the Project Explorer view (on page 268) (or the file system) and dropping it in the desired location in the DITA map opened in Author mode. You can also accomplish the same thing by using the Copy and Paste contextual menu actions.
3. If your topic uses a key reference (on page 2448), set up the appropriate key definition in your map (on page 2349).
4. If you want to define relationships between topics, other than those defined in the topics themselves, you can add a relationship table to your map (on page 2498).
5. When you have finished adding topics, check that your map is complete and that all topic links and keys resolve correctly. To do this validation, click the Validate and Check for Completeness action (on page 2360) on the toolbar in the DITA Maps Manager.

Displaying Multiple References to the Same Topics

Whenever multiple references to the same topic are detected in the context of the current map in the DITA Maps Manager (on page 2315), an indicator will appear in the top-right corner of the Author mode editor that shows the number of times the current topic is referenced in the DITA map. It also includes navigation arrows that allow you to jump to the next or previous reference in the DITA Maps Manager.

Working with Content References

The DITA content reference feature lets you insert a piece of source content by referencing it from its source. When you need to update that content, you only need to do it in one place. The source content can be referenced using the DITA @conref or @conkeyref attributes.

There are several strategies for managing content references:

- **Reusable components** - With this strategy, you create a new file for each piece of content that you want to reuse and you insert references from the content of the reusable component files. For example, suppose that you have a disclaimer that needs to be included in certain sections of your documentation. You can create a reusable component that contains your disclaimer and reuse it as often as you need to. If the disclaimer ever needed to be updated, you only have to edit it in one file.
- **Single-source content references** - You may prefer to keep many pieces of reusable content in one file. For example, you might want to create a single file that contains all the actions that are available in various menus or toolbars for your software application. Then, wherever you need to describe or display an action in your documentation, you can reuse content from that single file by inserting content references. This strategy requires more setup than reusable components, but might make it easier to centrally managing the reused content and it allows for more flexibility in the XML structure of the reusable content.
• **Arbitrary content references** - Although it is not recommended, you can create content references among topics without storing the reusable content in components or a single file. This strategy might make it difficult to manage content that is reused and to maintain continuity and accuracy, since you may not have any indication that content you are editing is reused elsewhere.

A reference to the external content is created by adding a `@conref` or `@conkeyref` attribute to an element in the local document. The `@conref` or `@conkeyref` attribute defines a link to the referenced content, made up of a path to the file and the topic ID within the file. The path may also reference a specific element ID within the topic. Referenced content is not physically copied to the referencing file. However, by default, Oxygen XML Editor Eclipse plugin displays it in **Author** mode as if it is there in the referencing file. If you want to expand referenced content on demand (rather than having it be automatically expanded), open the **Preferences** dialog box (on page 70), go to **Editor > Edit modes > Author**, and deselect the **Display referenced content** option (on page 139).

**Note:**
A reference also displays tracked changes (on page 2659) and comments that are included in the source fragment. To edit these comments (or accept/reject changes) right-click the comment or tracked change and select **Edit Reference**.

**Tip:**
To search for references made through a direct content reference, use the **Search References** action from the contextual menu.

- Doctales - Content Key Reference

**Creating a DITA Content Reference**

**DITA Content Reference**

A DITA content reference, or `conref`, is one of the main content reuse features of DITA (on page 2453). It is a mechanism for re-using the same content in multiple topics (or even in multiple locations within the same topic).
For a `conref` to be created, the source content must have an `id` attribute that the `conref` can reference. Therefore, creating a `conref` requires that you add an `id` to the content to be reused before inserting a `conref` into the topic that reuses the referenced content.

**Assigning an ID to the Referenced Content**

To add an `id` to a DITA element in a topic, place the cursor on the element and select `Edit Attributes` from the contextual menu to open the in-place attribute editor (on page 405). Enter `id` as the Name of the attribute and a value of your choice in the Value field. You can also use the Attributes view (on page 403) to enter a value in the `id` attribute.

**Note:**
The element may already have an `id`, since in some cases, Oxygen XML Editor Eclipse plugin automatically generates an ID value when the `id` attribute is created.

**Creating a Content Reference**

To create a content reference (`conref`), follow these steps:

1. Make sure the element you want to reference has an `ID` assigned to it (on page 2459).
2. In Author mode (on page 241), place the cursor at the location where you want the reused content to be inserted.
3. Select the Reuse Content action on the main toolbar (or from the DITA menu or Reuse submenu of the contextual menu). The Reuse Content dialog box (on page 2465) is displayed.
4. In the Location field of the Reuse Content dialog box, select the topic that contains the element you want to reference. The elements that you can reference are presented in a table.
5. Select the Target ID of the element (or elements) to have their content inserted, and verify the content in the Preview pane. The `id` value of the element that you select is automatically added to the Reference to (`conref`) field.
6. Make any other selections you need in the Reuse Content dialog box (on page 2465). If you select multiple elements, the Expand to (`conrefend`) field is automatically filled with the `id` value of the last element in your selection.
7. Click Insert or Insert and close to create the content reference.

**Using Copy/Paste Actions to Create a Content Reference**

Oxygen XML Editor Eclipse plugin also includes support for creating content references with simple copy/paste actions. The copied content must be an entire DITA XML element with an ID attribute. Also, the location in the document where you paste the element must be valid, although as long as the Smart paste and drag and drop option (on page 155) is selected in the Schema-Aware preferences page, if you try to paste it in an invalid location, Oxygen XML Editor Eclipse plugin will attempt to place it in a valid location, and may prompt you with one or more choices for where to place it.

To create a content reference (`conref`) using copy/paste actions, follow these steps:
1. Copy an entire DITA element that has an ID attribute assigned to it.
2. Place the cursor at a location where the copied element will be valid.
3. Select the **Paste as Content Reference** action from the **Paste Special** submenu from the contextual menu.

**Other Ways to Reuse Content**

- You can use the **Components** tab in the **DITA Reusable Components** view (**on page 2487**) to easily insert content references.
- An alternate way to reuse content is to use the Oxygen XML Editor Eclipse plugin **Create Reusable Component** (**on page 2477**) and **Insert Reusable Component** (**on page 2478**) actions (available in the **DITA** menu and the **Reuse** submenu of the contextual menu). They handle the details of creating an **ID** and **conref** and create reusable component files, separate from your normal content files. This can help you manage your reusable content more effectively.
- You can also **insert reusable content using content key references** (**on page 2460**). This may also make reusable content easier to manage, depending on your particular situation and needs.
- Other topics in this section include information about more specialized or advanced ways of reusing content, such as **code references** (**on page 2473**), the **conref push mechanism** (**on page 2474**), **variable text** (**on page 2478**), **key scopes** (**on page 2480**), and **branch filtering** (**on page 2482**).

---

**Creating a DITA Content Key Reference**

**DITA Content Key Reference**

A DITA content key reference, or **@conkeyref**, is a mechanism for inserting a piece of content from one topic into another. It is a version of the **DITA content reference mechanism** (**on page 2458**) that uses **keys** (**on page 2448**) to locate the content to reuse rather than direct references to topics that contain reused content.

As with a **conref**, a **conkeyref** requires that the element to be reused has an **@id** attribute. It also requires the topic that contains the reusable content to be assigned a **key** (**on page 2448**) in a map. As with all uses of keys, you can substitute multiple maps or use **profiling** (**on page 2556**) to create multiple definitions of keys in a single map. This allows the same **@conkeyref** to pull in content from various sources, depending on how your build is configured. This can make it easier to create and manage sophisticated content reuse scenarios.
Creating a Content Key Reference

To create a content key reference (@conkeyref), follow these steps:

1. Make sure the topic that contains the reusable content is assigned a key in the DITA map and the element you want to reference has an ID assigned to it.
2. In Author mode (on page 241), place the cursor at the location where you want the reused content to be inserted.
3. Select Reuse Content on the main toolbar (or from the DITA menu or Reuse submenu of the contextual menu). The Reuse Content dialog box (on page 2465) is displayed.
4. Select the Key radio button for the content source and use the Choose Key Reference button to select the key for the topic that contains the reusable content (you can also select one from the drop-down list in the Key field). The elements that you can reference from the source are presented in the table in the middle of the Reuse Content dialog box.
5. Select the Target ID of the element (or elements) that you want to insert, and verify the content in the Preview pane. The @id value of the element that you select is automatically added to the Reference to (conkeyref) field.
6. Make any other selections you need in the Reuse Content dialog box (on page 2468). If you select multiple elements, the Expand to (conrefend) field is automatically filled with the @id value of the last element in your selection.
7. Click Insert or Insert and close to create the content reference.

Note:
If you are using Text mode (on page 240), when you insert a @conkeyref attribute, after you enter the first quote (conkeyref=), the Content Completion Assistant will list all the defined keys that you can select from. Also, after you select the key, the Content Completion Assistant will then list the element IDs from the referenced topic, allowing you to insert an anchor. Note that this only works for local files.

Using Copy/Paste Actions to Create a Content Key Reference

Oxygen XML Editor Eclipse plugin also includes support for creating content key references with simple copy/paste actions. When the DITA content is processed, the key references are resolved using key definitions from DITA maps. The copied content must be an entire DITA XML element with an ID attribute and the topic that contains the reusable content must have a key assigned in a DITA map. Also, the location in the document where you paste the element must be valid, although as long as the Smart paste and drag and drop option (on page 155) is selected in the Schema-Aware preferences page, if you try to paste it in an invalid location, Oxygen XML Editor Eclipse plugin will attempt to place it in a valid location, and may prompt you with one or more choices for where to place it.

To create a content key reference (@conkeyref) using copy/paste actions, follow these steps:
1. In the DITA Maps Manager view (on page 2315), make sure that the Context combo box (on page 2319) points to the correct map that stores the keys.

2. Make sure the topic that contains the content you want to reference has a key assigned to it. To assign a key, right-click the topic with its parent map opened in the DITA Maps Manager (on page 2315), select Edit Properties, and enter a value in the Keys field.

3. In a topic with an assigned key, copy an entire DITA element that has an ID attribute assigned to it.

4. Place the cursor at a location where the copied element will be valid.

5. Select the Paste as Content Key Reference action from the Paste Special submenu from the contextual menu.

Other Ways to Reuse Content

- You can use the Components tab in the DITA Reusable Components view (on page 2487) to easily insert content key references.
- You can also insert reusable content using content references (@conref) (on page 2458).
- Other topics in this section include information about more specialized or advanced ways or reusing content, such as code references (on page 2473), the conref push mechanism (on page 2474), variable text (on page 2478), key scopes (on page 2480), and branch filtering (on page 2482).

Related Information:
Reuse Content Dialog Box (on page 2465)
DITA Reusable Components View (on page 2483)
Creating a DITA Content Reference (on page 2458)
Editing DITA Content References (on page 2462)
Working with Reusable Components (on page 2476)
Working with Content References (on page 2457)

Editing DITA Content References

When you reference reusable content using a @conref or @conkeyref attribute, by default, the content is grayed out in the document and can only be edited from the source document. To edit the source of the referenced content, click the icon at the beginning of the inserted content. This will open the source document where you can edit the referenced content.

Oxygen XML Editor Eclipse plugin also includes some actions that allow you to quickly edit existing content references. When the element that contains a content reference (@conref or @conkeyref) is selected, the following actions are available in the DITA menu and the Reuse submenu of the contextual menu:

Edit Content Reference

This action is available for elements with a @conref or @conkeyref attribute. It opens the Edit Content Reference dialog box that allows you to edit the source location (or key) and source element of a content reference (or content key reference), and the reference details (@conref/@conkeyref and @conrefend attributes). For more information, see Reuse Content Dialog Box (on page 2465).
Replace Reference with Content

Replaces the referenced fragment (@conref or @conkeyref) at the cursor position with its content from its source. This action is useful if you want to make changes to the content in the currently edited document without changing the referenced fragment in its source location. If the source content includes references to other topics/resources (hrefs), the operation also resolves those references relative to the new location. Attributes are preserved according to the following priority:

1. Attributes from the elements in the current document that reference other content are preserved except for attributes with a -dita-use-conref-target value.
2. Attributes from the referenced content are brought into the replaced elements in the current document except for @id attributes.

Replace All References with Content

Replaces all referenced fragments (@keyref, @conref, or @conkeyref) in the current document with the content. Attributes are preserved according to the following priority:

1. Attributes from the elements in the current document that reference other content are preserved except for attributes with a -dita-use-conref-target value.
2. Attributes from the referenced content are brought into the replaced elements in the current document except for @id attributes.

For keyrefs inside <xref> or <link> elements, the @keyref attribute is changed to an @href attribute, while the rest of the content for the keyref is replaced with its source content.

If the source content includes references to other topics/resources (hrefs), the operation also resolves those references relative to the new location.

Remove Content Reference

Removes the content reference (@conref or @conkeyref) inside the element at the cursor position.

Converting Conrefs to Conkeyrefs

Oxygen XML Editor Eclipse plugin includes a DITA refactoring operation called Convert conrefs to conkeyrefs that will find all content references (that reference content outside the current document) and convert them to content key references. You can also use it to quickly convert all content references in the current document or multiple documents at once.

To access the Convert conrefs to conkeyrefs operation, use one of the following methods:

Single Document Method

With the document opened in the editor, right-click anywhere in the main editing pane (or right-click the topic reference in the DITA Maps Manager (on page 2315)), go to the Refactoring submenu, and choose Convert conrefs to conkeyrefs.
Multiple Documents At Once Method

Select **XML Refactoring** from the XML Tools menu (or from the Refactoring submenu when you right-click a document in the Project Explorer view (on page 268) or the DITA Maps Manager view (on page 2315)). Then select Convert conrefs to conkeyrefs from the DITA section and click Next.

Either method will proceed to the XML Refactoring Wizard. If you used the Multiple Documents At Once Method (on page 2464), the wizard page allows you to choose a scope for the operation and some filtering options:

- **Scope** - Select from a variety of options to define the scope that will have resources affected by the operation. For example, you can choose to affect all resources in the Project, All opened files, Current DITA map hierarchy, or just the Current file.
- **Filters** section
  - **Include files** - Specifies files to be excluded from the operation. You can specify multiple files by separating them with commas and the patterns can include wildcards (such as * or ?).
  - **Restrict to known XML file types only** - Excludes non-XML file types from the operation.

If you used the Single Document Method (on page 2463), the scope will be the current file so the scope and filtering options are not displayed.

You can then use one of the following buttons to proceed with the operation:

**Preview**

You can use the Preview button to open a comparison panel where you can review all the changes that will be made by the refactoring operation before applying the changes.

**Warning:**

It is always recommended to use the Preview button to make sure the operation is not going to do something unexpected and after you click the Finish button, any Undo action will only revert changes on the current document.

**Finish**

When you use the Finish button, the operation will be processed and all content references will be converted to content key references (either all content references in the current document or all content references in all of the documents specified in the scope). The file name for each converted document is used as the value for its new key. However, the operation does NOT automatically add the key to the DITA Map (on page 2654), so you still need to manually define each key in your DITA map (on page 2349).

Defining Keys in DITA Maps (on page 2349)

Reuse Content Dialog Box

The Reuse Content dialog box provides a mechanism for reusing content fragments. DITA `@conref`, `@conkeyref`, and `@keyref` attributes can be used to insert references to reusable content. The `@conref` attribute stores a reference to another element and is processed to replace the referencing element with the referenced element. The `@conkeyref` attribute uses keys (on page 2448) to locate the content to reuse rather than direct references to the topic that contains the reusable content. The `@keyref` attribute also uses keys (on page 2448) and can be used to indirectly reference metadata that may have different values in various circumstances.

Note:
For a `conref` or `conkeyref`, to reference the content inside a DITA element, the source element must have an `@id` attribute assigned to it. The element containing the content reference acts as a placeholder for the referenced element. For more details about DITA `@conref` and `@conkeyref` attributes, go to https://www.oxygenxml.com/dita/1.3/specs/archSpec/base/conref.html.

Note:
For the purposes of using a `@keyref`, keys are defined at map level and referenced afterward. For more information about the DITA `@keyref` attribute, go to https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/thekeyrefattribute.html.

Oxygen XML Editor Eclipse plugin displays the referenced content (on page 371) of a DITA content reference if it can resolve it to a valid resource. If you use URIs instead of local paths in your XML documents and your DITA-OT transformation needs an XML Catalog (on page 2659) to map the URIs to local paths, you need to add the catalog in Oxygen XML Editor Eclipse plugin (on page 593). If the URIs can be resolved, the referenced content is displayed in Author mode and in the transformation output.

In Author mode, a reference to reusable content (`@conref`, `@conkeyref`, or `@keyref`) can easily be inserted at the cursor position by using the Reuse Content dialog box. It can be opened with any of the following methods:

- Click the Reuse Content action on the main toolbar.
- In the contextual menu of the editing area, go to Reuse > Reuse Content.
- Go to DITA > Reuse Content.

Your selection at the top of the dialog box for choosing the content source determines whether Oxygen XML Editor Eclipse plugin will insert a `@conref`, `@conkeyref`, or `@keyref`. 
If you select **Location** for the content source, a *content reference* (@conref) will be inserted. If you select **Key** for the content source, keys will be used to insert a *content key reference* (@conkeyref) or a *key reference* (@keyref).

**Content Reference (@conref) Options Using the Reuse Content Dialog Box**

*Figure 617. Reuse Content Dialog Box (with the Default Insert Content Reference Options Displayed)*

Choose the content source

When **Location** is selected for the content source, a *content reference* (@conref) will be inserted. Here you can specify the path of the topic that contains the content you want to reference.

The dialog box offers the following options:

1. **Select an element from the content source Section**

   - **Target ID**
   - **Element**
   - **Content**
   - **Topic ID**

   - **Preview**
   - **Source**

   - **Getting Started**

   - *This chapter is designed to help you get started using [product] as quickly as possible and to provide you with a variety of resources to help you get the most out of...*
Show elements of type

You can use this drop-down list to select specific types of elements to be displayed in the subsequent table. This can help you narrow down the list of possible source elements that you can select.

Text Filter Field

You can also use the text filter field to narrow down the list of possible source elements to be displayed in the subsequent table.

Element Table

Presents all the element IDs defined in the source topic. Use this table to select the Target ID of the element that you want to reference. You can select multiple contiguous elements to reference a block of content.

Preview Pane

Displays the content that will be references. If you select multiple elements in the element table, the content from all the selected elements is displayed.

Source Pane

Displays the source code of the element to be referenced.

Reference details Section

Reference to (conref)

Oxygen XML Editor Eclipse plugin automatically fills this text field with the value of the @conref attribute to be inserted. However, you can edit this value if need be.

Reference to range end (conrefend)

If you select multiple elements (of the same type) in the element table, Oxygen XML Editor Eclipse plugin automatically fills this text field with the @id value of the last element in your selection. This value will be inserted as a @conrefend attribute, defining the end of the conref range.
Content Key Reference (@conkeyref) Options Using the Reuse Content Dialog Box

Choose the content source Section

When Key is selected for the content source, you can use keys to reference content. You can use the Choose Key Reference button to open the Choose Key dialog box that allows you to select one from a list of all the keys that are gathered from the root map (on page 2658) (you can also select one from the drop-down list in the Key field).

Note:
If the current DITA map is not selected as the root map, no keys will be listed.

Tip:
You can also use the DITA Reusable Components view (on page 2483) for similar purposes.
The **Choose Key** dialog box includes the following:

- **Change Root Map** - Opens a small dialog box that allows you to select a root map (on page 2331).
- **Search Filter** - You can enter text in the filter field at the top of the dialog box to filter the list and search for a specific key.
- **Sortable Columns** - The dialog box includes the following columns that can be sorted by clicking on the heading:
  - **Key** - The name of the key (the value of the `@keys` attribute).
  - **Description** - The description of the key that is obtained from its definition. Keys that are defined with a text value in the `<navtitle>` or `<keyword>` element have that value listed in this column.
  - **Href** - Keys that are defined with a value in an `href` attribute have that href value listed in this column.
  - **Definition Location** - The name of the DITA map (on page 2654) where the key is defined.
- **Group by Definition Location** - A contextual menu action that can be used to group (and sort) all the keys based upon the value in the **Definition Location** column.

To insert a content key reference (`@conkeyref`), select the key that contains the content you want to reference. Notice that the file path is shown in the `Href` column. Keys that do not have a value in the `Href` column are for referencing metadata with a `@keyref` attribute. Therefore, to insert a `@conkeyref`, you need to select a key that does have a value (file path) in the `Href` column.

After you select a key, click **OK** to return to the **Reuse Content** dialog box.

When a key that is defined as a content key reference has been selected, the **Reuse Content** dialog box offers the following additional options for inserting a `@conkeyref`:
Select an element from the content source Section

Show elements of type
You can use this drop-down list to select specific types of elements to be displayed in the subsequent table. This can help you narrow down the list of possible source elements that you can select.

Text Filter Field
You can also use the text filter field to narrow down the list of possible source elements to be displayed in the subsequent table.

Element Table
Presents all the element IDs defined in the source topic. Use this table to select the Target ID of the element that you want to reference. You can select multiple contiguous elements to reference a block of content.

Preview Pane
Displays the content that will be references. If you select multiple elements in the element table, the content from all the selected elements is displayed.

Source Pane
Displays the source code of the element to be referenced.

Reference details Section

Reference type
The type of reference that will be inserted. If you selected a key that references a DITA resource, you will notice that conkeyref value is automatically selected.

Reference to
Oxygen XML Editor Eclipse plugin automatically fills this text field with the value of the @conkeyref attribute to be inserted. However, you can edit this value if need be.

Fallback to (conref)
You can select this option to define a @conref attribute to be used as a fallback to determine the content reference relationship if the specified conkeyref cannot be resolved.

Reference to range end (conrefend)
If you select multiple elements (of the same type) in the element table, Oxygen XML Editor Eclipse plugin automatically fills this text field with the @id value of the last element in your selection. This value will be inserted as a @conrefend attribute, defining the end of the conkeyref range.
Key Reference to Metadata (@keyref) Options Using the Reuse Content Dialog Box

Figure 620. Insert Key Reference Options

Choose the content source:

- **Location**: 
- **Key**: product

Select an element from the content source, or multiple elements for a range of reused content

Show elements of type: All

<table>
<thead>
<tr>
<th>Target ID</th>
<th>Element</th>
<th>Content</th>
<th>Topic ID</th>
</tr>
</thead>
</table>

Reference details:

- **Reference type**: keyref
- **Reference to**: product
- **Element name**: ph

Choose the content source Section

When **Key** is selected for the content source, you can use keys to reference content. You can use the **Choose Key Reference** button to open the **Choose Key** dialog box that allows you to select one from a list of all the keys that are gathered from the root map (on page 2658) (you can also select one from the drop-down list in the **Key** field).

**Note:**

If the current DITA map is not selected as the root map, no keys will be listed.

**Tip:**

You can also use the DITA Reusable Components view (on page 2483) for similar purposes.
The **Choose Key** dialog box includes the following:

- **Change Root Map** - Opens a small dialog box that allows you to select a root map *(on page 2331)*.
- **Search Filter** - You can enter text in the filter field at the top of the dialog box to filter the list and search for a specific key.
- **Sortable Columns** - The dialog box includes the following columns that can be sorted by clicking on the heading:
  - **Key** - The name of the key (the value of the `@keys` attribute).
  - **Description** - The description of the key that is obtained from its definition. Keys that are defined with a text value in the `<navtitle>` or `<keyword>` element have that value listed in this column.
  - **Href** - Keys that are defined with a value in an `href` attribute have that href value listed in this column.
  - **Definition Location** - The name of the DITA map *(on page 2654)* where the key is defined.
- **Group by Definition Location** - A contextual menu action that can be used to group (and sort) all the keys based upon the value in the **Definition Location** column.

To insert a *key reference* to metadata (`@keyref`), select the key you want to reference. Keys that do not have a value in the **Href** column are for referencing metadata with a `@keyref` attribute. Therefore, to insert a `@keyref`, you need to select a key that does not have a value (file path) in the **Href** column.

After you select a key, click **OK** to return to the **Reuse Content** dialog box.

When a key that references metadata has been selected, the **Reuse Content** dialog box offers the following additional options for inserting a `@keyref`: 
Select an element from the content source Section

This section is not used when referencing metadata.

Reference details Section

Reference type

The type of reference that will be inserted. If you selected a key that does not reference a DITA resource, you will notice that keyref value is automatically selected.

Reference to

Oxygen XML Editor Eclipse plugin automatically fills this text field with the value of the @keyref attribute to be inserted.

Element name

Oxygen XML Editor Eclipse plugin automatically selects the element that is most commonly used for the selected type of key reference, but you can use the drop-down list to choose another element to use for the reference.

Finalizing Your Content Reference Configuration

Once you click Insert or Insert and close, the configured content reference is inserted into your document.

Tip:

You can easily insert multiple content references by keeping the Reuse Content dialog box opened, using the Insert button.

Working with Content References (on page 2457)

Working with Code References

Code References

The DITA <coderef> element can be used to reference an external file that contains literal code. This is especially useful if you need to reference code from an external source that may occasionally change. Another advantage is that you don't have to convert illegal characters into their character equivalents. When the <coderef> is processed, the referenced code file is imported and delimiting characters (such as < or >) are displayed as standard text, rather than treated as XML markup.

For more information about code references, see DITA 1.3 Specification: Coderef.
Example of using a Coderef

This code is an example of how to use a coderef.

```xml
<coderef href="MyExternalCode.xsl"/>
```

Defining Line Ranges

DITA-OT provides additional code reference processing support that allows you to define line ranges in case you only want to reference certain parts of the external file, rather than the whole file.

For information and examples of how to define line ranges, see DITA Open Toolkit Documentation: Extended Code Reference Processing.

Working with the Conref Push Mechanism

Content Reference Push Mechanism

The usual method of using content references pulls element content from a source element and inserts it in the current topic. DITA 1.2 introduced an alternative method of content referencing, allowing element content to be pushed, or injected, from a source topic to another topic without any special coding in the topic where the content will be re-used. This technique is known as a content reference push mechanism (conref push).

The conref push mechanism requires elements in the target topic (the topic where the content is to be pushed) to have ID elements, as the push mechanism inserts elements before or after a named element, or replaces the named element. Assuming the source topic is included in the DITA map (on page 2654), the conref push will be processed during the publishing stage for the DITA map.

Example of a Conref Push Scenario

An example of a scenario where a conref push would be useful is where a car manufacturer produces driver manuals that are distributed to various regions with their own specific regulations and certain sections need to be customized by the local car dealers before publishing. The local dealer could use a conref push technique to insert specific content without modifying the manufacturer-supplied content.

Push Current Element Action

Oxygen XML Editor Eclipse plugin includes an action that allows you to easily reference content with a conref push mechanism. The Push Current Element action is available in the DITA menu and in the Reuse subfolder of the contextual menu when editing in Author mode. Selecting this action opens the Push current element dialog box that allows you to select a target resource and element, and where to insert the current element content.
Choose the target resource

- **Location URL**: Allows you to select a Location URL for the target resource and the table in the next section of the dialog box will be populated using the information from the specified resource.
- **Key**: Allows you to select a Key for the target resource.

Select the target element

The table in this section contains the available elements (identified by their ID) that can be replaced by, or pushed before/after, the current element, according to the push action.

Push action

- **replace the target element**: The target element will be replaced with the current element content.
- **push before**: The current element content will be inserted before the target element.
- **push after**: The current element content will be inserted after the target element.

On the technical side, the value of the `@conaction` attribute in the current element will be set to `push replace` and the `@conref` or `@conkeyref` attribute will be set to the specified reference.
The current element content will be inserted before the specified target element in the target resource.

On the technical side, the value of the `@conaction` attribute in the current element will be set to `pushbefore`. Another element with the same name and class as the target element will be inserted in the document after the current element. The new element will have the `@conaction` attribute set to `mark` and the `@conref` or `@conkeyref` attribute will be set to the specified reference.

**push after**

The current element content will be inserted after the specified target element in the target resource.

On the technical side, the value of the `@conaction` attribute in the current element will be set to `pushafter`. Another element with the same name and class as the target element will be inserted in the document before the current element. The new element will have the `@conaction` attribute set to `mark` and the `@conref` or `@conkeyref` attribute will be set to the specified reference.

You can also use the Preview panel to view the content that will be pushed and the Source panel to see the XML code for the content to be pushed. After you click OK, the conref push mechanism is inserted in the current document. The changes in the target resource will be processed when you transform the DITA map.

**Resources**

For more information about the conref push mechanism and other advanced DITA profiling concepts, watch our Webinar: Working with DITA in Oxygen - Advanced Profiling and Reuse Strategies.

- Doctales - Content Reference Push

**Working with Reusable Components**

In DITA, the content of almost any element can be made reusable simply by adding an `@id` attribute to the element. The DITA content reference mechanism can reuse any element with an ID. However, it is not considered best practice to arbitrarily reuse pieces of text from random topics due to the difficulties this creates in trying to manage it. It also creates the possibility of authors deleting or changing content that is reused in other topics without being aware that the content is reused.

To prevent these types of problems, you can create reusable components to manage a separate set of topics that contain topics designed specifically for reuse. Then, all of your reusable content can be referenced from the reusable components and if the content needs to be updated you only need to edit it in one place.
Oxygen XML Editor Eclipse plugin allows you to select content in a topic, create a reusable component from it and reference that component in other locations by using the Create Reusable Component (on page 2477) and Insert Reusable Component (on page 2478) actions.

Related Information:  
DITA Reusable Components View (on page 2483)

Creating a Reusable Content Component

Oxygen XML Editor Eclipse plugin makes it easy to create a reusable component from existing topic content.

Note:
To ensure that the topic file that contains the reusable component is a valid container for the reusable content component, Oxygen XML Editor Eclipse plugin attempts to use the same schema information in the current topic for the file that contains the reused component. If it cannot create a valid instance of the reused content file with this approach, the application creates a specialized topic type automatically. This specialization is designed to make sure that the content is compatible with the topic type that it is created from. You can make changes to the configuration file (OXYGEN_INSTALL_DIR\frameworks\dita\reuse\reuse_configuration.properties) or override it from a framework extension to control if the created reusable component file should be based on the currently edited topic or it should be an automatically created DITA specialization topic.

Follow these steps to create a reusable component:

1. In Author mode, select the content you want to make into a reusable component (or place the cursor inside an element you want to reuse).
2. Select the Create Reusable Component action that is available in the DITA menu or the Reuse submenu of the contextual menu.
   The Create Reusable Component dialog box is displayed.
3. Use the Reuse Content drop-down list to select the scope of the content to be made reusable. It allows you to select how much of the current content you want to make reusable. The choices presented include the element at the current cursor position and its ancestor elements.
4. Add a description. This is used as a description for the reusable component, but is not part of the reused content. It is just to help you identify the reusable content and will not become part of your output.
5. If the Replace selection with content reference option is selected, the selection in the current topic will be replaced with a content reference (@conref) that points to the new reusable component. If multiple elements are selected (for example, multiple steps or list items), the selection is replaced with a content reference range (@conref and @conrefend).
6. Select a file name and location to save the topic containing the reusable component and click Save. It is considered best practice to save or store reusable components in an area set aside for that purpose.
A file is created that contains one reusable component. You can reference the reused content in other topics by using a content reference (on page 2458) or content key reference (on page 2460). Also, if the Replace selection with content reference option was selected, Oxygen XML Editor Eclipse plugin replaces the selected content with a content reference that will be displayed in your current topic with a gray background and it can only be edited in the source file (the new reusable component). To edit the source file, click the Edit Content icon at the beginning of the content reference.

Inserting a Reusable Content Component

Oxygen XML Editor Eclipse plugin includes an Insert Reusable Content action that allows you to easily insert a reusable content component that you created using the Create Reusable Component action (on page 2477).

![CAUTION:]

This action is only designed to insert reusable components created using the Oxygen XML Editor Eclipse plugin Create Reusable Component action. It assumes certain things about the structure of the reusable content file that may not be true of reusable content created by other methods and it may not provide the expected results if used with content that does not have the same structure.

The Insert Reusable Content action creates a DITA @conref to insert the content, and creates a parent element for the @conref attribute based on the type of the reusable element in the reusable component file. This action ensures that the correct element is used to create the @conref. However, that element must still be inserted at a point in the current topic where that element type is permitted.

To insert a reusable component that was created using the Create Reusable Component action, follow these steps:

1. Place the cursor at the insertion point where you want the reusable component to be inserted.
2. Select the Insert Reusable Component action that is available in the DITA menu or the Reuse submenu of the contextual menu.
   The Insert Reusable Component dialog box is displayed.
3. Locate the reusable content file that you want to insert its content.
4. If you select Content reference in the Insert as drop-down list, the action will add a @conref attribute to the DITA element at the current location. If you select Copy in the drop-down list, the content of the reusable component file will simply be pasted at the current location (assuming the content is valid at the current location).
5. Click Insert to perform the action.

Working with Variable Text in DITA

You may often find that you want a certain piece of text in a topic to have a different value in various circumstances. For example, if you are reusing a topic about a feature that is shared between several products, you might want to make the name of the product a variable so that the correct product name is used in the manual for each product.
For example, you might have a sentence like this:

The quick-heat feature allows [product-name] to come up to temperature quickly.

You need a way to substitute the correct product name for each product.

One way to do this would be to use conditional profiling to provide conditional values using the @product profiling attribute, as in the following example:

```xml
<p>The quick-heat feature allows <ph product="basic">Basic Widget</ph> <ph product="pro">Pro Widget</ph> to come up to temperature quickly.</p>
```

However, this approach means that you are repeating the product names over and over again everywhere the product name is mentioned. This is time consuming for authors and will create a maintenance problem if the product names change.

The alternative is to use a key reference, as in the following example:

```xml
<p>The quick-heat feature allows <ph keyref="product"/> to come up to temperature quickly.</p>
```

The definition of the key reference determines the name of the product:

```xml
<keydef keys="product" product="basic">
  <topicmeta>
    <keywords>
      <keyword>Basic Widget</keyword>
    </keywords>
  </topicmeta>
</keydef>

<keydef keys="product" product="pro">
  <topicmeta>
    <keywords>
      <keyword>Pro Widget</keyword>
    </keywords>
  </topicmeta>
</keydef>
```

When the content is published, the value defined in the product key will be inserted for each product.

**Inserting a Keyref**

To insert a defined key reference (on page 2349) into a document in Oxygen XML Editor Eclipse plugin Author mode, use one of the following methods (the method you choose simply depends on which Oxygen XML Editor Eclipse plugin feature you prefer):
• **DITA Reusable Components View Method**

Use the **DITA Reusable Components** view (on page 2483) to insert a variable reference to the defined key (on page 2349). For example, in the Keys tab, find a key defined as a variable and double-click it. Oxygen XML Editor Eclipse plugin will insert the variable as a `<ph>` element with a `@keyref` attribute that references the specified key.

• **Code Template Method**

Add the source code pattern of the defined key (on page 2349) to a code template (on page 122) so that it appears in the list of proposals in the **Content Completion Assistant** (on page 2653). For example, the code pattern could be something like `<ph keyref="product">` for defined `product` key.

• **Reuse Content Dialog Box Method**

Use the **Reuse Content** action on the main toolbar to open the **Reuse Content** dialog box (on page 2465). Use the Key option to select a key that is defined as a variable (key reference to metadata) (on page 2471) and Oxygen XML Editor Eclipse plugin will insert the variable as a `<ph>` element with a `@keyref` attribute that references the specified key.

• **Manual Method**

Manually insert the `@keyref` attribute using the attributes editor as follows:

1. Press **Enter** and select a DITA element (for example, `<ph>`) that supports the `@keyref` attribute.
2. Select **Edit Attributes** from the contextual menu to bring up the attributes editor (on page 405).
3. In the **Name** field, select `keyref`.
4. In the **Value** field, select or enter the name of the defined key (on page 2349).

**Related Information:**
- DITA Reusable Components View (on page 2483)
- Defining Keys in DITA Maps (on page 2349)
- Doctales - Key Reference (keyref)

**Working with DITA 1.3 Key Scopes**

DITA 1.3 includes the possibility of using a concept called **Key Scopes** (or scoped keys). It allows you to reuse a topic in multiple places within the same **DITA map** (on page 2654), but with slightly different content in each instance.

**Key Scopes Use-Case**

Suppose that you develop a software product and you have a topic in your user guide that explains how to install your product on a Windows operating system. Suppose that the steps are exactly the same for installing it on Linux and the only difference is the name of the operating system. Therefore, it would be helpful if you could reuse the exact same content in two different topics, but with the name of the operating
system different in each instance. In DITA 1.2, this is not possible since keys can only be resolved to a single value. However, with the DITA 1.3 Key Scopes mechanism, you can define multiple values for the same key depending on the context.

How to Use Key Scopes in Oxygen XML Editor Eclipse plugin

To use DITA 1.3 key scopes in Oxygen XML Editor Eclipse plugin, follow these steps:

1. Define the keys (on page 2448) to be used in multiple places within your DITA map.
2. For each particular topic that contains the keys, define the key scopes:
   a. Right-click the topic in the DITA Maps Manager (on page 2315) and select Edit properties.
   b. In the Keys tab (on page 2353), enter a value (or multiple values) in the Key scopes field.
   c. Click OK to save your changes.
3. Save the DITA map.

Result: In the DITA Maps Manager (on page 2315), you can now see the key scopes in brackets and when you open each topic reference.

Figure 623. Key Scopes in DITA Maps Manager

The content will also be expanded in Author mode according to the context of the key scope you defined for that particular topic. Also, when you transform the DITA map, the scoped keys will be reflected in the published content.

Resources

- You can find a more detailed example and download samples for reuse possibilities based on key scopes in the DITA 1.3 Key Scopes - Next Generation of Reuse blog post.
- You can also watch our DITA 1.3 video tutorial to see how key scopes can be used in Oxygen XML Editor Eclipse plugin.
- For more information about key scopes and other advanced DITA reuse concepts, watch our Webinar: Working with DITA in Oxygen - Advanced Profiling and Reuse Strategies.

Oxygen Video Tutorial: DITA 1.3 (Key Scopes, Branch Filtering)
Doctales - Key Scopes
Working with DITA 1.3 Branch Filtering

DITA 1.3 allows you to use a mechanism called *Branch Filtering* that enables you to set filtering conditions for specific branches of a *DITA map* (on page 2654). This makes it possible for multiple conditional profiles to be applied within a single publication, each time with a different filter.

**Branch Filtering Use-Case**

Suppose that you sell two models of a mobile phone and you need to create a brochure for each model. You want both brochures to have the same structure and most of the content is the same for both brochures. The only differences are in the values for certain details (for example, the model name, size dimensions, battery life, etc.) Therefore, it would be helpful if you could use the same topic and reference it twice in the same map, with each reference using different filtering conditions. In DITA 1.2, this is not possible since you can only apply one DITAVAL filter to a map. However, with the DITA 1.3 *Branch Filtering* mechanism, you can reuse content multiple times within the same map, each time using different filters.

**How to Use Branch Filtering in Oxygen XML Editor Eclipse plugin**

To use DITA 1.3 branch filtering in Oxygen XML Editor Eclipse plugin, follow these steps:

1. The support for DITA 1.3 must be enabled in the DITA preferences page (on page 82).
2. Assuming you have already defined your profiling attributes (on page 441), create a DITAVAL filter file (on page 2579).
3. Insert a reference to the DITAVAL filter file in the *DITA map*:
   a. Right-click the *DITA map* reference in the *DITA Maps Manager* (on page 2315) and select **Append Child > DITAVAL Reference**.
   b. Select the DITAVAL file.
   c. Click **Insert and Close**.
4. Save the *DITA map*.

