

What will this cost me?

Evaluating the work ahead for a migration to 2.0

Robert D. Anderson

DITA-OT Day 2026

February 1, 2026, Brussels, Belgium

Today's agenda

What is this about again?

1

What's
changed

2

How to know
what it will
cost

3

What has to
wait

4

Resources

A lot of things were deprecated and replaced in 1.x

Attributes were replaced with elements

Generally to better enable localization and content reuse

Replacements exist already, use an element

For example, `<alt>`, `<title>`, etc

A lot of things were deprecated and replaced in 1.x

Attributes were replaced with elements	Generally to better enable localization and content reuse	 Replacements exist already, use an element
		 For example, <code><alt></code> , <code><title></code> , etc
Some things were just removed	In general, you shouldn't have them If you do, you were probably using it for something unexpected	 Elements like <code>indextermref</code> , attributes like <code>@query</code>
		 Remove them, and find a replacement for markup not used as intended

A lot of things were deprecated and replaced in 1.x

Attributes were replaced with elements	Generally to better enable localization and content reuse	 Replacements exist already, use an element
		 For example, <code><alt></code> , <code><title></code> , etc
Some things were just removed	In general, you shouldn't have them If you do, you were probably using it for something unexpected	 Elements like <code>indextermref</code> , attributes like <code>@query</code>
		 Remove them, and find a replacement for markup not used as intended
We found a better way to do things	For example, a generic <code><div></code> element replaced several similar elements	 Switch to the replacement
		 Should not see any change in behavior

Other markup was removed later

Determined the element is not needed

Aiming to simplify the language

No replacement needed, or something else is close enough

Unlikely to have big impacts

For example, `<unknown>`, `<data-about>`

Other markup was removed later

Determined the element is not needed	Aiming to simplify the language		Unlikely to have big impacts
	No replacement needed, or something else is close enough		For example, <code><unknown></code> , <code><data-about></code>
New features replacing old behavior	Alternate titles domain		Allows for easier extension with your own titles and processing
			Likely impacts, and cannot update markup until using 2.0
			
			

Other markup was removed later

Determined the element is not needed	Aiming to simplify the language		Unlikely to have big impacts
	No replacement needed, or something else is close enough		For example, <code><unknown></code> , <code><data-about></code>
New features replacing old behavior	Alternate titles domain		Allows for easier extension with your own titles and processing
			Likely impacts, and cannot update markup until using 2.0
Some features not yet implemented	Most of them are there, but a few are known to be missing		<code><sort-as></code> to replace <code><index-sort-as></code>
			@copy-to

Some items no longer supportable by TC

Lack of use	Domain does not get enough usage to justify being in the spec	“Delayed Conref” domain
		XNAL domain

Some items no longer supportable by TC

Lack of use	Domain does not get enough usage to justify being in the spec	“Delayed Conref” domain
		XNAL domain
Lack of expertise	Machinery task	No longer have expertise at TC
		Can still upgrade, but TC will not own / define

Some items no longer supportable by TC

Lack of use	Domain does not get enough usage to justify being in the spec	“Delayed Conref” domain
		XNAL domain
Lack of expertise	Machinery task	No longer have expertise at TC
		Can still upgrade, but TC will not own / define
Lack of time / formality not as urgent	Learning and training	Only widely used module that was removed
		Compatible grammars available

Why would you have to wait?

<linktext> (only in 1.x) becomes <linktitle> (only in 2.x)

New markup
not available

Why would you have to wait?

New markup
not available

`<linktext>` (only in 1.x) becomes `<linktitle>` (only in 2.x)

Replacement
not yet defined

`@copy-to` removed, replacement not clearly laid out

Why would you have to wait?

New markup
not available

`<linktext>` (only in 1.x) becomes `<linktitle>` (only in 2.x)

Replacement
not yet defined

`@copy-to` removed, replacement not clearly laid out

Replacement
not yet
implemented

`<linktitle>` not working until today's release