**Result:** You can now see the ditaval files referenced in the *DITA Maps Manager* (on page 2315) and when you transform the *DITA map*, filtered content will be reflected in the published output.

**Figure 624. Branch Filtering in DITA Maps Manager**

```
- Syncoro Mobile Phones
  - The X1000 Phone [X1000Scope]
    - model = X1000
  - Phone Details
    - Phone Details
     - ditaval/X1000only.ditaval

- The X2000 Phone [X2000Scope]
  - model = X2000
  - Phone Details
    - Phone Details
     - ditaval/X2000only.ditaval
```
Resources

- You can find a more detailed example and download samples for reuse possibilities based on key scopes in the *DITA 1.3 Branch Filtering - Next Generation of Reuse* blog post.
- You can also watch our *DITA 1.3 video tutorial* to see how branch filtering can be used in Oxygen XML Editor Eclipse plugin.
- For more information about branch filtering and other advanced DITA reuse concepts, watch our Webinar: *Working with DITA in Oxygen - Advanced Profiling and Reuse Strategies*.

Oxygen Video Tutorial: DITA 1.3 (Key Scopes, Branch Filtering)

DITA Reusable Components View

The *DITA Reusable Components* view is helpful if you use a large number of keys or reusable components in your DITA project. It collects all of the keys and reusable components that are defined in the *root map (on page 2658)* and presents them in a side view where you can easily locate and insert references to them. It recollects the keys anytime the *root map is changed (on page 2331)* or you switch the editor focus to a different file.

If the view is not displayed, it can be opened by selecting it from Window > Show View > Other. By default, it appears in the bottom-right section of the editor.

It includes the following tabs:

- **Keys (on page 2484)** - Displays all the keys that are defined in the *root map (on page 2658)* and provides ways to easily insert references to them as cross reference links, key references, or variables. It includes a search field, some filtering and sorting options to help you find particular keys, and some contextual menu actions. It also supports drag and drop actions and double-clicking a key is the fastest way to insert a reference.

  **Note:**

  If the keys are gathered from peer DITA maps (used in cross publication references), the keys that define variables are not presented.

- **Components (on page 2487)** - Displays all the reusable components found in the *root map (on page 2658)* and provides ways to easily insert them as content references or content key references. To determine which components to display in this tab, Oxygen XML Editor Eclipse plugin looks for any `topicref` in the *root map (on page 2658)* that is marked as *resource-only* and then looks for elements
with an assigned @id attribute value. This tab includes a search field, some filtering options, and some simple links and contextual menu actions to quickly insert references or open their source file. It also supports drag and drop and double-clicking actions.

**Keys Tab**

The **DITA Reusable Components** view collects all the keys that are defined in the current root map (on page 2658) and displays them in the Keys tab. This tab has two view modes. The default tiles style view mode and a table style view mode.

**Tiles Mode**

The default tiles mode displays the keys as blocks (cards). The advantage of this display mode is that more information about each particular key can be seen even when the view is sized with a small width. Each block (card) displays the name of the key (the value of the @keys attribute), followed by its description and/or @href value, then followed by the name of the DITA map file where the key is defined.

**Table Mode**

You can switch to a table style display mode by selecting the Table mode toggle action from the Settings menu. The advantage of this display mode is that more keys can be listed at once. In this mode, keys that are defined with a text value in the <navtitle> or <keyword> element have that value listed in the Description column, while keys that are defined with a value in an @href attribute have that href value listed in the Href column.
Both display modes in the Keys tab include a variety of features and options:

**Search Filter**

You can enter text in the filter field at the top of this tab to filter the list and search for specific keys.

**Sorting**

**Tiles Mode:** In the default tiles display mode, to sort the keys alphabetically in ascending order, select Sort by key name from the 🍃 Settings menu.

**Table Mode:** In the table display mode, the following columns can be sorted by clicking the heading:

- **Key** - The name of the key (the value of the @keys attribute).
- **Description** - The description of the key that is obtained from its definition. Keys that are defined with a text value in the `<navtitle>` or `<keyword>` element have that value listed in this column.
- **Href** - Keys that are defined with a value in an @href attribute have that href value listed in this column.
- **Definition Location** - The name of the DITA map (on page 2654) where the key is defined.

**Double-Click Mechanism**

You can double-click any key listed in this tab to insert a key reference at the current cursor position or surrounding the current selection.

- If the selected key points to an @href value, it is inserted as a cross reference link (xref) (on page 2492).
- If the selected key is a reference to an image, it is inserted as an `<image>` element.
- If the selected key does not have an associated @href, it is inserted as a variable reference (ph) (on page 2478).
Drag and Drop Mechanism

You can drag a key from this tab and drop it in the main editor to insert a key reference at the current cursor position.

- If the selected key points to an @href value, it is inserted as a cross reference link (xref) (on page 2492).
- If the selected key is a reference to an image, it is inserted as an image element.
- If the selected key does not have an associated @href, it is inserted as a variable reference (ph) (on page 2478).

Contextual Menu Actions

Insert as Link

Inserts a cross reference link (xref) (on page 2492) to the selected key at the current cursor position or surrounding the current selection.

Insert as Variable

Inserts a variable reference (ph) (on page 2478) to the selected key at the current cursor position or surrounding the current selection. However, if the selected key is a reference to an image, this action inserts the key reference in an image element.

Insert as Keyref

Presents a submenu with all the elements that can be inserted at the current cursor position. Selecting an element will insert that element at the current cursor position or surrounding the current selection with a @keyref attribute and its value set to the selected key.

Insert as Figure

Available if the selection is an image, it inserts the image inside a figure element (<fig>). Note that the <title> element of the inserted figure will be empty.

Rename Key

Opens a refactoring wizard (on page 610) where you can easily rename the key and define the scope of the operation. It also updates all references to it.

Notes:

- This action does not work on DITA 1.3 key scopes.
- This action is only available if the DITA map opened in the DITA Maps Manager is also selected as the Root map.

Go to Definition

Opens the DITA map where the key is defined.
Search References

Searches for all references to the selected key in the entire DITA map structure.

Group by Definition Location (Available in Table mode only)

A toggle action that can be used to group (and sort) all the keys based on the value in the Definition Location column.

Settings Menu

This menu includes the following options:

Filtering Options

- **Show all** - Shows all defined keys found in the current root map (on page 2658).
- **Show only variables** - Filters the keys to show only those defined as variable references (on page 2478).
- **Show only maps and topics** - Filters the keys to show only those that reference DITA maps or topics.
- **Show only multimedia resources** - Filters the keys to show only those that reference multimedia resources (such as images).
- **Show only external resources** - Filters the keys to show only those that reference external resources (such as web links).

Sort by key name (Available in Tiles mode only)

Sorts the keys alphabetically in ascending order.

Table mode

A toggle action that switches between the table and tiles display modes.

Components Tab

The DITA Reusable Components view collects all the topics from the current root map (on page 2658) that are marked as resource-only, then collects the reusable components from those topics, and displays them in the Components tab. To set a topic as resource-only, the `<topicref>` in the DITA map file must have a `@processing-role` attribute set like this:

```xml
<topicref href="topics/randomize-xml-content.dita" processing-role="resource-only"/>
```

The DITA Reusable Components view considers topic references that contain `processing-role="resource-only"` to be candidates to contain reusable components. The reusable components inside these topics are collected from all elements that have an `ID` specified. These reusable components are displayed in the Components tab along with the file name and the specific names of the elements that contain an `ID` attribute.
The **Components** tab includes the following features and options:

**Search Filter**
You can enter text in the filter field at the top of this tab to filter the list and search for specific content inside the list of reusable components. This field supports many of the Lucene-based search patterns, such as wildcards (\* or ?), boolean operators (AND, OR, NOT), fuzzy searches (~), boosting searches (^), and more.

**Settings Menu**
This menu includes the following options:

- **Compact Mode**
  You can use this toggle action to switch the display for the **Components** tab to a compact visualization mode. When switched to Compact mode, fewer details are shown for each component, but more components are displayed in the view.

- **Reindex**
  You can use this action force a re-indexing of the reusable components.

- **Show Elements of Type**
  You can use this drop-down list to select specific types of elements to be displayed in the list of components. This can help you narrow down the list of possible source elements that you can select.
Source File(s)
You can use this combo box to search for specific source files (the topics that contain reusable components) or select a file from its drop-down list. You can also use wildcards (such as * or ?) in this field.

Double-Click Mechanism
You can double-click any reusable component listed in preview window in this tab to insert it as a content reference or content key reference at the current cursor position or replace the current selection.

- If the parent topic of the selected component has a key defined, it is inserted as a content key reference (conkeyref) (on page 2460).
- If the parent topic of the selected component does not have a key defined, it is inserted as a content reference (conref) (on page 2458).

Drag and Drop Mechanism
You can drag a reusable component from the preview window in this tab and drop it in the main editor to insert a content reference or content key reference at the current cursor position.

- If the parent topic of the selected component has a key defined, it is inserted as a content key reference (conkeyref) (on page 2460).
- If the parent topic of the selected component does not have a key defined, it is inserted as a content reference (conref) (on page 2458).

Hover and Click Actions
If you hover over a component shown in the preview window, you have access to the following link actions:

Insert
Inserts the component as a content reference or content key reference at the current cursor position or replaces the current selection. If the parent topic has a key defined, it is inserted as a content key reference (conkeyref) (on page 2460). Otherwise, it is inserted as a content reference (conref) (on page 2458).

Open
Opens the source file that contains the reusable component.

Contextual Menu Actions

Insert Content Reference
Inserts the component as a content reference (conref) (on page 2458) at the current cursor position or replaces the current selection.

Insert Content Key Reference
Inserts the component as a content key reference (`conkeyref`) at the current cursor position or replaces the current selection. This action is only available if the parent topic has a key defined.

**Go to Definition**

Opens the source file that contains the reusable component.

**Search References**

Searches for all references to the selected component in the entire DITA map (on page 2654) structure.

### Linking in DITA

DITA provides support for various types of linking between topics, some of which is automated, while others are specified by the author. Oxygen XML Editor Eclipse plugin provides support for all forms of linking in DITA.

#### Linking Between Parent, Child, and Sibling Topics

A **DITA map** (on page 2654) creates a hierarchical relationship between topics. That relationship map expresses a narrative flow from one topic to another, or it may be used as a classification system to help the reader find topics based on their classification, without creating a narrative flow. Since there may be various types of relationships between topics in a hierarchy, you may want to create links between topics in a variety of ways. For instance, if your topics are supposed to be organized into a narrative flow, you may want to have links to the next and previous topics in that flow. If your topics are part of a hierarchical classification, you may want links from parent to child topics, and vice versa, but not to the next and previous topics.

Parent, child, and sibling links are created automatically by the DITA output transformations (and may differ between various output formats). The kinds of links that are created are determined by the DITA **collection-type attribute** (on page 2355).

#### In-Line Linking in the Content of a Topic

DITA supports linking within the text of a topic using the `<xref>` element. The destination of the link can be expressed directly using the `@href` attribute or indirectly using the `@keyref` attribute. If you use the `@keyref`
attribute, you link to a key rather than directly to a topic. That key is then assigned to a topic in a map that includes that topic. This means that you can change the destination that a key points to by editing the key definition in the map or by substituting another map in the build.

**Linking Between Related Topics**

In addition to the relationships between topics that expressed by their place in the hierarchy of a map, a topic may be related to other topics in various ways. For instance, a task topic may be related to a concept topic that gives the background of the task, or to a reference topic that provides data needed to complete the task. Task topics may also be related to other tasks in a related area, or concepts to related concepts.

Typically, they are grouped in a list at the end of the topic, although this depends on the behavior of the output transformation. DITA provides two mechanisms for expressing relationships between topics at the topic level: the Related Links section of a topic and relationship tables in maps. To add related links, select Related Link to Topic, Related Link to File, or Related Link to Web Page from the Link drop-down menu from the toolbar (or the Link submenu in the contextual menu or DITA menu).

**Tip:**
You can use the Find Similar Topics action (available in the contextual menu or DITA menu) to quickly find related topics that can be added as related links. It opens the Open/Find Resource view and performs a search using text content from the <title>, <shortdesc>, <keyword>, and <indexterm> elements.

**Managing Links**

Links can break for a variety of reasons. The topic that a link points to may be renamed or removed. A topic may be used in a map that does not include a linked topic. A topic or a key may not exist in a map when a particular profile is applied. The DITA Maps Manager (on page 2315) provides a way to validate all the links in the documents that are included in the map (on page 2360). This can include validating all the profiling conditions that are applied.

**Related information**

Short Video Clip: Learn DITA Editing with Oxygen - Various Ways to Insert Links

**Hierarchical Linking in DITA Maps**

To create hierarchical linking between the topics in a DITA map (on page 2654), you set the appropriate value of the @collection-type attribute on the map. See the DITA documentation for the meaning of each of the values of the @collection-type attribute.

**Note:**
Publishing scripts determine when and how to create hierarchical links. The @collection-type attribute does not force a particular style of linking. Instead, it declares what the nature of the relationship is between the topics. The publishing scripts use that information to determine how to link topics.
Scripts for different types of media might make the determination depending on what is appropriate for the particular type of media. You can provide additional instructions to the scripts using the @linking attribute.

To add the @collection-type to an item in a map:

1. Right-click the topic and choose Edit Properties. The Edit Properties dialog box is displayed.
2. In the Attributes tab, select the appropriate value from the Collection type drop-down list.
3. You can use the Other attributes table to add a value to the @linking attribute.

Linking in DITA Topics

Direct Links

Inline links can be created DITA topics using the <xref> element. The destination of the link can be expressed directly by using the @href attribute and the target can be another topic or a specific element within the other topic, another location within the same topic, a file, or a web link. You can also create direct related links to topics, files, or websites in a DITA topic using the <related-links> element.

Indirect Links Using Keys

The destination of the link can also be expressed indirectly by using keys (on page 2448) to create either inline links or related links (with the @keyref attribute). By using keys, you avoid creating a direct dependency between topics. This makes links easier to manage and can make it easier to reuse topics in various publications. It can also be helpful in verifying the completeness of a publication, by ensuring that a publication map provides a key definition for every key reference used in the content.

Links based on keys require two pieces:

- Key Definition - Assigns a key to a topic so that other topics can link to it. For more information, see Defining Keys in DITA Maps (on page 2349).
- Key Reference - Created in an <xref> element and specifies the key to link to.

The key reference points to a key definition, and the key definition points to a topic. Key definitions are created in maps, as an element on the <topicref> element that points to a topic. This allows you to assign a particular key to one topic in one map and to another topic in another map. When a topic that links to that key is used in each of these maps, the links work correctly in both maps.

Inserting a Link in Oxygen XML Editor Eclipse plugin

To insert a link in Author mode (on page 241), use the actions available in the Link drop-down menu from the toolbar (or the Link submenu in the contextual menu or DITA menu). You can choose between the following types of inline links:

- Cross Reference
Opens the **Cross Reference (xref)** dialog box *(on page 2494)* that allows you to insert a cross reference link to a target DITA resource at the current location within a document. The target resource can be the location of a file or a key that is already defined in your DITA map structure. Once the target resource has been selected, you can also target specific elements within that resource. Depending on the context where it is invoked, the action inserts one of the following two elements:

- `<xref>` - Used to link to other topics or another location within the same topic and points to the target using the `@href` or `@keyref` attribute.
- `<fragref>` - A logical reference to a fragment element within a syntax diagram and points to the target using the `@href` or `@keyref` attribute.

**File Reference**

Opens a dialog box that allows you to insert a link to a target non-DITA file resource at the current location within a document. The target resource can be the location of a file or a key that is already defined in your **DITA map** structure. It inserts an `<xref>` element with either an `@href` attribute or a `@keyref` attribute. If you select **Location** for the target, the link is expressed in an `@href` attribute. If you select **Key** for the target, keys will be used to express the link in a `@keyref` attribute. You can select a key from the drop-down list or click the Choose Key Reference button to use the Choose Key dialog box *(on page 2495)*.

**Web Link**

Opens a dialog box that allows you to insert a link to a target web-related resource at the current location within a document. The target resource can be a URL or a key that is already defined in your **DITA map** structure. It inserts an `<xref>` element with either an `@href` attribute or a `@keyref` attribute. If you select **URL** for the target resource, the link is expressed in an `@href` attribute. If you select **Key** for the target, keys will be used to express the link in a `@keyref` attribute. You can select a key from the drop-down list or click the Choose Key Reference button to use the Choose Key dialog box *(on page 2495)*.

**Related Link to Topic**

Opens the **Cross Reference (xref)** dialog box *(on page 2494)* that allows you to insert a link to a target DITA resource in a related links section that is typically at the bottom of your topic (although this depends on the behavior of the output transformation). The target resource can be the location of a file or a key that is already defined in your **DITA map** structure. Once the target resource has been selected, you can also target specific elements within that resource. If a related links section does not already exist, this action creates one. Specifically, it inserts a `<link>` element inside a `related-links` element.

**Tip:**

You can use the **Find Similar Topics** action (available in the contextual menu or **DITA** menu) to quickly find related topics that can be added as related links. It opens the
Open/Find Resource view and performs a search using text content from the `<title>`, `<shortdesc>`, `<keyword>`, and `<indexterm>` elements.

Related Link to File

Opens a dialog box that allows you to insert a link to a target non-DITA file resource in a related links section that is typically at the bottom of your topic (although this depends on the behavior of the output transformation). The target resource can be the location of a file or a key that is already defined in your DITA map structure. If a related links section does not already exist, this action creates one. Specifically, it inserts a `<link>` element inside a `related-links` element. If you select Location for the target, the link is expressed in an `@href` attribute. If you select Key for the target, keys will be used to express the link in a `@keyref` attribute. You can select a key from the drop-down list or click the Choose Key Reference button to use the Choose Key dialog box (on page 2495).

Related Link to Web Page

Opens the Web Link dialog box that allows you to insert a link to a target web-related resource in a related links section that is typically at the bottom of your topic (although this depends on the behavior of the output transformation). The target resource can be a URL or a key that is already defined in your DITA map structure. If a related links section does not already exist, this action creates one. Specifically, it inserts a `<link>` element inside a `related-links` element. If you select URL for the target resource, the link is expressed in an `@href` attribute. If you select Key for the target, keys will be used to express the link in a `@keyref` attribute. You can select a key from the drop-down list or click the Choose Key Reference button to use the Choose Key dialog box (on page 2495).

Cross Reference (xref) Dialog Box

The Cross Reference (xref) dialog box is displayed when you insert a Cross Reference or Related Link to Topic (from the Link drop-down menu). It allows you to insert a link to a target resource at the current location within a document (for a Cross Reference link) or in a related links section (for a Related Link to Topic). The target resource can be the location of a file or a key that is already defined in your DITA map structure. Once the target resource has been selected, you can also target specific elements within that resource.
Figure 628. Cross Reference (xref) Dialog Box

This dialog box includes the following sections and fields:

Choose the Target Resource Section

Location

If you select Location for the target, the link is expressed in an `@href` attribute.

Key

If you select Key for the target, keys will be used to express the link in a `@keyref` attribute. You can use the `Choose Key Reference` button to open the Choose Key dialog box that allows you to select one from a list of all the keys that are gathered from the root map (on page 2658) (you can also select one from the drop-down list in the Key field).
Tip:
You can also use the DITA Reusable Components view (on page 2483) for similar purposes.

Figure 629. Choose Key Dialog Box

The Choose Key dialog box includes the following:

- **Change Root Map** - Opens a small dialog box that allows you to select a root map (on page 2331).
- **Search Filter** - You can enter text in the filter field at the top of the dialog box to filter the list and search for specific keys.
- **Sortable Columns** - The dialog box includes the following columns that can be sorted by clicking on the heading:
  - **Key** - The name of the key (the value of the @keys attribute).
  - **Description** - The description of the key that is obtained from its definition. Keys that are defined with a text value in the <navtitle> or <keyword> element have that value listed in this column.
  - **Href** - Keys that are defined with a value in an @href attribute have that href value listed in this column.
  - **Definition Location** - The name of the DITA map (on page 2654) where the key is defined.
- **Group by Definition Location** - A contextual menu action that can be used to group (and sort) all the keys based upon the value in the Definition Location column.

Select the Target Element Section

This section can be used to target a specific element inside the target resource.

Show elements of type
You can use this drop-down list to select specific types of elements to be displayed in the subsequent table. This can help you narrow down the list of possible source elements that you can select.

**Text Filter Field**

You can also use the text filter field to narrow down the list of possible source elements to be displayed in the subsequent table.

**Element Table**

Presents all the element IDs defined in the source topic. Use this table to select the Target ID of the element that you want to reference.

**Preview Pane**

Displays the content that will be referenced.

**Source Pane**

Displays the XML source code of the element to be referenced.

Once you click **Insert** or **Insert and close**, the configured cross reference is inserted into your document.

**Tip:**

You can easily insert multiple cross references by keeping the dialog box opened, using the **Insert** button.

### Using Copy/Paste or Drag/Drop Actions to Insert a Cross Reference

Oxygen XML Editor Eclipse plugin also includes support for inserting cross reference links with simple copy/paste or drag/drop actions ( additionally, you can insert them using the **Paste as Link** or **Paste as Link (keyref)** actions found in the [Paste Special] submenu from the contextual menu). The copied/dragged content must be an entire DITA XML element with an `@id` attribute or a `<topicref>`. Also, the location in the document where you paste or drop the link must be valid, although as long as the **Smart paste and drag and drop option** (on page 155) is selected in the [Schema-Aware] preferences page, if you try to paste it in an invalid location, Oxygen XML Editor Eclipse plugin will attempt to place it in a valid location, and may prompt you with one or more choices for where to place it.

When the link is inserted, Oxygen XML Editor Eclipse plugin automatically tries to populate certain attributes based on detected values. The `@format`, `@scope`, and `@type` attributes are populated if their corresponding options are selected in the [Inserting Links] section of the DITA Topics preferences page (on page 87). Even if their corresponding options are not selected, the `@format` and `@scope` attributes are populated if their detected values are different than the default values.

**Note:**

For the sake of performance, the `@type` attribute is never automatically computed in the following cases:
When using drag/drop or copy/paste actions from the DITA Maps Manager view (on page 2315) or from the Keys tab of the DITA Reusable Components view (on page 2483).

When using the Paste as Link or Paste as Link (keyref) actions to paste a topic reference that was copied from the DITA Maps Manager view (on page 2315) and its <topicref> elements do not have the @type attribute defined.

Typically, cross reference links are inserted with an @href attribute, but it is also possible to insert them with a @keyref attribute using the Paste as Link (keyref) contextual menu action or copy/paste or drag/drop actions. For the latter method, follow these steps:

1. In the DITA Maps Manager view (on page 2315), make sure that the Context combo box (on page 2319) points to the correct map that stores the keys.
2. Make sure the topic that contains the content you want to reference has a key assigned to it. To assign a key, right-click the topic with its parent map opened in the DITA Maps Manager (on page 2315), select Edit Properties, and enter a value in the Keys field.
3. Copy an entire DITA element that has an ID attribute assigned to it from a topic with an assigned key, or a <topicref> from a DITA map.
4. Place the cursor at a location, where you want to insert the link.
5. Select the Paste as Link (keyref) action from the Paste Special submenu from the contextual menu.

Linking with Relationship Tables in DITA

A relationship table is used to express relationships between topics outside of the topics themselves. The DITA publishing scripts can then create links between related topics when the content is published.

The reason for using a relationship table is to help make topics easier to reuse. If a topic links directly to another topic, this creates a dependency between the topics. If one topic is reused in a publication where the other is not used, the link is broken. By defining relationships between topics in a relationship table, you avoid creating this dependency.

To create an appropriate set of links between topics in multiple publications, you can create a separate relationship table for each publication. If you are creating multiple publications by applying profiling conditions to a single map, you can also profile your relationship table.

To create a relationship table, follow these steps:
1. If the map is currently open in the DITA Maps Manager (on page 2315), double-click the map icon (🛈) to open the map in Author mode. If it opens in Text mode, click Author at the bottom left to switch to Author mode.

2. Move the insertion point inside the map root element (usually `<map>`, but it might be `<bookmap>`, or another specialization of the `<map>` element). The easiest way to do this is to click below the title of the map in the editor and then press the up arrow once. Confirm that you are inside the map root element by checking the breadcrumbs at the top left of the editor window. You should only see the name of the map root element.

3. Select the Insert Relationship Table action on the toolbar or from the Relationship Table submenu of the contextual menu. 
   The Insert Relationship Table dialog box is displayed.

4. Set the number of rows, the number of columns, a table title (optional), and select whether or not you want a table header. Click Insert.

5. Enter the type of the topics in the header of each column.
   The header of the table (the `<relheader>` element) already contains a `<relcolspec>` element for each table column. You should set the value of the @type attribute of each `<relcolspec>` element to a value such as concept, task, or reference. When you click in the header cell of a column (that is a `<relcolspec>` element), you can see all the attributes of that `<relcolspec>` element, including the @type attribute in the Attributes view (on page 403). You can edit the attribute type in this view.

6. To insert a topic reference in a cell, place the cursor in a table cell and select Insert Reference (on page 2380) from the contextual menu or the DITA Map toolbar.

7. To add a new row to the table or remove an existing row use Insert Relationship Row/ Delete Relationship Row from the contextual menu or the DITA Map toolbar.

8. To add a new column to the table or remove an existing column, use Insert Relationship Column/ Delete Relationship Column contextual menu or the DITA Map toolbar. If you double-click the relationship table (or select it and press Enter, or choose Open from the contextual menu) the DITA map is opened in the editor with the cursor positioned inside the corresponding relationship table.

9. To add topic references to your relationship table, drag and drop topics from the DITA Maps Manager (on page 2315) or the Project Explorer (on page 268) view into the appropriate cell in the relationship table.
   See the DITA documentation for a full explanation of the relationship table format and its options. Note that you can change all the selections that you make here later by using the actions on the toolbar (or in the Relationship Table submenu of the contextual menu) or by editing the underlying XML in Text mode.

10. Save the DITA map.
    Relationship tables are also displayed in the DITA Maps Manager view (on page 2315), along with the other elements in its DITA map.
You can open the DITA map to edit the relationship table by doing one of the following:

- Double-click the appropriate relationship table in the DITA Maps Manager (on page 2315).
- Select the relationship table in the DITA Maps Manager (on page 2315) and press Enter.
- Select Open from the contextual menu of the relationship table in the DITA Maps Manager (on page 2315).

Publishing DITA Output

As a structured writing format, DITA produces structured content (content that is annotated with specific structural and semantic information rather than with formatting information). To create a publication, your DITA map (on page 2654) and its associated topics must be processed by a transformation script. That script is responsible for how the structural and semantic information in the DITA files is converted into formatting information for display.

Oxygen XML Editor Eclipse plugin publishes DITA content to various output sources using a bundled version of the DITA Open Toolkit. The DITA-OT is an open-source publishing engine that can publish DITA content to various output sources such as XHTML, PDF, or Windows Help (CHM). Since it has a plugin-based architecture, it can be extended with extra plugins that either define new formats for conversion or customize an existing conversion format. You can run the DITA-OT from Oxygen XML Editor Eclipse plugin using a transformation scenario or you can run it directly from a command line: http://www.dita-ot.org/dev/topics/building-output.html.

The DITA-OT that comes bundled with Oxygen XML Editor Eclipse plugin contains more plugins than the standard DITA-OT that can be downloaded from their official website. For example, it contains pre-installed plugins for converting DITA content to Word, EPUB, WebHelp, or to publish to PDF using CSS to customize the output.

You can download and install extra publishing plugins either from the DITA Open Toolkit registry or from the list of free plugins (on page 2590) on the Oxygen XML Editor Eclipse plugin GitHub account.
Warning:
Keep in mind that there could be instances where there are differences between what you see in Author mode and what you see in the published output. This is typically due to certain limitations in the publishing engine, especially when the source documents contain advanced constructs such as key scopes, branch filtering, chunking, or reusing content through direct references between topics marked for publishing.

DITA Map Transformation Scenarios

Built-in transformation scenarios allow you to transform DITA maps (on page 2654) to a variety of outputs, such as WebHelp, PDF, ODF, XHTML, EPUB, CHM, Kindle, and MS Word. Oxygen XML Editor Eclipse plugin also includes a special Run DITA-OT Integrator (on page 1193) that can be used to integrate a DITA-OT plugin and a DITA Map Metrics Report transformation that generates a statistics report for your DITA map. All of them are listed in the DITA Map section in the Configure Transformation Scenario(s) dialog box (on page 1284).

A variety of transformations scenarios are available for DITA maps (on page 2654):

- Built-in transformation scenarios allow you to transform a DITA map to a variety of outputs, such as WebHelp, PDF, ODF, XHTML, EPUB, CHM, Kindle, Metrics Report, and MS Word.
- Run DITA-OT Integrator (on page 1193) - Use this transformation scenario if you want to integrate a DITA-OT plugin (on page 2587). This scenario runs an Ant task that integrates all the plugins from the DITA-OT/plugins directory.

DITA Map WebHelp Responsive Transformation

DITA content can be transformed into several types of WebHelp Responsive systems (with or without a feedback section). The WebHelp Responsive layout and features (on page 1295) are designed to adapt to any device and screen size to provide an optimal viewing and interaction experience. Oxygen XML Editor Eclipse plugin also provides numerous possibilities for customizing the WebHelp Responsive output (on page 1379).

WebHelp Responsive Transformation Scenario

To publish a DITA map (on page 2654) as WebHelp Responsive output, follow these steps:

1. Select the Configure Transformation Scenario(s) action from the DITA Maps Manager (on page 2315) toolbar.
2. Select the DITA Map WebHelp Responsive scenario from the DITA Map section.
3. If you want to configure the transformation, click the **Edit** button.

**Step Result:** This opens an **Edit scenario** configuration dialog box that allows you to configure various options in the following tabs:

- **Templates Tab** *(on page 2528)* - This tab contains a set of built-in publishing templates *(on page 1340)* that you can use for the layout of your WebHelp system output. You can also create your own publishing templates or edit existing ones *(on page 1379)*.
- **Parameters Tab** *(on page 2534)* - This tab includes numerous parameters that can be set to customize your WebHelp system output. See the **Parameters section** *(on page 1171)* below for details about the most commonly used parameters for WebHelp Responsive transformations.
- **Feedback Tab** *(on page 2535)* - This tab is for those who want to add the **Oxygen Feedback** comments component at the bottom of each WebHelp page so that you can interact with your readers.
- **Filters Tab** *(on page 2536)* - This tab allows you to filter certain content elements from the generated output.
- **Advanced Tab** *(on page 2537)* - This tab allows you to specify some advanced options for the transformation scenario.
- **Output Tab** *(on page 2540)* - This tab allows you to configure options that are related to the location where the output is generated.

4. Click **Apply associated** to process the transformation.

**Result:** When the **DITA Map WebHelp Responsive** transformation is complete, the output is automatically opened in your default browser.

**General Parameters for Customizing WebHelp Responsive Output**

To customize a transformation scenario, you can edit various parameters, including the following most commonly used ones:

- **default.language**
  
  This parameter is used if the language is not detected in the **DITA map**. The default value is `en-us`.

- **clean.output**
  
  Deletes all files from the output folder before the transformation is performed (only `no` and `yes` values are valid and the default value is `no`).

- **editlink.remote.ditamap.url**
  
  Use this parameter in conjunction with **editlink.web.author.url** to add an **Edit** link next to the topic title in the WebHelp output. When a user clicks the link, the topic is opened in Oxygen XML Web Author where they can make changes that can be saved to a file server. The value should be set as the custom URL of the **main DITA map**. For example, a GitHub custom URL might look like this: `https://getFileContent/oxyengxml/userguide/master/UserGuide.ditamap`.

- **editlink.web.author.url**
This parameter needs to be used in conjunction with `editlink.remote.ditamap.url` to add an *Edit* link next to the topic title in the WebHelp output. When a user clicks the link, the topic is opened in Oxygen XML Web Author where they can make changes that can be saved to a file server. The value should be set as the URL of the Web Author installation. For example: https://www.oxygenxml.com/oxygen-xml-web-author/.

**editlink.present.only.path.to.topic**

When this parameter is set to "true", the DITA topic path is displayed to the right of each topic title in the WebHelp Responsive output. Also, when this parameter is used, the `editlink.ditamap.edit.url`, `editlink.remote.ditamap.url`, and `editlink.web.author.url` parameters are ignored.

**fix.external.refs.com.oxygenxml** (Only supported when the DITA-OT transformation process is started from Oxygen XML Editor Eclipse plugin)

The DITA Open Toolkit usually has problems processing references that point to locations outside of the directory of the processed *DITA map*. This parameter is used to specify whether or not the application should try to fix such references in a temporary files folder before the DITA Open Toolkit is invoked on the fixed references. The fix has no impact on your edited DITA content. Allowed values: `true` or `false` (default).

**force.unique**

When set to `true` (default value), the transformation will be forced to create unique output files for each instance of a resource when a map contains multiple references to a single topic.

**use.stemming**

Controls whether or not you want to include stemming search algorithms into the published output (default setting is `false`).

**webhelp.csh.disable.topicID.fallback**

Specifies whether or not topic ID *fallbacks* are enabled when computing the mapping of context sensitive help and `resourceid` information is not available. Possible values are `false` (default) and `true`.

**webhelp.custom.resources**

The file path to a directory that contains resources files. All files from this directory will be copied to the root of the WebHelp output.

**webhelp.favicon**

The file path that points to an image to be used as a *favicon* in the WebHelp output.

**webhelp.reload.stylesheet**

Set this parameter to `true` if you have out of memory problems when generating WebHelp. It will increase processing time but decrease the memory footprint. The default value is `false`.

**webhelp.search.custom.excludes.file**
The path of the file that contains name patterns for HTML files that should not be indexed by the WebHelp search engine. Each exclude pattern must be on a new line. The patterns are considered to be relative to the output directory, and they accept wildcards such as ‘*’ (matches zero or more characters) or ‘?’ (matches one character). For more information about the patterns, see https://ant.apache.org/manual/dirtasks.html#patterns.

**webhelp.search.japanese.dictionary**

The file path of the dictionary that will be used by the Kuromoji morphological engine for indexing Japanese content in the WebHelp pages. The encoding for the dictionary must be UTF8.

**webhelp.search.enable.pagination**

Specifies whether or not search results will be displayed on multiple pages. Allowed values are yes or no.

**webhelp.search.index.elements.to.exclude**

Specifies a list of HTML elements that will not be indexed by the search engine. The value of the @class attribute can be used to exclude specific HTML elements from indexing. For example, the div.not-indexed value will not index all <div> elements that have a @class attribute with the value of not-indexed. Use a comma separator to specify more than one element.

**webhelp.search.page.numberOfItems**

Specifies the number of search results items displayed on each page. This parameter is only used when the webhelp.search.enable.pagination parameter is enabled.

**webhelp.search.ranking**

If this parameter is set to false then the 5-star rating mechanism is no longer included in the search results that are displayed on the Search tab (default setting is true).

**webhelp.search.stop.words.include**

Specifies a list of words that will be ignored by the search engine. Use a comma separator to specify more than one word.

**webhelp.show.changes.and.comments**

When set to yes, user comments, replies to comments, and tracked changes are published in the WebHelp output. The default value is no.

**webhelp.sitemap.base.url**

Base URL for all the <loc> elements in the generated sitemap.xml file. If this parameter is specified, the loc element will contain the value of this parameter plus the relative path to the page. If this parameter is not specified, the loc element will only contain the relative path of the page (the relative file path from the @href attribute of a <topicref> element from the DITA map, appended to this base URL value).

**webhelp.sitemap.change.frequency**
The value of the `changefreq` element in the generated `sitemap.xml` file. The `changefreq` element is optional in `sitemap.xml`. If you leave this parameter set to its default empty value, then the `changefreq` element is not added in `sitemap.xml`. Allowed values: `<empty string>`, `always`, `hourly`, `daily`, `weekly`, `monthly`, `yearly`, `never`.

**webhelp.sitemap.priority**

The value of the `priority` element in the generated `sitemap.xml` file. It can be set to any fractional number between 0.0 (least important priority) and 1.0 (most important priority). For example, 0.3, 0.5, or 0.8. The `priority` element is optional in `sitemap.xml`. If you leave this parameter set to its default empty value, then the `priority` element is not added in `sitemap.xml`.

**Parameters Specific to Oxygen WebHelp Responsive**

**webhelp.fragment.feedback**

You can integrate Oxygen Feedback with your WebHelp Responsive output to provide a comments area at the bottom of each page where readers can offer feedback. When you create an Oxygen Feedback site configuration, an HTML fragment is generated during the final step of the creation process and that fragment should be set as the value for this parameter.

**webhelp.default.collection.type.sequence**

Specifies if the `sequence` value will be used by default when the `@collection-type` attribute is not specified. This option is helpful if you want to have Next and Previous navigational buttons generated for all HTML pages. Allowed values are `no` (default) and `yes`.

**webhelp.enable.search.autocomplete**

Specifies if the Autocomplete feature is enabled in the WebHelp search text field. The default value is `yes`.

**webhelp.enable.html.fragments.cleanup**

Enables or disables the automatic conversion of HTML fragments to well-formed XML. If set to `true` (default), the transformation automatically converts non-well-formed HTML content to a well-formed XML equivalent. If set to `false`, the transformation will fail if at least one HTML fragment is not well-formed.

**webhelp.enable.scroll.to.search.term**

Specifies whether or not the page should scroll to the first search term when opening the search results page. Possible values are `no` (default) and `true`.

**webhelp.fragment.after.body**

This parameter can be used to display a given XHTML fragment after the body in all types of pages. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.after.body.main.page**
This parameter can be used to display a given XHTML fragment after the body in the main page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.after.body.topic.page**

This parameter can be used to display a given XHTML fragment after the body in the topic page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.after.body.search.page**

This parameter can be used to display a given XHTML fragment after the body in the search results page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.after.body.terms.page**

This parameter can be used to display a given XHTML fragment after the body in the index terms page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.after.logo_and_title**

This parameter can be used to display a given XHTML fragment after the logo and title in all types of pages. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.after.search.input**

This parameter can be used to display a given XHTML fragment after the search field in all types of pages. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.after.main.page.search (deprecated)**

This parameter is deprecated. Use `webhelp.fragment.after.search.input.main.page` instead.

**webhelp.fragment.after.search.input.main.page**

This parameter can be used to display a given XHTML fragment after the search field in all the main page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.after.search.input.topic.page**

This parameter can be used to display a given XHTML fragment after the search field in all the topic page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.after.search.input.search.page**

This parameter can be used to display a given XHTML fragment after the search field in all the search results page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.
webhelp.fragment.after.search.input.terms.page

This parameter can be used to display a given XHTML fragment after the search field in all the index terms page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.after.toc_or_tiles

This parameter can be used to display a given XHTML fragment after the table of contents or tiles in the main page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.after.top_menu

This parameter can be used to display a given XHTML fragment after the top menu in all types of pages. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.before.body

This parameter can be used to display a given XHTML fragment before the page body in all types of pages. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.before.body.main.page

This parameter can be used to display a given XHTML fragment before the page body in the main page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.before.body.topic.page

This parameter can be used to display a given XHTML fragment before the page body in the topic page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.before.body.search.page

This parameter can be used to display a given XHTML fragment before the page body in the search results page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.before.body/terms.page

This parameter can be used to display a given XHTML fragment before the page body in the index terms page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.before.logo_and_title

This parameter can be used to display a given XHTML fragment before the logo and title. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.before.search.input
This parameter can be used to display a given XHTML fragment before the search field in all types of pages. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

**webhelp.fragment.before.main.page.search (deprecated)**

This parameter is deprecated. Use `webhelp.fragment.before.search.input.main.page` instead.

**webhelp.fragment.before.search.input.main.page**

This parameter can be used to display a given XHTML fragment before the search field in the main page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

**webhelp.fragment.before.search.input.topic.page**

This parameter can be used to display a given XHTML fragment before the search field in the topic page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

**webhelp.fragment.before.search.input.search.page**

This parameter can be used to display a given XHTML fragment before the search field in the search results page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

**webhelp.fragment.before.search.input.terms.page**

This parameter can be used to display a given XHTML fragment before the search field in the index terms page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

**webhelp.fragment.before.toc_or_tiles**

This parameter can be used to display a given XHTML fragment before the table of contents or tiles in the main page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

**webhelp.fragment.before.top_menu**

This parameter can be used to display a given XHTML fragment before the top menu in all types of pages. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

**webhelp.fragment.footer**

This parameter can be used to display a given XHTML fragment as the page footer in all types of pages. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

⚠️ **Important:**

This parameter should only be used if you are using a valid, purchased license of Oxygen XML Editor Eclipse plugin (do not use it with a trial license).
webhelp.fragment.head

This parameter can be used to display a given XHTML fragment in the header section in all types of pages. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.head.main.page

This parameter can be used to display a given XHTML fragment in the header section in the main page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.head.topic.page

This parameter can be used to display a given XHTML fragment in the header section in the topic page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.head.search.page

This parameter can be used to display a given XHTML fragment in the header section in the search results page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.head.terms.page

This parameter can be used to display a given XHTML fragment in the header section in the index terms page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.welcome

This parameter can be used to display a given XHTML fragment as a welcome message (or title). The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.after.header

This parameter can be used to display a given XHTML fragment after the header section in all types of pages. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.after.header.main.page

This parameter can be used to display a given XHTML fragment after the header section in the main page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.after.header.topic.page

This parameter can be used to display a given XHTML fragment after the header section in the topic page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.after.header.search.page
This parameter can be used to display a given XHTML fragment after the header section in the search results page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.after.header.terms.page**

This parameter can be used to display a given XHTML fragment after the header section in the index terms page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.before.search.input**

This parameter can be used to display a given XHTML fragment before the search field in all types of pages. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.after.search.input**

This parameter can be used to display a given XHTML fragment after the search field in all types of pages. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.before.main.content.area**

This parameter can be used to display a given XHTML fragment before the main content section in all types of pages. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.before.main.content.area.main.page**

This parameter can be used to display a given XHTML fragment before the main content section in the main page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.before.main.content.area.topic.page**

This parameter can be used to display a given XHTML fragment before the main content section in the topic page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.before.main.content.area.search.page**

This parameter can be used to display a given XHTML fragment before the main content section in the search results page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.before.main.content.area.terms.page**

This parameter can be used to display a given XHTML fragment before the main content section in the index terms page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.after.main.content.area**
This parameter can be used to display a given XHTML fragment after the main content section in all types of pages. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.after.main.content.area.main.page**

This parameter can be used to display a given XHTML fragment after the main content section in the main page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.after.main.content.area.topic.page**

This parameter can be used to display a given XHTML fragment after the main content section in the topic page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.before.topic.toolbar**

This parameter can be used to display a given XHTML fragment before the toolbar buttons above the topic content in the topic page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.after.topic.toolbar**

This parameter can be used to display a given XHTML fragment after the toolbar buttons above the topic content in the topic page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.before.topic.breadcrumb**

This parameter can be used to display a given XHTML fragment before the breadcrumb component in the topic page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.after.topic.breadcrumb**

This parameter can be used to display a given XHTML fragment after the breadcrumb component in the topic page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.before.publication.toc**

This parameter can be used to display a given XHTML fragment before the publication's table of contents component in the topic page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.after.publication.toc**

This parameter can be used to display a given XHTML fragment after the publication's table of contents component in the topic page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.before.topic.content**
This parameter can be used to display a given XHTML fragment before the topic's content in the topic page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.after.topic.content**

This parameter can be used to display a given XHTML fragment after the topic's content in the topic page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.before.feedback**

This parameter can be used to display a given XHTML fragment before the Oxygen Feedback commenting component in the topic page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.after.feedback**

This parameter can be used to display a given XHTML fragment after the Oxygen Feedback commenting component in the topic page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.before.topic.toc**

This parameter can be used to display a given XHTML fragment before the topic's table of contents component in the topic page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.after.topic.toc**

This parameter can be used to display a given XHTML fragment after the topic's table of contents component in the topic page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.custom.search.engine.results**

This parameter can be used to replace the search results area with custom XHTML content. The value of the parameter is the path to an XHTML file that contains your custom content.

**webhelp.fragment.custom.search.engine.script**

This parameter can be used to replace WebHelp's built-in search engine with your own custom search engine. The value of the parameter is the path to an XHTML file that contains the scripts required for your custom search engine to run.

**webhelp.labels.generation.mode**

Controls whether or not labels are generated in the output. These labels are useful because users can easily search for topics with the same label by simply clicking on the label presented in the output. Possible values are:
• **keywords-label** - Generates labels for each defined `<keyword>` element that has the `@outputclass` attribute value set to `label`.

• **keywords** - Generates labels for each defined `<keyword>` element. If the topic contains `<keyword>` elements with the `@outputclass` attribute value set to `label`, then only these elements will have labels generated for them in the output.

• **disable** - Disables the generation of labels in the Webhelp Responsive output.

**webhelp.merge.nested.topics.related.links**

Specifies if the related links from nested topics will be merged with the links in the parent topic. Thus the links will be moved from the topic content to the related links component and all of the links from the same group (for example, Related Tasks, Related References, Related Information) are merged into a single group. The default value is **yes**.

**webhelp.publication.toc.hide.chunked.topics**

Specifies if the table of contents will contain links for **chunked** topics. The default value is **yes**.

**webhelp.publication.toc.links**

Specifies which links will be included in the table of contents. The possible values are:

- **chapter** (default) - The TOC will include links for the current topic, its children, its siblings, and its direct ancestor (including the direct ancestor's siblings), and the parent chapter.
- **topic** - The TOC will only include links for the current topic and its direct children.
- **all** - The TOC will include all links.

**webhelp.publication.toc.tooltip.position**

By default, if a topic contains a `<shortdesc>` element, its content is displayed in a tooltip when the user hovers over its link in the table of contents. This parameter controls whether or not this tooltip is displayed and its position relative to the link. The possible values are:

- **left**
- **right** (default)
- **top**
- **bottom**
- **hidden** - The tooltip will not be displayed.

**webhelp.search.default.operator**

Makes it possible to change the default operator for the search engine. Possible values are **and** or **or** (default). If set to **and** while the search query is WORD1 WORD2, the search engine only returns results for topics that contain both WORD1 and WORD2. If set to **or** and the search query is WORD1 WORD2, the search engine returns results for topics that contain either WORD1 or WORD2.

**webhelp.search.stop.words.exclude**
Specifies a list of words that will be excluded from the default list of stop words that are filtered out before the search processing. Use comma separators to specify more than one word (for example: if, for, is).

webhelp.show.breadcrumb

Specifies if the breadcrumb component will be presented in the output. The default value is yes.

webhelp.show.child.links

Specifies if child links will be generated in the output for all topics that have subtopics. The default value is no.

webhelp.show.indexterms.link

Specifies if an icon that links to the index terms page will be displayed in the output. The default value is yes (meaning the index terms icon is displayed). If set to false, the index terms icon is not displayed in the output and the index terms page is not generated.

webhelp.show.main.page.tiles

Specifies if the tiles component will be presented in the main page of the output. For a tree style layout, this parameter should be set to no.

webhelp.show.main.page.toc

Specifies if the table of contents will be presented in the main page of the output. The default value is yes.

webhelp.show.navigation.links

Specifies if navigation links will be presented in the output. The default value is yes.

webhelp.show.print.link

Specifies if a print link or icon will be presented within each topic in the output. The default value is yes.

webhelp.show.related.links

Specifies if the related links component will be presented in the WebHelp Responsive output. The default value is yes. The webhelp.merge.nested.topics.related.links parameter can be used in conjunction with this one to merge the related links from nested topics into the links in the parent topic.

webhelp.show.publication.toc

Specifies if a table of contents will be presented on the left side of each topic in the output. The default value is yes.

webhelp.show.topic.toc

Specifies if a topic table of contents will be presented on the right side of each topic in the output. This table of contents contains links to each <section> within the current topic that contains an @id attribute and the section corresponding to the current scroll position is highlighted. The default value is yes.
webhelp.show.top.menu

Specifies if a menu will be presented at the topic of the main page in the output. The default value is yes.

webhelp.skip.main.page.generation

If set to true, the default main page is not generated in the output. The default value is false.

webhelp.top.menu.activated.on.click

When this parameter is activated (set to yes), clicking an item in the top menu will expand the submenu (if available). You can then click on a submenu item to open the item (topic). You can click outside the menu or press ESC to hide the menu. When set to no (default), hovering over a menu item displays the menu content.

webhelp.top.menu.depth

Specifies the maximum depth level of the topics that will be included in the top menu. The default value is 3. A value of 0 means that the menu has unlimited depth.

webhelp.topic.collapsible.elements.initial.state

Specifies the initial state of collapsible elements (tables with titles, nested topics with titles, sections with titles, index term groups). The possible values are collapsed or expanded (default value).

Parameters for Adding a Link to PDF Documentation in WebHelp Responsive Output

The following transformation parameters can be used to generate a PDF link component in the WebHelp Responsive output (for example, it could link to the PDF equivalent of the documentation):

webhelp.pdf.link.url

Specifies the target URL for the PDF link component.

webhelp.pdf.link.text

Specifies the text for the PDF link component.

webhelp.pdf.link.icon.path

Specifies the path or URL of the image icon to be used for the PDF link component. If not specified, a default icon is used.

webhelp.show.pdf.link

Specifies whether or not the PDF link component is shown in the WebHelp Responsive output. Allowed values are: yes (default) and no.

webhelp.pdf.link.anchor.enabled

Specifies whether or not the current topic ID should be appended as the name destination at the end of the PDF link. Allowed values are: yes (default) and no.
DITA Map PDF - based on HTML5 & CSS Transformation

Oxygen XML Editor Eclipse plugin includes a built-in **DITA Map PDF - based on HTML5 & CSS** transformation scenario based on a **DITA-OT CSS-based PDF Publishing plugin** that converts DITA maps to PDF using a CSS-based processing engine and an HTML5 intermediate format. Oxygen XML Editor Eclipse plugin comes bundled with a built-in CSS-based PDF processing engine called **Oxygen PDF Chemistry**. Oxygen XML Editor Eclipse plugin also supports some third-party processors.

For those who are familiar with CSS, this makes it very easy to style and customize the PDF output of your DITA projects without having to work with **xsl:fo** customizations. This transformation also includes some built-in publishing templates that you can use for the layout of your PDF output and you can create your own templates or edit existing ones.

The following CSS-based PDF processors can be used:

- **Oxygen PDF Chemistry** - A built-in processor that is bundled with Oxygen XML Editor Eclipse plugin. For more information, see the **Oxygen PDF Chemistry User Guide**. This is the supported processor.

- **Prince Print with CSS** (not included in the Oxygen XML Editor Eclipse plugin installation kit) - A third-party component that needs to be purchased from [http://www.princexml.com](http://www.princexml.com).

- **Antenna House Formatter** (not included in the Oxygen XML Editor Eclipse plugin installation kit) - A third-party component that needs to be purchased from [http://www.antennahouse.com/antenna1/formatter/](http://www.antennahouse.com/antenna1/formatter/).

How to Create the Transformation Scenario

To create a **DITA Map PDF - based on HTML5 & CSS** transformation scenario, follow these steps:

1. Click the **Configure Transformation Scenario(s)** button from the **DITA Maps Manager** toolbar.
2. Select the **DITA Map PDF - based on HTML5 & CSS** transformation scenario.
3. If you want to configure the transformation, click the **Edit** button.

**Step Result:** This opens an **Edit scenario** configuration dialog box that allows you to configure various options in the following tabs:
Templates Tab (on page 2528) - This tab contains a set of built-in publishing templates that you can use for the layout of your WebHelp system output. You can also create your own publishing templates by saving one from the gallery and changing it.

Parameters Tab (on page 2534) - This tab includes numerous parameters that can be set to customize the transformation.

Filters Tab (on page 2536) - This tab allows you to filter certain content elements from the generated output.

Advanced Tab (on page 2537) - This tab allows you to specify some advanced options for the transformation scenario.

Output Tab (on page 2540) - This tab allows you to configure options that are related to the location where the output is generated.

4. In the Parameters tab, configure any of the following parameters (if applicable):
   - args.css - Specifies a path to a custom CSS to be used in addition to those specified in the publishing template. The files must have URL syntax and be separated using semicolons. Also, the dita.css.list parameter must be left empty to use these files in addition to the selection in the Styles drop-down menu.
   - css.processor.type - This is where you choose the processor type. You can select between Oxygen PDF Chemistry, Prince XML, or Antenna House.
   - css.processor.path.chemistry (if you are using the Oxygen PDF Chemistry processor) - Specifies the path to the Oxygen PDF Chemistry executable file that will be run to generate the PDF. If
this parameter is not set, the transformation will use the processor specified in the CSS-based Processors preferences page (on page 187).
° css.processor.path.prince (if you are using the Prince Print with CSS processor) - Specifies the path to the Prince executable file that will be run to produce the PDF. If you installed Prince using its default settings, you can leave this blank.
° css.processor.path.antenna-house (if you are using the Antenna House Formatter processor) - Specifies the path to the Antenna House executable file that will be run to produce the PDF. If you installed Antenna House using its default settings, you can leave this blank.
° show.changes.and.comments - When set to yes, user comments, replies to comments, and tracked changes are published in the PDF output. The default value is no.
° figure.title.placement - Controls the position of the figure title relative to the image. Allowed values are "top" and "bottom", "top" is the default

5. Click OK and run the transformation scenario.

Customizing the Output

For information about customizing the output, see CSS-based DITA to PDF Customization (on page 1521).

CSS-based DITA to PDF Customization (on page 1521)

DITA Map PDF - based on XSL-FO Transformation

Oxygen XML Editor Eclipse plugin comes bundled with the DITA Open Toolkit that provides a mechanism for converting DITA maps (on page 2654) to PDF output.

Creating a DITA Map PDF - based on XSL-FO Transformation Scenario

To create a DITA Map PDF - based on XSL-FO transformation scenario, follow these steps:

1. Click the Configure Transformation Scenario(s) button from the DITA Maps Manager (on page 2315) toolbar.
2. Select DITA Map PDF - based on XSL-FO and click the Edit button (or use the Duplicate button if your framework (on page 2655) is read-only).
3. Use the various tabs to configure the transformation scenario. In the Parameters tab, you can use a variety of parameters to customize the output. For example, the following parameters are just a few of the most commonly used ones:
- `show.changes.and.comments` - If set to `yes`, user comments, replies to comments, and *tracked changes* are published in the PDF output.
- `customization.dir` - Specifies the path to a customization directory.
- `editlink.present.only.path.to.topic` - When this parameter is set to "true", the DITA topic path is displayed to the right of each topic title in the PDF output.

4. Click **OK** and then the **Apply Associated** button to run the transformation scenario.

**Related Information:**
XSL FO-based DITA to PDF Customization *(on page 1782)*

### DITA Map MS Office Word Transformation

Oxygen XML Editor Eclipse plugin comes bundled with a transformation scenario that allows you to convert DITA maps *(on page 2654)* to Microsoft Office Word documents. It utilizes the DITA to Word plugin created by Jarno Elovirta. This plugin contains a Word document named `Normal.docx` (located in: `{OXYGEN_INSTALL_DIR}/frameworks/dita/DITA-OT/plugins/com.elovirta.ooxml/resources`) that is used by the transformation scenario as a template to generate the final Word document.

**Tip:**
You can make general modifications to the `Normal.docx` template file to alter the published output. The Word application used to edit the `Normal.docx` should be configured with English locale as the style names for each Word element must be in English.

### Configuring the Transformation Scenario

To configure a DITA Map to MS Office Word transformation scenario, follow these steps:

1. Open the DITA map in the DITA Maps Manager *(on page 2315)*.
2. Click the **Configure Transformation Scenario(s)** button from the DITA Maps Manager *(on page 2315)* toolbar.
3. Select DITA Map MS Office Word.
4. For advanced customizations, in the Parameters tab you can use any of the following parameters that are unique to this transformation scenario to specify paths to files that affect the output in various ways:
   - `dotx.file` - Specifies the path to a Word template file (*.docx) that will be used in the transformation to generate the final Word document. Set this parameter if you want to use a different template file other than the `Normal.docx` file that is used by default.
   - `document.flat.xsl` - Specifies the path to a pre-process clean-up stylesheet.
   - `core.xsl` - Specifies the path to a core metadata stylesheet.
   - `custom.xsl` - Specifies the path to a custom metadata stylesheet.
   - `document.xsl` - Specifies the path to a main document stylesheet.
   - `comments.xsl` - Specifies the path to a comments stylesheet.
   - `numbering.xsl` - Specifies the path to a list and title numbering stylesheet.
Oxygen XML Editor Eclipse Plugin 26.0 | 21 - DITA Authoring | 2520

- **footnotes.xsl** - Specifies the path to a footnote stylesheet.
- **document.xml.xsl** - Specifies the path to a document relations metadata stylesheet.
- **inkscape.exec** - Specifies the path to an Inkscape (open-source vector graphics editor) executable file.

5. Click **OK** and run the transformation scenario.

**Result:** The result of the transformation will automatically be opened in your system's default word processing application (such as Microsoft Word).

---

**DITA Map CHM (Compiled HTML Help) Transformation**

To perform a **Compiled HTML Help (CHM)** transformation, Oxygen XML Editor Eclipse plugin needs **Microsoft HTML Help Workshop** to be installed on your computer. Oxygen XML Editor Eclipse plugin automatically detects if **HTML Help Workshop** is installed and uses it.

**Note:**

**HTML Help Workshop** might fail if the files used for transformation contain accents in their names, due to different encodings used when writing the **.hhp** and **.hhc** files. If the transformation fails to produce the CHM output but the **.hhp** (HTML Help Project) file is already generated, you can manually try to build the CHM output using **HTML Help Workshop**.

---

**Changing the Output Encoding**

Oxygen XML Editor Eclipse plugin uses the **htmlhelp.locale** parameter to correctly display specific characters of different languages in the output of the **Compiled HTML Help (CHM)** transformation. By default, the **DITA Map CHM** transformation scenario that comes bundled with Oxygen XML Editor Eclipse plugin has the **htmlhelp.locale** parameter set to **en-US**.

To customize this parameter, follow this procedure:

1. Use the **Configure Transformation Scenario(s) (Alt + Shift + T, C (Command + Option + T, C on macOS))** action from the toolbar or the XML menu.
2. Select the **DITA Map CHM** transformation scenario and click the **Edit** button.
3. In the **Parameter** tab, search for the **htmlhelp.locale** parameter and change its value to the desired language tag.
Note:

The format of the `htmlhelp.locale` parameter is LL-CC, where LL represents the language code (en, for example) and CC represents the country code (us, for example). The language codes are contained in the ISO 639-1 standard and the country codes are contained in the ISO 3166-1 standard. For further details about language tags, go to http://www.rfc-editor.org/rfc/rfc5646.txt.

Customizing the CHM Output

There are several possibilities available for customizing the CHM output:

• You can use a custom CSS stylesheet to customize how the HTML content is rendered in the output:
  1. Create the custom CSS.
  2. Select the DITA Map CHM transformation scenario and click the Edit button.
  3. In the Parameter tab, set the `args.css` parameter to point to the location of your custom CSS and make sure the `args.copy.css` parameter is set to yes to instruct the transformation to copy the custom CSS to the output folder.
  4. Run the transformation.

• If you are familiar with XSLT, there are two XSLT stylesheets that are used in the transformation to compile various settings and components in the CHM output. They are found in the following directory: `OXYGEN_INSTALL_DIR/frameworks/dita/DITA-OT/plugins/org.dita.htmlhelp/xsl/map2htmlhelp`. The files are as follows:
  ◦ `map2hhcImpl.xsl` - This file is used to compile the table of contents.
  ◦ `map2hhpImpl.xsl` - This file contains information for compiling the CHM and various settings that are read by the HTML Help Workshop when creating the output.

DITA Map Kindle Transformation

Oxygen XML Editor Eclipse plugin requires KindleGen to generate Kindle output from DITA maps (on page 2654). To install KindleGen for use by Oxygen XML Editor Eclipse plugin, follow these steps:

1. Go to www.amazon.com/kindleformat/kindlegen and download the zip file that matches your operating system.
2. Unzip the file on your local disk.
3. Start Oxygen XML Editor Eclipse plugin and open a DITA map in the DITA Maps Manager view (on page 2315).
4. Click the ➤ Configure Transformation Scenario(s) button.
5. Select the DITA Map Kindle transformation and click the Edit button to edit it.
6. Go to Parameters tab and set the kindlegen.executable parameter as the path to the KindleGen directory.
7. Accept the changes.
DITA Map Metrics Report Transformation

A DITA Map Metrics Report action is available on the DITA Maps Manager toolbar and in the DITA Maps main menu. It generates an overview report that contains useful statistics for a DITA map.

As an alternate approach, to create a metrics report from a DITA map (on page 2654) using a transformation scenario, follow these steps:

1. Select the Configure Transformation Scenario(s) action from the DITA Maps Manager (on page 2315) toolbar.
2. Select the DITA Map Metrics Report scenario from the DITA Map section.
3. Run the transformation.

The generated HTML report contains information such as:

- The number of processed maps and topics.
- The number of map/bookmap/topic/task/concept/reference types in the DITA map.
- Content reuse percentage.
- Number of elements and attributes of different types used in the entire DITA map structure.
- Number of words and characters used in the entire DITA map structure.
- DITA conditional processing attributes used in the DITA maps.
- Processing instructions.
- External links.
- All @outputclass attribute values gathered from the DITA project.

**Important:**
If you have cross references that point to content outside the scope of the DITA map, that referenced content is not counted. For example, if you have links to topics that are not included in the DITA map hierarchy, the content in those topics is ignored when generating the statistics.

The metrics report can also be obtained in XML format, making it possible to construct a metrics report evolution between multiple versions of the same DITA project.

DITA Map Zendesk Publishing

Oxygen XML Editor Eclipse plugin includes a built-in transformation scenario that provides the ability to publish DITA topics to XHTML output and upload them directly as articles to the Zendesk Help Center.

**Attention:**
This feature is only available in the Enterprise edition of Oxygen XML Editor Eclipse plugin.

To run the transformation, follow these steps:
1. Start Oxygen XML Editor Eclipse plugin and open a DITA map in the DITA Maps Manager view (on page 2315).
2. Click the Configure Transformation Scenario(s) button.
3. Create a new DITA-OT transformation scenario and choose the Zendesk Help Center transformation type.
4. Go to Parameters tab and set the following parameters:
   
   **Host**
   
   The URL reference to the Zendesk Help Center (for example, https://your-domain.zendesk.com).
   
   **Username**
   
   The username (e-mail address) for the account used to upload the content.
   
   **API Token**
   
   
   **Article category**
   
   The name of the category where the articles are uploaded. The category needs to be created in the Zendesk admin pages: https://support.zendesk.com/hc/en-us/articles/218222877-Organizing-knowledge-base-content-in-categories-and-sections#topic_hjs_tll4_kk.
   
   **Article section**
   
   The name of the section (inside the parent category) where articles are uploaded. The section needs to be created in the Zendesk admin pages: https://support.zendesk.com/hc/en-us/articles/218222877-Organizing-knowledge-base-content-in-categories-and-sections#topic_ysj_wtt_zz.
   
   **Create article draft**
   
   This setting controls whether the articles should be published (if the value is false) or saved as drafts (if the value is true). The default value is false.
   
   **Permission group name**
   
   The name of the Zendesk permission group that controls who edits and publishes articles: https://support.zendesk.com/hc/en-us/articles/203661966-Creating-managing-and-using-groups.
   
   5. Save the changes and run the transformation.

---

**Important:**

There may be cases when the publishing breaks, presenting an error related to HTTPS certificates, similar to this one:
This usually occurs if an HTTPS proxy server is installed in your company's network. In this case, if running on Windows, you can edit the transformation scenario you are using to publish DITA to Zendesk and in the Advanced tab, go to the JVM Arguments field and set this value:

-Djavax.net.ssl.trustStoreType=Windows-ROOT -Djavax.net.ssl.trustStore=C:\Windows\win.ini

Resources

For more information about publishing content to the Zendesk Help Center, watch the following video demonstration:

https://www.youtube.com/embed/QZ_9Fk_L0k8

Run DITA-OT Integrator Transformation

Oxygen XML Editor Eclipse plugin comes bundled with a transformation scenario designed to integrate DITA-OT plugins (on page 2657). These DITA-OT plugins are used for various customizations. It is called Run DITA-OT Integrator and is found in the DITA Map section of the Configure Transformation Scenario(s) dialog box (on page 1284).

Attention: The integration will be performed on the DITA-OT version specified in the DITA Open Toolkit section of the DITA preferences page (on page 81).

CAUTION: Oxygen XML Editor Eclipse plugin support engineers do not officially offer support and troubleshooting assistance for custom DITA-OT distributions or custom installed DITA-OT plugins. If you discover any issues or inconsistent behavior while using a custom DITA-OT or a DITA-OT that contains custom DITA-OT plugins, you should revert to the default built-in DITA-OT.

Running the Transformation Scenario

To integrate a DITA-OT plugin, follow these steps:
1. If Oxygen XML Editor Eclipse plugin was installed in the default location, you may need to restart and run it as an administrator.

2. Select the Apply Transformation Scenario(s) or Configure Transformation Scenario(s) action from the DITA Maps Manager toolbar (you could also use the same action on the main toolbar or open the Transformation Scenarios view).

3. Select the Run DITA-OT Integrator transformation scenario. If the integrator is not visible, select the Show all scenarios action that is available in the Settings drop-down menu.

4. Apply the scenario.

5. Check the Results panel at the bottom of the application to make sure the build was successful.

6. Restart Oxygen XML Editor Eclipse plugin with your normal permissions.

Related Information:
- Configure Transformation Scenario(s) Dialog Box
- Installing a DITA-OT Plugin
- Integrating a DITA Specialization

DITA Topic Transformation Scenarios

Oxygen XML Editor Eclipse plugin includes built-in transformation scenarios for transforming individual DITA Topics to HTML5, XHTML, or PDF output. They can be found in the DITA section in the Configure Transformation Scenario(s) dialog box.

The available transformations scenarios for individual DITA topics include:

- **DITA HTML5** - This DITA-OT transformation scenario generates HTML5 output from a single DITA topic.
- **DITA XHTML** - This DITA-OT transformation scenario generates XHTML output from a single DITA topic. This was the first transformation scenario created for the DITA Open Toolkit and it originally served as the basis for all HTML-based transformations.
- **DITA PDF - based on HTML5 & CSS** - This transformation scenario converts individual DITA topics to PDF using a CSS-based processing engine and an HTML5 intermediate format. Oxygen XML Editor Eclipse plugin comes bundled with a built-in CSS-based PDF processing engine called Oxygen PDF Chemistry. Oxygen XML Editor Eclipse plugin also supports some third-party processors.

For those who are familiar with CSS, this makes it very easy to style and customize the PDF output of your DITA projects without having to work with xsl:fo customizations. Another advantage of this transformation scenario is that you can use the same customization CSS or publishing template that you use for converting entire DITA maps.

The transformation scenario automatically detects the currently selected context DITA map so that keys and references are properly resolved (the detected context map is set as the value of the args.root.map parameter (this can be changed in the Parameters tab). It also automatically detects the currently applied profiling condition set to be used as the default filtering option in the transformation scenario (this can be changed in the Filters tab).
The transformation scenario also supports a parameter named `args.enable.root.map.key.processing` that can be used to specify whether or not the values for `@keyref` and `@conkeyref` attributes within the transformed topics are resolved. The possible values are:

- **no** - This means that the values for all `@keyref` and `@conkeyref` attributes are ignored in the transformation. This results in lower processing times.
- **yes** - This means that the values for any `@keyref` and `@conkeyref` attributes found in the transformed topic are processed and resolved using the value of the `args.root.map` parameter.
- **auto** - This means that the process will search for any `@keyref` and `@conkeyref` attributes within the transformed topic and if any are found, the values will be processed and resolved using the value of the `args.root.map` parameter. If none are found, the `@keyref` and `@conkeyref` attributes are ignored.

- **DITA PDF - based on XSL-FO** - This DITA-OT transformation scenario converts individual DITA topics to PDF using an `xsl:fo` processor.

### Related Information:
- Editing a Transformation Scenario (on page 1281)
- Configure Transformation Scenario(s) Dialog Box (on page 1284)
- Applying Associated Transformation Scenarios (on page 1283)
- DITA Map Transformation Scenarios (on page 2501)

### Running a DITA Transformation Scenario

To select and run a transformation scenario on your DITA map, follow these steps:

1. Click the ✉️ **Configure Transformation Scenario(s)** button on the DITA Maps Manager toolbar (on page 2317). The **Configure Transformation Scenario(s)** dialog box (on page 1284) appears. This dialog box lists all the transformation scenarios that have been configured in your project. Oxygen XML Editor Eclipse plugin provides a default set of transformation scenarios, but the people in charge of your DITA system may have provided others that are specifically configured for your needs.
2. Select the transformation scenario you want to run and click **Apply Associated**. The transformation scenario runs in the background. You can continue to work in Oxygen XML Editor Eclipse plugin while the transformation is running. If there are errors or warnings, Oxygen XML Editor Eclipse plugin displays them when the transformation is complete. If the transformation is successful, Oxygen XML Editor Eclipse plugin opens the output in the appropriate application.
3. To rerun the same scenario again, click the ⬅️ **Apply Transformation Scenario(s)** button.

### Creating or Editing a DITA-OT Transformation

#### Creating a DITA-OT Transformation Scenario

To create a DITA-OT Transformation scenario, use one of the following methods:
• Use the Configure Transformation Scenario(s) (Alt + Shift + T, C (Command + Option + T, C on macOS)) action from the DITA Maps Manager toolbar, main toolbar, or the XML menu. Then click the New button and select DITA-OT Transformation.

• Go to Window > Show View and select Transformation Scenarios to display this view. Click the New Scenario drop-down menu button and select DITA-OT Transformation.

Both methods open the DITA Transformation Type dialog box that presents the list of possible outputs.

![Figure 632. DITA Transformation Type Dialog Box](image)

Select the desired type of output and click OK. This opens the New Scenario dialog box.

The upper part of the dialog box allows you to specify the Name of the transformation scenario.

The lower part of the dialog box contains several tabs that allow you to configure the options that control the transformation.

**Editing a DITA-OT Transformation Scenario**

Editing a transformation scenario is useful if you need to configure some of its parameters.

To configure an existing transformation scenario, follow these steps:

1. Select the Configure Transformation Scenario(s) (Alt + Shift + T, C (Command + Option + T, C on macOS)) action from the DITA Maps Manager toolbar, main toolbar, or the XML menu.

   **Step Result:** The Configure Transformation Scenario(s) dialog box (on page 1284) is opened.
2. Select the particular transformation scenario and click the **Edit** button at the bottom of the dialog box or from the contextual menu.

**Note:**
Since transformation scenarios that are associated with built-in frameworks *(on page 2655)* are read-only, these scenarios will prompt you to use the **Duplicate** button and then edit the duplicated scenario *(on page 1283)*.

**Result:** This will open an **Edit scenario configuration dialog box (on page 1281)** that contains several tabs that allow you to configure the options that control the transformation.

**Related Information:**
- Creating a DITA-OT Plugin *(on page 2583)*
- Installing a DITA-OT Plugin *(on page 2587)*
- DITA Open Toolkit Documentation

**Templates Tab (DITA-OT Transformations)**

When you create a new transformation scenario *(on page 1201)* or edit an existing one *(on page 1281)*, a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The **Templates** tab is available for DITA-OT transformations with **WebHelp Responsive** or **PDF - based on HTML5 & CSS** output types and it provides a set of built-in **publishing templates (on page 1340)**. You can use one of them to publish your documentation or as a starting point for a new publishing template.

**Figure 633. Templates Tab**

![Templates Tab](image)
Filtering and Previewing Templates

You can click on the tags at the top of the pane to filter the templates and narrow your search. Each built-in template also includes an Online preview icon in the bottom-right corner that opens a webpage in your default browser providing a sample of how the main page will look when that particular template is used to generate the output.

Built-in Templates Locations

Oxygen XML Editor Eclipse plugin scans the following locations to find the built-in templates to display in the dialog box:

- **WebHelp Responsive Templates** - All built-in WebHelp Responsive publishing templates are stored in the following directory: `DITA-OT-DIR/plugins/com.oxygenxml.webhelp.responsive/templates`.
- **PDF - based on HTML5 & CSS** - All built-in PDF publishing templates are stored in the following directories:
  - `DITA-OT-DIR/plugins/com.oxygenxml.pdf.css/templates`
  - `DITA-OT-DIR/plugins/com.oxygenxml.webhelp.responsive/templates`

Custom Templates Locations

Oxygen XML Editor Eclipse plugin scans the locations specified in the DITA > Publishing preferences page (on page 86) to find custom templates to display in the dialog box. You can access that preferences page directly from the Template tab by clicking on the Configure Publishing Templates Gallery link.

Selecting Custom Templates

Once you are finished configuring your template, you can click the Choose Custom Publishing Template link to select your template.

You can also add your custom templates (on page 1383) to the list of templates displayed in the Templates tab. To do this, store them in a directory, then click the Configure Publishing Templates Gallery link to open the DITA > Publishing preferences page (on page 86) where you can add that directory to the list. All the templates contained in your template directory will be displayed in the preview pane along with all the built-in templates.

Save Template As Button

You can use the Save template as button (at the bottom-left of the transformation dialog box) to export the currently selected template into a new template package that can be used as a starting point to create your own custom template (on page 1546). Clicking this button will open a template package configuration dialog box (on page 2530) that contains some options and displays the parameters that will be exported to your template package.
Template Errors

When the Templates tab is opened, all templates (built-in and custom) are loaded and validated. Specifically, certain elements in the template descriptor file are checked for validity. If errors are encountered that prevents the template from loading, the following message will be displayed toward the bottom of the dialog box:

ยก Some templates could not be loaded. More details

If you click the More details link, a window will open with more information about the encountered error. For example, it might offer a hint that the element is missing from the expected descriptor file structure.

Also, if a template could be loaded, but certain elements could not be found in the descriptor file, a warning icon (⚠️) will be displayed on the template's image (in the Templates tab of the transformation dialog box). For example, this happens if a valid preview-image element cannot be found.

Sharing Publishing Template

To share a publishing template with others, following these steps:

1. Copy your template in a new folder.
2. Go to Options > Preferences > DITA > Publishing (on page 86) and add that new folder to the list.
3. Switch the option as the bottom of that preferences page to Project Options.
4. Share your project file (.xpr).

Resources

For more information about customizing publishing templates, watch our video demonstration:

https://www.youtube.com/embed/zNmXfKWXwO8

Related Information:

- Publishing Templates (on page 1340)
- Publishing Template Package Contents for PDF Customizations (on page 1540)
- Publishing Template Package Contents for WebHelp Responsive Customizations (on page 1343)

Template Package Configuration Dialog Box

The Save template as button (at the bottom-left of the transformation dialog box for WebHelp Responsive or PDF - based on HTML5 & CSS transformations) can be used to export the currently selected template into a new template package that can be used as a starting point to create your own custom template (on page 1546). The result will be a ZIP archive that contains a template descriptor file and other resources (such as CSS files) that were attached to the selected template.

Clicking the Save template as button opens a template package configuration dialog box contains the following options and components:

Name
Required field used to specify the name for the new template. This will become the text value of the `<name>` element in the template descriptor file. This information is displayed as the name of the template in the transformation scenario dialog box.

**Description**

Optional field used to specify a template description. This will become the text value of the `<description>` element in the template descriptor file. This information is displayed when the user hovers over the template in the transformation scenario dialog box.

**Parameter Table**

This table displays the parameters that will be exported. Only certain relevant parameters are exported. The parameters and their values will be inserted in the `<parameters>` section of the template descriptor file. If any of the parameter values point to a file path that references a template resource (such as CSS files, custom HTML fragments, images), those resources will automatically be copied to the new template package and their references will be changed accordingly.

**Note:**

Additional resources that are referenced in CSS files or other resources will not be copied to the new template package, so you will need to copy them manually and update their references in the template descriptor file.

**Include WebHelp Customization**

The same publishing template package can contain both a WebHelp Responsive and PDF customization and you can use the same template in both types of transformations ([DITA Map WebHelp Responsive](on page 1170) or [DITA Map to PDF - based on HTML5 & CSS](on page 1184)). This option specifies that the custom template will include a WebHelp Responsive customization.

**Include HTML Page Layout Files**

For WebHelp Responsive customizations, select this option if you want to copy the default HTML Page Layout Files ([on page 1359](on page 1359)) into your template package. They are helpful if you want to change the structure of the generated HTML pages.

**Include PDF Customization**

The same publishing template package can contain both a WebHelp Responsive and PDF customization and you can use the same template in both types of transformations ([DITA Map WebHelp Responsive](on page 1170) or [DITA Map to PDF - based on HTML5 & CSS](on page 1184)). This option specifies that the custom template will include a PDF customization.

**Save as**

Use this field to specify the name and path of the ZIP file where the template will be saved.
When you create a new transformation scenario (on page 1201) or edit an existing one (on page 1281), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The FO Processor tab is available for DITA-OT transformations with a PDF output type.

This tab allows you to select an FO Processor to be used for the transformation.
You can choose one of the following processors:

**Apache FOP**

The default processor that comes bundled with Oxygen XML Editor Eclipse plugin.

**XEP**

The **RenderX** XEP processor. If XEP is already installed, Oxygen XML Editor Eclipse plugin displays the detected installation path under the drop-down menu. XEP is considered installed if it was detected in one of the following sources:

- XEP was configured as an external FO Processor in the **FO Processors** option page (on page 183).
- The system property `com.oxygenxml.xep.location` was set to point to the XEP executable file for the platform (for example: `xep.bat` on Windows).
- XEP was installed in the `DITA-OT-DIR/plugins/org.dita.pdf2/lib` directory of the Oxygen XML Editor Eclipse plugin installation directory.

**Antenna House**

The **Antenna House** (AH Formatter) processor. If Antenna House is already installed, Oxygen XML Editor Eclipse plugin displays the detected installation path under the drop-down menu. Antenna House is considered installed if it was detected in one of the following sources:

- Environment variable set by Antenna House installation (the newest installation version will be used).
- Antenna House was added as an external FO Processor in the Oxygen XML Editor Eclipse plugin preferences pages.
To further customize the PDF output obtained from the Antenna House processor, follow these steps:

1. **Edit** the transformation scenario.
2. Open the **Parameters tab** *(on page 2534)*.
3. Add the env.AXF_OPT parameter and point to the Antenna House configuration file.

**Related information**

- FO Processors Preferences *(on page 183)*
- XSL-FO (Apache FOP) Processor for Generating PDF Output *(on page 1263)*

**Parameters Tab (DITA-OT Transformations)**

When you create a new transformation scenario *(on page 1201)* or edit an existing one *(on page 1281)*, a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The **Parameters** tab allows you to configure the parameters sent to the DITA-OT build file.

The table in this tab displays all the parameters that the DITA-OT documentation specifies as available for each chosen type of transformation (for example, XHTML or PDF), along with their description and current values. You can find more information about each parameter in the DITA-OT Documentation. You can also add, edit, and remove parameters, and you can use the text box to filter or search for a specific term in the entire parameters collection. Note that edited parameters are displayed with their name in bold.

Depending on the type of a parameter, its value can be one of the following:

- A simple text field for simple parameter values.
- A combo box with some predefined values.
- A file chooser and an **editor variable** *(on page 218)* selector to simplify setting a file path as the value of a parameter.

**Note:**

To input parameter values at runtime, use the **ask editor variable** *(on page 219)* in the **Value** column.

Below the table, the following actions are available for managing parameters:

**New**

Opens the **Add Parameter** dialog box that allows you to add a new parameter to the list. You can specify the **Value** of the parameter by using the **Insert Editor Variables** *(on page 218)* button or the **Browse** button.

**Unset**
Resets the selected parameter to its default value. Available only for edited parameters with set values.

**Edit**

Opens the **Edit Parameter** dialog box that allows you to change the value of the selected parameter or its description.

**Delete**

Removes the selected parameter from the list. It is available only for new parameters that have been added to the list.

**Parameters Contributed by an Oxygen Publishing Template**

Transformation parameters that are defined in an Oxygen Publishing Template (on page 1539) descriptor file are displayed in italics. After creating a publishing template (on page 1546) and adding it to the templates gallery (on page 1383), when you select the template in the **Templates tab (on page 2528)**, the **Parameters** tab will automatically be updated to include the parameters defined in the template descriptor file.

**Related Information:**

DITA Open Toolkit Documentation

**Feedback Tab (DITA-OT Transformations)**

When you create a new transformation scenario (on page 1201) or edit an existing one (on page 1281), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The **Feedback** tab is for those who want to provide a way for users to offer feedback and ask questions in the published output and it is available for the **DITA Map WebHelp Responsive** transformation type. To add a comments component in the output, you need to use Oxygen Feedback to create a site configuration for the website where your WebHelp output is published and use this Feedback tab to instruct the transformation to install the comments component at the bottom of each WebHelp page.

When you create a site configuration in the Oxygen Feedback administration interface, an HTML fragment is generated during the final step of the creation process. You need to click the **Edit** button at the bottom-right of this tab to open a dialog box where you will paste the generated HTML fragment. The HTML fragment can also be set in an Oxygen Publishing Template (on page 1539), either as an HTML fragment extension point (on page 1350) or as a transformation parameter (on page 1348) (the `webhelp.fragment.feedback` parameter).

If the fragment is specified in multiple places, the order of precedence (from highest to lowest) is:

- The fragment specified directly in the Feedback tab.
- The fragment specified in a publishing template as an HTML fragment extension point.
- The fragment specified in a publishing template as a transformation parameter.
Filters Tab (DITA Transformations)

When you create a new transformation scenario (on page 1201) or edit an existing one (on page 1281), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The Filters tab allows you to add filters to remove certain content elements from the generated output.

**Figure 636. Edit Filters Tab**

You can choose one of the following options to define filters:

**Use DITAVAL file**

If you already have a DITAVAL file associated with the DITA map (on page 2654), you can specify the file to be used when filtering content. You can specify the path by using the text field, its history drop-down, the Insert Editor Variables (on page 218) button, or the browsing actions in the Browse drop-down list. You can find out more about constructing a DITAVAL file in the DITA Documentation.

**Note:**

If a filter file is specified in the args.filter parameter (in the Parameters tab (on page 2534)), the filters are combined (neither file takes precedence over the other).

**Use profiling condition set**
Sets the profiling condition set (on page 2564) that will be applied to your transformation.

Exclude from output all elements with any of the following attributes

By using the + New, Edit, or Delete buttons at the bottom of the pane, you can configure a list of attributes (name and value) to exclude all elements that contain any of these attributes from the output.

Note:
The colors and styles of the profiled content (on page 2569) settings are used for rendering it in Author mode but are not applied in the output.

Advanced Tab (DITA-OT Transformations)

When you create a new transformation scenario (on page 1201) or edit an existing one (on page 1281), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The Advanced tab allows you to specify advanced options for the transformation scenario.
You can specify the following options:

**Prefer using the "dita" command**

When selected, Oxygen XML Editor Eclipse plugin will attempt to use the `dita.bat` executable script (`dita.sh` for macOS and Linux) that is bundled with DITA-OT to run the transformation. If not selected, the transformation will run as an ANT process. Also, when this option is selected, other options (Custom build file, Build target, Ant Home) become unavailable. This setting is checked by default in newly created DITA-OT transformation scenario.

**Note:**

Even when this option is selected, the `dita.bat` (`dita` for macOS and Linux) executable cannot be used in some cases. For example, if the DITA Map is published from a remote location or if the `fix.external.refs` parameter is enabled in the Parameters tab, the transformation is started as an ANT process instead of using the executable.

**Custom build file**
If you use a custom DITA-OT build file, you can specify the path to the customized build file. If empty, the build.xml file from the dita.dir parameter that is configured in the Parameters tab (on page 2534) is used. You can specify the path by using the text field, the Insert Editor Variables (on page 218) button, or the Browse button.

**Build target**

Optionally, you can specify a build target for the build file. If no target is specified, the default init target is used.

**Additional Ant arguments**

You can specify additional Ant-specific command-line arguments (such as -diagnostics).

**Ant Home**

You can choose between the default or custom Ant installation to run the transformation.

**Java Home**

You can choose between the default or custom Java installation to run the transformation. The default path is the Java installation that is used by Oxygen XML Editor Eclipse plugin.

**Note:**

It may be possible that the used Java version is incompatible with the DITA Open Toolkit engine. If you encounter related errors running the transformation, consider installing a Java VM that is supported by the DITA-OT publishing engine and using it in the Java Home text field.

**JVM Arguments**

This parameter allows you to set specific parameters for the Java Virtual Machine used by Ant. When performing a large transformation, you may want to increase the memory allocated to the Java Virtual Machine. This will help avoid Out of Memory error messages (OutOfMemoryError). For example, if it is set to -Xmx2g, the transformation process is allowed to use a maximum 2 gigabytes of memory. If you do not specify an -Xmx value in this field, by default, the application will use a maximum of about a quarter of the total memory available on the machine.

**Libraries**

By default, Oxygen XML Editor Eclipse plugin adds libraries (as high priority) that are not transformation-dependent and also patches for certain DITA Open Toolkit bugs. You can use this button to specify additional libraries (JAR (on page 2655) files or additional class paths) to be used by the transformer.

**Tip:**

You can specify the path to the additional libraries using wildcards (for example, ${oxygenHome}/lib/*.jar).
Output Tab (DITA-OT Transformations)

When you create a new transformation scenario (on page 1201) or edit an existing one (on page 1281), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The Output tab allows you to configure options that are related to the location where the output is generated.

![Figure 638. Output Settings Tab](image)

You can specify the following parameters:

**Base directory**

All the relative paths that appear as values in parameters are considered relative to the base directory. The default value is the directory where the transformed map is located. You can specify the path by using the text field, the Insert Editor Variables (on page 218) button, or the Browse button.

**Temporary files directory**
This directory is used to store pre-processed temporary files until the final output is obtained. You can specify the path by using the text field, the Insert Editor Variables (on page 218) button, or the Browse button.

Output directory

The folder where the content of the final output is stored. You can specify the path by using the text field, the Insert Editor Variables (on page 218) button, or the Browse button.

**Note:**

If the DITA map (on page 2654) or topic is opened from a remote location or a ZIP file, the parameters must specify absolute paths.

Open in Browser/System Application

If selected, Oxygen XML Editor Eclipse plugin automatically opens the result of the transformation in a system application associated with the file type of the result (for example, in Windows PDF files are often opened in Acrobat Reader).

**Note:**

To set the web browser that is used for displaying HTML/XHTML pages, go to Window > Preferences > General > Web Browser and specify it there.

- **Output file** - When Open in Browser/System Application is selected, you can use this button to automatically open the default output file at the end of the transformation.
- **Other location** - When Open in Browser/System Application is selected, you can use this option to open the file specified in this field at the end of the transformation. You can specify the path by using the text field, the Insert Editor Variables (on page 218) button, or the Browse button.

Open in editor

When this is option is selected, at the end of the transformation, the default output file is opened in a new editor panel with the appropriate built-in editor type (for example, if the result is an XML file it is opened in the built-in XML editor, or if it is an XSL-FO file it is opened with the built-in FO editor).

Customizing DITA Transformations

You can customize the appearance of any of the output types by customizing the output transformations. There are several ways to do this:
Most transformations are configurable by passing parameters to the transformation script. Oxygen XML Editor Eclipse plugin allows you to set parameters (on page 2534) on a transformation scenario and you can save and share them with others (on page 1290). You can also use the `$\text{ask}$ editor variable (on page 219) in the Parameters tab to instruct Oxygen XML Editor Eclipse plugin to prompt you for a particular parameter whenever a transformation scenario is run. You can set up multiple transformation scenarios for a given output type, allowing you to maintain several customized transformation scenarios for multiple types of output configurations.

If you want to customize an output in a way not supported by the built-in customization options, you can create a modified version of the transformation code and execute it using a custom build file (on page 2543). Sometimes the transformation code exports specific forms of extensions or customizations. You should consult the DITA Open Toolkit for the transformation type that you are interested in to see what customization options are supported. Oxygen XML Editor Eclipse plugin provides full editing and debugging support from XSLT and CSS stylesheets (on page 1891), which you can use to modify transformation code.

You can also write your own transformation code (and execute it using a custom build file (on page 2543)) to produce a type of output not supported by the DITA Open Toolkit. Oxygen XML Editor Eclipse plugin provides a full source editing environment for developing such transformations. You can create Oxygen XML Editor Eclipse plugin transformation scenarios to run these scripts once they are complete.

There are also many other ways to customize specific types of output generated from DITA transformations:

- **WebHelp** - For information about customizing WebHelp output, see the WebHelp Output section (on page 1294).
- **PDF** - For information about customizing PDF output generated from DITA content, see XSL FO-based DITA to PDF Customization (on page 1782).

**Publishing Customizations**

Some customizations (usually for HTML-based output), can be made simply by creating a custom CSS and they do not involve modifying the DITA-OT engine in any way. Instead, most customizations involve adding a new plugin to the DITA-OT. Here are some best practices to follow before beginning your customization:

1. Copy the bundled DITA-OT folder (usually `OXYGEN_INSTALL_DIR\frameworks\dita\DITA-OT`) to a location where you have full write access so that you have the ability to install new DITA-OT plugins (on page 2587).
2. Go to Options > Preferences > DITA, select Custom for the DITA Open Toolkit option and set the Location to be the path to the location where you copied the bundled DITA-OT folder. This will allow you to upgrade the version of Oxygen XML Editor Eclipse plugin at anytime without affecting the publishing system.
3. Share that external DITA-OT folder with the rest of the team. If you are using a repository (such as Subversion or Git), you can commit the entire modified DITA-OT publishing engine as part of your
project. This will allow everyone in your team to use the official changes that you made. This will also allow you to set up some kind of automatic publishing system using an open-source integration server (such as Travis CI or Jenkins).

**Customizing XHTML-based Output**

XHTML-based output can be modified by using a custom CSS stylesheet to override various styles. If you edit an XHTML transformation scenario (on page 2526), there is a parameter called `args.css` that can be set to point to your custom CSS and a parameter called `args.copy.css` that as long as it is set to `yes`, the CSS is copied to the output folder.

You can also create plugins to customize the XHTML-based output by adding an extra XSLT stylesheet. For information, see: [https://blog.oxygenxml.com/topics/creating-simple-dita-open-toolkit.html](https://blog.oxygenxml.com/topics/creating-simple-dita-open-toolkit.html). A list with all DITA-OT XSLT extension points can be found here: [http://www.dita-ot.org/dev/extension-points/plugin-extension-points-xslt-import.html](http://www.dita-ot.org/dev/extension-points/plugin-extension-points-xslt-import.html).

**Customizing WebHelp-based Output**

The DITA-OT that comes bundled in Oxygen XML Editor Eclipse plugin includes specific plugins that provide the ability to publish DITA content to WebHelp Responsive (on page 1295) output.

For information about customizing WebHelp Responsive output, see Customizing WebHelp Responsive Output (on page 1379).

**Customizing PDF-based Output**

DITA to PDF output can be customized either by creating a PDF customization folder (in this case, the DITA-OT folder will not be modified at all) or by creating a PDF customization plugin. For information about customizing DITA to PDF output, see XSL FO-based DITA to PDF Customization (on page 1782).

There is also a book called DITA For Print that contains details about how to customize various aspects.

**Customizing PDF Output with CSS**

Oxygen XML Editor Eclipse plugin also includes a transformation scenario called DITA Map PDF - based on HTML5 & CSS (on page 2516) that is based on a DITA-OT CSS-based PDF Publishing plugin that allows you to convert DITA maps (on page 2654) to PDF using a CSS layout processor. For those who are familiar with CSS, this makes it very easy to style and customize the PDF output of your DITA projects without having to work with xsl:fo customizations. For more information about customizing PDF output using this transformation scenario, see Customization CSS (on page 1550).

**Related Information:**

DITA Open Toolkit Documentation

**Using a Custom Build File**

You can use a Custom Build File to customize transformation scenarios.
To use a custom build file in a DITA-OT transformation, follow these steps:

1. Use the Configure Transformation Scenario(s) action to open the Configure Transformation Scenario(s) dialog box (on page 1284).
2. Select the transformation scenario and click Edit.
3. Go to the Advanced (on page 2537) tab and change the Custom build file path to point to the custom build file.

As an example, if you want to call a custom script before running the DITA-OT, your custom build file would have the following content:

```xml
<project basedir="." default="dist">
  <!--The DITA-OT default build file-->
  <import file="build.xml"/>
  <target name="dist">
    <!-- You could run your script here -->
    <!--<exec></exec>-->  
    <!--Call the DITA-OT default target-->
    <antcall target="init"/>
  </target>
</project>
```

**Note:**

If you use the built-in Ant 1.9.8 build tool that comes bundled with Oxygen XML Editor Eclipse plugin, it is located in the `[OXYGEN_INSTALL_DIR]/tools/ant` directory. Any additional libraries for Ant must be copied to the Oxygen XML Editor Eclipse plugin Ant lib directory.

### Adding a Watermark in DITA Map to XHTML Output

To add a watermark to the XHTML output of a DITA map (on page 2654) transformation, follow these steps:

1. Create a custom CSS stylesheet that includes the watermark image, as in the following example:

   ```html
   body {
       background-image: url(MyWatermarkImage.png);
   }
   ```

2. Edit a DITA Map XHTML transformation scenario and in the Parameters tab set the value of the `args.css` parameter as the path to your watermark image.
3. Set the value of the `args.copycss` parameter to yes.
4. Apply the transformation scenario.
5. Copy the watermark image in the output directory of the transformation scenario, next to the CSS file created in step 1.
How to Add Syntax Highlights for Codeblocks in the Output

Syntax Highlighting makes it easier to read the semantics of the structured content by displaying each type of code (language) in different colors and fonts. The application provides the ability to add syntax highlights in codeblocks for DITA to PDF or HTML-based output through the use of the @outputclass attribute and a variety of predefined values are available.

To provide syntax highlighting in the codeblocks that appear in the output, add the @outputclass attribute on the <codeblock> element and set its value to one of the predefined language values. The Content Completion Assistant offers a list of the possible values when adding the @outputclass attribute in Text mode but there are also two simple ways to set the value in Author mode:

- Select the <codeblock> element in the editor and in the Attributes view, click on the Value cell for the @outputclass attribute and select one of the predefined values (for example, language-xml).
- Select the <codeblock> element in the editor and use the Alt + Enter keyboard shortcut to open the in-place attributes editor window. Then select one of the predefined values from the Value drop-down menu.

The predefined values that can be selected are:

- language-json
- language-yaml
- language-xml
- language-bourne
- language-c
- language-cmd
- language-cpp
- language-csharp
- language-css
- language-dtd
- language-ini
- language-java
- language-javascript
- language-lua
- language-perl
- language-powershell
- language-php
- language-python
- language-ruby
• language-sql
• language-xquery

⚠️ **Attention:**
It is recommended that you do not add inline elements in the codeblocks when using this `@outputclass` attribute, as it may lead to improper highlighting.

💡 **Tip:**
Starting with version 24.0, the language values can also be set without using the `language-` prefix.

**Example:**

The following codeblock with the `@outputclass` set as `language-css`:

```xml
codeblock outputclass="language-css" id="codeblock_1">@page preface-page {
  background-color:silver;
  @top-center{
    content: "Custom Preface Header";
  }
}
*{[class =~ "topic/topic"][@topicrefclass =~ "bookmap/preface"] {
  page: preface-page;
}</codeblock>
```

would like this in WebHelp output:

```xml
@page preface-page {
  background-color:silver;
  @top-center{
    content: "Custom Preface Header";
  }
}
*{[class =~ "topic/topic"][@topicrefclass =~ "bookmap/preface"] {
  page: preface-page;
}
```

**Publishing with a DITA-OT Project File**

The *DITA Open Toolkit* project file allows you to define all your DITA map input and filter pairs and to produce the desired output formats by applying the publishing engine over this single project file: [https://www.dita-ot.org/dev/topics/using-project-files.html](https://www.dita-ot.org/dev/topics/using-project-files.html).
Once a DITA-OT project file is opened in the application, two predefined publishing scenarios become available in the **Configure Transformation Scenario(s)** dialog box *(on page 1284)*:

- **Publish DITA-OT Project (all deliverables)** - Runs the publishing engine and produces output for all deliverables defined in the project file.
- **Publish DITA-OT Project (select deliverable)** - Runs the publishing engine and produces output for only one deliverable specified by the end-user.

Some of the allowed transformation parameters that are relevant to the DITA-OT project file include:

- **project.file** - Specifies the path to the project file.
- **dita-ot.dir** - Specifies the directory where DITA-OT, used in transformation is installed.
- **additional.args** - Specifies the additional arguments used in transformation.
- **deliverable.id** - Specifies the id of the deliverable. This parameter is only available in the **Publish DITA-OT Project (select deliverable)** transformation.
- **jvm.args** - Specifies the JVM arguments used by the transformation for each deliverable. This can be used to increase the memory allocation used by the transformation.

**Example:** To set the JVM memory allocation to 5 GB for publishing deliverables, append the following value to the existing ones:

```
-Xmx5G
```

If the "pdf-css-html5" (based on Chemistry PDF CSS processor) deliverable publication fails with an Out Of Memory Error, try appending the `baseJVMArgLine` parameter to the "jvm.args" parameter value. For example:

```
-DbaseJVMArgLine=-Xmx5G
```

**Tip:**
When a DITA-OT project file is open in **Author** mode, there is a play button (▶) next to the project file name. You can use this button to publish all deliverables specified in the file. While the transformation is running, the button turns into a stop button in case you need to terminate the process.

**Related Information:**
DITA Open Toolkit Project *(on page 2593)*

**Dynamic Word, Excel, OpenAPI, HTML, Markdown to DITA Conversion**

The publishing engine has support to dynamically convert various types of non-DITA resources to DITA while publishing. This support also enables the dynamically converted document titles for the non-DITA resources that are referenced in a DITA map to be displayed as the title of the resource in the **DITA Maps Manager**.
Attention:

These features are available with no restrictions when the publishing process is done using the default publishing engine that is bundled in Oxygen XML Editor/Author or if you have integrated the DITA-OT dynamic converter plugin into a custom DITA-OT distribution. However, if the publishing process is done from a command line, this feature requires an Oxygen Publishing Engine license.

To enable this support for a particular resource that is referenced in a DITA map, you must specify one of the following values for the @format attribute on the <topicref> element:

**Word to DITA** (*word-to-dita*)

*Microsoft Word* documents that are referenced in the DITA map using the *word-to-dita* value for the @format attribute get dynamically converted to DITA topics during publishing. Image references and internal links are preserved.

**Example:**

```xml
<topicref href="sample.docx" format="word-to-dita"/>
```

**Excel to DITA** (*excel-to-dita*)

*Microsoft Excel* documents that are referenced in the DITA map using the *excel-to-dita* value for the @format attribute get dynamically converted to DITA topics that contain one or more tables during publishing.

**Example:**

```xml
<topicref href="sample.xlsx" format="excel-to-dita"/>
```

**OpenAPI to DITA** (*openapi-to-dita*)

OpenAPI documents (versions 2.0, 3.0, or 3.1) in JSON or YAML format that are referenced in the DITA map using the *openapi-to-dita* value for the @format attribute get dynamically converted to DITA topics during publishing.

**Example:**

```xml
<topicref href="openapi.json" format="openapi-to-dita"/>
<topicref href="openapi.yaml" format="openapi-to-dita"/>
```

**HTML to DITA** (*html-to-dita*)

HTML documents that are referenced in the DITA map using the *html-to-dita* value for the @format attribute get dynamically converted to DITA topics during publishing.

**Example:**

```xml
<topicref href="sample.html" format="html-to-dita"/>
```

**Markdown to DITA** (*markdown*)

Markdown documents that are referenced in the DITA map using the `markdown` value for the `@format` attribute get dynamically converted to DITA topics during publishing using the support for Markdown bundled with the publishing engine by default.

Example:

```xml
<topicref href="sample.md" format="markdown"/>
```

**Markdown to DITA (markdown-to-dita)**

Markdown documents that are referenced in the DITA map using the `markdown-to-dita` value for the `@format` attribute get dynamically converted to DITA topics during publishing using the special conversion plugin provided by Oxygen XML Editor Eclipse plugin. The `markdown-to-dita` format conversion is more flexible than the built-in `markdown` conversion, allowing the conversion of Markdown documents that do not have consistent heading levels.

Example:

```xml
<topicref href="sample.md" format="markdown-to-dita"/>
```

**Troubleshooting DITA Transformation Problems**

This section contains some topics to help you troubleshoot DITA transformation issues.

**DITA Map Transformation Fails (Cannot Connect to External Location)**

**Problem**

*DITA map (on page 2654)* transformation fails because it cannot connect to an external location.

**Solution**

The transformation is run as an external Ant process so you can continue using the application as the transformation unfolds. All output from the process appears in the DITA Transformation tab.

The HTTP proxy settings are used for the Ant transformation, so if the transformation fails because it cannot connect to an external location, you can check the Network Connections.
DITA Map WebHelp Transformation Fails (Duplicate Topic References Found)

Problem

DITA Map WebHelp transformation fails with a message that indicates duplicate topic references were found.

Cause

By default the WebHelp transformation uses the force-unique parameter set to true to force the transformation to create unique output files for each instance of a resource when a map contains multiple references to a single topic. However, there are cases when this feature does not work as expected and the duplicate topic references are not handled properly.

Solution

To solve this issue, you should manually set a unique @copy-to attribute on any duplicate topic reference that was not handled automatically by DITA-OT:

```xml
<map>
  ...
  <topicref href="../topics/MyTopic.dita"/>
  ...
  <topicref href="../topics/MyTopic.dita" copy-to="../topics/MyTopic-2.dita"/>
</map>
```

DITA-OT Transformation Takes a Long Time to Process

Problem

A DITA transformation takes an extremely long time to process (over an hour, for example).

Cause

Large delays in DITA-OT processing are usually caused by intensive disk operations, CPU usage, or connections to remote websites. The DITA-OT processing is very disk-intensive, each stage takes the entire content from the transformation temporary files folder, reads it, modifies it, and then writes it back.

Solution

There are several things you can try to troubleshoot this problem:

- If you are using a shared or remote drive, it is recommended to specify a local drive for the output and temporary files directory (edit the transformation scenario and in the Output tab, select a local directory for Temporary files directory and Output directory).
- If you want to test if the publishing has a problem downloading remote resources, you could disable the network adapter on the computer and then try to publish. The purpose is to see if the publishing finishes without any reported error about obtaining a certain HTTP resource.
Using DTDs instead of XML Schemas is faster. This is because of a default transformation parameter called \texttt{args.grammar.cache} that only works for DTD-based DITA topics.

You can increase the memory available to Oxygen XML Editor Eclipse plugin (on page 2284). Sometimes, just increasing the amount of memory available to the DITA-OT process may be enough to lower the time necessary for the publishing to run.

You can enable some logging to help you determine which stage in the process is taking a long time. Edit the transformation scenario and in the Advanced tab, enter \texttt{logger org.apache.tools.ant.listener.ProfileLogger} in the Additional arguments field. Then go to Options > Preferences > DITA > Logging and select Always for the Show console output option.

You could try disabling antivirus applications since the publishing process is very disk intensive and certain antivirus application might slow down the process.

If the published DITA map is part of a larger DITA project with lots of maps and topics, references from topics in the current map to topics in other sub-projects might result in problems resolving those references. You could look in the output folder to see if the number of HTML documents match the number of DITA topics in your map.

**DITA PDF Transformation Fails**

**Problem**

The DITA to PDF transformation fails.

**Cause**

To generate the PDF output, Oxygen XML Editor Eclipse plugin uses the DITA Open Toolkit. This process sometimes results in errors. For information about some of the most common errors, see DITA PDF Processing Common Errors (on page 2552).

**Solution**

If your transformation fails, you can detect some of the problems that caused the errors by running the Validate and Check for Completeness action (on page 2360). Depending on the options you select when you run it, this action reports errors such as topics referenced in other topics but not in the DITA map (on page 2654), broken links, and missing external resources.

You can analyze the Results tab of the DITA transformation and search for messages that contain text similar to \texttt{[fop] [ERROR]}. If you encounter this type of error message, edit the transformation scenario you are using and set the \texttt{clean.temp} parameter to no and the \texttt{retain.topic.fo} parameter to yes. Run the transformation, go to the temporary directory of the transformation, open the \texttt{topic.fo} file and go to the line indicated by the error. Depending on the XSL FO context try to find the DITA topic that contains the text that generates the error.

If none of the above methods helps you, go to Help > About > Components > Frameworks and check what version of the DITA Open Toolkit you are using. Copy the whole output from the DITA-OT console output and either report the problem on the DITA User List or send it to support@oxygenxml.com.
DITA PDF Processing Common Errors

There are cases when the PDF processing fails when trying to publish DITA content to a PDF file. This topic lists some of the common problems and possible solutions.

Problem: Cannot Save PDF

The FO processor cannot save the PDF at the specified target. The console output contains messages like this:

```
[fop] [ERROR] Anttask - Error rendering fo file:
C:\samples\dita\temp\pdf\oxygen_dita_temp\topic.fo
<Failed to open C:\samples\dita\out\pdf\test.pdf>
Failed to open samples\dita\out\pdf\test.pdf
............
[fop] Caused by: java.io.FileNotFoundException:
C:\Users\default\Desktop\bev\out\pdf\test.pdf
(The process cannot access the file because it is being used by another process)
```

Solution: Cannot Save PDF

Such an error message usually means that the PDF file is already opened in a PDF reader application. The solution is to close the open PDF before running the transformation.

Problem: Table Contains More Cells Than Defined in Colspec

One of the DITA tables contains more cells in a table row than the defined number of `<colspec>` elements. The console output contains messages like this:

```
[fop] [ERROR] Anttask - Error rendering fo file:
D:\projects\eXml\samples\dita\flowers\temp\pdf\oxygen_dita_temp\topic.fo
<net.sf.saxon.trans.XPathException: org.apache.fop.fo.ValidationException: 
The column-number or number of cells in the row overflows the number of 
fo:table-columns specified for the table. 
(See position 179:-1)>net.sf.saxon.trans.XPathException: 
org.apache.fop.fo.ValidationException: The column-number or number of cells 
in the row overflows the number of fo:table-columns specified for the table. 
(See position 179:-1)
[fop] at org.apache.fop.tools.anttasks.FOPTaskStarter.renderInputHandler 
(Fop.java:657)
[fop] at net.sf.saxon.event.ContentHandlerProxy.startContent 
(ContentHandlerProxy.java:375)
............
```
Solution: Table Contains More Cells Than Defined in Colspec

To resolve this issue, correct the @colspec attribute on the table that caused the issue. To locate the table that caused the issue:

1. Edit the transformation scenario and set the parameter `clean.temp` to `no`.
2. Run the transformation, open the `topic.fo` file in Oxygen XML Editor Eclipse plugin, and look in it at the line specified in the error message (See position 179:-1).
3. Look around that line in the XSL-FO file to find relevant text content that you can use (for example, with the Find/Replace in Files action in the DITA Maps Manager view (on page 2315)) to find the original DITA topic where the table was generated.

Problem: Broken Link

There is a broken link in the generated XSL-FO file. The PDF is generated but contains a link that is not working. The console output contains messages like this:

Solution: Broken Link

To resolve this issue:

1. Use the Validate and Check for Completeness action available in the DITA Maps Manager view (on page 2315) to find such problems.
2. If you publish to PDF using a DITAVAL filter, select the same DITAVAL file in the DITA Map Completeness Check dialog box.
3. If the Validate and Check for Completeness action does not discover any issues, edit the transformation scenario and set the `clean.temp` parameter to `no`.
4. Run the transformation, open the `topic.fo` file in Oxygen XML Editor Eclipse plugin, and search for the unresolved ID references (for example: `unique_4_Connect_42_wrongID`).
5. Look in the XSL-FO file to find relevant text content that you can use (for example, with the Find/Replace in Files action in the DITA Maps Manager view (on page 2315)) to find the original DITA topic where the table was generated.

Related Information:

How to Enable Debugging for FO Processor Transformations (on page 1266)
DITA to CHM Transformation Fails - Cannot Open File

Problem

The DITA to CHM transformation fails with the following error: 

```
[exec] HHC5010: Error: Cannot open
"fileName.chm". Compilation stopped.
```

Cause

This error occurs when the CHM output file is opened and the transformation scenario cannot rewrite its content.

Solution

To solve this issue, close the CHM help file and run the transformation scenario again.

Tip:

It is a good practice to validate the DITA map (on page 2654) before executing the transformation scenario. To do so, run the Validate and Check for Completeness action (on page 2360). Depending on the selected options, it will report detected errors, such as topics referenced in other topics (but not in the DITA map), broken links, and missing external resources.

Related Information:

DITA Map CHM (Compiled HTML Help) Transformation (on page 2520)

DITA to CHM Transformation Fails - Compilation Failed

Problem

The DITA to CHM transformation fails with the following error: 

```
[exec] HHC5003: Error: Compilation failed
while compiling fileName.
```

Cause 1

One possible cause for this error is that the processed file does not exist.

Solution 1

To solve this issue, fix the file reference before executing the transformation scenario again.

Cause 2

Another possible cause for this error is that the processed file has a name that contains space characters.

Solution 2

To solve the issue, remove any spacing from the file name and run the transformation scenario again.
Tip:
It is a good practice to validate the DITA map (on page 2654) before executing the transformation scenario. To do so, run the Validate and Check for Completeness action (on page 2360). Depending on the selected options, it will report detected errors, such as topics referenced in other topics (but not in the DITA map), broken links, and missing external resources.

Related Information:
DITA Map CHM (Compiled HTML Help) Transformation (on page 2520)

Solving DITA Transformation Errors

If a DITA transformation results in errors or warnings, the information is displayed in the message panel at the bottom of the editor. The information includes the severity, description of the problem, the name of the resource, and the path of the resource.

To help prevent and solve DITA transformation problems, follow these steps:

1. Validate the DITA map (on page 2360) by using the Validate and Check for Completeness action that is available on the DITA Maps Manager (on page 2315) toolbar and in the DITA Maps menu.
2. If this action results in validation errors, solve them prior to executing the transformation. Also, you should pay attention to the warning messages because they may identify problems in the transformation.
3. Run the DITA transformation scenario (on page 1228).
4. If the transformation results in errors or warnings, they are displayed in the Results panel (on page 334) at the bottom of the editor. The following information is presented to help you troubleshoot the problems:
   ◦ Severity - The first column displays the following icons that indicate the severity of the problem:
     • Informational - The transformation encountered a condition of which you should be aware.
     • Warning - The transformation encountered a problem that should be corrected.
     • Error - The transformation encountered a more severe problem, and the output is affected or cannot be generated.
   ◦ Info - Click the See More icon to open a web page that contains more details about DITA-OT error messages.
   ◦ Description - A description of the problem.
   ◦ Resource - The name of the transformation resource.
   ◦ System ID - The path of the transformation resource.
5. Use this information or other resources from the online DITA-OT community to solve the transformation problems before re-executing the transformation scenario.
6. If you need to contact the Oxygen technical support team, they will need you to send the entire transformation scenario execution log. To obtain it:
a. Go to the Options > Preferences > DITA preferences page and set the Show console output option to Always.
b. Execute the transformation scenario again. The console output messages are displayed in the DITA-OT view.
c. Copy the entire log, save it in a text file, then send it to the Oxygen technical support team.
d. After your issue has been solved, go back to the Options > Preferences > DITA preferences page and set the Show console output option to When build fails.

Related Information:
Troubleshooting DITA Transformation Problems (on page 2549)

DITA Profiling / Conditional Text

DITA offers support for conditionally profiling content by using profiling attributes. With Oxygen XML Editor Eclipse plugin, you can define values for the DITA profiling attributes and they can be easily managed to filter content in the published output. You can switch between profile sets to see how the edited content looks like before publishing.

Oxygen XML Editor Eclipse plugin includes a Attributes and Condition Sets preferences page (on page 146) where you can create and manage profiling attributes and condition sets. Oxygen XML Editor Eclipse plugin also offers convenient support for customizing and controlling profiling attribute values with a subject scheme (on page 2573) or DITAVAL file (on page 2578).

Profiling Attributes

You can profile content elements or map elements by adding one or more of the default DITA profiling attributes (@product, @platform, @audience, @rev, @props, and @otherprops). You can also create your own custom profiling attributes and profiling condition sets. The profiling attributes may contain one or more tokens that represent conditions to be applied to the content when a publication is built.

For example, you could define a section of a topic that would only be included for a publication related to the Windows platform by adding the @platform profiling attribute:

```xml
<section platform="windows"/>
```

For information about creating and editing profiling attributes, see Creating and Editing Profiling Attributes in DITA (on page 2557).

Profiling Conditions

DITA allows you to conditionally profile parts of a topic so that certain parts of the topic are displayed when certain profiling conditions are set. Profiling conditions can be set both within topics and in maps. When set in a topic, they allow you to suppress an element (such as paragraph), step in a procedure, item in a list, or even a phrase within a sentence. When set in a map, they allow you to suppress an entire topic or group of topics. You can then create a variety of publications from a single map by applying profiling conditions to the build.
For information about creating and editing condition sets, see Creating and Editing Profiling Condition Sets in DITA (on page 2562).

Resources

For more information about DITA profiling, see the following resources:

- Webinar: Working with DITA in Oxygen - Basic Profiling and Reuse Strategies
- Webinar: Working with DITA in Oxygen - Advanced Profiling and Reuse Strategies

Creating and Editing Profiling Attributes in DITA

You can filter DITA content or the structure of a document by using profiling attributes or profiling conditions sets (on page 2562).

Defining Profiling Attributes for DITA Content

To create or edit profiling attributes for filtering DITA content, follow these steps:

1. If you are creating a new attribute, make sure the attribute is already defined in the document DTD or schema before continuing with the procedure.

   Tip:
   For less technical users who do not want to create attribute specializations in DTD/XML Schema, you may want to use profiling attribute groups (on page 2571) instead (use an existing profiling attribute with sub-attributes).

2. Open the Preferences dialog box (on page 70) and go to Editor > Edit modes > Author > Profiling / Conditional Text > Attributes and Condition Sets.

   Information:
   The Profiling Attributes section (on page 147) is used to define the attributes and their values. For DITA documents, the default attributes are included (@audience, @platform, @product, @props, @otherprops, and @rev), but if a Subject Scheme Map (on page 2573) is used for profiling your content, you will see the attributes defined in your subject scheme map instead.

3. To add new attributes and values, click the New button at the bottom of the Profiling Attributes table. To customize existing attributes and their values, select an attribute and click the Edit button.

   Step Result: In either case, this opens a Profiling Attribute configuration dialog box where you can define attributes that exist in your schema.
Figure 639. Profiling Attribute Dialog Box

The following options are available in this dialog box:

**Document type**

Select the document type *(framework (on page 2655)).*

Tip:

You can use the * or ? wildcards in this combo box. For example, DITA* would match any document type that starts with "DITA". You can also specify multiple document types by using commas to separate them.

**Attribute name**

The name of the profiling attribute.

**Display name**

This optional field is used for descriptive rendering in profiling dialog boxes.

**Attribute Values Table**

This table displays information about the values for the profiling attribute. You can configure them by using the buttons at the bottom of the table (New, Edit, Delete).
The columns are as follows:

- **Value** - The attribute value. You can also define profiling attribute groups using the following format: `ParentAttrValue(SubAttrValue1 SubAttrValue2)`. For more information, see Conditional Profiling Attribute Groups (on page 2571).

- **Label** - You can specify a label for the attribute value that will be rendered as its name in various components in Author mode (Edit Profiling Attributes dialog box (on page 2560), Condition Set dialog box (on page 2562), Profiling tab in the Edit Properties dialog box (on page 2356), DITA Maps Manager (on page 2315)). If the Label is not specified, the Value will be used as its rendered name.

- **Description** - A description for the attribute value that will be displayed in this table.

**Single value**

Select this option if you want the attribute to only accept a single value.

**Multiple values separated by**

Select this option if you want the attribute to accept multiple values, and you can choose the type of delimiter to use. You can choose between space, comma, and semicolon, or you can enter a custom delimiter in the text field. A custom delimiter must be supported by the specified document type. For example, the DITA document type only accepts spaces as delimiters for attribute values.

4. After defining or configuring the attributes and their values according to your needs, click OK to confirm your selections and close the Profiling Attributes configuration dialog box.

5. Click Apply to save the changes.

**Result:** You should see your changes in the Profiling Attribute table.

You can also use the Profiling Condition Sets section to apply more complex filters on your DITA content.

**Adding Profiling Attribute Values Directly in a Document**

You can add values directly to the existing profiling attributes in a document using the In-Place Attributes Editor (on page 384) in Author mode, the Attributes view (on page 403), or in the source code in Text mode. However, this just adds them to the document and does not change the conditional text configuration. If you invoke the Edit Profiling Attributes action (from the contextual menu in Author mode) on the new value, the Profiling Values Conflict dialog box will appear and it includes an Add these values to the configuration action that will automatically add the new value to the particular profiling attribute. It also includes an Edit the configuration action that opens the Attributes and Condition Sets preferences page (on page 146) where you can edit the profiling configuration.

**Note:**

If the Allow contributing extra profiling attribute values option (on page 147) is not selected in the Attributes and Condition Sets preferences page, the Profiling Values Conflict dialog box will never appear, so this automatically adding value not be possible.
Applying Profiling Attributes in DITA

Profiling attributes are applied on element nodes. You can apply profiling attributes on a text fragment (it will automatically be wrapped into a phrase-type element), on a single element, or on multiple elements at the same time. If there is no selection in your document, the profiling attributes are applied on the element at the cursor position.

You can apply defined DITA profiling attributes (on page 2557) as follows:

**DITA Topics**

To profile DITA topics, right-click a topic reference in the DITA Maps Manager (on page 2315), select Edit Properties from the contextual menu, go to the Profiling tab, and select the appropriate values.

**DITA Content**

To profile DITA content in Author mode, highlight the content and select Edit Profiling Attributes from the contextual menu and select the appropriate values in the Edit Profiling Attributes dialog box.
DITA Elements

To profile specific XML elements in **Author** mode, position the cursor inside the element, right-click, select **Edit Profiling Attributes** (you can also right-click the element in the breadcrumb (on page 377) or Outline (on page 325) view), and select the appropriate values in the **Edit Profiling Attributes** dialog box. You can also use the **Attributes view** (on page 403) to set the profiling attributes on the element at the current cursor position.

**Figure 641. Edit Profiling Attributes Dialog Box**

![Edit Profiling Attributes Dialog Box](image)

The profiling attributes, and their potential values, that appear in this dialog box depend on what has been configured in Oxygen XML Editor Eclipse plugin. If you have a large list of profiling attributes, you can use the text filter field to search for attributes or values, and you can expand or collapse attributes by using the **Expand All**/**Collapse All** buttons to the right of the text filter or the arrow button to the left of the profiling attribute name.

The attributes and values that appear in the dialog box are determined as follows:

- If your **root map** (on page 2658) references a DITA **subject scheme map** (on page 2658) that defines values for the profiling attributes (on page 2573), those values are used. Oxygen XML Editor Eclipse plugin collects all the profiling values from the **subject scheme map** that is referenced in the map that is currently opened in the **DITA Maps Manager** (on page 2315) (or set as the **root map** (on page 2331)). In the image above (on page 2561) (taken from the Oxygen XML Editor Eclipse plugin documentation project), you see values for eight products. They are the only values that are defined in the **subject scheme map** and thus, are the only ones that appear in the dialog box.
• If you have defined profiling attribute values (on page 2557) for the DITA document type in the Attributes and Condition Sets preferences page (on page 146), those values are displayed in the dialog box.

• Otherwise, a generic default set of profiling attributes and values are available.

The attribute names and values selected in the Edit Profiling Attributes dialog box are set on the elements contained in the profiled fragment. If you only select a fragment of content (rather than the entire element), this fragment is wrapped in phrase-type elements where the profiling attributes are set.

If the Show Profiling Attributes option (on page 450) (available in the Profiling / Conditional Text toolbar menu) is selected, a green border is painted around profiled text in the Author mode and all profiling attributes set on the current element are listed at the end of the highlighted block. To edit the attributes of a profiled fragment, click one of the listed attribute values. A form control pops up and allows you to add or remove attribute values.

Figure 642. Profiling Attribute Value Form Control Pop Up

Related Information:
Creating and Editing Profiling Attributes in DITA (on page 2557)
Creating and Editing Profiling Condition Sets in DITA (on page 2562)
Applying Profiling Condition Sets in DITA (on page 2564)
Showing and Filtering Profiled Content in DITA (on page 2566)
Customizing Colors and Styles for Rendering Profiling in Author Mode (on page 2569)

Creating and Editing Profiling Condition Sets in DITA

Multiple profiling attributes can be aggregated into a profiling condition set that allows you to apply more complex filters on the document content. In DITA, profiling conditions can be set within both topics and in maps. When set in a topic, you can filter an element (such as paragraph), step in a procedure, item in a list, or even a phrase within a sentence. When set in a map, you can filter an entire topic or group of topics.
Creating Profiling Condition Sets

To create a new profiling condition set, follow these steps:

1. Open the Preferences dialog box (on page 70) and go to Editor > Edit modes > Author > Profiling/Conditional Text > Attributes and Condition Sets.

   Information:
The Profiling Condition Sets section (on page 148) is used to define condition sets.

2. To add new condition set, click the New button at the bottom of the Profiling Condition Sets table. To customize existing condition sets, select an existing condition set and click the Edit button.

   Step Result: In either case, this opens a Condition Set configuration dialog box where you can define attributes that exist in your schema.

   ![](condition_set_configuration_dialog_box.png)

   The following options are available in this dialog box:

   Name
The name of the new condition set.

**Document type**

Select the document type *(framework (on page 2655))* that has profiling attributes defined.

**Use DITAVAL file**

For DITA projects, select this option if you want the Profiling Condition Set to reference a DITAVAL file *(on page 2578)*. You can specify the path by using the text field, its history drop-down, the ‣ Insert Editor Variables *(on page 218)* button, or the browsing actions in the ‣ *Browse* drop-down list.

**Include the content matching the following conditions**

You can select this option to define the combination of attribute values for your condition set by selecting the appropriate checkboxes for the values you want to be included in this particular condition set. If you have defined a lot of profiling attributes, you can use the filter text field to search for specific conditions.

3. After defining or configuring the condition sets according to your needs, click OK to confirm your selections and close the Condition Set configuration dialog box.

4. Click Apply to save the condition set.

---

**Applying Profiling Condition Sets in DITA**

All defined Profiling Condition Sets *(on page 2562)* are available as shortcuts in the ‣ Profiling / Conditional Text toolbar menu *(on page 450)*. Select a menu entry to apply the condition set. The filtered content is then grayed-out in the Author mode, Outline view *(on page 325)*, and DITA Maps Manager view *(on page 2315)*. Your selection will also be used as the default condition set *(on page 2581)* in transformation scenarios (this can be changed in the Filters tab). An element is filtered-out when one of its attributes is part of the condition set and its value does not match any of the values covered by the condition set.

**EXAMPLE:**

Suppose that you have the following document:
**Spray painting**

Short Description: When paint is applied using a spray nozzle, it is referred to as spray painting.

Context:

- The garage is a good place to spray paint.

<table>
<thead>
<tr>
<th>Step 1</th>
</tr>
</thead>
<tbody>
<tr>
<td>Move the car out of the garage to avoid getting paint on it.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 2</th>
</tr>
</thead>
<tbody>
<tr>
<td>Place newspaper, cardboard, or a drop-cloth on the garage floor.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 3</th>
</tr>
</thead>
<tbody>
<tr>
<td>Place the object to be painted on the covered area.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 4</th>
</tr>
</thead>
<tbody>
<tr>
<td>Follow the directions on the paint can to paint the object.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 5</th>
</tr>
</thead>
<tbody>
<tr>
<td>Let the paint dry thoroughly before you move the object.</td>
</tr>
</tbody>
</table>

If you apply the following condition set, it means that you want to filter out the content to only include content profiled with the **expert** value for the **@audience** attribute and content that has the **prop1** value for the **@other** attribute.
This is how the document looks in Author mode after you apply the condition set:

```
Spray painting

Short Description: When paint is applied using a spray nozzle, it is referred to as spray painting.

Context:

The garage is a good place to spray paint.

Step 1
Move the car out of the garage to avoid getting paint on it. Audience [novice]

Step 2
Place newspaper, cardboard, or a drop-cloth on the garage floor. Audience [expert]

Step 3
Place the object to be painted on the covered area. Audience [expert] Other [prop2]

Step 4
Follow the directions on the paint can to paint the object. Audience [expert] Other [prop1]

Step 5
Let the paint dry thoroughly before you move the object. Audience [novice] Other [prop1]
```

### Showing and Filtering Profiled Content in DITA

You can visualize the effect of profiling content by using the profiling tools in the **Profiling/Conditional Text** drop-down menu that is located on the DITA Maps Manager *(on page 2315)* toolbar and on the main toolbar. This drop-down menu includes the following filtering options:

**Show Profiling Colors and Styles**

Select this option to show colors and styles for profiled content in Author mode and the DITA Maps Manager *(on page 2315)*. You can configure the colors and styles or specify whether or not this option is selected by default in the Profiling/Conditional Text > Colors and Styles preferences page *(on page 148)*.

**Show Profiling Attributes**

Select this option to display the values of the profiling attributes at the end of profiled content in Author mode and next to the nodes in the DITA Maps Manager *(on page 2315)*. You can specify
whether or not this option is selected by default in the Profiling/Conditional Text preferences page (on page 146).

**Show Excluded Content**

Controls whether the content filtered out by a particular condition set is hidden or grayed-out in Author mode, the DITA Maps Manager (on page 2315), and the Outline (on page 325) view. When this option is selected and a condition set is selected in this drop-down menu (on page 2567), the filtered content is grayed-out. If this option is not selected and a condition set is selected in this drop-down menu (on page 2567), the filtered content is hidden. You can specify whether or not this option is selected by default in the Profiling/Conditional Text preferences page (on page 146).

**Choose Condition Set (Available if more than 15 condition sets are defined)**

This option is available if you have more than 15 conditions sets defined. It opens a dialog box that makes it easier to find and select condition sets that are not displayed in this drop-down menu.

**List of Defined Condition Sets**

Up to 15 defined condition sets are listed and you can toggle each one of them on to filter the content in Author mode and the DITA Maps Manager (on page 2315) to only show content that will appear in the output for that particular condition set. If there are more than 15 defined condition sets, the rest of them can be accessed in the More submenu or by using the Choose Condition Set option (on page 2567) to access a dialog box that presents all of them.

**Profiling Settings**

Opens the Attributes and Condition Sets preferences page (on page 146) where you can add and edit profiling attributes and condition sets.

**Figure 644. Example: Profiling Controls in Author Mode**

<table>
<thead>
<tr>
<th>Mowing equipment needs regular checks and maintenance. Monthly, you should:</th>
</tr>
</thead>
<tbody>
<tr>
<td>✷ Refill the oil</td>
</tr>
<tr>
<td>○ Remove the oil fill cap;</td>
</tr>
<tr>
<td>○ Pour new oil gradually. Regularly check the dipstick to see if the oil level reached the maximum mark;</td>
</tr>
<tr>
<td>product [Gasoline]</td>
</tr>
<tr>
<td>✷ Sharpen the blades:</td>
</tr>
<tr>
<td>○ Clamp the blade to a vice or to the edge of a solid surface;</td>
</tr>
<tr>
<td>○ Using an electric grinder or a file, grind the length of the blade until it is sharp;</td>
</tr>
<tr>
<td>✷ Check the electric cable for any signs of wear. Replace it if worn; product [Electric]</td>
</tr>
<tr>
<td>✷ Clean the mower's underside for debris; product [Electric, Gasoline]</td>
</tr>
<tr>
<td>✷ Inspect the general state of the mower. Use a ratchet to tighten any loose bolts;</td>
</tr>
<tr>
<td>✷ Lubricate the gears of the manual lawn mower; product [Manual]</td>
</tr>
</tbody>
</table>
If the **Show Profiling Attributes** option is selected, a green border is painted around profiled text in the **Author** mode. Also, all profiling attributes set on the current element are listed at the end of the highlighted block and in its tooltip message. To edit the attributes of a profiled fragment, click one of the listed attribute values. A form control pops up and allows you to add or remove attribute values.

**Figure 645. Profiling Attribute Value Form Control Pop Up**

![Form Control Pop Up]

**Profiling Attribute Icons in the DITA Maps Manager**

The following icons are used to mark profiled and non-profiled topics in the **DITA Maps Manager**:

- ■ - The topic reference contains profiling attributes.
- □ - The topic reference inherits profiling attributes from an ancestor.
- ✔ - The topic reference contains a profiling attribute and inherits profiling from an ancestor.
- – (hyphen) - The topic reference neither contains nor inherits profiling attributes.
Figure 646. Rendering Profiled Topics in DITA Maps Manager

Related Information:

- Applying Profiling Attributes in DITA (on page 2560)
- Creating and Editing Profiled Attributes in DITA (on page 2557)
- Applying Profiling Condition Sets in DITA (on page 2564)
- Customizing Colors and Styles for Rendering Profiling in Author Mode (on page 2569)

Customizing Colors and Styles for Rendering Profiling in Author Mode

By applying profiling colors and styles, you can mark profiled content in Author mode and the DITA Maps Manager (on page 2315) so that you can instantly spot differences between multiple variants of the output. This allows you to preview the content that will go into the published output. The excluded text is grayed-out or hidden in Author mode and excluded nodes are grayed-out or hidden in the DITA Maps Manager (on page 2315).
Choosing the right style for a specific profiling attribute is a matter of personal taste, but be aware of the following:

- If the same block of text is profiled with two or more profiling attributes, their associated styles combine. Depending on the styling, this might result in an excessively styled content that may prove difficult to read or work with.
- It is recommended that you only profile the differences. There is no need to profile common content, since excessive profiling can visually pollute the document.
- A mnemonic associated with a style will help you instantly spot differences in the types of content.

### Styling Profiling Attribute Values

To set colors and styles for profiling attribute values, follow these steps:

1. Select the **Show Profiling Colors and Styles** option *(on page 450)* from the **Profiling / Conditional Text** toolbar drop-down menu.
2. Select **Profiling Settings** *(on page 451)* from the **Profiling / Conditional Text** toolbar drop-down menu. This is a shortcut to the **Attributes and Condition Sets** preferences page *(on page 146)*.
3. Go to the **Colors and Styles** preferences page *(on page 148)* to configure the colors and styling for the profiling attributes.
4. Go to the **Attributes preferences page** *(on page 150)* to configure how you want the profiling attributes to appear in Oxygen XML Editor Eclipse plugin.

**Result:** The styling is now applied in the **Author** editing mode, the **Outline view** *(on page 325)*, and in the **DITA Maps Manager view** *(on page 2315)*. Also, to help you more easily identify the profiling you want to apply in...
the current context, the styling is applied in the Edit Profiling Attributes dialog box (on page 441) and in the inline form control pop-up that allows you to quickly set the profiling attributes.

Figure 648. Profiling Attribute Value Form Control Pop Up

Alternate Method with a DITAVAL File: If you are using a DITAVAL filter file to control the filtering of profiled content in DITA topics, you can use a flag filter to define the colors and styles that will be used when rendering the profiling. For detailed information about this alternate method, see the procedure in the Styling the Rendering of Profiled Content Using a DITAVAL File (on page 2580) topic.

Conditional Profiling Attribute Groups

Overview

Conditional processing attributes can be specified using grouped values. Groups organize the attributes into subcategories. This is intended to support situations where an attribute applies to multiple specialized subcategories. For example, suppose a company needs to filter content for several internal teams (operations and support) and they use the @audience attribute with the values ops and support, but the Support team has several levels of personnel (L1, L2, and L3). They could use a group to define the levels (L1, L2, and L3) as subcategories for the support value. Using groups for these subcategories allows each category to be processed independently.

A major advantage is that you do not need to add new profiling attributes using a DTD specialization. You can re-use existing DITA profiling attributes (such as @product, @audience, @otherprops) and specify multiple attribute subcategories.
Creating a Conditional Profiling Attribute Group

To create a group in Oxygen XML Editor Eclipse plugin:

1. Open the Preferences dialog box (on page 70) and go to Editor > Edit modes > Author > Profiling / Conditional Text > Attributes and Condition sets.

2. To add new attributes and values, click the New button at the bottom of the Profiling Attributes table. To customize existing attributes and their values, select an attribute and click the Edit button.

   **Step Result:** In either case, this opens a Profiling Attribute configuration dialog box where you can define attributes that exist in your schema.

3. Specify the appropriate values for the Document type, Attribute name, and Display name.

   For information about the Profiling Attribute configuration dialog box, see Defining Profiling Attributes for DITA Content (on page 2557).

4. Click the New button at the bottom of the attribute values table.

5. In the Value field of the resulting dialog box, define groups using the following format: 

   ParentAttrValue(SubAttrValue1 SubAttrValue2). For example:

   ```
   support(L1 L2 L3)
   ```

6. Click OK and Apply to save and apply the changes.

Using Conditional Profiling Attribute Groups in Conjunction with a DITAVAL File

You can use groups to customize a hierarchy of profiling attribute values and then use it in conjunction with a DITAVAL file to filter or flag (on page 2578) the values. For example, suppose the company described in the example in the Overview section (on page 2571) needed to generate content for the Support team, but only for L1 and L2 support personnel. The DITAVAL file could look like this:

```
<val>
  <prop action="include" att="support" val="L1"/>
  <prop action="include" att="support" val="L2"/>
  <prop action="exclude" att="support" val="L3"/>
</val>
```

That DITAVAL file could then be used for a condition set (on page 2562) to filter content in Author mode or during the transformation stage to filter content in the output (on page 2581) and content profiled with the L1 and L2 values would be included while content with the L3 value would be excluded.

This example company could also have another DITAVAL file for filtering out all content profiled for any of the three subcategories (L1, L2, L3) by simply excluding the support value (since L1, L2, and L3 are subcategories of it).
<val>
  <prop action="exclude" att="support"/>
</val>

Defining Conditional Profiling Attribute Groups in a Subject Scheme Map

You can define conditional profiling attribute groups in a subject scheme map (on page 2573) as in the following example:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE subjectScheme PUBLIC "-//OASIS//DTD DITA Subject Scheme Map//EN" "subjectScheme.dtd">
<subjectScheme>
  <enumerationdef>
    <attributedef name="product"/>
    <subjectdef keys="productKeys">
      <subjectdef keys="myGroup1(gr1v1)"/>
      <subjectdef keys="myGroup1(gr1v2)"/>
      <subjectdef keys="product1"/>
    </subjectdef>
  </enumerationdef>
</subjectScheme>
```

In the above example, myGroup1 is the profiling attribute group for the @product attribute and gr1v1 and gr1v2 in parentheses are the values.

DITA 1.3 Specifications: Conditional Processing Values and Groups

Customizing Profiling Values with a Subject Scheme Map

Overview

A subject scheme map (on page 2658) allows you to create and manage custom profiling values in DITA documents without having to write a DITA specialization. Ultimately, this allows you to filter and flag content in Author mode or in transformed output.

Subject scheme maps use key definitions to define a collection of profiling values. You can also use subject scheme maps to filter out (reject) the values for certain attributes so that you only see the attributes or values that you want to use in Author mode or the transformed output.
The highest level of map (main DITA map (on page 2658)) that uses the set of profiling values must reference the subject scheme map where the profiling values are defined and the @type attribute needs to be set to subjectScheme for the reference, as in the following example:

```xml
<topicref href="test.ditamap" format="ditamap" type="subjectScheme"/>
```

### Advantages of Using a Subject Scheme Map

The advantages of using a subject scheme to control profiling attribute values include:

- You can create a hierarchy of profiling attribute values and use a DITAVAL file to filter or flag the tree of values.
- You can share the subject scheme files with others without having to share preferences or the entire project.
- The subject scheme offers validation support so you are notified if an undefined value is used.

### Creating a Subject Scheme Map

To create and configure a subject scheme map, follow this procedure:

1. Use the New Document wizard (on page 245) to create a new Subject Scheme document (New from Templates > Framework templates > DITA Map > map > Subject Scheme).
2. Use the controls in Author mode to define the hierarchical tree of values for your subject scheme (see the Author mode example below (on page 2576)) or switch to Text mode and define it there if you prefer (see the Text mode example below (on page 2576)).

   **Note:**

   The pre-defined subject scheme template includes Navigation Titles (<navtitle> element). This element is not required, but if you use it, the text that you enter for the <navtitle> will be used (instead of the name of the value) in the various places where profiling attributes are presented in Oxygen XML Editor Eclipse plugin (on page 2577). An example of when this might be helpful is if you want to use abbreviations for the name of a value, but you want to see its full name in Oxygen XML Editor Eclipse plugin.

3. Bind the particular attribute to the key you define for the tree of values using the <attributedef> and <subjectdef> elements inside the <enumerationdef> element. Notice that in the examples below (on page 2576), the audience attribute is bound to the audienceKey value.

   **Tip:**

   By default, attributes can accept multiple values, but you can use outputclass="single_value" to specify that a certain attribute only accepts a single value at a time and the attribute will be presented in Oxygen XML Editor Eclipse plugin with radio buttons instead of checkboxes. For example:
You can also define a specific set of possible attribute values for a specific attribute name that is set on a specific element name. For example, you can define a specific set of `@outputclass` attribute values only for the `<image>` element:

```xml
<enumerationdef>
  <elementdef name="image"/>
  <attributedef name="outputclass"/>
  <subjectdef keyref="imgOutputClassValuesKey"/>
</enumerationdef>
```

4. If you want to filter out (reject) values for certain attributes, bind the attributes to a blank value (as you see for the `props` and `otherprops` attributes in the examples below (on page 2576)). This means that those attributes will not appear in the various places where profiling attributes are presented in Oxygen XML Editor Eclipse plugin (on page 2577).

5. Save your `subject scheme` file.

6. Reference your `subject scheme` in the highest level of map (main DITA map (on page 2658)) that will use the set of profiling values and set its type to `subjectScheme`. The easiest way to do this is:
   a. With your `subject scheme` file opened in the editor, go to the DITA Maps Manager view, right-click the main DITA map, and select Append Child > Reference to the currently edited file.
   b. In the Insert Topic Reference dialog box, go to the Attributes tab and in the Type field, enter or select `subjectScheme`.
   c. Click the Insert and Close button and save your main DITA map.

### Using a Subject Scheme in Conjunction with a DITAVAL File

You can use a subject scheme to customize a hierarchy of profiling attribute values and then use it in conjunction with a DITAVAL file to filter or flag (on page 2578) the entire tree of values. For example, suppose one of the values for the `audience` attribute in a hierarchical subject scheme is `surgeon` and it has two subordinate values of `neuro-surgeon` and `plastic-surgeon` (see the examples below (on page 2576)). You could create a DITAVAL file with the following content:

```xml
<val>
  <prop action="exclude" att="audience" val="surgeon"/>
</val>
```

That DITAVAL file could then be used for a condition set (on page 2562) to filter content in Author mode or during the transformation stage to filter content in the output (on page 2581) and the `neuro-surgeon` and `plastic-surgeon` values would be excluded by the filter since the subject scheme defines them as subordinate values of the `surgeon` value.
Example: Subject Scheme Map that Defines Custom Values for the Audience Attribute

This example uses typical audience values for medical personnel (therapist, oncologist, physicist, radiologist, surgeon, and so on). The audience attribute is bound to the audienceKey value (which defines the tree of values). You can also see that it filters out all possible values for other attributes (props and otherprops) so that they won't be available in the various places where profiling attributes are presented in Oxygen XML Editor Eclipse plugin (on page 2577).

Example using Author mode controls:

Figure 649. Subject Scheme Author Mode Controls

Example code in Text mode:
<subjectScheme>
<!-- A scheme that defines audience user values -->

<subjectdef keys="audienceKey">
  <subjectdef keys="therapist"/>
  <subjectdef keys="oncologist"/>
  <subjectdef keys="physicist"/>
  <subjectdef keys="radiologist"/>
  <subjectdef keys="surgeon"/>
    <subjectdef keys="neuro-surgeon"/>
    <subjectdef keys="plastic-surgeon"/>
  </subjectdef>
</subjectdef>

<!-- Binding the audience attribute to the values defined in the key -->
<enumerationdef>
  <attributedef name="audience"/>
  <subjectdef keyref="audienceKey"/>
</enumerationdef>

<!-- Reject all possible values for other profiling attributes -->
<enumerationdef>
  <attributedef name="props"/>
  <subjectdef/>
</enumerationdef>
<enumerationdef>
  <attributedef name="otherprops"/>
  <subjectdef/>
</enumerationdef>
</subjectScheme>

Where the Profiling Attributes are Available in Oxygen XML Editor Eclipse plugin

When you edit a DITA topic in the Text or Author mode, Oxygen XML Editor Eclipse plugin collects all the profiling values from the subject scheme map (on page 2658) that is referenced in the map that is currently opened in the DITA Maps Manager (on page 2315) (or set as the root map (on page 2331)). The values of profiling attributes defined in a Subject Scheme Map are available in the following places in Oxygen XML Editor Eclipse plugin (regardless of their mapping in the Profiling/Conditional Text preferences page (on page 145)):

- The Profiling tab of the Edit Properties dialog box (on page 2356).
- The Edit Profiling Attribute dialog box (on page 2561).
- The inline profiling controls in Author mode (on page 2567).
- The proposals for the attribute values in the Content Completion Assistant (on page 2653).

Related Information:
Filtering Profiling Values with a DITAVAL File (on page 2578)
DITA 1.3 Specifications: Subject Scheme Maps

Filtering Profiling Values with a DITAVAL File

You can use a DITAVAL filter file to control the filtering or flagging of profiled content or to identify which values are to be used for conditional processing during a particular output.

DITAVAL Filtering Use-Case

Suppose that a medical publication uses the audience profiling attribute to profile the content for the following types of users: therapist, physician, and surgeon. Suppose that in the output, you want to exclude any content that is profiled as surgeon value for the @audience attribute.

You could use a DITAVAL filter file to exclude anything that is profiled as surgeon:

```xml
<val>
  <prop action="exclude" att="audience" val="surgeon"/>
</val>
```

If you then transform the main DITA map (on page 2654) and specify the DITAVAL filter file in the transformation scenario, the output will exclude anything that is profiled as surgeon.

DITAVAL Filter File Editor in Author Mode

The Author editing mode in Oxygen XML Editor Eclipse plugin offer a simple and intuitive editor for creating or modifying DITAVAL files. It provides a series of drop-down menus and text fields that allow you to easily define the filters.
Use the +... button to display a drop-down list that contains elements that you can add at that particular location in the DITAVAL file. Clicking this button at the top (next to the DITAVAL FILTER File title, allows you to insert the following elements:

- **Style Conflict** - Inserts a `<style-conflict>` element that declares behavior to be used when one or more flagging methods collide on a single content element. You can use the simple drop-down menus to select values for the `@foreground-conflict-color` and `@background-conflict-color` attributes.

- **Filter** - Inserts a `<prop>` element that identifies an attribute to apply a filtering action on. The possible actions that you can select are `include`, `exclude`, `passthrough`, and `flag`. If you select the `flag` action, you can use the drop-down menus to select values for the `@style`, `@color`, and `@background` attributes.

- **Flag** - Inserts a `<revprop>` element that identifies a value in the `@rev` attribute that should be flagged in some manner. The allowed actions are `include`, `passthrough`, and `flag`. If you select the `flag` action, you can use the drop-down menus to select values for the `@style`, `@color`, `@background`, and `@changebar` attributes.

See the [DITAVAL Element Specifications](#) for more details about the allowed filters and flags.

### How to Create a DITAVAL Filter File

To create a DITAVAL filter file, follow these steps:

1. Go to **File > New**.
2. Scroll to the **Framework templates > DITA** folder.
3. Select the **Filter** template file and click **Create**.
4. Define your filters in the DITAVAL file (in **Text** or **Author** mode).
5. Save the DITAVAL file.

**Result:** The DITAVAL filter file can now be used for all of the following:
• To apply a reference to the DITAVAL file in a Profiling Condition Set using the Use DITAVAL File option in the Condition Set configuration dialog box (on page 2562).

• You can use the Import from DITAVAL option in the Attributes and Condition Sets preferences page (on page 146) to use the DITAVAL file to define profiling attributes.

• You can use the DITAVAL file to apply the filters to the output by specifying the DITAVAL file in the transformation scenario (on page 2536).

• You can use the filter file in the DITA Map Completeness Check dialog box (on page 2361) when validating your DITA map (on page 2654).

• DITAVAL files are also used when working with the DITA 1.3 Branch Filtering mechanism. For more details, see: Working with DITA 1.3 Branch Filtering (on page 2482).

• You can define the colors and styles to be used for rendering profiled condition sets (on page 2580) in Author mode and the DITA Maps Manager (on page 2315) view by using a Flag filter in the DITAVAL file.

### Related information

DITAVAL Element Specifications
Working with DITA 1.3 Branch Filtering (on page 2482)
Customizing Profiling Values with a Subject Scheme Map (on page 2573)
Styling the Rendering of Profiled Content Using a DITAVAL File (on page 2580)
Conditional Profiling Attribute Groups (on page 2571)

### Styling the Rendering of Profiled Content Using a DITAVAL File

If you are using a DITAVAL filter file to control the filtering of profiled content, you can define the colors and styles to be used for rendering profiled condition sets in Author mode and the DITA Maps Manager (on page 2315) by defining the styles in a flag filter that is set in a DITAVAL filter file.

### How to Define a Flag for a Condition Set in a DITAVAL Filter File

To define the colors and styles to be used for rendering profiled condition sets by using a flag filter in a DITAVAL filter file, follow these steps:

1. Create or edit your DITAVAL file (on page 2579) to define your profiling condition set (on page 2562).
2. In Author mode, define the filters for your condition set (on page 2578).
3. Select Flag from the drop-down menu on in a particular Filter or Flag Revision to present additional drop-down menus that allow you to configure the colors and styles for the particular condition set.
4. Save the DITAVAL file.

**Result:** Test your changes by opening profiled content in Author mode or the DITA Maps Manager (on page 2315) and use the options in the **Profiling / Conditional Text** drop-down menu to see how the changes in your DITAVAL flag are rendered.

**EXAMPLE:**

Using a Flag on a Filter to define the styling for a condition set like this:
will render the styling of the profiled content in **Author** mode to look like this:

![Shortcut Keys](image)

and will render the styling in the **DITA Maps Manager view** (on page 2315) to look like this:

![Filters Tab](image)

**Publishing Profiled DITA Content**

You can create a variety of publications or versions of your documentation from a single map by applying profiling conditions to the build.

Oxygen XML Editor Eclipse plugin includes preconfigured transformation scenarios for DITA. By default, these scenarios take the current **profiling condition set** (on page 2564) into account during the transformation, as defined in the **Filters tab** (on page 2536) when creating a DITA transformation (on page 1228). You can also specify a **DITAVAL file** (on page 2578) that defines filters for your profiled content.

![Profiling Option in the Filters Tab](image)
Conditional Processing to Generate Multiple Deliverables

By default, the content of most elements is included in all output media. Within maps and topics, elements can specify the delivery targets to which they apply.

Within maps, topic references can use the `@deliveryTarget` attribute to indicate the delivery targets to which they apply. Within topics, most elements can use the `@deliveryTarget` attribute to indicate the delivery targets.

If a referenced topic should be excluded from all output formats, set the `@processing-role` attribute to `resource-only` instead of using the `@deliveryTarget` attribute. Content within that topic can still be referenced for display in other locations.

```
@deliveryTarget
```

The intended delivery target of the content, for example html, pdf, or epub. This attribute is a replacement for the now deprecated `@print` attribute.

The `@deliveryTarget` attribute is specialized from the `@props` attribute. It is defined in the `deliveryTargetAttDomain`, which is integrated into all OASIS-provided document-type shells. If this domain is not integrated into a given document-type shell, the `@deliveryTarget` attribute will not be available.

The `@deliveryTarget` attribute is processed the same way as any other conditional processing attribute. For example, `<topicref deliveryTarget="html5 epub" href="example.dita"/>` uses two values for `@deliveryTarget`. A conditional processing profile can then set rules for `@deliveryTarget` that determine whether the topic is included or excluded when the map is rendered as HTML5 or EPUB.

DITA Open Toolkit Support

The DITA Open Toolkit is an open-source publishing engine that can generate various output formats (for example, HTML, PDF, CHM) from DITA content. Oxygen XML Editor Eclipse plugin includes support for the DITA Open Toolkit. This section includes information about how to install and create a DITA-OT plugin (on page 2657), and how to use an external instance of the DITA Open Toolkit.

Related Information:

DITA Open Toolkit Documentation

DITA-OT Plugins

The architecture of the DITA Open Toolkit publishing engine is plugin-based. A plugin can add support for publishing DITA content as a new format or for customizing an existing output format. The DITA Open Toolkit bundled with Oxygen XML Editor Eclipse plugin already has lots of plugins pre-installed but you can also install additional plugins (on page 2657) or create your own.
Creating a DITA-OT Plugin

Oxygen XML Editor Eclipse plugin provides the ability to install additional DITA Open Toolkit plugins (on page 2587) that can be found from various sources (for example, Oxygen's public GitHub repository includes some DITA-OT plugins). It is also possible to create your own plugin.

CAUTION:
Oxygen XML Editor Eclipse plugin support engineers do not officially offer support and troubleshooting assistance for custom DITA-OT distributions or custom installed DITA-OT plugins. If you discover any issues or inconsistent behavior while using a custom DITA-OT or a DITA-OT that contains custom DITA-OT plugins, you should revert to the default built-in DITA-OT.

To create a DITA-OT plugin, follow these steps:

1. Create a new folder in the plugins folder located in your DITA-OT directory (for example, if you are using DITA 4.1.1, the path would look like this: [OXYGEN_INSTALL_DIR]/frameworks/dita/DITA-OT/plugins/MyNewPlugin).

2. Create a plugin.xml file in that same folder. This file will contain the extension points for the plugin. For example, references to the XSLT stylesheets that will be used to style the output.

Note:
You can easily create this file by using the DITA-OT Plugin new document template that is included in Oxygen XML Editor Eclipse plugin (from the New from templates wizard (on page 252) you can find this template in Framework templates > DITA > plugin.

Example:

```xml
<plugin id="org.metadita.specialization.music">
   <feature extension="dita.specialization.catalog.relative" file="catalog-dita.xml"/>
   <feature extension="dita.xsl.xhtml" file="xsl/music2xhtml.xsl"/>
   <feature extension="dita.xsl.html5" file="xsl/music2xhtml.xsl"/>
</plugin>
```

Tip:
Oxygen XML Editor Eclipse plugin includes special editing support when adding extension points in the plugin.xml file. If you place the cursor in the value of the @extension attribute and press Ctrl+Space, a list of possible extension points is presented with links to the DITA-OT documentation. For more information about extension points that are available to use in the plugin.xml file, see: http://www.dita-ot.org/dev/extension-points/extension-points-by-plugin.html.
3. Install the newly created DITA-OT plugin (on page 2587) by running the built-in transformation scenario called Run DITA-OT Integrator (on page 2524) from the Apply Transformation Scenario(s) (on page 1168) or Configure Transformation Scenario(s) dialog box (on page 1284).

Note:
If the integrator is not visible, select the Show all scenarios option in the Settings drop-down menu.

You can share your new plugin with other users who have the same DITA-OT distribution by sending them your newly created folder along with the installation instructions (on page 2587).

Related Information:
DITA Open Toolkit Documentation
Defining the Transformation Type and Allowed Parameters in a DITA-OT Plugin (on page 2588)

Example: Creating a DITA-OT Plugin for Embedding Video Resources

To offer a detailed example of the steps required to create a new DITA Open Toolkit plugin (on page 2657), this topic uses an example of creating an XSLT customization plugin that provides support for referencing video and audio content using the DITA `<object>` element and then publishing to HTML and PDF output formats. This plugin (com.oxygenxml.media) is available in the DITA Open Toolkit distribution that comes bundled with the latest version of Oxygen XML Editor Eclipse plugin, but these instructions show you how you could create it if it were not included.

The following procedure is meant to help you with creating the plugin:

1. Create a folder for your plugin in the DITA-OT plugins folder (DITA-OT-DIR/plugins/).
2. Create a plugin.xml file (in the same plugin folder) that contains the extension points of the plugin.

Note:
You can easily create this file by using the DITA-OT Plugin template that is included in Oxygen XML Editor Eclipse plugin (from the New from templates wizard (on page 252) you can find this template in Framework templates > DITA > plugin).

Example: Media Plugin File

```xml
<plugin id="com.oxygenxml.media">
  <feature extension="package.support.name" value="Oxygen XML Editor Support"/>
  <feature extension="package.support.email" value="support@oxygenxml.com"/>
  <feature extension="package.version" value="21.0"/>
  <feature extension="dita.xsl.xhtml" value="xhtmlMedia.xsl" type="file"/>
  <feature extension="dita.xsl.xslfo" value="pdfMedia.xsl" type="file"/>
</plugin>
```
The most important extensions in it are the references to the XSLT stylesheets that will be used to style the HTML and PDF outputs.

You can find other DITA-OT plugin extension points here: http://www.dita-ot.org/dev/extension-points/extension-points-by-plugin.html.

3. Create an XSLT stylesheet to customize the output types. In this example, to customize the HTML output, it is necessary to create an XSLT stylesheet called `xhtmlMedia.xsl` (in the same plugin folder).

```
<xsl:template
  match="*[contains(@class, ' topic/object ')]*[contains(@outputclass, 'video')]">
  <video class="embed-responsive-item">
    <xsl:call-template name="commonattributes"/>
    <xsl:call-template name="setidname"/>
    <xsl:call-template name="copySource"/>
  </video>
</xsl:template>
```

4. Create additional XSLT stylesheets to customize all other desired output types. In this example, to customize the PDF output it is necessary to create an XSLT stylesheet called `pdfMedia.xsl` (in the same plugin folder).

In this case, you might find an appropriate XSLT stylesheet called `DITA-OT-DIR/plugins/org.dita.pdf2/xsl/fo/topic.xsl` to use as a starting point to overwrite the `pdfMedia.xsl` stylesheets, with results looking something like this:

```
<!--Treat video, audio or iframe objects as links-->
<xsl:template
  match="*[contains(@class, ' topic/object ')]*[contains(@outputclass, 'video')]">
  <xsl:variable name="target" select="@data"/>
  <xsl:variable name="baseDir">
    <xsl:call-template name="substring-before-last">
      <xsl:with-param name="text" select="@xtrf"/>
    </xsl:call-template>
  </xsl:variable>
  <xsl:call-template name="substring-before-last">
    <xsl:with-param name="text" select="@xtrf"/>
  </xsl:call-template>
</xsl:template>
```
5. To install the created plugin in the DITA-OT, run the built-in transformation scenario called **Run DITA-OT Integrator** (on page 2524) by executing it from the **Apply Transformation Scenario(s)** dialog box (on page 1168). If the integrator is not visible, select the **Show all scenarios** option that is available in the **Settings** drop-down menu. For more information, see **Installing a DITA-OT Plugin** (on page 2587).

**Results of running the integrator using the media plugin example:**

XSLT content is applied with priority when publishing to both HTML and PDF outputs.

a. For the HTML output, in the XSLT stylesheet **DITA-OT-DIR/plugins/org.dita.xhtml/xsl/dita2html-base.xsl**, a new import automatically appeared:

```xml
<xsl:import href="../plugins/com.oxygenxml.media/xhtmlMedia.xsl"/>
```

This import is placed after all base imports and thus has a higher priority. For more information about imported template precedence, see: [http://www.w3.org/TR/xslt#import](http://www.w3.org/TR/xslt#import).

b. Likewise, for the PDF output, in the top-level stylesheet **DITA-OT-DIR/plugins/org.dita.pdf2/xsl/fo/topic2fo_shell_fop.xsl**, a new import statement appeared:

```xml
<xsl:import href="../../../com.oxygenxml.media/pdfMedia.xsl"/>
```

Now, you can distribute your plugin folder to anyone that has a DITA-OT installation along with some simple installation notes. Your customization will work provided the templates you are overwriting have not changed from one DITA-OT distribution to the other.

**Related Information:**

DITA Open Toolkit Documentation
Installing a DITA-OT Plugin

Oxygen XML Editor Eclipse plugin comes bundled with various DITA-OT plugins (on page 2657), but the architecture of the DITA Open Toolkit also allows you to install additional plugins that can be found from various sources (for example, Oxygen's public GitHub repository includes some DITA-OT plugins).

**CAUTION:**
Oxygen XML Editor Eclipse plugin support engineers do not officially offer support and troubleshooting assistance for custom DITA-OT distributions or custom installed DITA-OT plugins. If you discover any issues or inconsistent behavior while using a custom DITA-OT or a DITA-OT that contains custom DITA-OT plugins, you should revert to the default built-in DITA-OT.

**Installing a DITA-OT Plugin**

To install a DITA-OT plugin, following this procedure:

1. Copy the additional plugin to the location of the DITA-OT version you are using (by default, DITA-OT-DIR\plugins directory).
2. Select the Configure Transformation Scenario(s) (on page 1284) action from the DITA Maps Manager toolbar (you could also use the same action on the main toolbar or open the Transformation Scenarios view (on page 1290)).
3. Select the Run DITA-OT Integrator transformation scenario (on page 2524). If the integrator is not visible, select the Show all scenarios option that is available in the Settings drop-down menu.

**Important:**
The folder where the DITA-OT is located needs to have full write access permissions set to it. For example, in Windows, if you are integrating plugins in the DITA-OT folder bundled with Oxygen XML Editor Eclipse plugin and your application is installed in the Program Files folder, you can start the Oxygen XML Editor Eclipse plugin main executable with administrative rights for the integrator process to be able to modify resources in the DITA-OT folder.

4. Apply the scenario (on page 1283).
5. Check the Results panel at the bottom of the application to make sure the build was successful.

After the installation, you can open a DITA map and use the Configure Transformation Scenarios dialog box to create a new DITA-OT transformation scenario. Oxygen XML Editor Eclipse plugin detects that transformation type declaration from the DITA-OT plugin and presents descriptions in the DITA Transformation Type dialog box (on page 1228). Oxygen XML Editor Eclipse plugin also shows the contributed parameters from the plugin in the transformation scenario's Parameters tab (on page 2534).
Defining the Transformation Type and Allowed Parameters in a DITA-OT Plugin

Custom DITA-OT plugins may contribute new transformation types (transtypes) and each transtype may have a set of allowed configuration parameters. If a DITA-OT plugin declares a transtype, Oxygen XML Editor Eclipse plugin detects that transformation type declaration and presents descriptions in the DITA Transformation Type dialog box (on page 1228) and the contributed parameters in the transformation scenario’s Parameters tab (on page 2534).

To define a transformation type and its contributed parameters in a DITA-OT plugin, follow this procedure:

1. If you have not already done so, create a DITA-OT plugin.xml file (on page 2583) (you can easily create this file by using the DITA-OT Plugin new document template in the New from templates wizard (on page 252)).

2. In the plugin.xml file, define the transformation type details by using the <transtype> element to specify a name, description, and the transtype it extends.

   ```xml
   <transtype name="xhtml" extends="base-html" desc="HTML"/>
   ```

3. Define allowed parameters by using the <param> element to specify the name, description, and information about the default and allowed set of values. For more information, see: https://www.dita-ot.org/3.1/topics/plugin-configfile.html.

   ```xml
   <param name="args.indexshow" desc="Specifies whether to show the index" type="enum">
     <val>yes</val>
     <val default="true">no</val>
   </param>
   ```

   Depending on the type declared for a parameter, Oxygen XML Editor Eclipse plugin will help you pick values for each parameter edited in the Parameters tab of the transformation scenario configuration dialog box. For example, for parameters of type "enum", Oxygen XML Editor Eclipse plugin will present a combo box for choosing the proper value for the parameter.

4. You can also extend various extension points in your plugin.xml. For more information, see: https://www.dita-ot.org/3.1/extension-points/plugin-extension-points.html.
Plugin Extension Example - Promote Parameters:

It is possible to promote certain transformation parameters so that they appear above the table of allowed parameters and values in the Parameters tab of the transformation scenario configuration dialog box. To do this, you could create a pluginExtension.xml file in the root folder of the DITA-OT plugin and use the <promotedParams> element to define the promoted parameters. Here is an example:

```xml
<extensionPlugin>
  <transystype name="pdf-css-html5">
    <promotedParams>
      <param name="args.css" promotedName="CSS"/>
      <param name="args.css.param.numbering" promotedName="Numbering"/>
      <param name="args.chapter.layout" promotedName="Chapter layout"/>
    </promotedParams>
  </transystype>
</extensionPlugin>
```

The example above results in the Parameters tab looking like this:

![Promoted Parameters](image)

5. Install the plugin (on page 2587).

Note:

If the plugin is installed using an external command line, you may need to restart Oxygen XML Editor Eclipse plugin to properly re-detect the newly contributed transtypes and parameters.

Example of a plugin.xml File:

```xml
<plugin id="com.oxygenxml.pdf.prince">
  <!-- extensions -->
```

<feature extension="dita.conductor.transetype.check" value="pdf-prince" type="txt"/>
<feature extension="dita.conductor.target.relative" value="integrator.xml" type="file"/>
<feature extension="dita.conductor.transetype.print" value="pdf-prince"/>
<transtype name="pdf-prince" extends="commons" desc="PDF (Prince XML)">
  <param name="princeExecPath" type="file" desc="Path to the Prince executable"/>
</transtype>
</plugin>

https://www.youtube.com/embed/LcrR0YUflQ4

Built-in Third-Party DITA Open Toolkit Plugins

The DITA Open Toolkit 4.1.1 distribution that is bundled with Oxygen XML Editor Eclipse plugin includes some pre-installed third-party open-source plugins (on page 2657) that add extra publishing formats and functionality.

The plugins that come bundled with Oxygen XML Editor Eclipse plugin include:

- **DITA For Publishers** - These plugins allow DITA content to be published to additional formats, such as EPUB 2.0 and Kindle.
- **DITA to Word** - This plugin allows users to publish DITA content to MS Word.
- **DITA Community** - These plugins allow support for DITA 1.3 with embedded or referenced MathML and SVG images.

Extra Free Publishing Plugins

The DITA Open Toolkit publishing engine comes with support for predefined output formats such as HTM5, PDF, and Eclipse Help. Since the architecture of the publishing engine is plugin-based, over time, lots of useful plugins were developed in the Oxygen XML GitHub account that enhance the publishing and some of them are listed below. The plugins that are already installed within the DITA-OT engine that comes bundled with Oxygen XML Editor Eclipse plugin are listed with a [Bundled] marker.

**Plugin that Converts DITA Maps to PDF Using CSS 3 [Bundled]**

You can use this very popular plugin to publish DITA to PDF output using CSS. As the publishing engine, it can use the Oxygen XML Chemistry processor (freely bundled with Oxygen XML Editor), the Antenna House engine, or the Prince XML engine.
DITA Metrics Report [Bundled]

This is a very useful open-source plugin can be used to generate an HTML report from an existing DITA project and contains a lot of useful information, including:

- Total number of maps and topics that are part of the project.
- Total number of elements used in topics and maps along with a table presenting all element names and their usage counter.
- The used elements for each DITA domain.
- Total number of attributes used in topics and maps along with a table presenting all attribute names and their usage counter.
- Statistics about the conditional attributes used in the project.
- Information about content reuse.
- Text and content statistics, including both total words (word count) and unique words (vocabulary).
- List of largest and smallest topics and the number of words each one uses.
- Listing of all links to resources outside of the project.
- A metrics evolution report between different versions of your documentation.

Export DITA Map Plugin [Bundled]

You can use this free plugin to create a ZIP file from your entire DITA project. The plugin also takes filters/profiling into account when including topics.

Publish DITA Content with References to Video and Audio Resources. [Bundled]

A DITA Open Toolkit plugin can be used to convert the DITA `<object>` element to various HTML 5 structures (such as `<video>`, `<audio>`, or `<iframe>`).

Show Consecutive `Codeblocks` in Multiple Tabs for WebHelp Output

This open-source plugin can be used to display consecutive DITA `<codeblock>` elements in separate tabs.

Add Edit Links in HTML or PDF-based Output [Bundled]

This plugin can be used to add edit links in HTML or PDF-based output that allows subject matter experts to offer feedback for the published content directly in the source using a DITA web editing tool (such as Oxygen XML Web Author).

Create a Single Merged XML Document From an Entire DITA Project [Bundled]

This plugin can be used to produce a merged output from the entire DITA map structure without further processing. It is useful if you want to further process the merged XML document for producing various reports.
Dynamically Publish Excel Content as DITA

A DITA Open Toolkit plugin that can be used to dynamically convert Excel files to DITA (Excel files referenced with `format=excel` in DITA maps).

Dynamically Use JSON Content in DITA Topics

A DITA Open Toolkit plugin that can be used to dynamically convert JSON content to DITA (JSON files referenced with `format=json` in DITA maps).

Dynamically Publish ASCIIDoc Content as DITA

A DITA Open Toolkit plugin that can be used to dynamically convert ASCIIDoc content to DITA (ASCIIDoc files referenced with `format=ant-parser` in DITA maps).

Embed HTML Content in DITA Topics [Bundled]

A plugin that can be used to embed well-formed HTML content in a DITA topic inside a special element.

Embed LaTeX Equations in DITA Content

A DITA Open Toolkit plugin that can be used to publish embedded LaTeX mathematical equations to HTML and PDF.

Embed UML Diagrams in DITA Content

A DITA Open Toolkit plugin that can be used to publish embedded UML diagrams equations to HTML and PDF.

Float Images in HTML and PDF Outputs

A plugin that can be used to float an image referenced in a DITA topic left or right depending on the specified `@outputclass` attribute value.

Embed Referenced MathML and SVGZ Images in HTML Output

A DITA Open Toolkit plugin that can be used to embed referenced MathML and SVG images in the HTML5 and XHTML output.

Dynamically Convert DITA Tables to Graphs

A DITA Open Toolkit plugin that converts DITA tables having a certain structure to SVG graphs.

Show Oxygen Change Tracking Information in the PDF Output [Bundled]

This plugin can be used to display Oxygen XML Editor tracked changes (insertions, deletions, or comments) in the PDF output.

Sample Customization Plugin for Classic PDF (XSL-FO) Output

This sample DITA Open Toolkit PDF customization plugin is a good starting point if you want to:
• Customize fonts.
• Customize a cover page to provide custom logos and coloring.
• Customize page headers and footers.

PDF (XSL-FO) - Generate Numbers Before a Topic's Title

A DITA-OT PDF customization plugin that can be installed to generate numbers before each topic's title.

Presents Chapters With Landscape Orientation in PDF (XSL-FO) output

A PDF customization folder that can be used to define landscape orientation for a certain chapter.

Using an External DITA Open Toolkit in Oxygen XML Editor Eclipse plugin

Oxygen XML Editor Eclipse plugin comes bundled with a DITA Open Toolkit, located in the DITA-OT-DIR directory. If you want to use an external DITA-OT for all transformations and validations, you can open the Preferences dialog box (on page 70) and go to the DITA page (on page 81), where you can specify the DITA-OT to be used.

Related Information:
- Editing a Transformation Scenario (on page 1281)
- Creating New Transformation Scenarios (on page 1201)
- DITA Open Toolkit Documentation

DITA Open Toolkit Project

The DITA Open Toolkit project file allows you to define all your DITA map input and filter pairs and to produce the desired output formats by applying the publishing engine over this single project file: https://www.dita-ot.org/dev/topics/using-project-files.html.

Oxygen XML Editor Eclipse plugin has special support for creating, editing, validating, and publishing DITA Open Toolkit project files represented in XML format. It can also use such files to detect connections between DITA resources in the entire project and to apply root map and filter pairs when editing.

Editing DITA Open Toolkit Project Files

The New Document wizard (on page 245) includes a template to help you create DITA Open Toolkit project files (with an .xml file extension). The template is located in the Framework templates > DITA-OT folder. There is also a sample project file that can be found in the application samples folder: OXYGEN_INSTALL_DIR/samples/dita/mobile-phone/mobilePhoneProjectFile.xml.

When working with a DITA-OT project file in the Author visual editing mode, you can see a compact representation of the file by default. You can switch to the Edit style in the Styles toolbar drop-down menu to edit the file using form controls and inline buttons. The additional View as YAML style can be selected to see a visual representation of the same document in YAML. Content for all additional project files included in
the current edited file will appear expanded in place. The included content is read-only by default but can be
directly edited if the Allow referenced content to be edited checkbox is selected in the Options > Preferences
> Editor > Edit Modes > Author preferences page.

DITA-OT Project File Content Completion

Content completion is available according to the associated schema and it is enhanced with proposals for ID
references, available transformation types, parameter names, and values.

DITA-OT Project File Validation

The default automatic validation support for DITA-OT project files has enhanced Schematron rules that report
invalid references to non-existing contexts. The default validation is based on a validation scenario named
DITA-OT Project that is included in the DITA-OT project framework.

The DITA-OT Project framework also includes a validation scenario named DITA-OT Project Validation and
Completeness Check. It contains validation units that automatically validate the project file based on the
DITA-OT Project scenario and also a manual validation unit based on the DITA-OT Project Validation and
Completeness Check validation engine that validates all contexts recursively.

When creating a validation scenario (on page 556), or editing an existing scenario (on page 566) for a DITA-
OT project file, you can select DITA-OT Project Validation and Completeness Check engine in the Validation
engine column and clicking the Settings button for that engine opens the Configure validation engine
dialog box where you can configure options for validating the DITA-OT project.
The options available in this dialog box include:

**Batch validate referenced DITA resources**

This option specifies the level of validation that applies to referenced DITA files:

- If the checkbox is left unchecked (default setting), the DITA files will be validated using the rules defined in the DTD or XML Schema declared in the document.
- If the checkbox is selected, the DITA files will be validated using rules defined in their associated validation scenario (on page 555).

**Check the existence of non-DITA references resources**

Extends the validation of referenced resources to non-DITA files.

**Include remote resources**

Select this option if you want to check that remote referenced binary resources (such as images, movie clips, ZIP archives) exist at the specified location.

**Report references to resources outside of the DITA map folder**

If selected, it will report any references to DITA resources that are located outside the main DITA map (on page 2658) folder.

**Report links to topics not referenced in DITA maps**
Checks that all the topics referenced by other topics are also linked in the DITA map. Also reports related links defined in relationship tables whose target topics are not referenced in the DITA Map.

**Report multiple references to the same topic**

If selected, it will report warnings when a topic is referenced multiple times in the DITA map, unless a unique @copy-to attribute is used on the `<topicref>` element for any topic that is referenced multiple times.

For example, it will **not** report a warning if there is a topic referenced twice, but the second `<topicref>` has a @copy-to attribute set:

```xml
<topicref href="topic.dita"/>
.....
<topicref href="topic.dita" copy-to="topic2.dita"/>
```

On the other hand, it **will** report a warning if there is a topic referenced twice and none of the reference-type elements has a @copy-to attribute set or both of them have the @copy-to attribute set to the same value:

```xml
<topicref href="topic.dita" copy-to="topic2.dita"/>
.....
<topicref href="topic.dita" copy-to="topic2.dita"/>
```

**Check for duplicate topic IDs within the DITA map context**

Checks for multiple topics with the same ID in the context of the entire map.

**Report duplicate key definitions**

Checks the DITA map for multiple key references with the same key defined for them. This is helpful because if you have two different resources with the same value for the @keys attribute, all references will point to the first one encountered and the other will be ignored.

**Note:**

This option takes key scopes (on page 2480) into account. For example, if you have something like this:

```xml
<topicref href="t2.dita" keys="k2"/>
<topicgroup keyscope="ks">
  <topicref href="t2.dita" keys="k2"/>
</topicgroup>
```

it will not report the "k2" key as a duplicate because it is defined in a key scope (on page 2480) on the second occurrence.

**Report unreferenced key definitions**
Checks the entire DITA map and reports any key definitions that are not referenced anywhere. Note that if the Use DITAVAL filters option is selected, this check will search for unreferenced key definitions based upon your selected filter.

**Report unreferenced reusable elements**

Checks the entire DITA map and reports any detected reusable elements that are not referenced anywhere. It looks for elements that have an ID specified in the following types of topic references:

- Any `<topicref>` that contains a `processing-role` attribute set to `resource-only`.
- Any other referenced topic that contains elements that are reused elsewhere through a `@conref` or `@conkeyref`.

**Report table layout problems**

Looks for table layout problems. The types of errors that may be reported include:

- If a row has fewer cells than the number of columns detected.
- For a CALS table, if a cell has a vertical span greater than the available rows count.
- For a CALS table, if the number of `<colspecs>` is different than the number of columns detected from the table `@cols` attribute.
- For a CALS table, if the number of columns detected from the table `@cols` attribute is different than the number of columns detected in the table structure.
- For a CALS table, if the value of the `@cols`, `@rowsep`, or `@colsep` attributes are not numeric.
- For a CALS table, if the `@namest`, `@nameend`, or `@colname` attributes point to an incorrect column name.

**Identify possible conflicts in profile attribute values**

When the profiling attributes of a topic contain values that are not found in parent topic profiling attributes, the content of the topic is overshadowed when generating profiled output. This option reports these possible conflicts.

**Report attributes and values that conflict with profiling preferences**

Looks for profiling attributes and values that are not defined in the Profiling / Conditional Text preferences page (on page 145) (you can click the Profiling Preferences button to open this preferences page). It also checks if profiling attributes defined as single-value have multiple values set in the searched topics.

**Additional Schematron checks**

Allows you to select a Schematron file that Oxygen XML Editor Eclipse plugin will use for the validation of DITA resources. You can specify the path by using the text field, its history dropdown, the Insert Editor Variables (on page 218) button, or the browsing actions in the Browse drop-down list.
Advanced Tip:
Some APIs are available that retrieve information about DITA keys that are referenced within a topic. The APIs can be called from XSLT Stylesheets (including XML Refactoring operations) or Schematron schemas. For details, see API Documentation: DITAXSLTExtensionFunctionUtil.

Publishing DITA Open Toolkit Project Files

Once a DITA-OT project file is opened in the application, two predefined publishing scenarios become available in the Configure Transformation Scenario(s) dialog box (on page 1284):

- **Publish DITA-OT Project (all deliverables)** - Runs the publishing engine and produces output for all deliverables defined in the project file.
- **Publish DITA-OT Project (select deliverable)** - Runs the publishing engine and produces output for only one deliverable specified by the end-user.

Some of the allowed transformation parameters that are relevant to the DITA-OT project file include:

- **project.file** - Specifies the path to the project file.
- **dita-ot.dir** - Specifies the directory where DITA-OT, used in transformation is installed.
- **additional.args** - Specifies the additional arguments used in transformation.
- **deliverable.id** - Specifies the id of the deliverable. This parameter is only available in the Publish DITA-OT Project (select deliverable) transformation.
- **jvm.args** - Specifies the JVM arguments used by the transformation for each deliverable. This can be used to increase the memory allocation used by the transformation.

**Example:** To set the JVM memory allocation to 5 GB for publishing deliverables, append the following value to the existing ones:

```
-Xmx5G
```

If the "pdf-css-html5" (based on Chemistry PDF CSS processor) deliverable publication fails with an Out Of Memory Error, try appending the `baseJVMArgLine` parameter to the "jvm.args" parameter value. For example:

```
-DbaseJVMArgLine-Xmx5G
```

When editing DITA OT project files in the Author visual editing mode, each presented deliverable has an inline button that can be used to individually publish it.

Main Files Support for DITA Open Toolkit Project Files

If you enable main files support at project level (on page 2604), you can choose to detect all top-level DITA Open Toolkit project files and to add them to the Main Files folder. You could also manually add the top-level
files for your DITA-OT project in the Main Files folder. The benefit of this is that whenever you rename or move files in the Project Explorer view, the references to those resources will automatically be updated.

Tip: The Referenced/Dependent Resources view (on page 2606) also works for DITA-OT project files.

Editing Contexts Detected from DITA Open Toolkit Project Files

Once a DITA-OT project file is added to the Main Files folder, the Context drop-down menu on the DITA Maps Manager toolbar will contain context DITA maps defined in the project file and the Profiling/Conditional Text menu will contain filter pairs gathered from the project file. When you select one of them in the drop-down menu, the application gathers the keys from the context DITA map and applies the filters specified in that context.

DITA Specialization Support

DITA is designed to let you design new markup and new document types that allow any general-purpose DITA processor to process documents that use the new markup. This in turn enables blind interchange of DITA documents from any source. In particular, in the context of a map, you can combine topics of any type and get usable results from any general-purpose DITA processor. Specialization is the one truly unique and distinguishing aspect of DITA. Even if you have no use for any aspect of DITA modularity or reuse, you still have a use for specialization simply because it enables reliable interchange in a way that no other XML application does.

For detailed information and step-by-step tutorials about DITA specializations, see DITA 4 Practitioners: DITA Configuration and Specialization Tutorials.

In addition, the topics in this section contain information about using DITA specializations in Oxygen XML Editor Eclipse plugin.

Integrating a DITA Specialization

A DITA specialization can have its document type defined with any of the following:

- **XSD** - For configuration and specialization tutorials, see [http://dita4practitioners.github.io/dita-specialization-tutorials/](http://dita4practitioners.github.io/dita-specialization-tutorials/).
- **Relax NG** - For more information, see the following presentation: Creating DITA-OT Constraint/ Specialization Plugins. For Relax NG coding requirements, see [https://www.oxygenxml.com/dita/1.3/specs/archSpec/base/relax-ng-requirements.html](https://www.oxygenxml.com/dita/1.3/specs/archSpec/base/relax-ng-requirements.html).
A DITA specialization may optionally include specialized processing, that is new XSLT template rules that match the extension part of the `@class` attribute values of the new elements, and thus extend the default processing available in the DITA Open Toolkit.

To integrate a DITA specialization into Oxygen XML Editor Eclipse plugin, use one of the following methods:

**DITA-OT Plugin Method**

**CAUTION:**
Oxygen XML Editor Eclipse plugin support engineers do not officially offer support and troubleshooting assistance for custom DITA-OT distributions or custom installed DITA-OT plugins. If you discover any issues or inconsistent behavior while using a custom DITA-OT or a DITA-OT that contains custom DITA-OT plugins, you should revert to the default built-in DITA-OT.

If the DITA specialization is available as a DITA Open Toolkit plugin, follow this procedure:

1. Copy the additional plugin to the location of the DITA-OT version you are using (by default, `DITA-OT-DIR\plugins` directory).

   **Important:**
   The application needs to have full write access permissions to the DITA-OT directory.

2. If Oxygen XML Editor Eclipse plugin was installed in the default location, you may need to restart and run it as an administrator.

3. Select the **Configure Transformation Scenario(s) (on page 1284)** action from the DITA Maps Manager toolbar (you could also use the same action on the main toolbar or open the Transformation Scenarios view (on page 1290)).

4. Select the **Run DITA-OT Integrator** transformation scenario (on page 2524).

   **Tip:**
   If you don’t see that scenario in the **Configure Transformation Scenario(s) (on page 1284)** dialog box or Transformation Scenarios view (on page 1290), click the **Settings** button and select the **Show all scenarios** option, but don’t forget to change it back to **Show only the scenarios available for the editor** after you are finished with this procedure.

5. Apply the scenario (on page 1283).

6. Check the **Results** panel at the bottom of the application to make sure the build was successful.

7. Restart Oxygen XML Editor Eclipse plugin with your normal permissions.

**Tip:**
Oxygen XML Editor Eclipse plugin detects new document templates (on page 252) contributed by the DITA-OT plugin as long as you do the following:
1. Create a new folder called **template_folders** inside your DITA OT plugin's folder. For example: `DITA-OT-DIR\plugins\my_custom_plugin\template_folders`.
2. Create one or more subfolders inside the **template_folders** directory that contain the new document templates. The new document templates found in those subfolders will be available in the New document wizard.

**Alternative Methods**

If the DITA specialization is not available as a DITA-OT plugin, you have the following options:

- If the DTDs that define the extension elements are located in a folder outside the DITA Open Toolkit folder, add new rules to the DITA-OT catalog file. These rules are meant for resolving the DTD references from the DITA files that use the specialized elements to that folder. This allows for correct resolution of DTD references to your local DTD files and is needed for both validation and transformation of the DITA maps or topics. The DITA-OT catalog file is called `catalog-dita.xml` and is located in the root folder of the DITA Open Toolkit.
- If there is specialized processing provided by XSLT stylesheets that override the default stylesheets from DITA-OT, these new stylesheets must be called from the DITA-OT Ant build scripts.

**Important:**

If you are using DITA specialization elements in your DITA files, it is recommended that you activate the **Enable DTD/XML Schema processing in document type detection** option in the Document Type Association preferences page (on page 88).

- You could create your own document templates (on page 252), store them in a custom directory, then add that directory to the list of template directories that Oxygen XML Editor Eclipse plugin uses by adding the directory to the list in the Document Templates Preferences (on page 87) page.

**Related Information:**

DITA Configuration and Specialization Tutorials

**Editing DITA Map Specializations**

In addition to recognizing the default DITA map (on page 2654) formats (`<map>` and `<bookmap>`), the DITA Maps Manager view (on page 2315) can also be used to open and edit specializations of DITA maps.

All advanced editing actions available for the map (such as insertion actions or editing properties) allow you to specify the element in an editable combo box. The elements that initially appear in the combo box are all the elements that are allowed to appear at the insert position for the given specialization.

The topic titles rendered in the DITA Maps Manager view (on page 2315) are collected from the target files by matching the `@class` attribute and not a specific element name.
When editing DITA specializations of maps in the main editor, the insertions of topic reference, topic heading, topic group and conref actions should work without modification. For the table actions, you have to modify each action manually to insert the correct element name at the cursor position. You can go to the DITA Map document type from the Document Type Association preferences page (on page 88) and edit the table actions to insert the element names as specified in your specialization. See Creating a Framework through the Configuration Dialog (on page 1919) for more details.

Related Information:
DITA Configuration and Specialization Tutorials
Integrating a DITA Specialization (on page 2599)

Editing DITA Topic Specializations

In addition to recognizing the default DITA topic formats, topic specializations can also be edited in Author mode.

The content completion should work without additional modifications and you can choose the tags that are allowed at the cursor position.

The CSS styles used for rendering the elements should also work on the specialized topics without additional modifications.

The toolbar/menu actions should be customized to insert the correct element names. You can go to the DITA document type from the Document Type Association preferences page (on page 88) and edit the actions to insert the element names, as specified in your specialization. See Creating a Framework through the Configuration Dialog (on page 1919) for more details.

DITA Configuration and Specialization Tutorials
Integrating a DITA Specialization (on page 2599)

Translating DITA Projects Overview

This topic contains some general information about translating DITA content and is meant to help those who do not store their DITA projects through a Content Management System (CMS) or other type of service that already includes their own translation support.

Choosing a Translation Agency

To minimize translation costs, it is recommended to choose a translation agency that is able to handle DITA content directly, without requiring you to convert the content to some intermediary format. This means that you benefit from the DITA reusable content features (on page 2453).

If you plan to translate your DITA project, it is also recommended that you contact a DITA-aware translation agency as early in your process as possible because translation agencies who translate DITA content directly usually need to have a preliminary discussion about how your project is structured, which terms need to be
skipped when translating, how various measuring units are translated, how content is reused, your metadata strategy, and how screenshots are handled. Those discussions may influence the way that you organize and write your DITA content.

---

**Note:**
If your translation agency does not directly handle DITA content, there are commercial tools that can be used to convert DITA to XLIFF (for example, https://www.maxprograms.com/products/fluenta.html).

---

### Optimizing Content for Translation

In general, there are three main principles to take into account when writing DITA content that will be translated:

1. Use a controlled vocabulary (for example, the Simplified Technical English vocabulary).
2. Avoid reusing inline elements other than product names. The following DITA Users List discussion describes the reasons for this: https://lists.oasis-open.org/archives/dita/201301/msg00029.html.
3. Avoid profiling/filtering content at inline level, for similar reasons.

### General DITA Project Structure

It is usually considered best practice to organize your DITA maps/topics in a separate folder for each language. One folder that contains the English version of all of your DITA resources and a separate folder for each of the other languages you will translate with equivalent DITA resources translated in that specific language.

### General Translation Workflow

When translating DITA content, the most common workflow involves these steps:

1. Create your content in the primary language.
2. Before each release, you gather all the DITA files that have been changed and need to be translated. The Oxygen Translation Package Builder Add-on could be handy for this.
3. Send a copy of the relevant DITA files to the translation agency (known also as “localization service provider”).
4. Receive translated DITA content back from the translation agency and integrate it in each language-specific project folder (on page 2603).

### Publishing Translated Content

All of your translated DITA maps and topics should have the `xml:lang` attribute set with the appropriate value on the root element. Along with the actual translated content, the published output may also contain static text (such as the word Table followed by the table number, Figure following by the number, or Note appearing before the content of each DITA `<note>` element). The DITA Open Toolkit includes support for various languages for HTML-based output and PDF-based output. You can also add support for other languages:
Globalizing DITA Content: Customizing Generated Text. For information about how to add a new language to the Oxygen WebHelp Responsive output, see Adding a New Language (on page 1432).

Liability

Translation agencies usually do not assume any liability for incorrectly translated content. If possible, it is recommended to have someone who is familiar with the particular language be responsible for reviewing and accepting the translated content. For example, if your company has regional headquarters located in various countries, perhaps someone from each headquarters could review the translated content.

Other Resources

Here are some links to other resources that might help you with translating DITA projects:

- DITA Translation: Organizing Your DITA Files
- DITA Translation: Using XLIFF to Translate DITA Projects
- WhP Localization Services Blog Page
- Webinar: DITA Project Management, Validation, and Translation in a Docs as Code Environment

Main Files Support in DITA

Oxygen XML Editor Eclipse plugin includes a feature that allows you to define Main Files (on page 2656) at project level. This feature is typically used in Oxygen XML Editor Eclipse plugin for XML documents to determine the context for operations such as validation, content completion, refactoring, searches, or displaying components collected from various modules. For DITA projects, this feature has a more limited purpose in Oxygen XML Editor Eclipse plugin since it is mainly used to provide the means for updating references to moved or renamed resources.

Since you can move or rename DITA resources (such as topics and maps) in the DITA Maps Manager (on page 2315), the root map (on page 2658) is used as the scope to update all the references to the moved or renamed resources. However, you do not have this option for non-DITA resources (such as folders, images, HTML files, audio, video, text files, Markdown documents) since they do not appear in the DITA Maps Manager. Also, when moving DITA resources in the DITA Maps Manager, you have to do it one at a time.

You can use the Main Files support in DITA to update all the references to moved or renamed resources in the scope of the Main Files, and since the root map (on page 2658) will be set as the Main File, you achieve the same result as if you were moving or renaming them in the DITA Maps Manager. It also allows you to move multiple DITA resources (or entire folders) at once in the Project Explorer view (on page 268), instead of the DITA Maps Manager, while still giving you the option of updating all the references.

How to Enable Main Files Support in DITA

To use the Main Files support in DITA, follow these steps:
1. Go to the Project Explorer view (on page 268) and select Enable Main Files Support from the contextual menu of the project root folder.

2. Add the main DITA map (root map) (on page 2658) to the Main Files folder by doing one of the following:
   - Right-click the project root folder or the Main Files folder and select Detect Main Files from Project.
   - Manually add the root map (on page 2658) to the Main Files folder by right-clicking a file from your project and selecting Add to Main Files from the contextual menu (or simply drag and drop it into the Main Files folder).

   **Tip:** You can set multiple maps in the Main Files folder and all of them will automatically be added to the list of root maps you can select from the drop-down menu in the DITA Maps Manager toolbar (on page 2319).

3. [Alternative] If you have a defined DITA Open Toolkit project XML file (on page 2598) you can add it to the Main Files folder. Once you do that the application will know the dependencies between all resources directly and indirectly referenced from the project file, including DITA maps, topics, binary resources and DITAVAL filter files.

### Moving or Renaming Non-DITA Resources and Updating the References to Them

With the Main Files support enabled, you can move or rename non-DITA resources (such as folders, images, HTML files, audio, video, text files, Markdown documents) or move multiple normal DITA resources (or entire folders) in the Project Explorer view (on page 268) and Oxygen XML Editor Eclipse plugin will offer the option of updating all the references to the moved or renamed resources in the scope of the Main Files (in this case, the main DITA map (root map) (on page 2658)).

To move or rename non-DITA resources (or move multiple DITA resources) and update the references to them, follow these steps:

1. Enable Main Files support and add your root DITA map (on page 2658) to the Main Files folder as described in the How to Enable Main Files Support in DITA (on page 2604) section above.

2. Go to the Project Explorer view (on page 268), and use one of the following methods to move or rename the resources:

   **Moving Resources**

   To move resources in the Project Explorer view (on page 268), do one of the following:
Simply drag and drop the resource to the new location in the tree structure.

- Use the Move action (or Copy and Paste actions) from the contextual menu.
- Right-click the resource and select Refactoring > Move resource action from the contextual menu. Note that this method also allows you to specify a new name and destination path in the Move resource dialog box.

Result: In all cases, a Move resource dialog box will be presented.

Renaming Resources

To rename resources in the Project Explorer view (on page 268), do one of the following:

- Select the resource and press F2, or simply left-click again, until the in-place editor allows you to change the file name.
- Right-click the resource and select Rename or Refactoring > Rename resource .

Result: In all cases, a Rename resource dialog box will be presented.

3. Make sure the Update references of the moved resource(s) option is selected in the resulting Move or Rename dialog box and keep the scope as main files to make sure all the references to the moved or renamed resource are updated.

DITA Referenced/Dependent Resources View

The Referenced/Dependent Resources view displays the hierarchy or dependencies for resources included in an XML document. For DITA resources, it will only show direct references, so resources that are indirectly referenced through keys are not presented in the hierarchy or dependencies tree.

To see the references or dependencies for a DITA resource (maps or topics), right-click a resource in the Project Explorer view (on page 268) and either select Show referenced resources or Show dependent resources.

If you want to view the dependencies for a media resource (such as images) directly referenced in a DITA topic, click the Show dependencies for button on the toolbar of the Referenced/Dependent Resources view, select the All files filter in the file browser, find the particular resource, and double-click it.
The following actions are available on the toolbar of the **Referenced/Dependent Resources** view:

- **Refresh**
  Refreshes the hierarchical structure.

- **Stop**
  Stops the computing.

- **Show hierarchy for**
  Computes the hierarchical structure of the references for a resource.

- **Show dependencies for**
  Computes the structure of the dependencies for a resource.

- **Configure dependencies search scope**
  Allows you to configure a scope to compute the dependencies structure. You can restrict the scope to the current project or to one or multiple *working sets (on page 2659)*. If the **Use only Main Files, if enabled** checkbox is selected, the scope of the search is restricted to the *Main Files* directory (on page 2604).

- **History**
  Provides access to the list of previously computed dependencies. Use the **Clear history** button to remove all items from this list.

The contextual menu for a resource listed in the **Referenced/Dependent Resources** view contains the following actions:
Open

Opens the resource. You can also double-click a resource in the hierarchical structure to open it.

Go to reference

Opens the source document where the resource is referenced.

Copy location

Copies the location of the resource.

Move resource

Opens the Move resource dialog box where the following fields are available:

- **Destination** - Presents the path to the current location of the resource you want to move and gives you the option to introduce a new location.
- **New name** - Presents the current name of the moved resource and gives you the option to change it.
- **Update references of the moved resource(s)** - As long as Main Files support is enabled (on page 2604), you can select this option to update the references to the resource you are moving, in accordance with the new location and name. A Preview option is available that allows you to see what will be updated before selecting Move to process the operation.

Rename resource

Opens the Rename resource dialog box where the following fields are available:

- **New name** - Presents the current name of the edited resource and allows you to modify it.
- **Update references of the renamed resource(s)** - As long as Main Files support is enabled (on page 2604), you can select this option to update the references to the resource you are renaming. A Preview option is available that allows you to see what will be updated before selecting Rename to process the operation.

Show referenced resources

Shows the references for the selected resource.

Show dependent resources

Shows the dependencies for the selected resource.

Add to Main Files

Adds the currently selected resource in the Main Files directory.

Expand More

Expands more of the children of the selected resource from the structure.

Collapse All

Collapses all children of the selected resource from the structure.
Tip:
When a recursive reference is encountered in the view, the reference is marked with a special icon ⊗.

Search and Rename Actions for IDs in DITA

Oxygen XML Editor Eclipse plugin allows you to search references to ID attributes (either direct references using the @href and @conref attributes or indirect references using @keyref or @conkeyref attributes) or to rename the id attribute in all the declared and referenced locations. The main benefit of this feature is the fact that it allows you to rename @id attributes (or search for their references) in the scope of the entire project. It also works for IDs defined inside DITA maps and then referenced in maps and topics.

In Author mode, these operations are available for DITA documents in the contextual menu (grouped in the Manage IDs submenu). In Text mode, these actions are also available in the Quick Assist menu. To access it, place the cursor inside the value of an @id attribute and click the yellow light bulb icon.

The possible actions include:

- **Rename in**
  - Renames the ID and all of its occurrences. Selecting this action opens a dialog box where you insert the new ID value and choose the scope of the rename operation. For a preview of the changes you are about to make, click Preview. This opens the Preview dialog box, which presents a list with the files that contain changes and a preview zone of these changes.

- **Rename in File** (Available in the Text mode only)
  - Renames the ID you are editing and all its occurrences in the current file.

- **Search References**
  - Searches for the references of the ID. By default, the scope of this action is the current project.

- **Search References in**
  - Searches for the references of the ID and you can choose the scope of the operation or configure working sets to use for the scope.

- **Search Declarations** (Available in the Text mode only)
  - Searches for the declaration of the ID reference. By default, the scope of this action is the current project.

- **Search Declarations in** (Available in the Text mode only)
  - Searches for the declaration of the ID reference and you can choose the scope of the operation or configure working sets to use for the scope.

- **Search Occurrences in file**
  - Searches for the declaration and references of the ID in the current document and presents the results in the message panel at the bottom of the application.

- **Change scope** (Available in the Quick Assist menu in Text mode only)
Opens a dialog box where you can choose the scope of the operation or configure working sets to use for the scope.

**Tip:**
A quick way to go to the declaration of an ID in **Text** mode is to move the cursor over an ID reference and use the **Ctrl + Single-Click (Command + Single-Click on macOS)** navigation.

Selecting an ID that you use for search or refactor operations differs between the **Text** and **Author** modes. In the **Text** mode, you position the cursor inside the declaration or reference of an ID. In the **Author** mode, Oxygen XML Editor Eclipse plugin collects all the IDs by analyzing each element from the path to the root. If more IDs are available, you are prompted to choose one of them.

**Related Information:**
Main Files Support in DITA (on page 2604)

## Metadata

Metadata is a broad concept that describes data that explains or identifies other data. Metadata can be used for many purposes, from driving automation of document builds to enabling authors and readers to find content more easily. DITA provides numerous types of metadata, each of which is used and created differently. Some of the most important forms of metadata in DITA are topic and taxonomy.

### Topic Metadata

Topic metadata describes the topic and what it is about. Topic metadata can be inserted in the `<prolog>` element of a topic or inside the `<topicref>` element that points to a topic from a map. In other words, metadata about the topic can be asserted by the topic itself, or can be assigned to it by the map that includes it in the build. This allows multiple maps to assign different metadata to the same topic. This may be appropriate when you want to describe a topic differently in various documents.

### Taxonomy and Subject Scheme

A taxonomy is a controlled vocabulary. It can be used to standardize how many things in your content and metadata are named. This consistency in naming can help ensure that automated processes work correctly, and that consistent terminology is used in content, and in metadata. In DITA, taxonomies are created using **subject scheme maps (on page 2658)**. When you are authoring, many of the values you choose from have been defined in **subject scheme maps**.

## Migrating MS Office Documents to DITA

Oxygen XML Editor Eclipse plugin integrates the entire **DITA for Publishers plugins suite** and provides some possibilities for migrating content from Microsoft Office® (and other Office-type formats) to DITA. There are also possibilities for migrating various other types of formats. For more information, see **Migrating Various Document Formats to and from DITA (on page 2612)**.
Migration from Office-type formats to XML is rarely perfect and manual changes may need to be made to the converted content, but the methods described below should help you find the best approach for your particular case.

**Smart Paste (Single Document)**

1. Open the document in MS Office (or other similar application), select all the content, and copy it.
2. Open Oxygen XML Editor Eclipse plugin and create a new DITA topic.
3. Paste the selected content in **Author** mode. The *Smart Paste functionality (on page 388)* will attempt to convert the content to DITA structure.

**HTML to DITA (Single Document)**

1. Save your document as HTML.
2. Once you have converted it to HTML, you have several possibilities:
   - In Oxygen XML Editor Eclipse plugin, select **File > Import/Convert > HTML File to XHTML** to import it as XHTML. Then, open the XHTML in Oxygen XML Editor Eclipse plugin and use one of the *XHTML to DITA transformation scenarios (on page 1109)* to convert the content to DITA structure.
   - Open the HTML file in any web browser, select all of its content, and copy it. Then, open Oxygen XML Editor Eclipse plugin, create a new **DITA** topic, and paste the selected content in **Author** mode. The *Smart Paste functionality (on page 388)* will attempt to convert the HTML content to DITA structure.

**Word to *LibreOffice*** to DITA (Single Document)**

1. Open the document in the *LibreOffice* application and save it as *DocBook*.
2. Open the *DocBook* document in Oxygen XML Editor Eclipse plugin.
3. Run the built-in *DocBook to DITA transformation scenario (on page 1199)*.
4. You may need to make some manual adjustments for elements that could not be mapped.

**Word to DITA using DITA For Publishers (Single Document)**

1. Save the document in the MS Word DOCX format.
2. Open it in the *Archive Browser view (on page 1803)* in Oxygen XML Editor Eclipse plugin and then open the *document.xml* file contained in the archive.
3. Run the built-in *DOCX DITA transformation scenario*. This scenario runs a build file over the DOCX archive and should produce a DITA project that contains a **DITA map** and multiple topics.
4. You may need to do some manual reconfiguration to map DOCX styles to DITA content. The XSLT conversion is part of the *DITA For Publishers* plugin and there is documentation for it available here: [http://www.dita4publishers.org/d4p-users-guide/user_docs/d4p-users-guide/word2dita/word2dita-intro.html](http://www.dita4publishers.org/d4p-users-guide/user_docs/d4p-users-guide/word2dita/word2dita-intro.html).
Word to DocBook to DITA (Multiple Documents)

1. Use a tool to convert the documents to **DocBook**. For example, *Pandoc* is a free document converter engine that can convert **DOCX** documents to **DocBook** and according to *Pandoc's manual*, you can specify multiple input files and use wildcards in the commands.

2. Save the newly converted **DocBook** documents somewhere in your project.

3. Perform a batch transformation (on page 1289) on all the newly converted **DocBook** documents:
   a. Select all the **DocBook** documents in the Project Explorer view (on page 268).
   b. Right-click the selected files and choose Transform > Configure Transformation Scenario(s).
   c. Apply the built-in **DocBook to DITA** transformation scenario (on page 1199).

4. You may need to make some manual adjustments in the resulting documents for elements that could not be mapped.

Migrating Excel and Other Types of Spreadsheets to DITA

It is possible to convert Microsoft Excel (or other similar types of documents) to DITA. To do this, copy the spreadsheet content and paste it in an open DITA topic in Author mode. The *Smart Paste functionality (on page 388)* will attempt to convert the content to DITA structure.

Resources

For more information about migrating to DITA, see the following resources:

- Webinar: Integrating Various Document Formats (OpenAPI, Word, Markdown, HTML, Excel) into DITA Documentation
- Webinar: Working with DITA in Oxygen - Migrating to DITA and Refactoring

Related information

- Migrating Various Document Formats to and from DITA (on page 2612)
- Smart Paste in Author Mode (on page 388)
- Importing Data (on page 1879)
- Working with Archives (on page 1803)

Migrating Various Document Formats to and from DITA

When organizations decide to use DITA for structuring, developing, managing, or publishing content, they usually already have content written in other formats and need to convert it to DITA. There are a variety of possibilities for a conversion to DITA, depending on the original format of the content.

Migration from other formats to DITA is rarely perfect and manual changes may need to be made to the converted content, but the methods described below should help you find the best approach for your particular case.
Migrating Microsoft Office and Other Similar Types of Documents to DITA

There are various possibilities for migrating content from Microsoft Office® (and other Office-type formats) to DITA. For details, see Migrating MS Office Documents to DITA (on page 2610).

Migrating Google Docs to DITA

There are several possibilities to convert Google Docs to DITA:

- Copy the content from Google Docs and paste it in an open DITA topic in Author mode. The Smart Paste functionality (on page 388) will attempt to convert the content to DITA.
- Save the Google document as OpenDocumentFormat (ODF), then open it in the free LibreOffice application and save it as DocBook. Next, open the DocBook document in Oxygen XML Editor Eclipse plugin and run the built-in transformation scenario called DocBook to DITA (on page 1199).

In all cases, you may need to make some manual adjustments in the resulting documents for elements that couldn't be mapped.

Migrating HTML Content to DITA

There are several possibilities to convert HTML content to DITA:

- Copy the HTML content and paste it in an open DITA topic in Author mode. The Smart Paste functionality (on page 388) will attempt to convert the content to DITA.
- Convert the HTML file to XHTML by selecting File > Import/Convert > HTML File to XHTML. Then, open the XHTML file and use one of the XHTML to DITA Transformation Scenarios (on page 1109) to convert the content to DITA.

Migrating Unstructured FrameMaker to DITA

There is a blog post that details various possibilities for converting Unstructured FrameMaker content to DITA: Migrating Unstructured FrameMaker to DITA.

Migrating MadCap Content to DITA

Some recent MadCap versions seem to have facilities to export content directly to DITA. Otherwise, you will need to convert XHTML content to DITA with a custom XSLT stylesheet to preserve variable references.

Migrating Other Formats to DITA

You may find third-party applications (such as Pandoc) that can convert your content to HTML or to some kind of XML format like DocBook. Once you have HTML or DocBook content, you can convert them to DITA using one of the methods described above.
Migrate from DITA to Confluence and Other Formats

There are various possible methods available for converting DITA content to Confluence and other formats (such as Microsoft Word or HTML). For details and ideas for some of the possible methods, see the DITA to Confluence blog post.

Resources

For more information about migrating to DITA, see the following resources:

- Webinar: Integrating Various Document Formats (OpenAPI, Word, Markdown, HTML, Excel) into DITA Documentation
- Webinar: Working with DITA in Oxygen - Migrating to DITA and Refactoring
- Video: Integrating REST-API Content into DITA Documentation in Oxygen
- Blog post: Migrating MS Word to DITA Using the Batch Documents Converter

How to Count Words in DITA Topics or Maps

There are various ways to count words in Oxygen XML Editor Eclipse plugin:

- Open a DITA topic in the Author visual editing mode, right-click anywhere in the editor, and select Text > Count Words.
- Open a DITA map in the DITA Maps Manager view. Click the Open map in editor with resolved topics toolbar button. In the newly opened DITA map, right-click anywhere in the editor and select Text > Count Words.
- Open a DITA map in the DITA Maps Manager view. Click the Configure Transformation Scenarios toolbar button and choose the DITA Map Metrics Report transformation scenario.

Tip:
Along with the word count, the DITA Map Metrics Report Transformation (on page 2522) provides additional information (such as the number of processed maps and topics, content reuse percentage, the number of elements, attributes, words, and characters used, and more).

DITA 1.3 Support

Starting with version 17.1, Oxygen XML Editor Eclipse plugin includes support for some DITA 1.3 features.

The Oxygen XML Editor Eclipse plugin publication of the full DITA 1.3 specifications can be found at https://www.oxygenxml.com/dita/1.3/specs/index.html#introduction/dita-release-overview.html.

The following table is a list of DITA 1.3 features and their implementation status in Oxygen XML Editor Eclipse plugin:
<table>
<thead>
<tr>
<th>Feature</th>
<th>Editing</th>
<th>Publishing [DITA Open Tool- it 4.1.1 is used]</th>
</tr>
</thead>
<tbody>
<tr>
<td>DITA 1.3 DTD, XML Schema, and Relax NG-based maps/topics/tasks/references, etc.</td>
<td>New DITA 1.3 document templates. By default, DITA topics and maps that do not specify version in the DOCTYPE declaration are also considered to be DITA 1.3 Specific annotations presented in the content completion assistance window and documentation tooltips for all new DITA 1.3 elements</td>
<td>N/A</td>
</tr>
<tr>
<td>Learning Object and Group maps</td>
<td>New document templates</td>
<td>No specific support implemented</td>
</tr>
<tr>
<td>Troubleshooting specialization</td>
<td>Create and edit new troubleshooting topics</td>
<td>No specific support implemented</td>
</tr>
<tr>
<td>XML markup domain</td>
<td>Validation and Content Completion</td>
<td>Special rendering in PDF and XHTML-based outputs</td>
</tr>
<tr>
<td>Equation and MathML domain</td>
<td>Validation and content completion</td>
<td>Special rendering in PDF and XHTML-based outputs</td>
</tr>
<tr>
<td>SVG domain</td>
<td>Validation and content completion</td>
<td>Special rendering in PDF and XHTML-based outputs</td>
</tr>
<tr>
<td>Other new DITA 1.3 elements (div, strike-through, overline, etc.)</td>
<td>Validation and Content Completion</td>
<td>Special rendering in PDF and XHTML-based outputs</td>
</tr>
<tr>
<td>Release management domain</td>
<td>Validation and Content Completion</td>
<td>No specific support implemented</td>
</tr>
<tr>
<td><strong>Scoped keys (on page 2480)</strong></td>
<td>Define key scopes</td>
<td>Partially implemented (Various issues may still be encountered)</td>
</tr>
<tr>
<td></td>
<td>Validate and check for completeness</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Resolve keyrefs and conkeyrefs taking key scopes into account</td>
<td></td>
</tr>
</tbody>
</table>
### Table 51. DITA 1.3 Features Implementation Status (continued)

<table>
<thead>
<tr>
<th>Feature</th>
<th>Editing</th>
<th>Publishing [DITA Open Toolkit 4.1.1 is used]</th>
</tr>
</thead>
<tbody>
<tr>
<td>Key scope information is displayed in a tooltip when hovering over an item in the DITA Maps Manager</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Branch filtering <em>(on page 2482)</em></td>
<td>Display, create, and edit <code>&lt;ditavalref&gt;</code> elements</td>
<td>Partially implemented (Various issues may still be encountered)</td>
</tr>
<tr>
<td>Key-based cross deliverable addressing</td>
<td>Special display for references to DITA maps with <code>scope=&quot;peer&quot;</code> and a defined <code>keyscope</code> Gather and present keys from peer maps</td>
<td>Not implemented.</td>
</tr>
<tr>
<td>Shorthand to address syntax that identifies elements in the same topic</td>
<td>Properly resolved for validation, links, and conrefs</td>
<td>Implemented</td>
</tr>
<tr>
<td>Various table attributes <em>(orientation, rotation, scope, and headers on cells)</em></td>
<td>Not implemented in the Table Properties action support. However, attributes can be changed from the Attributes view</td>
<td>Not implemented</td>
</tr>
<tr>
<td>New Map <code>topicref</code> attributes <em>(cascade, deliveryTarget)</em></td>
<td>Allow setting new attributes, propose proper values for them</td>
<td>Implemented</td>
</tr>
</tbody>
</table>

Watch our DITA 1.3 video tutorial for more information about key scopes and branch filtering.

### DITA 2.0 Support

Starting with version 23, Oxygen XML Editor Eclipse plugin includes support for some DITA 2.0 features. To enable this support, go to the **Options > Preferences > DITA** page and select the **Enable DITA 2.0 Editing Support (Experimental)** checkbox. Enabling it results in DITA 2.0 topic and map templates being available in the **New from templates** wizard *(on page 252)*.

The following table is a list of DITA 2.0 features and their implementation status in Oxygen XML Editor Eclipse plugin. The list of proposed DITA 2.0 changes is published here: [https://www.oasis-open.org/committees/download.php/65626/DITA-2.0-proposals.pdf](https://www.oasis-open.org/committees/download.php/65626/DITA-2.0-proposals.pdf).
<table>

<td>Also supported by the publishing engine.</td>
</tr>
</tbody>
</table>
22. Scripting Oxygen

Although Oxygen XML Editor Eclipse plugin is mostly intended to be a visual editing tool, the all platforms distribution is bundled with a scripts subfolder that contains scripts to automate and run various utilities from a command line.

To run any of these scripts, you are required to purchase a special scripting commercial license. Trial scripting licenses are also available, by request, for clients who are interested in testing the scripts for their particular workflows. Once you have a scripting license key available, you should copy the license key to a file named scriptinglicensekey.txt and save it in the main application directory (the parent directory of the "scripts" directory).

For more information about the Oxygen Scripting support, watch our Webinar: Automate XML processing with Oxygen XML Scripting.

DITA Validate and Check For Completeness

⚠️ Attention:
This script is bundled with the all platforms distribution of Oxygen XML Editor Eclipse plugin. To run the script, you are required to purchase a special scripting commercial license.

The Validate and Check For Completeness (on page 2360) action that is available on the toolbar of the DITA Maps Manager view provides the ability to validate a DITA map or a DITA Open Toolkit project file with a large array of settings. The settings dialog box has an Export settings option that can be used to export the settings to an XML configuration file. Once the settings are exported, you can use the validateCheckDITA.sh script (found in the scripts subfolder inside Oxygen's installation directory) to run a validation on a DITA map or DITA Open Toolkit project file and report the results in a separate XML document.

Sample Command-Line Arguments for the Validate and Check for Completeness Script:

```
sh scripts/validateCheckDITA.sh -i inputfile [-c contextId] [-s settingsFile] [-r reportFile]
```

A public example of using such a script as a GitHub action for reporting errors in pull requests on DITA project can be found here: https://github.com/oxygenxml/blog/blob/master/.github/workflows/workflow.yml. The GitHub action calls a Gradle script target named runValidation: https://github.com/oxygenxml/blog/blob/master/build/build.gradle.
Transform

**Attention:**

- This script is bundled with the all platforms distribution of Oxygen XML Editor Eclipse plugin. To run the script, you are required to purchase a special scripting commercial license.
- To execute a scenario based on WebHelp using this script, in addition to the scripting commercial license, you are required to purchase an Oxygen XML WebHelp license or a Oxygen Publishing Engine license.
- To execute a scenario based on Chemistry using this script, in addition to the scripting commercial license, you are required to purchase an Oxygen PDF Chemistry license or a Oxygen Publishing Engine license.

The Transform script (`transform.sh`, found in the `scripts` subfolder inside Oxygen's installation directory) helps you to execute a transformation scenario. You can run the scenarios for the existing document types (frameworks) (on page 2655) without setting a scenarios file, but for others, you have to specify a specialized scenarios file or a project file that contains scenarios.

You can export transformation scenarios from Oxygen XML Editor Eclipse plugin into a specialized scenarios file by using the Export selected scenarios action from the Transformation Scenarios view or using the Export Global Transformation Scenarios action from the Options menu.

**Arguments for the Transform Script**

```
sh scripts/transform.sh -i inputFile -sn scenarioName [-s scenariosFile] [-v]
```

- `-i inputFile`
  The input file that the transformation scenario is applied to.

- `-sn scenarioName`
  The name of the transformation scenario to be executed.

- `-s scenariosFile`
  The name of a file that contains additional scenarios. It can be a specialized scenarios file or a project file that contains project transformation scenarios.

  The scenarios from this file are merged with the scenarios from the document types (frameworks) (on page 2655).

- `-v`
  This argument can be specified to activate verbose logging for DITA-OT and ANT scenarios. It is useful for debugging.
Tip:
For a GitHub use case sample of this script, see Oxygen Transformation Template.

Validate

Attention:
This script is bundled with the all platforms distribution of Oxygen XML Editor Eclipse plugin. To run the script, you are required to purchase a special scripting commercial license.

All the validations possible in Oxygen XML Editor Eclipse plugin can also be performed from scripting. This includes validating various types of XML schemas, such as XSD, RNG, RNC, DTD, and NVDL, as well as JSON Schema, XProc, ANT, XSLT, XQuery, CSS, LESS, HTML, WSDL, OpenAPI, and of course, XML with XML schema, and JSON/YAML with JSON Schema.

The Validate script (validate.sh, found in the scripts subfolder inside Oxygen's installation directory) can be used to validate a file or a directory and get the validation results in various formats.

Arguments for the Transform Script

```
```

- **fileOrDirPath**
  Mandatory argument that specifies the path of the file or directory to validate (it can also be provided as a URL, but if you are validating directories, the only protocol considered is 'file://').

- **-s schemaFilePath**
  Optional argument that specifies the file path of the schema to validate against (it can also be provided as a URL).

- **-sn scenarioName**
  Optional argument that specifies the name of the validation scenario to be applied.

- **-sf scenariosFilePath**
  Optional argument that specifies the path of the file that stores the validation scenarios (either an Oxygen scenarios file or an Oxygen project file). It can also be provided as a URL.

Notes:

- The file that stores the validation scenarios must have a similar format to that generated from Oxygen by invoking Export Global Validation Scenarios from the Options menu. This type of Oxygen-generated scenarios files has a .scenarios
file extension by default and contains all the necessary information about custom validation scenarios created in Oxygen.

- Oxygen also saves the custom validation scenarios (as well as the scenario associations made explicitly for the files you work with) in special formatted Oxygen project files (usually with the .xpr file extension). Therefore, by using the arguments provided through -sn and -sf options, you can apply any scenario that was previously stored in either a scenarios file or an Oxygen project file.

- The -s and -sn options are mutually exclusive. Specifying both in the same command line is not allowed.

- **-if includeFilesFilter**
  
  Use this argument to only validate the files that match the specified pattern (e.g. .xml,.json). The default value is *.

- **-ef excludeFilesFilter**
  
  Excludes the files that match the specified pattern (e.g. test.wsdl,draft.xsl) from the validation.

- **-ed excludeSubdirsFilter**
  
  Excludes the sub-directories that match the specified pattern (e.g. .svn,_svn,.git).

- **-rf reportFile**
  
  Specifies the path for the report file to save the validation results, instead of presenting them in the console. The content of the report file is formatted according to the -rft argument. The report file path can also be provided as a URL.

- **-rft reportFormat**
  
  Specifies the format of the validation report. Possible values: txt, text, xml, json, html, htm. Default values: txt, text.

- **-v**
  
  Prints additional information to the console (Verbose mode).

- **-help | --help | -h | --h**
  
  Displays help text.

---

**Additional Notes:**

- Avoid activating the Verbose mode (-v option) when opting to redirect the console (and the validation report implicitly) to a specific file. That is done using the > operator instead of the -rf option. The additional information provided through verbose mode is also saved to the report file, making it to be reported as invalid when inspected in specialized editors. However, that information is placed at the beginning of the report, as plain text. If removed, the report should become valid.
• If the validation uses the **Saxon** engine and you do not have a commercial license, then the script automatically uses the **Saxon Home Edition** distribution that does not require a license. However, if the validation involves specific **Saxon Personal / Enterprise Edition** advanced features, then the validation report clearly signals that an appropriate **Saxon** license was not found. Placing a valid **Saxon** license file in the **lib** directory from the **Oxygen** installation folder solves the problem and the validation operation works as expected.

### Examples of the Validate Script

**Example 1: Validate a File by Applying a Custom Validation Scenario**

```sh
sh scripts/validate.sh "workspace/xmlFolder/xmlFile.xml" -sn "xmlValScn" -sf "workspace/scn/valScn.scenarios"
```

This command implies validating **xmlFile.xml** by applying the validation scenario named **xmlValScn**, described in the **valScn.scenarios** file. If you want to apply more than one validation scenario, you can use the `-sn scenarioName` construct multiple times.

**Example 2: Validate a Directory by Applying an Oxygen Default Validation Scenario**

```sh
sh scripts/validate.sh "workspace/DITAFolder" -sn "DITA"
```

A scenario name is provided, but without specifying a scenarios file. This command implies validating all files from **DITAFolder** by applying the **Oxygen** default validation scenario named **DITA** (in accordance with the association made in the **Document Type Configuration Dialog Box (on page 90)**).

**Example 3: Validate a File by Applying Associated Scenarios Stored in an Oxygen Project File**

```sh
sh scripts/validate.sh "workspace/mainFolder/main.xml" -sf "workspace/proj/proj-1.xpr"
```

A scenarios file is provided, but without specifying a scenario name. In this case, the argument provided through the `-sf` option is assumed to be an **Oxygen** project file and it is used to search for validation scenario associations made for the **main.xml** file. This command line implies that if validation scenario associations for **main.xml** are found in **proj-1.xpr**, then those scenarios are identified and applied. Otherwise, the validation first considers the schema associations declared in **main.xml** (if any), or default Oxygen validation scenarios are applied in accordance with the type of the file to validate (e.g. XML in this example).

**Example 4: Directory Default Validation and Custom Formatted Report Saved to a Specific Location**

```sh
sh scripts/validate.sh ../important/xmlFolder -rft html -rf "../important/reports/validation rep.html"
```

No validation scenario name, no scenario file, and no schema provided. This command line involves validating all files from the **xmlFolder**. Each file is validated against the schema(s) internally associated (if any). Otherwise, the default Oxygen validation scenarios for the
respective file type are applied. Also, the validation report is formatted in HTML and is saved to the validation rep.html file at the specified location.

Figure 655. Example of an HTML Validation Report

<table>
<thead>
<tr>
<th>SUMMARY</th>
</tr>
</thead>
<tbody>
<tr>
<td>5 files verified in total</td>
</tr>
<tr>
<td>3 files reported with validation problems</td>
</tr>
<tr>
<td>6 problems found on aggregate</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>FILES WITH VALIDATION PROBLEMS</th>
</tr>
</thead>
<tbody>
<tr>
<td>D:workspace/library/lib_dir/finallibrary.json (4 problems)</td>

| Description | #books/1/genre: ["Prose", "Fiction"] is not a valid value. Expected: [Prose, Drama, Science, Romance, Poetry] |
| Severity | Error |
| Engine name | JSON Validator |
| System ID | D:workspace/library/lib_dir/finallibrary.json |
| Main validation file | D:workspace/library/lib_dir/finallibrary.json |
| Schema | D:workspace/library/test-dir/lib schema |
| Start location | line: 20, column: 13 |
| End location | line: 20, column: 20 |

Resources

For more information about the validation script, see the following resources:

- Video: Validating XML and JSON Using Oxygen Command Line Scripts
- Webinar: Validating XML and JSON Documents Using Oxygen Scripting

Tip:

For some GitHub use case samples of this script, see Oxygen Validation Template and Oxygen Validation Action.
XML Refactoring

Attention:

• This script is bundled with the all platforms distribution of Oxygen XML Editor Eclipse plugin. To run the script, you are required to purchase a special scripting commercial license.
• To execute an XQuery refactoring operation using this script, in addition to the scripting commercial license, you are required to purchase a Saxon EE license.

The XML Refactoring script (xmlRefactoring.sh, found in the scripts subfolder inside Oxygen's installation directory) can be used to execute XML refactoring operations (on page 607). You can run a refactoring operation by specifying the operation id of the operation. If, in addition to the refactoring operations provided by Oxygen XML Editor Eclipse plugin in the OXYGEN_INSTALL_DIR/refactoring folder and in framework configurations, you want to run a custom refactoring operation, you have to specify the directory that contains it, using the od (operations directory) argument.

Arguments for the XML Refactoring Script

```
sh scripts/xmlRefactoring.sh  -id operationId -i inputFilesOrDirectories [-f filesFilter]
[-od operationsDirectory] [-p param1=value1...] [-v]
```

- **-id operationId**
  
The ID of the refactoring operation to be executed.

- **-i inputFilesOrDirectories**
  
  A list of space-separated input files or directories that the refactoring operation is applied to.

- **-f filesFilter**
  
  Specifies a filter for the input files by using a file pattern. For example, to restrict the operation to only analyze build files, you could use build*.xml for the file pattern.

- **-od operationsDirectory**
  
  A directory that contains additional refactoring operations.

- **-p param1=value1...**
  
  A list of space-separated pairs of a parameter's name and value used by the refactoring operation.

- **-v**
  
  This argument can be specified to activate verbose logging.
DITA Translation Package Builder

**Attention:**
This script is bundled with the all platforms distribution of Oxygen XML Editor Eclipse plugin. To run the script, you are required to purchase a special scripting commercial license.

The DITA Translation Package Builder (translationPackageBuilder.sh, found in the scripts subfolder inside Oxygen's installation directory) script helps you to build a translation package for DITA files that can be sent to translators. You can also extract the changed files back into your project once you receive the package back from the translators.

This script requires the DITA Translation Package Builder add-on to be installed in the all platforms distribution of Oxygen XML Editor Eclipse plugin. To install it the add-on, follow these instructions:

1. Go on the DITA Translation Package Builder plugin Releases page and download the latest translation-package-builder-{version}-plugin.jar package.
2. Unzip it inside `{oxygenInstallDir}/plugins`.

**Note:**
Do not create any intermediate folders. Afterwards, the file system should look like this: `{oxygenInstallDir}/plugins/translation-package-builder-{version}/plugin.xml`

**Examples for the DITA Translation Package Builder Script**

**Example: Generating a Milestone File**

```
sh scripts/translationPackageBuilder.sh -gm -i ditamapFile [-m milestoneFile] [-verbose]
```

This action is the first one to use. It will generate a unique hash for each documentation resource. This information will be used by the second action to detect which files have been modified. A milestone file should be generated the first time you install this plugin and henceforth, after each package is sent to translators.

- **-gm**
  Requests the generation of a milestone file.

- **-i ditamapFile**
  The main DITA map file.

- **-m milestoneFile**
  The path to the milestone file. If missing, it is assumed that the milestone will be saved in the DITA map parent folder with the following name: `{ditamapName}_translation_milestone.xml`.

- **-verbose**
Generates a console log about the performed steps. It is useful for debugging.

**Example: Creating a Package with the Modified Files to Send to Translation**

```
sh scripts/translationPackageBuilder.sh -gp -i ditamapFile [-m milestoneFile] -p package.zip [-verbose]
```

This action detects which files have been changed since the last generated milestone. These files are packed inside a ZIP file that can be sent to translators. After doing this, you can also generate a new milestone so that the next package will only contain new changes.

- **gp**
  - Requests the generation of a package with the modified files.

- **-i ditamapFile**
  - The main DITA map file.

- **-m milestoneFile**
  - The path to the milestone file. If missing, it is assumed that the milestone will be located in the DITA map parent folder with the following name: `{ditamapName}_translation_milestone.xml`.

- **-p package.zip**
  - The path to the zip archive where all the modified files are collected.

- **-verbose**
  - Generates a console log about the performed steps. It is useful for debugging.

**Example: Applying a Translation Package Over a DITA Map**

```
sh scripts/translationPackageBuilder.sh -ap -i ditamapFile -p package.zip [-verbose]
```

When the translated files arrive from the translator, you should open the DITA map that corresponds to the received language (e.g. open `dita-map-french.ditamap` if the package contains the french translation). Invoking this action will extract the changed files inside the map's directory.

- **ap**
  - Requests the application of a translation package over a DITA map.

- **-i ditamapFile**
  - The main DITA map file that matches the received package language. For example, if the package contains topics translated into French, then this map is the French version of your DITA map.

- **-p package.zip**
  - The path to the archive with all the translated files.

- **-verbose**
Generates a console log about the performed steps. It is useful for debugging.

**Batch Converter**

⚠️ **Attention:**
This script is bundled with the all platforms distribution of Oxygen XML Editor Eclipse plugin. To run the script, you are required to purchase a special scripting commercial license.

The **Batch Converter** script (`batchConverter.sh`, found in the `scripts` subfolder inside Oxygen's installation directory) helps you to convert between the following formats:

- HTML to XHTML
- HTML to DITA
- HTML to DocBook4 / DocBook5
- Markdown to XHTML
- Markdown to DITA
- Markdown to DocBook4 / DocBook5
- Word to XHTML
- Word to DITA
- Word to DocBook4 / DocBook5
- Excel to DITA
- Confluence to DITA
- DocBook to DITA
- OpenAPI to DITA
- JSON to XML
- JSON to YAML
- XML to JSON
- YAML to JSON

This script requires the **Oxygen Batch Documents Converter** add-on to be installed in the all platforms distribution of an Enterprise edition of Oxygen XML Editor Eclipse plugin.

To install the add-on, follow these instructions:

1. Go on the **Oxygen Batch Documents Converter** plugin Releases page and download the latest `oxygen-batch-converter-{version}-plugin.jar` package.
2. Unzip it inside `{oxygenInstallDir}/plugins`.

💡 **Note:**
Do not create any intermediate folders. Afterwards, the file system should look like this: `{oxygenInstallDir}/plugins/oxygen-batch-converter-{version}/plugin.xml`
Arguments for the Batch Converter Script

```
sh scripts/batchConverter.sh -i inputFiles -if inputFormat -o outputDirectory
-of outputFormat [-ss (true|false)] [-csd (true|false)] [-cs converterSettingsFile]
```

- **-i inputFiles**
  
  A list of space-separated input files or directories in file syntax form.

- **-if inputFormat**
  
  The format of the input files. The possible values are: html, markdown, word, confluence, docbook, excel, openapi, json, yaml, or xml.

- **-o outputDirectory**
  
  The output directory in file syntax form.

- **-of outputFormat**
  
  The format of the output files. The possible values are: xhtml, dita, docbook4, docbook5, json, yaml, or xml.

- **-ss (true|false) [only for Word to DITA, HTML to DITA, Markdown to DITA, DocBook to DITA, and OpenAPI to DITA conversions]**
  
  Splits sections marked by titles or headings to separate files and create a DITA map. The possible values are true or false (default).

- **-csd (true|false) [only for Markdown to DITA conversions]**
  
  Creates short description elements from the first paragraph before the headings. Possible values are true or false (default).

- **-cs converterSettingsFile**
  
  A file that contains the Batch Documents Converter add-on preferences settings. It can be an xpr file that contains project options or an xml file that contains global options. If not specified, the operation uses the application's default settings.

Confluence to DITA

The Confluence to DITA conversion processes the HTML content generated by the Confluence export process. For exporting, login to your Confluence account and navigate to the specific space that you want to export. Go to Space Settings > Export space and choose to export it as HTML. The index.html file resulting from this process has to be provided in the inputFiles argument.

Compile Framework Script

⚠️ **Attention:**

This script is bundled with the all platforms distribution of Oxygen XML Editor Eclipse plugin.
A custom framework (on page 2655) (document type) can be created using a special XML descriptor file (on page 1920), either from scratch or by extending an existing built-in framework (such as DITA or DocBook) and then making modifications to it.

The Compile Framework Script (compileFrameworkScript.sh, found in the scripts subfolder inside Oxygen’s installation directory) helps you to compile the script into the *.framework file that represents the framework configuration. Although Oxygen XML Editor Eclipse plugin is now able to automatically compile and load scripts, you might want to compile it yourself to obtain the resulting *.framework file if your framework runs on a different version of Oxygen XML Editor Eclipse plugin.

Arguments for the Compile Framework Script

```
sh scripts/compileFrameworkScript.sh -i "script1.exf" "script2.exf" "frameworksDir"
```

-i inputFiles

A list of space-separated Framework Extension Script Files (on page 1922) (*.exf) or directories in file syntax form. If a directory is specified, the Framework Extension Script Files (on page 1922) are searched for inside it and in its child directories.

XSLT Stylesheets Documentation

⚠️ Attention:

This script is bundled with the all platforms distribution of Oxygen XML Editor Eclipse plugin. To run the script, you are required to purchase a special scripting commercial license.

You can generate documentation for XSLT Stylesheets from Oxygen XML Editor Eclipse plugin by using the Tools > Generate Documentation > XSLT Stylesheet Documentation main menu action. The settings dialog box has an Export settings option that can be used to export the settings to an XML configuration file. Once the settings are exported, you can use the stylesheetDocumentation.sh script (found in the scripts subfolder inside Oxygen’s installation directory) to generate XSLT stylesheets documentation from the command line.

Sample Command-Line Arguments for the Generate XSLT Stylesheet Documentation Script

```
sh scripts/stylesheetDocumentation.sh xslFile [-cfg:configFile] | [-out:outputFile]
```

Tip:

For some GitHub use case samples of this script, see Oxygen Documentation Template and Oxygen Documentation Action.

Related information

XML Schema Documentation (on page 2630)
WSDL Documentation (on page 2634)
XML Schema Documentation

Attention:
This script is bundled with the all platforms distribution of Oxygen XML Editor Eclipse plugin. To run the script, you are required to purchase a special scripting commercial license.

You can generate documentation for XML Schemas from Oxygen XML Editor Eclipse plugin by using the Tools > Generate Documentation > XML Schema Documentation main menu action. The settings dialog box has an Export settings option that can be used to export the settings to an XML configuration file. Once the settings are exported, you can use the schemaDocumentation.sh script (found in the scripts subfolder inside Oxygen's installation directory) to generate XML Schema documentation from the command line.

Sample Command-Line Arguments for the Generate XML Schema Documentation Script

```
```

Tip:
For some GitHub use case samples of this script, see Oxygen Documentation Template and Oxygen Documentation Action.

Related information
XSLT Stylesheets Documentation (on page 2629)
WSDL Documentation (on page 2634)

JSON Schema Documentation

Attention:
This script is bundled with the all platforms distribution of Oxygen XML Editor Eclipse plugin. To run the script, you are required to purchase a special scripting commercial license.

You can generate documentation for a JSON Schema file from Oxygen XML Editor Eclipse plugin by using the Tools > Generate Documentation > JSON Schema Documentation main menu action. This tool requires an additional add-on to be installed, so the first time you invoke the action, Oxygen XML Editor Eclipse plugin presents a dialog box asking if you want to install it. Once installed, you need to restart Oxygen XML Editor Eclipse plugin and the JSON Schema Documentation action will invoke the tool.

You can use the jsonSchemaDocGen.sh script (found in the scripts subfolder inside Oxygen's installation directory) to generate documentation from a JSON schema file using the command line.
Tip:
For some GitHub use-case samples for this script, see Oxygen Documentation Template and Oxygen Documentation Action.

Arguments for the JSON Schema Documentation Script

```
sh scripts/jsonSchemaDocGen.sh filePath [-ofp outputFilePath] [-sb split by (location, components)]
```

**filePath**
Mandatory argument specifying the path of the file that needs to generate documentation (it can also be provided as a URL).

**-ofp output file path**
Optional argument that specifies the path of the output file.

**-sb split by (location, components)**
Optional argument that specifies what type of split scenario is used (location, components). By default, one file scenario is used.

**-ea exclude annotations**
Optional argument that specifies if the JSON schema annotations should be present. Default value is true.

**-ec exclude constraints**
Optional argument that specifies if the JSON schema constraints should be present. Default value is true.

**-ep exclude properties**
Optional argument that specifies if the JSON schema properties should be present. Default value is true.

**-epp exclude pattern properties**
Optional argument that specifies if the JSON schema pattern properties should be present. Default value is true.

**-ee exclude enumerations**
Optional argument that specifies if the JSON schema enumerations should be present. Default value is true.

**-es exclude source**

Optional argument that specifies if the JSON schema source should be present. Default value is true.

-eub exclude used by
Optional argument that specifies if the JSON schema used by should be present. Default value is true.

-ecp exclude compositions
Optional argument that specifies if the JSON schema compositions should be present. Default value is true.

-ed exclude diagram
Optional argument that specifies if the JSON schema diagram should be present. Default value is true.

-eim exclude image map
Optional argument that specifies if the JSON schema image map should be present. Default value is true.

-il include location
Optional argument that specifies if the JSON schema location should be present. Default value is false.

-help | --help | -h | --h
Displays help text.

OpenAPI Documentation

Attention:
This script is bundled with the all platforms distribution of Oxygen XML Editor Eclipse plugin. To run the script, you are required to purchase a special scripting commercial license.

You can generate documentation for an OpenAPI file from Oxygen XML Editor Eclipse plugin by using the Tools > Generate Documentation > OpenAPI Documentation main menu action. This tool requires an additional add-on to be installed, so the first time you invoke the action, Oxygen XML Editor Eclipse plugin presents a dialog box asking if you want to install it. Once installed, you need to restart Oxygen XML Editor Eclipse plugin and the OpenAPI Documentation action will invoke the tool.

You can use the openApiDocGen.sh script (found in the scripts subfolder inside Oxygen's installation directory) to generate documentation from an OpenAPI file using the command line.

Tip:
For some GitHub use case samples of this script, see Oxygen Documentation Template and Oxygen Documentation Action.
# Arguments for the OpenAPI Documentation Script

```bash
sh scripts/openApiDocGen.sh filePath [-ofp outputFilePath] [-sb split by (location, components)]
```

**filePath**

Mandatory argument specifying the path of the file that needs to generate documentation (it can also be provided as a URL).

**-ofp output file path**

Optional argument that specifies the path of the output file.

**-sb split by (location, components)**

Optional argument that specifies what type of split scenario is used (location, components). By default, one file scenario is used.

**-ea exclude annotations**

Optional argument that specifies if the JSON schema annotations should be present. Default value is true.

**-ec exclude constraints**

Optional argument that specifies if the JSON schema constraints should be present. Default value is true.

**-ep exclude properties**

Optional argument that specifies if the JSON schema properties should be present. Default value is true.

**-epp exclude pattern properties**

Optional argument that specifies if the JSON schema pattern properties should be present. Default value is true.

**-ee exclude enumerations**

Optional argument that specifies if the JSON schema enumerations should be present. Default value is true.

**-es exclude source**

Optional argument that specifies if the JSON schema source should be present. Default value is true.

**-eub exclude used by**

Optional argument that specifies if the JSON schema used by should be present. Default value is true.
-ecp exclude compositions
  Optional argument that specifies if the JSON schema compositions should be present. Default value is true.

-ed exclude diagram
  Optional argument that specifies if the JSON schema diagram should be present. Default value is true.

-eim exclude image map
  Optional argument that specifies if the JSON schema image map should be present. Default value is true.

-il include location
  Optional argument that specifies if the JSON schema location should be present. Default value is false.

-help | --help | -h | --h
  Displays help text.

WSDL Documentation

⚠️ Attention:
  This script is bundled with the all platforms distribution of Oxygen XML Editor Eclipse plugin. To run the script, you are required to purchase a special scripting commercial license.

You can generate documentation for WSDL documents from Oxygen XML Editor Eclipse plugin by using the Tools > Generate Documentation > WSDL Documentation main menu action. The settings dialog box has an Export settings option that can be used to export the settings to an XML configuration file. Once the settings are exported, you can use the wsdlDocumentation.sh script (found in the scripts subfolder inside Oxygen's installation directory) to generate XML Schema documentation from the command line.

Sample Command-Line Arguments for the Generate WSDL Documentation Script

```
sh scripts/wsdlDocumentation.sh wsdlFile [-cfg:configFile] | [-out:outputFile]
```

ℹ️ Tip:
  For some GitHub use case samples of this script, see Oxygen Documentation Template and Oxygen Documentation Action.

XML Instance Generator

Attention:
This script is bundled with the all platforms distribution of Oxygen XML Editor Eclipse plugin. To run the script, you are required to purchase a special scripting commercial license.

You can generate multiple XML documents from an XML Schema from Oxygen XML Editor Eclipse plugin by using the Tools > Generate Sample XML Files main menu action. The settings dialog box has an Export settings option that can be used to export the settings to an XML configuration file. Once the settings are exported, you can use the xmlGenerator.sh script (found in the scripts subfolder inside Oxygen's installation directory) to generate multiple XML instance files from the command line.

Sample Command-Line Arguments for the Generate Sample XML Files Script

```bash
sh scripts/xmlGenerator.sh path/to/config/file [-verbose]
```

Extended Version of the Script and its Arguments

```bash
sh scripts/xmlGenerator.sh [[path_to_config_file] [-s XML_schema_path -r root [-n ns] [-o output_dir]
[-f instance_name] [-i num_of_instances]] [-verbose]]
```

- **path_to_config_file**
  The path to the file that contains the configuration to be used.

- **-s XML_schema_path**
  The path to the XML schema to be used for generating the XML file(s). This argument can also be provided as a URL.

- **-n ns**
  The namespace used for the XML namespace declaration.

- **-r root**
  The root element for the generated file(s).

- **-o output_dir**
  The output directory to be used for storing the generated file(s).

- **-f instance_name**
  The pattern name to be used for the generated file(s). It is usually the name plus extension.

- **-i num_of_instances**
  The number of XML files to be generated.

- **-verbose**
  This argument can be specified to activate verbose logging.
Flatten XML Schema

Attention:
This script is bundled with the all platforms distribution of Oxygen XML Editor Eclipse plugin. To run the script, you are required to purchase a special scripting commercial license.

You can flatten an XML schema that contains multiple includes and redefines to a single schema file from Oxygen XML Editor Eclipse plugin by using the Tools > Flatten Schema main menu action. You can use the equivalent flattenSchema.sh script (found in the scripts subfolder inside Oxygen's installation directory) to flatten an XML schema from the command line.

Sample Command-Line Arguments for the Flatten Schema Script

```
    [-flattenImports:<boolean_value>]
    | [-useCatalogs:<boolean_value>]
    [-flattenCatalogResolvedImports:<boolean_value>] [-verbose]]
```

Compare Directories

Attention:
This script is bundled with the all platforms distribution of Oxygen XML Editor Eclipse plugin. To run the script, you are required to purchase a special scripting commercial license.

The Compare Directories script (compareDirs.sh, found in the scripts subfolder inside Oxygen's installation directory) can be used to compare two directories and get the comparison results in various formats.

Arguments for the Compare Directories Script

```
sh scripts/compareDirs.sh firstDirPath secondDirPath [[baseDirPath] [-if includeFilesFilter]
    [-ia includeArchives] [-ef excludeFilesFilter] [-ed excludeSubdirsFilter] [-cm comparisonMode]
    [-alg comparisonAlg] [-als algStrength] [-iws ignoreWS] [-ipi ignorePI] [-icm ignoreComments]
    [-idt ignoreDocType] [-itn ignoreText] [-ins ignoreNS] [-ind ignoreNSDecl] [-inp ignorePrefixes]
    [-iao ignoreAttrOrder] [-iet ignoreExpStateForEmptyElems] [-enx XPathExprToExcludeNodes] [-out
    outputFormat] [-outf outfile outputFile] [-merge mergeOperation] [-mergeout outputDirPathForMerge]]
    [-help | --help | -h | --h]
```
Mandatory argument that specifies the first directory path (it can also be provided as a URL using 'file://' protocol).

**secondDirPath**

Mandatory argument that specifies the second directory path (it can also be provided as a URL using 'file://' protocol).

**baseDirPath**

Optional argument that specifies the path of the base directory that the other two directories will be compared against in a 3-way comparison (it can also be provided as a URL). If present, it must appear immediately after the first two mandatory arguments.

**-if includeFilesFilter**

Use this argument to only include files that match the specified pattern in the comparison (e.g. `.xml`, `.json`). Default value = `*`.

**-ia includeArchives**

If set to `true`, files from archives are included in the comparison. Default value = `false`.

**-ef excludeFilesFilter**

Use this argument to exclude files that match the specified pattern from the comparison (e.g. `*.jpg`).

**-ed excludeSubdirsFilter**

Use this argument to exclude sub-directories that match the specified pattern from the comparison (e.g. `.svn`, `_svn`, `.git`).

**-cm comparisonMode**

Specifies the comparison mode. There are three modes available: `content`, `binary`, and `timestamp`. Default value = `content`.

**-alg comparisonAlg**

Specifies the algorithm to be used for the comparison. Possible values: `auto`, `chars`, `words`, `lines`, `syntax_aware`, `xml_fast`, and `xml_accurate`. Default value = `auto`.

**-als algStrength**

Specifies the strength of the algorithm to be used for the comparison. Possible values: `low`, `medium`, `high`, and `very_high`. Default value = `medium`.

**-iws ignoreWS**

If set to `true`, whitespaces are ignored if differences consist only of whitespaces. Default value = `false`.

**-ipi ignorePI (only for the XML-aware algorithms)**

If set to `true`, processing instructions are ignored in the comparison. Default value = `false`.

**-icm ignoreComments (only for the XML-aware algorithms)**
If set to `true`, comments are ignored in the comparison. Default value = `false`.

- **idt ignoreDocType (only for the XML-aware algorithms)**
  If set to `true`, DOCTYPE sections are ignored in the comparison. Default value = `false`.

- **itn ignoreText (only for the XML-aware algorithms)**
  If set to `true`, text content is ignored in the comparison. Default value = `false`.

- **ins ignoreNS (only for the XML-aware algorithms)**
  If set to `true`, namespaces are ignored in the comparison. Default value = `false`.

- **ind ignoreNSDecl (only for the XML-aware algorithms)**
  If set to `true`, namespace declarations are ignored in the comparison. Default value = `false`.

- **inp ignorePrefixes (only for the XML-aware algorithms)**
  If set to `true`, prefixes are ignored in the comparison. Default value = `false`.

- **iao ignoreAttrOrder (only for the XML-aware algorithms)**
  If set to `true`, the order of attributes is ignored in the comparison. Default value = `false`.

- **iee ignoreExpStateForEmptyElems (only for the XML-aware algorithms)**
  If set to `true`, the expansion state for empty elements is ignored in the comparison. Default value = `false`.

- **enx XPathExprToExcludeNodes**
  Specifies an XPath expression to exclude certain nodes from the comparison.

  **Note:**
  The argument is only considered if you specify either `html/ifcr` or `htm/ifcr` as an option for the `-out` argument. These are the only script options that involve additional file comparisons, where exclusion of certain nodes from the comparison via XPath expressions can be applied.

- **merge mergeOperation**
  If set to `true`, a merge operation is invoked after the comparison. Default value = `false`.

  **Notes:**
  - This argument is considered only for 3-way comparisons (i.e. only if the `baseDirPath` argument is provided).
  - The merge operation is similar to the same process in any versioning system. Following the comparison between the first and second directories (relative to the base folder), all the differences of the type `incoming` are considered and the content of the first directory is updated accordingly.
-mergeout outputDirPathForMerge

Invokes a merge operation after the comparison and also allows you to specify the output directory path for the merge operation. For example, it allows you to specify a specific existing or new directory where the results of the merge operation is saved, other than the first directory path for the comparison (which is what happens when using only the -merge argument). The path of the directory can also be provided as a URL using file:// protocol. This argument and the -merge argument are not dependent on each other.

-out outputFormat

Notes:

- If you choose to save/redirect the console output to a file, this argument establishes the type of the output file and its content is formatted accordingly. If you skip specifying the "grouped" or the "raw" qualifiers, "grouped" takes precedence.
- If you choose the html or htm output format, it is recommended that you also choose to save/redirect the console to the specified HTML file to view the comparison result in your preferred browser.
- The "ifcr" qualifier for the html or htm values is considered only if the -outfile argument is also present. IFCR is an acronym for Include File Comparison Reports and it means that, along with generating the directory comparison report, separate file comparison reports will be generated for all modified file pairs. These reports are available through links from the main report and are saved to a specific directory based on the value provided by the outfile argument. It will have the same parent directory and the same name as the outputFile plus -OXY-FC-REPORTS added to the end of its name.
- The html value, as well as the grouped, raw, or ifcr qualifiers, are not considered if the -merge argument is present.

-outfile outputFile

Specifies the path for an output file to save the comparison results, instead of presenting them in the console. The content of the output file is formatted according to the -out argument. The output file path can also be provided as a URL using file:// protocol.

• Conflicting changes are not addressed.
• After the comparison, a report is created that provides details about the changes that were made.
-help | --help | -h | --h

Displays help text.

Notes:

- For boolean arguments, it is not necessary to provide the "true" value. Their presence in the argument list is equivalent to setting their value to "true" (and their absence from the argument list is equivalent to setting their value to "false"). However, constructs of the form `bool_option true|false` are accepted and interpreted accordingly.
- File markers used in reports are as follows: M = modified, O1 = only found in 1st directory, O2 = only found in 2nd directory.

Examples of Compare Directories Script

Example 1: Compare Directories and Include Archives While Excluding JPEGs

The following command results in archives being included in the comparison, while JPEGs are excluded:

```bash
sh scripts/compareDirs.sh dir1 dir2 -ia true -ef *.jpg
```

Example 2: Compare Directories Only Including XML Files While Excluding Comments and the Attribute Order

The following command only includes XML files (even from archives) in the comparison, while ignoring the comments and attribute order:

```bash
sh scripts/compareDirs.sh dir1 dir2 -if *.xml -ia -iao -icm
```

Example 3: Compare Directories Only Including XML Files While Excluding Comments and the Attribute Order

The following command redirects the comparison results to a JSON file named "results.json", with "raw" mode formatting:

```bash
sh scripts/compareDirs.sh dir1 dir2 -out json/raw > results.json
```

Example 4: Compare Directories and Generate Comparison Report

It is possible to generate a report in the form of an HTML file that contains the results of the comparison. The following command compares the directories and redirects the console to the specified HTML file to view the comparison results:

```bash
sh scripts/compareDirs.sh dir1 dir2 -out html -outfile results.html
```
Figure 656. Example of an HTML Report for Directory Comparison

Resources

For more information about the file comparison script and how to generate comparison reports in various formats, see the following resources:

- **Webinar:** The New Oxygen Compare and Merge Scripts.
- **Video:** Generating Directory Comparison Reports Using Command-Line Scripts.

**Tip:**
For some GitHub use case samples of this script, see Oxygen Comparison Template and Oxygen Comparison Action.

**Related information**
Compare Files Script (on page 2641)

**Attention:**
This script is bundled with the all platforms distribution of Oxygen XML Editor Eclipse plugin. To run the script, you are required to purchase a special scripting commercial license.

The **Compare Files** script (`compareFiles.sh`, found in the `scripts` subfolder inside Oxygen's installation directory) can be used to compare files (2-way or 3-way) and get the comparison results in various formats.

**Arguments for the Compare Files Script**

```
```
firstFilePath

Mandatory argument that specifies the first file path (it can also be provided as a URL).

secondFilePath

Mandatory argument that specifies the second file path (it can also be provided as a URL).

baseFilePath

Optional argument that specifies the path of the base file that the other two files will be compared against in a 3-way comparison (it can also be provided as a URL).

-ct contentType

Specifies the content type of the files to be compared. Possible values (based on known extensions of some of the most common file types): .xml, .dtd, .css, .rnc, .xquery, .json, .yaml, .java, .js, .c, .cpp, .pl, .py, .php, .sql, .bat, .sh, .properties, .txt. The option is used to force the file handling to the specific type of file. Otherwise, the file extension is auto-detected.

-alg comparisonAlg

Specifies the algorithm to be used for the comparison. Possible values: auto, chars, words, lines, syntax_aware, xml_fast, and xml_accurate. Default value = auto.

-als algStrength

Specifies the strength of the algorithm to be used for the comparison. Possible values: low, medium, high, and very_high. Default value = medium.

-iws ignoreWS

If set to true, whitespaces are ignored if differences consist only of whitespaces. Default value = false.

-mpi ignorePI (only for the XML-aware algorithms)

If set to true, processing instructions are ignored in the comparison. Default value = false.

-icm ignoreComments (only for the XML-aware algorithms)

If set to true, comments are ignored in the comparison. Default value = false.

-idt ignoreDocType (only for the XML-aware algorithms)

If set to true, DOCTYPE sections are ignored in the comparison. Default value = false.

-itn ignoreText (only for the XML-aware algorithms)

If set to true, text content is ignored in the comparison. Default value = false.

-ins ignoreNS (only for the XML-aware algorithms)

If set to true, namespaces are ignored in the comparison. Default value = false.

-ind ignoreNSDecl (only for the XML-aware algorithms)
If set to true, namespace declarations are ignored in the comparison. Default value = false.

-inp ignorePrefixes (only for the XML-aware algorithms)
If set to true, prefixes are ignored in the comparison. Default value = false.

-iao ignoreAttrOrder (only for the XML-aware algorithms)
If set to true, the order of attributes is ignored in the comparison. Default value = false.

-iee ignoreExpStateForEmptyElems (only for the XML-aware algorithms)
If set to true, the expansion state for empty elements is ignored in the comparison. Default value = false.

-enx XPathExprToExcludeNodes
Specifies an XPath expression to exclude certain nodes from the comparison.

-merge mergeOperation
If set to true, a merge operation is invoked after the comparison. Default value = false.

Notes:

- This argument is considered only for 3-way comparisons (i.e. only if the baseFilePath argument is provided).
- The merge operation is similar to the same process in any versioning system. Following the comparison between the first and second files (relative to the base file), all the differences of the type incoming are considered and the content of the first file is updated accordingly.
- If conflicting changes are detected, the merge operation is aborted and the first file remains unchanged.
- After the comparison and merge, a report is created that provides some details about the changes that were made.

-mergeout outputDirPathForMerge
Invokes a merge operation after the comparison and also allows you to specify the output directory path for the merged file. Instead of directly affecting the first compared file (which is what happens when using only the -merge argument), a new file is created with the same name as the first file and it is saved in the specified directory. The path of the output directory can also be provided as a URL. This argument and the -merge argument are not dependent on each other.

-out outputFormat
Specifies the format of the output. Possible values: yaml, json, xml, html, htm, html/inlineCSS, or htm/inlineCSS. Default value = yaml.
Notes:

- If you choose to save/redirect the console output to a file, this argument establishes the type of the output file and its content is formatted accordingly.
- If you choose any of the html, html/inlineCSS, htm, or htm/inlineCSS output formats, it is recommended that you also choose to save/redirect the console to the specified HTML file to view the comparison result in your preferred browser.
- The inlineCSS qualifier for the html and htm values implies that the CSS-based generated HTML code is more suitable to be directly inserted in emails (as most email clients only accept inline CSS styling for HTML emails).
- The html and htm values (with or without the inlineCSS qualifier) are not considered if the -merge argument is present.

-outfile outputFile

Specifies the path for an output file to save the comparison results, instead of presenting them in the console. The content of the output file is formatted according to the -out argument. The output file path can also be provided as a URL.

-help | --help | -h | --h

Displays help text.

Note:

For boolean arguments, it is not necessary to provide the "true" value. Their presence in the argument list is equivalent to setting their value to "true" (and their absence from the argument list is equivalent to setting their value to "false"). However, constructs of the form bool_option true|false are accepted and interpreted accordingly.

Examples of Compare Files Script

Example 1: Compare Files and View Results in XML Format

The following command compares the files (ignoring the namespaces and prefixes) and redirects the console output to the results.xml file (XML-formatted):

```
sh scripts/compareFiles file1 file2 -ins -inp -ind -out xml > results.xml
```

Example 2: Compare Files with Line by Line Algorithm

The following command compares the files using the lines algorithm and ignores whitespaces:

```
sh scripts/compareFiles.sh file1 file2 -alg lines -iws
```

Example 3: Compare Files and Generate Comparison Report
It is possible to generate a report in the form of an HTML file that contains the results of the comparison. The following command compares the files and redirects the console to the specified HTML file to view the comparison results:

```
sh scripts/compareFiles.sh file1 file2 -o out html -o outFileName.html
```

**Figure 657. Example of File Comparison Report in HTML Format**

**Merge Files with Change Tracking Highlights**

**Attention:**

This script is bundled with the all platforms distribution of Oxygen XML Editor Eclipse plugin. To run the script, you are required to purchase a special scripting commercial license.

The Merge Files with Change Tracking Highlights script (mergeFilesTrackChanges.sh, found in the scripts subfolder inside Oxygen's installation directory) can be used to merge 2 XML files (based on a 2-way
The **Author** mode comparison results are saved as documents with highlighted tracked changes that can later be reviewed and accepted or rejected.

**Notice:**

This script is intended to be used for merging XML documents (Oxygen XML Editor Eclipse plugin creates change tracking markers only for XML file types. Using this script for document types other than XML, or for documents that are not XML well-formed, causes document parsing errors and the merge operation fails.

### Arguments for the Merge Files with Change Tracking Highlights Script

```
sh mergeFilesTrackChanges.sh pathOfBaseFile pathOfFileToMergeWith [[pathOfOutFile] [-nb noBackupOfBaseFile]] [-help | --help | -h | --h]
```

- **pathOfBaseFile**
  - Mandatory argument that specifies the path of the base file (it can also be provided as a URL).

- **pathOfFileToMergeWith**
  - Mandatory argument that specifies the file to merge with (it can also be provided as a URL).

- **pathOfOutFile**
  - Optional argument that specifies the path of the file where the merge operation results are saved to (it can also be provided as a URL). If present, it must appear immediately after the first two mandatory arguments. If absent, the merge results are saved to the base file, by overwriting it. You cannot choose the same file specified as the file to merge with as the output file (the merge process is aborted in this case). Also, if the output is a remote resource, its entire parent directory structure must already exist. Otherwise, an I/O exception is thrown and the merge results cannot be saved.

- **-nb noBackupOfBaseFile**
  - Set to **true** if you do not want a backup copy of the base file on the hard disk. There are 2 situations when a backup of the base file is performed automatically and the backup operation must succeed to proceed with the merge. Otherwise, the merge process is aborted if the output file is not specified (i.e. the **pathOfOutFile** argument is not present) or the specified output file is the base file itself.

  The backup copy will have the same parent directory as the base directory and its name will be the name of the base file suffixed by ".OXY.BAK". The default value is **false**, which means that for either of the 2 previously mentioned situations, a backup copy of the base file will be kept on the hard disk.
Note:
The backup copy can be deleted only if the base file and, implicitly, its backup copy are local resources (not remote).

-help | --help | -h | --h
Displays help text.

Note:
For boolean arguments, it is not necessary to provide the "true" value. Their presence in the argument list is equivalent to setting their value to "true" (and their absence from the argument list is equivalent to setting their value to "false"). However, constructs of the form bool_option true|false are accepted and interpreted accordingly.

Examples of Compare Files Script

Example 1: Compare Files and View Results in XML Format
The following command results in merging file1 and file2 into outfile with changes highlighted:

```sh
sh scripts/mergeFilesTrackChanges.sh file1 file2 outfile
```

Example 2: Compare Files with Line by Line Algorithm
The following command results in merging file1 and file2 by overwriting file1. However, the file1 is backed up first:

```sh
sh scripts/mergeFilesTrackChanges.sh file1 file2
```

Example 3: Compare Files and Generate Comparison Report
The following command results in merging file1 and file2 by overwriting file1. Although file1 is initially backed up, the backup is eventually removed:

```sh
sh scripts/mergeFilesTrackChanges.sh file1 file2 -nb
```

Merge Directories with Change Tracking Highlights

Attention:
This script is bundled with the all platforms distribution of Oxygen XML Editor Eclipse plugin. To run the script, you are required to purchase a special scripting commercial license.

The Merge Directories with Change Tracking Highlights script (mergeDirsTrackChanges.sh, found in the scripts subfolder inside Oxygen's installation directory) can be used to merge 2 directories (based on a 2-way comparison). All pairs of modified XML files involved in the process are merged by saving the Author
mode comparison results as documents with highlighted tracked changes that can be later reviewed and accepted or rejected.

## Arguments for the Merge Directories with Change Tracking Highlights Script

```bash
sh mergeDirsTrackChanges.sh pathOfBaseDir pathOfDirToMergeWith [[pathOfOutDir] [-nb noBackupOfBaseDir] [-nu noUpdateOfModifNonXMLFiles] [-na noAddingFilesOnlyPresentInDirToMergeWith] [-nd noDeletionOfFilesOnlyPresentInBaseDir] [-cm createChangeTrackingMarkersForAddedXMLFiles]] [-help | --help | -h | --h]
```

- **pathOfBaseDir**
  Mandatory argument that specifies the path of the base directory (it can also be provided as a URL using `file://` protocol).

- **pathOfDirToMergeWith**
  Mandatory argument that specifies the path of the directory to merge with (it can also be provided as a URL using `file://` protocol).

- **pathOfOutDir**
  Optional argument that specifies the path of the directory where the merge operation results are saved to (it can also be provided as a URL using `file://` protocol). If present, it must appear immediately after the first two mandatory arguments. If absent, the merge results are saved to the base directory, by overwriting it. You cannot choose the same directory specified as the directory to merge with as the output directory (the merge process is aborted in this case).

- **-nb noBackupOfBaseDir**
  Set to `true` if you do not want a backup copy of the base directory on the hard disk. There are 2 situations when a backup of the base directory is performed automatically and the backup operation must succeed to proceed with the merge. Otherwise, the merge process is aborted if the output directory is not specified (i.e. the `pathOfOutDir` argument is not present) or the specified output directory is the base directory itself.

  The backup copy will have the same parent directory as the base directory and its name will be the name of the base directory suffixed by ".OXY.BAK". The default value is `false`, which means that for either of the 2 previously mentioned situations, a backup copy of the base directory will be kept on the hard disk.

- **-nu noUpdateOfModifNonXMLFiles**
  Set to `true` if you want to keep the non-XML files at their versions from the base directory. The default value is `false`, which means that all files in the output directory that are copies of non-XML files in the base directory will be replaced by their corresponding files in the directory to merge with.

- **-na noAddingFilesOnlyPresentInDirToMergeWith**
Set to true if you want to skip adding the files that are only present in the directory to merge with to the output directory as well. The default value is false, which means that all files that are only present in the directory to merge with are also added to the output directory.

**-nd noDeletionOfFilesOnlyPresentInBaseDir**

Set to true if you want to preserve the files that are only present in the base directory. The default value is false, which means that all files that are only present in the base directory and initially copied to the output directory are deleted.

**-cm createChangeTrackingMarkersForAddedXMLFiles**

Set to true if you want to create change tracking markers for the XML files only present in the directory to merge with (that will be added to the output directory). Although these files have no counterparts in the base directory, change tracking markers of the type “entire content added/inserted” will be created. The option is not necessarily intended for the merge process itself, but it might prove a useful addition when you want to apply various Oxygen transformation scenarios to the resulting output directory. For example, if you merge 2 versions of a DITA project and then want a PDF to highlight the changes between those versions, you can apply a transformation on the resulting ditamap file. The -am option presents the new DITA files as “added content” in the resulting PDF. Note that the option is only considered if the -na argument is absent or is explicitly set to false (default value).

**-help | --help | -h | --h**

Displays help text.

**Notes:**

- The merge process has a preliminary phase where the entire structure and content of the base directory is copied to the output directory.
- For boolean arguments, it is not necessary to provide the “true” value. Their presence in the argument list is equivalent to setting their value to “true” (and their absence from the argument list is equivalent to setting their value to “false”). However, constructs of the form bool_option true|false are accepted and interpreted accordingly.
- Once the merge operation is complete, a report file is created and saved in the output directory (in a separate subdirectory named “__OXY__MERGE__REPORT”). Loading the report file in Oxygen XML Editor Eclipse plugin provides additional functionality. Aside from the fact that the report provides an overview of the merge process, it also provides links to all the files in the resulting output directory. You can use the respective links to load the XML files in the editor, then switch to Author mode to review the tracked changes and accept or reject them.

**Examples of Compare Directories Script**

**Example 1: Compare Directories Without Updating non-XML Files**
The following command results in merging \texttt{dir1} and \texttt{dir2} into \texttt{outdir}, but without updating the non-XML files in \texttt{dir1} detected with changes to their version in \texttt{dir2}:

\texttt{sh scripts/mergeDirsTrackChanges.sh dir1 dir2 outdir -nu}

**Example 2: Compare Two Directories and Overwrite the First One**

The following command results in merging \texttt{dir1} and \texttt{dir2} by overwriting \texttt{dir1}. However, the \texttt{dir1} is backed up first:

\texttt{sh scripts/mergeDirsTrackChanges.sh dir1 dir2}

**Example 3: Compare Directories and Create Change Tracking Markers**

The following command results in merging \texttt{dir1} and \texttt{dir2} into \texttt{outdir} and creating change tracking markers (of the type "entire content added/inserted") for all XML files that are only present in \texttt{dir2} (to be added to the \texttt{outdir}):

\texttt{sh scripts/mergeDirsTrackChanges.sh dir1 dir2 outdir -cm}

**Figure 658. Example of a Merged File with Change Tracking Markers Opened in Author Mode**

\begin{center}
\includegraphics[width=\textwidth]{merged_file.png}
\end{center}

**Format and Indent Files**

\textbf{Attention:}

This script is bundled with the \texttt{all platforms distribution} of Oxygen XML Editor Eclipse plugin. To run the script, you are required to purchase a special \texttt{scripting commercial license}. 
The **Format and Indent Files** script (`batchFormatAndIndent.bat/batchFormatAndIndent.sh`, found in the `scripts` subfolder inside Oxygen's installation directory) can be used to format and indent multiple files at once.

**Arguments for the Format and Indent Files Script**

```bash
batchFormatAndIndent -i inputFilesAndDirs [-f filesFilter] [-s formattingSettingsFile] [-r] [-ih] [-v]
```

- **-i inputFilesAndDirs**
  The input files and directories.

- **-f filesFilter**
  A filter for the input files, specified by using a file pattern (e.g. `*.xml`, `t_*.dita`).

- **-s formattingSettingsFile**
  A file that contains formatting settings. It can be an `.xpr` file that contains project options or an `.xml` file that contains global options. If not specified, the operation uses the application's default settings.

- **-r**
  Use this argument if the operation should be performed recursively for the specified input directories.

- **-ih**
  Use this argument if you want the operation to also format and indent hidden files.

- **-v**
  Activates verbose logging. It is useful for debugging purposes.
23.

Glossary

Active Cell

*Active cell* refers to the selected cell where data is entered when you begin typing. Only one cell is active at a time. The *active cell* is bounded by a heavy border.

Alternate CSS Style

The *Alternate CSS Style* refers to the choices in the bottom half of *Styles* drop-down menu (on the toolbar) that makes it easy to apply style changes to your documents as they appear in *Author* mode and the output without having to edit the CSS stylesheets. By default, the *alternate styles* are applied like layers, they are merged sequentially with the *main CSS style* (*on page 2656*), and you can activate any number of them. However, if you deselect the *Enable multiple selection of alternate CSSs* option (*on page 96*) in the *CSS* subtab of the *Document Type* configuration dialog box (*on page 90*), the *alternate styles* are treated like *main CSS styles* (*on page 2656*) and you can only select one at a time.

For more information, see Configuring and Managing Multiple CSS Styles for a Framework (*on page 1933*).

Anchor

An *Anchor* is used in various types of links to take the user to a specific location within the target document. It is designated in a URL or in the value of the *@href* attribute with a # symbol followed by the anchor that is defined in a target ID (for example, href="MyTopic.dita#anchor").

Apache Ant

*Apache Ant* (Another Neat Tool) is a software tool for automating software build processes.

Block Element

A *block element* is intended to be visually separated from its siblings, usually vertically. For instance, paragraphs and list items are *block elements*. It is distinct from a *inline element*, which has no such separation.

Bookmap

A *bookmap* is a specialized *DITA map* used for creating books. A *bookmap* supports book divisions such as chapters and book lists such as indexes.
Callout

A **callout** is a string of text inside a graphic and is connected to a specific location in a document by a line. Oxygen XML Editor Eclipse plugin uses callouts to present comments and other types of review modifications.

Canonicalize

To **canonicalize** something means to convert it to a standard format that everyone generally uses. When using the term with regard to XML, it refers to the process of converting data that has more than one possible representations into a standardization that conforms to the specification of an XML document or document subset. It is helpful for applications that require the ability to test whether or not the content of an XML document or subset has been changed.

Content Completion Assistant

The **Content Completion Assistant** refers to a very helpful mechanism in Oxygen XML Editor Eclipse plugin that offers a list of proposed items that could be inserted at the current location, depending on the current context, editing mode, and type of document. It also tries to determine the most logical choice in the current editing context and displays that proposal at the beginning of the list.

For more information about this feature and how to invoke it, depending on your editing context, see the following:

- Content Completion Assistant in Author Mode *(on page 391)*
- Content Completion Assistant in Text Mode *(on page 318)*
- Content Completion Assistant in Grid Mode *(on page 363)*
- Content Completion in XSLT Stylesheets *(on page 658)*
- Content Completion in XML Schema *(on page 743)*
- Content Completion in XQuery *(on page 785)*
- Content Completion Assistance in WSDL Documents *(on page 803)*
- Content Completion in CSS Stylesheets *(on page 826)*
- Content Completion in Relax NG Schemas *(on page 835)*
- Content Completion in NVDL Schemas *(on page 851)*
- Content Completion in JavaScript Documents *(on page 934)*
- Content Completion in Schematron Documents *(on page 955)*
- Content Completion in SQF *(on page 992)*

Dockable

A **Dockable** window is one that can be moved and resized, and either floated or pinned to a location, allowing you to configure the workspace according to your preferences.

Document Fragment

A **document fragment** represents a portion of an XML document's tree of nodes or content.
Document Type Association

In general terms, a **Document Type Association** is a set of rules that associate a document type with a **framework** (on page 2655). In Oxygen XML Editor Eclipse plugin, **Document Type Association** also specifically refers to a **preferences page** (on page 88) where you can create new custom **frameworks** or edit existing ones. Note that **frameworks** (document types) that come built-in with Oxygen XML Editor Eclipse plugin are read-only, but you can **Extend** (on page 89) or **Duplicate** (on page 89) them to configure them as custom **frameworks**.

DITA Map

A **DITA map** is a component of the DITA **framework** (on page 2655) that provides the means for a hierarchical collection of DITA topics that can be processed to form an output. Maps do not contain the content of topics, but only references to them. These are known as topic references. Usually, the maps are saved on disk or in a CMS with the extension `.ditamap`.

Maps can also contain relationship tables that establish relationships between the topics contained within the map. Relationship tables are also used to generate links in your published document.

You can use your map or **bookmap** (on page 2652) to generate a deliverable using an output type such as XHTML, PDF, HTML Help, or Eclipse Help.

DITA Open Toolkit

**DITA Open Toolkit** is an open-source publishing engine for content authored in the Darwin Information Typing Architecture. It is a vendor-independent, open-source implementation of the DITA standard, released under the **Apache License, Version 2.0**.

The toolkit supports all versions of the **OASIS DITA specification**, including 1.0, 1.1, 1.2, and 1.3.

DITA-OT

**Related Information:**

http://www.dita-ot.org/

DITA-OT-DIR

**DITA_OT_DIR** refers to the default directory that is specified for your DITA Open Toolkit distribution in the **Window > Preferences > Oxygen XML Editor Eclipse plugin > DITA preferences page** (on page 81).

For example, if you are using DITA-OT 4.1.1 that comes bundled with Oxygen XML Editor Eclipse plugin, the default directory is: `[OXYGEN_INSTALL_DIR]/frameworks/dita/DITA-OT`. You can also specify a custom directory.
Foldable Element

A foldable element refers to elements that can be collapsed and expanded in Oxygen XML Editor Eclipse plugin. Foldable elements are marked with a small triangle ( ▼/ ▲ ) on the left side of the editor panel and you can use that triangle to quickly collapse or expand them. This feature is helpful when you are working with large documents and you want to temporarily hide blocks of content. You can right-click the triangle to access additional collapse and expand actions (Collapse Other Folds, Collapse Child Folds, Expand Child Folds, Expand All).

Framework

A framework refers to a package that contains resources and configuration information to provide ready-to-use support for a vocabulary or document type. A framework is associated to a document type according to a set of rules. It also includes a variety of settings that improve editing capabilities for its particular file type. Oxygen XML Editor Eclipse plugin includes a Document Type Configuration Dialog Box (on page 90) that allows you to define the set of rules and customize various authoring mechanisms for new or existing frameworks.

For advanced details about customizing your own framework, see the Creating and Configuring Custom Frameworks (on page 1919) section.

IDML

IDML is an abbreviation for Adobe InDesign Markup files.

Inline Element

An inline element is intended to be displayed in the same line of text as its siblings or the surrounding text. For instance, strong and emphasis in HTML are inline elements. It is distinct from a block element, which is visually separated from its siblings.

Java Archive

Java Archive (JAR) is an archive file format. JAR files are built on the ZIP file format and have the .jar file extension. Computer users can create or extract JAR files using the jar command or an archive tool.

Key Space

The concept of a Key Space in DITA refers to a set of all possible keys that can be used in a DITA map structure. A Key Space is established when a root map (on page 2658) defines a set of effective key bindings. When Oxygen XML Editor Eclipse plugin processes key references, it determines the effective binding of a given key to a resource in the context of the specified root map (on page 2331).
Keystore

A **Keystore** is an encrypted file that contains private keys and certificates. There are two types of keystores that are supported in Oxygen XML Editor Eclipse plugin:

- Java Key Store (JKS)
- Public-Key Cryptography Standards version 12 (PKCS-12)

Main CSS Style

The **Main CSS Style** refers to the selection in the top half of the Styles drop-down menu (on the toolbar) that makes it easy to quickly change the look of your documents as they appear in Author mode and the output without having to edit the CSS stylesheets. The main CSS applies to the whole document and you can also select one or more alternate styles (on page 2652) (listed in the bottom half of the drop-down menu) that behave like layers and are merged sequentially with the main CSS style.

For more information, see Configuring and Managing Multiple CSS Styles for a Framework (on page 1933).

Main File

A **Main File** typically refers to the root of an imported or included tree of modules and this support helps you simplify the configuration and development of XML projects. For more information, see the Contextual Project Operations Using ‘Main Files’ Support (on page 277) section.

Oxygen Publishing Template

*Oxygen Publishing Template* defines all the aspects related with the look and feel(layout and styles) for the WebHelp Responsive output.

The template is self-contained and packed as a ZIP archive making it easy to share with others. It represents the main method for customizing the WebHelp Responsive output.

**Related Information:**
Publishing Template Package Contents for WebHelp Responsive Customizations (on page 1343)

Perspective

In Oxygen XML Editor Eclipse plugin, a **perspective** refers to an interface layout geared towards a specific editing environment. Each perspective includes a unique set of interface objects, toolbars, views, and features. You can change the perspective by selecting the respective icon in the top-right corner of Oxygen XML Editor Eclipse plugin or by selecting the perspective from the Window > Perspective > Open Perspective menu.

The perspectives that are available in Oxygen XML Editor Eclipse plugin are:
• **Editor** *(on page 233)* - The most commonly used perspective and it is used to edit XML documents.

• **XSLT Debugger** *(on page 235)* - Used to detect problems in an XSLT transformation by executing the process step by step in a controlled environment.

• **XQuery Debugger** *(on page 236)* - Used to detect problems in an XQuery transformation process by executing the process step by step in a controlled environment.

• **Database** *(on page 237)* - Used to browse and manage databases.

**Plugin**

In Oxygen XML Editor Eclipse plugin, a **plugin** is a component that adds extended functionality using a series of extension points and can be installed as an **add-on**. For more information, along with a full list of add-ons that are officially supported for Oxygen XML Editor Eclipse plugin, see Oxygen XML Add-on Repositories.

**Pretty-Print**

*Pretty-print* refers to formatting and indenting the source code in **Text** mode to make the content easier to view and analyze. The formatting actions that are available in Oxygen XML Editor Eclipse plugin include:

- **Format and Indent Element** - Available in the **Source** submenu of the contextual menu for the current element.
- **Format and Indent** - Available on the toolbar for the entire current document.
- **Format and Indent** - Available in the contextual menu of the **Text view** *(on page 1213)* and applies to all the content in that view.
- **Format and Indent Files** - Available in the contextual menu of the **Project Explorer view** *(on page 268)* for one or more selected files.

**QName**

*QName* stands for “qualified name” and defines a valid identifier for elements and attributes. *QNames* are used as URI references to reference particular elements or attributes within XML documents.

**Quick Assist**

The **Quick Assist** feature gives you easy access to some of the most commonly used actions for the specific type of document you are editing. If one or more actions are available in the current context, they are accessible via a yellow bulb help (Visual Assist) placed at the current line in the stripe on the left side of the editor in **Text** mode. You can also invoke the quick assist menu by using the **Ctrl + 1** (*Meta 1* on macOS) keyboard shortcuts.
Quick Fix

The **Quick Fix** support in Oxygen XML Editor Eclipse plugin helps you resolve errors that appear in an XML document by offering proposals to fix problems such as missing required attributes or invalid elements. *Quick Fixes* are available in **Text** mode and **Author** mode and they can be presented and activated in several ways.

- When hovering over an area of text where a validation error or warning occurs, the **Quick Fix** proposals can be presented as links in a tooltip pop-up window.
- When hovering over an error or warning in **Author** mode, the **Quick Fix** proposals are presented in a small drop-down menu.
- If you place the cursor in the highlighted area where a validation error or warning occurs, a **Quick Fix** icon (ئة) is displayed in the stripe on the left side of the editor. Clicking that icon will allow you select from the available proposals.
- If you place the cursor in the highlighted area where a validation error or warning occurs, you can also access the **Quick Fix** menu by pressing `Ctrl + 1 (Command + 1 on macOS)` on your keyboard.

Oxygen XML Editor Eclipse plugin also provides support for defining and customizing a library of **Quick Fixes** using the Schematron language *(on page 980).*

Root Map

A **Root Map** (or main map) specifies a **DITA map** *(on page 2654)* that defines a hierarchical structure of submaps that are contained within the root map. Essentially, the root map defines a scope and provides the mechanism to allow your defined keys to be propagated throughout the entire map structure (this mechanism is also known as a **key space** *(on page 2655)*).

In Oxygen XML Editor Eclipse plugin, the **DITA Maps Manager** includes an option on its toolbar where you can easily specify the root map *(on page 2319)*, but there are also several other ways to select or change the root map *(on page 2331).*

Space-Preserved Element

A **spaced-preserved element** refers to elements that require white spaces and line endings to be preserved (for example, DITA `<codeblock>` and `<pre>` elements).

Subject Scheme Map

A **Subject Scheme Map** allows you to create custom controlled attribute values and to manage metadata. **Subject scheme maps** use a key definition to define a collection of controlled values rather than a collection of topics. The highest level of map that uses the set of controlled values must reference the **subject scheme map** where those controlled values are defined.

A controlled value is a keyword that can be used as a value in a metadata attribute. For example, the `@audience` metadata attribute may take a value that identifies the user group associated with a particular content unit (for medical equipment, that might include *therapist, oncologist, surgeon, radiologist*, and so
In a subject scheme map, you can define a list of these audience values and you can then use these values to profile your content. For more information, see Customizing Profiling Values with a Subject Scheme Map (on page 2573).

Track Changes

The Track Changes feature allows you to review changes that you or other authors have made and then accept or reject them. You can also manage the visualization mode of the tracked changes, add comments to changes, and mark them as being done. These actions are easily accessible from contextual menus, the toolbar, or the Review view (on page 436).

For more information about this feature, see Managing Tracked Changes (on page 415).

WebHelp Output Directory

WebHelp_OUTPUT_DIR refers to the output directory where WebHelp transformation files will be generated.

The output directory can be specified using the Output Directory text field in the Output tab of the transformation scenario dialog box.

When running the WebHelp transformation from a command line, the output directory can be specified using the -o or --output option.

Working Set

A Working Set refers to a set of files that will be used for the scope of search and refactoring operations. Many of the search and refactoring wizards include a step where you can specify the scope for the operation and you can choose one or more working sets to restrict the scope to that specified set of files.

XML Catalog

An XML Catalog maps a system ID or a URI reference for a resource (stored either remotely or locally) to a local copy of the same resource. Whenever XML processing relies on external resources (such as referenced schemas and stylesheets), the use of an XML Catalog becomes a necessity when Internet access is not available or the connection is slow.

Oxygen XML Editor Eclipse plugin includes default global catalogs as well as default catalogs for each of the built-in frameworks (on page 2655), and you can also create your own. Oxygen XML Editor Eclipse plugin uses these XML Catalogs to resolve references for document validation and transformations. For more information, see Working with XML Catalogs (on page 593).
